5.2.1.4 For hull surveys carried out in accordance with Appendix 1, Chapter 4, PART ONE of the Rules, statutory requirements of relevant SOLAS regulations corresponding to tightness test and structural test in Table 1 of this Appendix may not apply. Statutory requirements of SOLAS or ILLC '66 corresponding to other shipbuilding function in Table 1 are to be replaced by relevant requirements of the Administration of the flag State.
Annex 2 of Appendix 1, Chapter 4, PART ONE of the Rules is not applicable to fishing vessels.
5.2.1.5 Unless expressly provided, Appendix 2 , Chapter 4 , PART ONE of the Rules is not applicable to fishing vessels.
5.2.1.6 At surveys during construction of fishing vessels, survey items are at least to include:
(1) inspecting the hull structure of fish hold to ensure that the materials, scantlings, construction, arrangement and installation are in accordance with the approved plans, diagrams, specifications, calculations and other technical documentation and that the workmanship is in all respects satisfactory;
(2) confirming the validity of the fish hold polyurethane foam test report;
(3) confirming the availability of the alarm system fitted in the refrigerated room and fish hold.

Section 3 SURVEYS AFTER CONSTRUCTION

5.3.1 General requirements

5.3.1.1 For the purpose of maintaining the validity of certificates, fishing vessels which have been classed with ISC are to be subject to the surveys as specified in this Section.
5.3.1.2 Unless expressly provided by this Section, surveys after construction of fishing vessels are to comply with the provisions of Chapter 5, PART ONE of the Rules.
5.3.1.3 The following requirements in Chapter 5, PART ONE of the Rules are not applicable to surveys after construction of fishing vessels:
(1) provisions of Sections 3, 5, 6, 7, 8, 16, 17 and 18;
(2) Appendixes 2, 3, 6, 10, 11, 12, 13, 17, 18, 19 and 20.
5.3.1.4 At surveys after construction of fishing vessels, survey items are at least to include:
(1) inspecting the general conditions of fish hold;
(2) confirming the availability of the alarm system fitted in the refrigerated room and fish hold.

Section 4 INTACT STABILITY

5.4.1 General requirements

5.4.1.1 Compliance with the requirements for intact stability is a condition for classification of ships.
5.4.1.2 The intact stability of fishing vessels is to comply with the requirements of this Section, or it is to be demonstrated that their intact stability is in compliance with the requirements of the flag State Administration.
5.4.1.3 This Section applies to ocean-going fishing vessels of 24 m and over in length L_L.

5.4.2 Plans and documents

5.4.2.1 The following plans and documents are to be submitted for approval or confirmation:
(1) Stability calculations for loading conditions or loading manual;
(2) Curves or table of allowable height of center of gravity or allowable initial metacentric height;
(3) Coordinates of opening of flooding angles and curves or table of flooding angles.
5.4.2.2 The following plans and documents are to be submitted for information:
(1) General arrangement;
(2) Lines and offsets;
(3) Hydrostatic curves or table;
(4) Stability cross curves or table;
(5) Capacity curves or table;
(6) Arrangement of bilge keels;
(7) Plan of load line marks and draught;
(8) Auxiliary calculations for windage area and moment of area, icing, etc.;
(9) Cross-sectional area (if applicable);

(10) Arrangement of fixed ballast (if applicable);
(11) Approved inclining test report or light ship survey report;
(12) Arrangement of portable fish-hold divisions (if applicable);
(13) Arrangement of fishing machinery (if applicable).
5.4.2.3 The above information may be reduced as appropriate for fishing vessels of which the intact stability has been approved.

5.4.3 Requirements for intact stability

5.4.3.1 The intact stability of fishing vessels is to comply with the relevant requirements of IMO resolution MSC.267(85) – International Code on Intact Stability, 2008 (2008 IS Code), Part B. For fishing vessels with B/D ≥ 2.5, the requirements of 2.2.3 of Part A of the Code may be substituted by the following criteria:
(1) The heeling angle corresponding to the maximum righting lever is not to be less than 15°;
(2) The area under the curve of righting levers is not be less than 0.07 m·rad up to an angle of 15° when the maximum righting lever occurs at 15º and 0.055 m·rad up to an angle of 30º when the maximum righting lever occurs at 30º or above. Where the maximum righting lever occurs at angles of between 15º and 30º, the corresponding area under the righting lever curve is to be:

$$0.055+0.001（30^\circ -\varphi_{max}）\ \mathrm{m \cdot rad}$$

where: φ_{max}——The heeling angle corresponding to the maximum righting lever（°）.
5.4.3.2 The angle of heel at which progressive flooding of fish-holds could occur through hatches which remain open during fishing operations and which cannot rapidly be closed shall be at least 20° unless the stability criteria of the righting lever curve of 5.4.3.1 can be satisfied with the respective fish-holds partially or completely flooded.
5.4.3.3 Vessels engaged in particular fishing methods where additional external forces are imposed on the vessel during fishing operations, shall take account of the effects of external forces on stability.
5.4.3.4 For special type fishing vessels such as beam trawler, net vessel, cage vessel etc, the special requirements (if applicable) of the Administration shall be satisfied.
5.4.3.5 For fishing vessels, the condition where ice accretion is likely to occur will have bad effects on the stability, so icing should be taken into account in the analysis of loading conditions. The following allowance shall be made in the icing calculations:
(1) 30kg/m^2 on exposed weather decks;
(2) 7.5kg/m^2 for projected lateral area of each side of the vessel above the water plane;
(3) the icing weight of the projected lateral area of rails, all kinds of booms, girder (except masts) and rigging, and the icing weight of the projected lateral area of other small objects shall be computed by increasing the total projected area of continuous surfaces by 5% and the static moments of this area by 10%.
If there is a significant difference between the icing conditions and the above requirements, the icing standard may be 0.5 to 2 times the required; if the expected icing exceeds 2 times the above-mentioned requirement, more stringent requirements can be adopted.

Section 5 DAMAGE STABILITY

5.5.1 General requirements

5.5.1.1 Compliance with the applicable requirements for damage stability is a condition for classification of vessels.
5.5.1.2 The damage stability of vessels is to comply with the requirements of this Section, or it is to be demonstrated that their damage stability is in compliance with the requirements of the flag State Administration.
5.5.1.3 Vessels of 100 m in length and over and the total number of persons carried is 100 or more should be checked for damage stability according to the requirements of this section.

5.5.2 Plans and documents

5.5.2.1 The following plans and documents are to be submitted for approval or confirmation:
(1) Calculations of damage stability;
(2) Damage control plan.
5.5.2.2 The following plans and documents are to be submitted for information:

(1) General arrangement of doors and windows;
(2) General arrangement of scuttles, ventilators and air pipes;
(3) Plans and documents stated in 5.4.2 of this Chapter.

5.5.3 Requirements for damage stability

5.5.3.1 The damage stability of vessels is to comply with the relevant requirements of Regulation 14, Chapter III of the 1993 Torremolinos Protocol Relating to the 1977 Torremolinos International Convention for the Safety of Fishing Vessels as amended by the Cape Town Agreement of 2012 (hereinafter referred to as Convention for the Safety of Fishing Vessels).

Section 6 LOAD LINE MARKS AND MARKING

5.6.1 Load line marks

5.6.1.1 The load line marks and marking for ocean-going fishing vessels are to comply with the provisions of Section 11, Part 2 of this Rule.

5.6.1.2 If the load lines of certain seasons are not applicable due to the particularity of the fishing vessel or the nature of the business or restricted by navigation, these load line segments may not be mapped.

Section 7 STRUCTURAL ARRANGEMENT

5.7.1 General Provisions

5.7.1.1 The provisions of this section apply to ocean-going steel fishing vessels of 24 m and over in length.

5.7.2 **Arrangement of watertight bulkheads**

5.7.2.1 Fishing vessels shall be fitted with a collision bulkhead and at least watertight bulkhead in the before and after end of the main machinery space. Such watertight bulkheads shall be extended up to the working deck.

5.7.2.2 Watertight subdivision bulkhead whether transverse or longitudinal shall be prevented ingress of water from any direction in the water pressure produced in intact and damage condition. In all cases, watertight subdivision bulkheads shall be capable of supporting at least the pressure due to a head of water up to the working deck. In damage condition, water pressure shall be taken into account in the balance, including the worst condition of intermediate stage of flooding.

5.7.2.3 Steps and recesses in watertight bulkheads shall be as strong as the bulkhead at the place where each occurs.

5.7.3 **Arrangement of collision bulkheads**

5.7.3.1 The distance between collision bulkheads and forward perpendicular of fishing vessels shall be meets the following requirements:

(1) not less than 0.05L and not more than 0.08L for vessels of 45m in length and over;

(2) not less than 0.05L and not more than 0.05L plus 1.35m for vessels of less than 45m and more than 24m in length, expect as may be allowed by ISC;

(3) less than 2.0m for vessels of 24m in length and over.

5.7.3.2 Where any part of the ship below the waterline extends forward of the forward perpendicular, e.g., a bulbous bow, the distances specified in paragraph 5.7.3.1 of this Section shall be measured from a point at mid-length of the extension forward of the forward perpendicular or from a point 0.015L forward perpendicular, whichever is lesser.

5.7.3.3 The bulkhead may have steps or recesses provided they are within the limits prescribed in paragraph 5.7.3.1 of this Section.

5.7.3.4 Where a long forward superstructure is fitted, the collision bulkhead shall be extended weathertight to the deck next above the working deck. The extension and collision bulkhead can be fitted on the different cross section provided it is located within the limits given in paragraph 5.7.3.1 of this Section and the part of the deck which forms the step is made effectively weathertight.

5.7.3.5 The pipes piercing the collision bulkhead shall be fitted with stop values capable of being operated from above the working deck, the valve being located inside the forepeak at the collision bulkhead with a indicator being used for show that the value turn on or off. The fitting of the valve without

institution operated from above the working deck on the after side of the collision bulkhead shall be authorized, provided that the valve is readily accessible under all service conditions and the space in which it is located is not a cargo space. All valves shall be of steel, bronze or other approved ductile material. Valves of ordinary cast iron or similar material are not acceptable.

5.7.3.6 No doors, manholes, access openings, or any other openings shall be fitted in the collision bulkhead below the working deck The number of openings in the collision bulkhead above the working deck shall be restricted to the minimum compatible with the design and normal operation of the vessels. All such openings shall be capable of being closed weathertight.

5.7.4 Stern tubes

5.7.4.1 In all cases stern tubes shall be enclosed in watertight spaces of moderate volume, to minimize the danger of water penetrating into the ship in case of damage to stern tube arrangements.

5.7.5 Openings and their closing appliances

5.7.5.1 The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the fishing vessels. Where penetrations of watertight bulkheads and internal decks are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity.

5.7.5.2 The acceptability height of hatchways coamings and sills for openings are to comply with the requirements in Table 5.7.5.2:

The acceptability height of hatchways coamings and sills for openings Table 5.7.5.2

Item \ Opening position	Position 1	Position 2
Superstructure and deckhouse sill (mm)	380	300/150
Sill of companionways (mm)	380	300/150
Machinery space opening (mm)	600	300
Height of hatch coamings (mm)	600	450/300

5.7.5.3 Weathertight doors

(1) all access openings in bulkheads of enclosed superstructure and other outer structures through which water could enter and endanger the vessel, shall be fitted with doors permanently attached to the bulkhead, framed and stiffened so that the whole structure is of equivalent strength to the unpierced structure, and weathertight when closed. As an alternative measure, where the stairway in deckhouse could be enclosed in substantially constructed companionways fitted with weathertight door, the outer door need not to be weathertight. The means for securing these doors weathertight shall consist of gaskets and clamping devices or other equivalent means and shall be permanently attached to the bulkhead or to the doors themselves, and shall be so arranged that they can be operated from each side of the bulkhead;

(2) weathertight doors directly access to exposed space are to open outwards.

5.7.5.4 Fish-holds and other hatchways, miscellaneous openings in working deck and superstructure decks are to comply with the following requirements:

(1) the hatchways coamings are to have substantially constructed according to its positions. Where operating experience has shown justification, the height of these coamings may be reduced, or the coamings omitted entirely, provided that the safety of vessels is not thereby impaired. In this case, the hatchway openings shall be kept as small as practicable and the covers be permanently attached by hinges or equivalent means and be capable of being rapidly closed and battened down;

(2) the structure of hatchways closed by wood covers in Positions 1 and 2 and the means for keeping them weathertight are to comply with the relevant requirements of Regulation 15 of the Amendments to Annex I of Annex B to the Protocol of 1988 Relating to the *International Convention on Load Lines, 1966*;

(3) the structure of hatchways closed by covers other than wood in Positions 1 and 2 and the means for keeping them weathertight are to comply with the relevant requirements of Regulation 6 of Chapter II of *Convention for the Safety of Fishing Vessels*.

5.7.5.5 Machinery space openings are to comply with the following requirements:

(1) machinery space openings are to be appropriate framed and efficiently enclosed by steel casings. Where machinery casings are not protected by other structures，the strength shall be considered specially. Access openings in such casings are to be fitted with weathertight doors, the sills of which are not less than 600 mm. Where machinery casings are not protected by other structures, double watertight doors are to be required for ships assigned freeboards less than those based on relevant requirements. An inner sill is not

less than 230mm in conjunction with the outer sill of 600 mm; The non-return valve which is to be closed directly and controlled locally shall be provided for sea inlet and discharge of the enclosure space between the double doors;

(2) opening shall be fitted with hatchway covers permanently attached to the bulkhead, framed and stiffened so that the whole structure is of equivalent strength to the unpierced structure, and weathertight when closed except access opening.

5.7.5.6 Other deck openings are to comply with the following requirements:

(1) where it is essential for fishing operations, flush deck scuttles of the screw, bayonet or equivalent type and manholes may be fitted provided these are capable of being closed watertight and such devices shall be permanently attached to the adjacent structure, except secured by closely spaced bolts. Having regard to the size and disposition of the openings and the design of the closing devices, metal-to-metal closures may be fitted that they are effectively watertight;

(2) openings other than hatchways, machinery space openings, manholes and flush scuttles in the working or superstructure deck shall be protected by enclosed structures fitted with weathertight doors or their equivalent. Companionways shall be situated as close as practicable to the centerline of the vessels.

5.7.5.7 Ventilators are to comply with the following requirements:

(1) ventilators to spaces below working deck or decks of enclosed superstructures are to have coamings of steel or other equivalent material, substantially constructed and efficiently connected to the deck. For vessels of 45m in length and over, the height above deck of ventilators coamings shall be at least 900mm on the working deck and at least 760mm on the superstructures deck. For vessels of less than 45m in length, the height of these coamings shall be 760mm and 450mm respectively;

(2) coamings of ventilators shall be of equivalent strength to the adjacent structure and capable of being closed weathertight by closing appliances permanently attached to the ventilators or adjacent structure. The closing appliances shall be permanently attached to the ventilators; Where other vessels such not fitted as this，the closing appliances shall be stored near the specified ventilators and convenient for use. Where the coaming of any ventilators exceeds 900mm in height, it shall be specially supported.

The thickness of ventilator coamings shall be not less than the requirements in Table 5.7.5.7, but need not exceed that of the deck.

Thickness of Ventilator Coamings **Table 5.7.5.7**

Internal diameter of coaming (mm)	Thickness of coaming (mm)	Internal diameter of coaming (mm)	Thickness of coaming (mm)
≤200	7.5	350	9.0
250	8.0	400	9.5
300	8.5	≥450	10.0

(3) the coamings of ventilators extend to more than 4.5 m above the working deck, and the coamings of ventilators extend to more than 2.3 m above the superstructures deck, need not be fitted with closing arrangements for vessels of 45m in length and over. The coamings of Ventilators extend to more than 3.4 m above the working deck, and the coamings of Ventilators extend to more than 1.7 m above the superstructures deck, need not be fitted with closing arrangements for vessels of less than 45m in length;

(4) Ventilators passing through superstructures other than enclosed superstructures are to have substantially constructed coamings of steel or other equivalent material at the working deck.

5.7.5.8 Air pipes are to comply with the following requirements:

(1) where air pipes to tanks and void spaces below deck extend above the working or the superstructure decks, the exposed parts of the pipes shall be of strength equivalent to the adjacent structures and fitted with appropriate protection. Openings of air pipes shall be provided with means of closing, permanently attaches to the pipe or adjacent structure.

The minimum wall thickness of air pipes above weather deck is to be:

6.0 mm for pipes of 80 mm external diameter or smaller;

8.5 mm for pipes of 165 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation;

(2) the height of air pipes above deck to the point where water may have access below shall be at least 760mm on the working deck and at least 450mm on the superstructure deck.

5.7.5.9 Freeing ports are to comply with the following requirements:

(1) where bulwarks on weather parts of the working deck or superstructures deck form wells, sufficient measures shall be provided to discharge of shipped water rapidly and freed of water;

(2) freeing ports area of bulwarks are to comply with the requirements of Regulation 14 of Chapter II of *Convention for the Safety of Fishing Vessels.*

5.7.5.10 Fish-holds gangway and other similar openings are to comply with the following requirements:
(1) fish-holds gangway of both sides of the vessels below working deck and other similar openings shall be fitted with the door open outwards, which are designed to ensure that they have equivalent watertight and structural integrity to the adjacent shell plating. The number of openings above is to be kept to a minimum compatible with the design and proper working of the fishing vessels;
(2) the lower edge of opening mentioned in(1) shall not be lower than the parallel of the side working deck, and the lowest point of the parallel shall be fitted at least 230mm above the top edge of the deepest operating waterline.

5.7.6 **Arrangement of double bottoms**
5.7.6.1 For vessels of 45m in length and over but less than 60m, a double bottom shall be fitted at least between front bulkhead of engine and collision bulkhead or close to these place as far as possible; For vessels of 60m in length and over but less than 75m, a double bottom shall be fitted in the area except engine at least, and that is to be extended to the collision bulkhead and the afterpeak bulkhead or close to these place as far as possible; For vessels of 45m in length and over, a double bottom shall be fitted in the midship that is to be extended to the collision bulkhead and the afterpeak bulkhead or close to these place as far as possible.
5.7.6.2 Where a double bottom is required to be fitted the inner bottom shall be continued out to the vessel's sides in such a manner as to protect the bottom to the turn of the bilge. Such protection will be deemed satisfactory if the inner bottom is not lower at any part than a plane parallel with the keel line and which is located not less than a vertical distance h measured from the keel line, h is to be less than *B/20.* However, in no case is the value of h to be less than 760 mm, and need not be taken as more than 2,000 mm.
5.7.6.3 A double bottom need not be fitted in way of watertight tanks, including dry tanks of moderate size, provided the safety of the vessel is not impaired in the event of bottom or side damage.
5.7.6.4 Small wells constructed in the double bottom in connection with drainage arrangements of fish-holds shall not extend downward more than necessary. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel. Other wells (e.g. for lubricating oil under main engines) may be permitted if satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with the requirements of this section. The vertical distance from the bottom of such a well to a plane coinciding with the keel line shall not be less than 500 mm.

5.7.7 **Arrangement of cofferdams**
5.7.7.1 Cofferdams are to be provided between compartments intended for fuel oil in double bottom and those intended for fresh water for boilers and drinking.
5.7.7.2 Cofferdams are only required between fuel oil tanks in double bottom and tanks immediately above where the inner bottom plating is subjected to the head of fuel oil contained therein, as in the case of a double bottom with its top raised at the sides. Where a corner to corner situation occurs for such tanks, they are not considered to be adjacent.
5.7.7.3 Cofferdams are to be provided between non-edible oil tanks, fish tanks and fresh water tanks; if the spaces between the fish tanks and non-edible oil tanks meet the requirements specified in 3.3.1.2, 3.3.1.3 or 3.3.1.4 of Part 1 of *Rules for Construction of Ocean-going Steel Fishing Vessels*, cofferdams are not needed.

5.7.8 **Arrangement of chain lockers**
5.7.8.1 Spurling pipes and cable lockers are to be watertight up to the deck exposed to weather. However, the bulkhead between separate chain lockers (Figure 5.7.8.1(1)) or the common bulkhead between adjacent lockers (Figure 5.7.8.1(2)) need not be watertight.
5.7.8.2 Where means of access are provided, they are to be closed by a substantial cover and secured by closely spaced bolts.
5.7.8.3 Where a means of access to spurling pipes or cable lockers is located below the weather deck, the manhole covers and securing appliances are to be in consistence with recognized standards (e.g., i) ISO 5894: 2018; ii) China: CB/T4392-2014 “Marine manhole cover”; iii) India: IS 15876-2009 “Ship and Marine Technology manholes with bolted covers”; iv) Japan: JIS F2304: 2015, “Ship’s Manholes” and JIS F2329: 1975, “Marine Small Size Manhole”; v) Korea: KS V ISO 5894: 2012; vi) Norway: NS 6260: 1985 "Manhole cover - overview"; vii) Russia: GOST 2021-90 “Ship’s steel manholes, Specifications”), or equivalent to the watertight manhole covers. The use of butterfly nuts and/or hinged bolts as the securing appliances of manhole covers is prohibited.

5.7.8.4 Spurling pipes through which anchor cables are led are to be provided with permanently attached closing appliances (e.g. steel plates in halves hooked over the spurling pipe tops, or canvas covers lashed) to minimize water ingress.

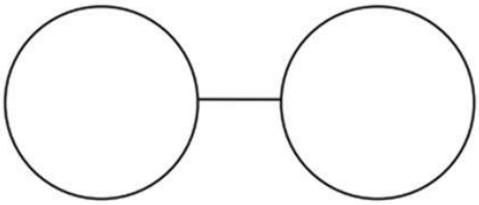

Figure 5.7.8.1(1)

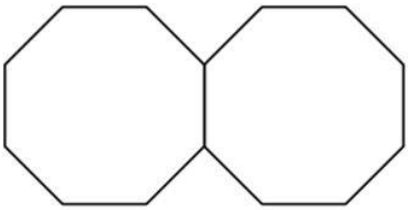

Figure 5.7.8.1(2)

Section 8 FIRE SAFETY

5.8.1 General requirements

5.8.1.1 This Section applies to ocean-going fishing vessels of 24m in length and over.

5.8.1.2 The fire safety of fishing vessels is to meet the requirements of this Section, taking into account the requirements of the flag State Administration, if any.

5.8.1.3 The fire safety of fishing vessels of 45m in length and over is to comply with the relevant provisions of Convention for the Safety of Fishing Vessels.

5.8.2 Plans and documents

5.8.2.1 The following plans and documents are to be submitted for approval or confirmation:

(1) Fire protection zone division plan and typical fire protection node plan;

(2) Fire insulation arrangement plan, deck covering arrangement plan and fire door arrangement plan;

(3) Ventilation system arrangement plan;

(4) Fixed fire extinguishing system arrangement plan and fire extinguishing dose calculation sheet;

(5) Water fire extinguishing system arrangement plan;

(6) Arrangement plan of fixed fire detection and alarm system;

(7) Control system diagram of quick closing valve for fuel and lubricating oil tanks;

(8) Fire control plan;

(9) Other plans and documents considered necessary by ISC.

5.8.3 Product certificate

5.8.3.1 All the main materials, equipment and devices used for fire protection of fishing vessels are to have corresponding ISC product certificates. For details, please refer to the relevant requirements in Appendix 1 B List of Requirements for Certification of Ship's Statutory Products of Chapter 3, Part 1 of this Rules.

5.8.4 Use of substitutes

5.8.4.1 Any special type of equipment, appliance, fire extinguishing agent or device mentioned in this Section may be replaced by other types of equipment without reducing efficiency, but relevant calculation, test or use experience are to be provided.

5.8.5 Fire safety requirements for fishing vessels of 30m in length and over but less than 45m

5.8.5.1 Structural fire protection

(1) The hull, superstructure, decks and deckhouses are to be constructed of non-combustible materials.

(2) The decks and bulkheads separating machinery spaces of category A from accommodation spaces, service spaces or control stations are to be constructed to "A-0" class standard. Decks and bulkheads separating other machinery spaces from accommodation, service spaces and control stations are to be "A-0" class standard. Decks and bulkheads separating the skipper's cabin from the wheelhouse, control stations from accommodation and service spaces are to be constructed to "B" class standard.

(3) The bulkheads of corridors serving accommodation spaces, service spaces and control stations are to be

of "B-0" class divisions.
(4) Any bulkhead of corridor serving accommodation spaces, service spaces and control stations is to extend from deck to deck unless a continuous ceiling of the same class as the bulkhead is fitted on both sides of the bulkhead, in which case the bulkhead may terminate at the continuous ceiling.
(5) Interior stairways serving accommodation spaces, service spaces or control stations are to be made of steel or other equivalent material. Such stairways are to be within enclosures constructed of "B-15" class divisions, provided that, where a stairway penetrates at least two decks.
(6) Doors and other closures of openings in bulkheads and decks referred to in 5.8.5.1 (2) to (4) of this Section, doors fitted to stairway enclosures referred to in 5.8.5.1 (5) of this Section, and doors fitted in engine and boiler casings, are to be as far as practicable equivalent in resisting fire to the divisions in which they are fitted. Doors to machinery spaces of category A are to be self-closing.
(7) Lift trunks which pass through the accommodation and service spaces are to be constructed of steel or other equivalent material and to be provided with means of closing which will permit control of draught and smoke.
(8) The boundary bulkheads and decks of spaces containing any emergency source of power, and bulkheads and decks between galleys, paint rooms, lamp rooms or any store-rooms which contain appreciable quantities of highly flammable materials and accommodation spaces, service spaces or control stations, are to be constructed of "A" class divisions. However, "B-15" class divisions between a galley and accommodation spaces, service spaces and control stations may be accepted when the galley contains electrically heated furnaces, electrically heated hot water appliances or other electrically heated appliances only.
(9) Highly flammable products are to be carried in suitably sealed containers.
(10) When bulkheads or decks required by this Section to be "A" or "B" class divisions, are penetrated for the passage of by electrical cables, pipes, trucks, ducts, etc., arrangements are to be made to ensure that the fire integrity of the division is not impaired.
(11) Air spaces enclosed behind ceilings, panellings or linings in accommodation spaces, service spaces and control stations are to be divided by close-fitting draught stops spaced not more than 7 m apart.
(12) Windows and skylights to machinery spaces are to be as follows:

① where skylights can be opened, they are to be capable of being closed from outside the space. Skylights containing glass panels are to be fitted with external shutters of steel or other equivalent material permanently attached;

② glass or similar materials are not to be fitted in machinery space boundaries. This does not preclude the use of wire-reinforced glass for skylights and glass in control rooms within the machinery spaces; and

③ wire-reinforced glass is to be used in skylights referred to in 5.8.5.1(12) ① of this Section.

(13) Insulating materials in accommodation spaces, service spaces except domestic refrigerating compartments, control stations and machinery spaces are to be non-combustible. The surface of insulation fitted on the internal boundaries of machinery spaces of category A is to be impervious to oil or oil vapours.
(14) Within compartments used for stowage of fish, combustible insulation are to be protected by close-fitting cladding.

5.8.5.2 Ventilation system

(1) Except ventilators serving spaces in which stoves are installed can have no closing appliances in accordance with 5.8.5.3 (2) of this Section, means are to be provided to stop fans and close main openings to ventilation systems from outside the spaces served .
(2) Means are to be provided for closing, from a safe position, the annular spaces around funnels.
(3) Ventilation openings may be permitted in and under the doors in corridor bulkheads except that such openings are not to be permitted in and under stairway enclosure doors. The openings are to be provided only in the lower half of a door. Where such opening is in or under a door, the total net area of any such opening or openings is not to exceed $0.05m^2$. When such opening is cut in a door, it is to be fitted with a grille made of non-combustible material.
(4) Ventilation ducts for machinery spaces of category A or galleys are not to, in general, pass through accommodation spaces, service spaces or control stations. If the ducts are to be constructed of steel or equivalent material and arranged to preserve the integrity of the divisions, this arrangement can be permitted.
(5) Ventilation ducts of accommodation spaces, service spaces or control stations are not to, in general, pass through machinery spaces of category A or through galleys. If the ducts are to be constructed of steel or equivalent material and arranged to preserve the integrity of the divisions, this arrangement can be permitted.
(6) Store-rooms containing flammable products and exceeding $4m^2$ are to be provided with ventilation

arrangements which are separate from other ventilation systems. Ventilation are to be arranged at high and low levels and the inlets and outlets of ventilators are to be positioned in safe areas. Suitable wire mesh guards to arrest sparks are to be fitted over inlet and outlet ventilation openings.

(7) Ventilation systems serving machinery spaces are to be independent of systems serving other spaces.

(8) Where trunks or ducts serve spaces on both sides of "A" class bulkheads or decks, dampers are to be fitted so as to prevent the spread of fire and smoke between compartments. Manual dampers are to be operable from both sides of the bulkhead or the deck. Where the trunks or ducts with a free cross-sectional area exceeding $0.02m^2$ pass through "A" class bulkheads or decks, automatic self-closing dampers are to be fitted. Where the trunks with a free cross-sectional area exceeding $0.02m^2$ serving compartments situated only on one side of such bulkheads, unless the ducts are of steel in the vicinity of passage through the deck or bulkhead, the openings are to be lined with a steel sheet sleeve and comply in that portion of the duct with the following:

① for ducts with a free cross-sectional area exceeding $0.02m^2$, the sleeves are to have a thickness of at least 3 mm and a length of at least 0.9m. When passing through bulkheads, this length are to preferably be divided evenly on each side of the bulkhead. Ducts or sheet sleeve fitted to these ducts are to be provided with fire insulation. The insulation are to have at least the same fire integrity as the bulkhead or deck through which the duct passes. Equivalent penetration protection may be provided; and

② ducts with a free cross-sectional area exceeding $0.075m^2$ are to be fitted with fire dampers in addition to the requirements of ① above. The fire damper is to operate automatically, but is also to be capable of being closed manually from both sides of the bulkhead or deck. The damper is to be provided with an indicator which shows whether the damper is open or closed. Fire dampers are not required, however, where ducts pass through spaces surrounded by "A" class divisions, without serving those spaces, provided those ducts have the same fire integrity as the bulkheads which they penetrate.

5.8.5.3 Heating installations

(1) Electric radiators are to be fixed in position and so constructed as to reduce fire risks to a minimum. No such radiator are to be fitted with an element so exposed that clothing, curtains or other similar materials can be scorched or set on fire by heat from the element.

(2) Heating by means of open fires are not to be permitted. Heating stoves and other similar appliances are to be firmly secured and adequate protection and insulation against fire are to be provided beneath and around such appliances and in way of their uptakes. Uptakes of stoves which burn solid fuel are to be so arranged and designed as to minimize the possibility of becoming blocked by combustion products and are to have a ready means for cleaning. Dampers for limiting draughts in uptakes are still to leave an adequate area open when in the closed position. Spaces in which stoves are installed are to be provided with ventilators of sufficient area to provide adequate combustion-air for the stove. Such ventilators are to have no means of closure and their position is to be such that closing appliances in accordance with 5.7.5.7 in Section 7 of this Chapter are not required.

(3) Open flame gas appliances, except cooking stoves and water heaters, are not to be permitted. Spaces containing any such stoves or water heaters are to have adequate ventilation to remove fumes and possible gas leakage to a safe place. All pipes conveying gas from container to stove or water heater are to be of steel or other approved material. Automatic safety gas shut-off devices are to be fitted to operate on loss of pressure in the gas main pipe or flame failure on any appliance.

5.8.5.4 Miscellaneous items

(1) Exposed surfaces within accommodation spaces, service spaces, control stations, corridor and stairway enclosures and the concealed surfaces behind bulkheads, ceilings, panellings and linings in accommodation spaces, service spaces and control stations are to have low flame-spread characteristics.

(2) Paints, varnishes and other finishes used on exposed interior surfaces are not to be capable of producing excessive quantities of smoke or toxic gases or vapours.

(3) Primary deck coverings within accommodation and service spaces and control stations, are to be of approved material which will not readily ignite or give rise to toxic or explosive hazards at elevated temperatures.

(4) In accommodation and service spaces and control stations, pipes penetrating "A" or "B" class divisions are to be of approved materials capable of withstanding the temperature required by the division. Due to arrangement reasons, the pipes conveying oil or combustible liquids that pass through accommodation and service spaces are to be approved fire-resistant material.

(5) Materials readily rendered ineffective by heat are not to be used for overboard scuppers, sanitary discharges and other outlets which are close to the waterline and where the failure of the material in the event of fire would give rise to danger of flooding.

(6) All waste receptacles, other than those used in fish processing, are to be constructed of non-combustible materials with no openings in the sides and bottom.
(7) Machinery driving fuel oil transfer pumps, fuel oil unit pumps and other similar fuel pumps are to be fitted with remote controls situated outside the space concerned so that they can be stopped in the event of a fire arising in the space in which they are located.
(8) Drip trays are to be fitted, where necessary, to prevent oil leaking into bilges.

5.8.5.5 Storage of gas cylinders and dangerous materials

(1) Cylinders for compressed, liquefied or dissolved gases are to be clearly marked by means of prescribed identifying colours, have a clearly legible identification of the name and chemical formula of their contents and be properly secured.
(2) Cylinders containing flammable or other dangerous gases and expended cylinders are to be stored, properly secured, on open decks and all valves, pressure regulators and pipes leading from such cylinders are to be protected against damage. Cylinders are to be protected against excessive variations in temperature, direct rays of the sun, and accumulation of snow. Due to arrangement reasons, such cylinders an be permitted to be stored in compartments complying with the requirements of 5.8.5.5 (3) to (5) of this Section.
(3) Spaces containing highly flammable liquids, such as volatile paints, paraffin, benzol, etc., and, where permitted, liquefied gas, are to have direct access from open decks only. Pressure-adjusting devices and relief valves are to exhaust within the compartment. Where boundary bulkheads of such compartments adjoin other enclosed spaces, they are to be gastight.
(4) Except as necessary for service within the space, electrical wiring and fittings are not to be permitted within compartments used for the storage of highly flammable liquids or liquefied gases. Where such electrical fittings are installed, they are to be approved safety devices. Sources of heat are to be kept clear of such spaces and "No smoking" and "No naked light" notices are to be displayed in a prominent position.
(5) Separate storage are to be provided for each type of compressed gas. Compartments used for the storage of such gases are not to be used for storage of other combustible products nor for tools or objects not part of the gas distribution system.

5.8.5.6 Means of escape

(1) Stairways and ladders leading to and from all accommodation spaces and in spaces in which the crew is normally employed, other than machinery spaces, are to be so arranged as to provide ready means of escape to the open deck and, thence, to the survival craft:

① at all levels of accommodation at least one means of escape is be provided. Where two or more means of escape are provided, they are to be as widely separated as possible, which include the normal means of access from each restricted space or group of spaces;
② a corridor or a part of a corridor from which there is only one route of escape is not to preferably exceed 5 m in length and, in no case, be greater than 7 m in length; and
③ stairways and corridors used as means of escape are not to be less than 700 mm in clear width, and are to have a handrail on one side. Stairways and corridors with a clear width of 1800mm and over are to have handrails on both sides. "Clear width" is considered the distance between the handrail and the bulkhead on the other side or between the handrails on both sides. The angle of inclination of stairways is to be, in general, 45° but not greater than 50° and in machinery spaces and small spaces not more than 60°. Doorways which give access to a stairway is to be of the same size as the stairway.

(2) Two means of escape are to be provided from every machinery space of category A which are to be as widely separated as possible. Vertical escapes are to be by means of steel ladders. Where the size of the machinery spaces makes it impracticable, one of these means of escape may be omitted. Where the length of machinery space of category A is less than 7m, one means of escape can be permitted.

5.8.5.7 Automatic fire detection and alarm system

(1) Where appreciable amounts of combustible materials are used on the construction of accommodation spaces, service spaces and control stations, special consideration are to be given to the installation of an automatic fire detection and alarm system in those spaces, having due regard to the size of those spaces, their arrangement and location relative to control stations.

5.8.5.8 Fire pump

(1) Each fishing vessel is to be equipped with water fire extinguishing system. The minimum number and type of fire pumps to be fitted are to be as follows:

① one power pump not dependent upon the main machinery for its motive power; or
② one power pump driven by main machinery, provided that the propeller shafting can be readily disconnected or provided that a controllable pitch propeller is fitted.

(2) Sanitary, bilge, ballast, general service or any other pumps may be used as fire pumps if they comply with the requirements of this chapter and do not affect the ability to cope with pumping of the bilges. Fire pumps are to be so connected that they cannot be used for pumping oil or other flammable liquids.
(3) Centrifugal pumps or other pumps connected to the fire main through which backflow could occur are to be fitted with non-return valves.
(4) The total capacity of main power-operated fire pumps are to be at least:

$$Q=(0.15\sqrt{L(B+D)}+2.25)^2 \quad m^3/h$$

Where: L——Length, m
B——Breadth, m
D——Depth, m.

(5) Where two independent power-operated fire pumps are fitted, the capacity of each pump is not to be less than 40% of the quantity required by 5.8.5.8(4) of this Section.
(6) When main power fire pumps are delivering the quantity of water required by 5.8.5.8(4) of this Section through the fire main, fire hoses and nozzles, the pressure maintained at any hydrant is not to be less than $0.20N/mm^2$.
(7) The emergency fire pump of fishing vessel is to be fitted are to be as follows:

① if a fire in any one compartment could put all the fire pumps out of action, there is generally to be an emergency fire pump. This emergency fire pump can be portable.

② the emergency fire pump is to be capable of delivering water through the jet required by 5.8.5.10 (1) of this Section.

③ the fixed emergency fire pump can be driven by diesel engine or motor, and is to meet the requirements as follows:

—— the emergency fire pump is generally to be capable of maintaining a water jet with a range of 12m and over from the fire hydrant at the highest position of the fishing vessel (the number of fire hydrants is set as the following provision), and the pressure at the hydrant is not to be less than the provisions in 5.8.5.8(6) of this Section;

——when the emergency fire pump runs, the number of fire hydrants used at the same time is not to be less than one;

——the outlet pipe of the emergency fire pump is to be connected to the fire main;

—— the emergency fire pump is to be located outside the engine room and within spaces easily accessible, and be set above working deck as far as possible, and supplied water by an independent submarine valve located outside the main fire pump space.The locations of the pump and its suction are to be such that the pump can still run effectively at the lowest draught that may be encountered in the operation of fishing vessels. The emergency fire pump is to be self-priming;

——if the emergency fire pump is driven by motor, it is to be powered by emergency power supply and the continuous running time is not to be less than 3 hours when the main power supply is cut off;

—— if the emergency fire pump is directly driven by the diesel engine or indirectly driven by the emergency diesel generator set, the diesel engine is to be capable of being readily started in its cold condition down to the temperature of 0℃, and its fuel flash point (closed cup test) is not to be lower than 43℃, and fuel tank is to contain sufficient fuel to enable the pump to run on full load for at least 3 h. In addition sufficient reserves of fuel is to be available to enable the pump to be run on full load for an additional 9 h.

④ portable power emergency fire pump is suitable to be driven by diesel engine. fuel tank is to contain sufficient fuel to enable the pump to run on full load for at least 3 h. In addition sufficient reserves of fuel is to be available to enable the pump to be run on full load for an additional 9 h. The pump is to be equipped with necessary accessories.

⑤ for the emergency fire pump which is allowed to use portable power, the permanent sea connection device for emergency use is generally to be set outside the machinery space. The use of hose to absorb water directly from the outboard is to be approved by ISC.

⑥ the suction pipeline of emergency fire pump is to be designed to minimize the loss of suction head.

⑦ the emergency fire pump along with its submarine valve and other necessary valves are to be operable from outside compartments containing main fire pumps in a position not likely to be cut off by a fire in those compartments.

5.8.5.9 Fire mains
(1) Where more than one hydrant is required to provide the number of jets specified in 5.8.5.10 (1) of this Section, a fire main is to be provided.

(2) Materials readily rendered ineffective by heat are not to be used for fire mains, unless adequately protected.
(3) Where fire pump delivery pressure can exceed the designed working pressure of fire mains, relief valves is to be fitted.
(4) Fire mains are not to have any connection to any system other than those required for fire fighting, except for the purpose of washing the deck and anchor chains and operation of bilge ejectors, subject to the efficiency of the fire-fighting system being maintained.
(5) Where fire mains are not self-draining, suitable drain cocks is to be fitted where frost damage may be expected.
5.8.5.10 Fire hydrant, fire hose and water nozzles
(1) Fire hydrants are to be positioned so as to allow easy and quick connection of fire hoses and so that at least one jet can be directed into any part of the vessel which is normally accessible during navigation.
(2) The jet required in 5.8.5.10 (1) of this Section is to be from a single length of fire hose.
(3) In addition to the requirements of 5.8.5.10 (1) of this Section, machinery spaces of category A are to be provided with at least one hydrant complete with fire hose and dual purpose nozzle. The fire hydrant is to be located outside the space and near the entrance.
(4) For every required fire hydrant, there is to be one fire hose. At least one spare fire hose is to be provided in addition to this requirement.
(5) Single length of fire hose is not to exceed 20 m.
(6) Fire hoses is to be of an approved material. Each fire hose is to be provided with couplings and a jet /water mist dual-purpose nozzle.
(7) Except where fire hoses are permanently attached to the fire main, the couplings of fire hoses and nozzles are to be completely interchangeable.
(8) The nozzles, as required by 5.8.5.10 (6) of this Section are to be appropriate to the delivery capacity of the fire pumps fitted, but in any case are to have a diameter of not less than 12 mm.
5.8.5.11 A sufficient number of approved portable fire extinguishers are to be provided in control stations and accommodation and service spaces to ensure that at least one extinguisher of a suitable type is readily available for use in any part of such spaces. The total number of extinguishers in these spaces is not to be less than three.
5.8.5.12 Fire-extinguishing appliances in machinery spaces
(1) Water fire-extinguishing system is to be provided in machinery spaces.
(2) Machinery spaces are to be provided with at least a 45L foam extinguisher or its equivalent, so that foam or its equivalent can be directed onto parts of fire hazards.
5.8.5.13 One of the portable fire extinguishers intended for use in any space is to be stowed near an entrance to that space.
5.8.5.14 Fire-extinguishing appliances are to be kept in good order and available for immediate use at all times.

5.8.6 Fire safety requirements for fishing vessels of less than 30m in length

5.8.6.1 Structural fire protection
(1) The hull, superstructure, structural bulkheads, decks and deckhouses are to be constructed of steel or other equivalent materials.
(2) The surface of insulation fitted on the internal boundaries of machinery spaces of category A and spaces where oil products may enter is to be impervious to oil or oil vapours.
(3) All thermal insulation of accommodation spaces is to be constructed of non-combustible materials. Within compartments used for stowage of fish, combustible insulation are to be protected by close-fitting cladding.
(4) Doors between machinery spaces and accommodation spaces are to be steel or other equivalent materials. A door may be allowed between the kitchen and the dining room, but it is to be made of non-combustible materials; the kitchen and the dining room can be regarded as one common lounge and divided into two appropriate cabins where only electrically cooking appliances are fitted in the kitchen.
5.8.6.2 Ventilation system
(1) Ventilation systems serving machinery spaces are to be independent of systems serving other spaces, and the main air inlets and outlets are to be able to be closed from outside the spaces, and the ventilation ducts are not to, as far as possible, pass through other spaces.
(2) Ventilation ducts are to be made of steel or other non-combustible materials.
(3) All power ventilations are to be able to be stopped from easily accessible positions outside the spaces serviced.
5.8.6.3 Heating installations

(1) Electric radiators are to be fixed in position and so constructed as to reduce fire risks to a minimum. No such radiator are to be fitted with an element so exposed that clothing, curtains or other similar materials can be scorched or set on fire by heat from the element.
(2) Heating by means of open fires are not to be permitted. Heating stoves and other similar appliances are to be firmly secured and adequate protection and insulation against fire are to be provided beneath and around such appliances and in way of their uptakes. Uptakes of stoves which burn solid fuel are to be so arranged and designed as to minimize the possibility of becoming blocked by combustion products and are to have a ready means for cleaning. Dampers for limiting draughts in uptakes are still to leave an adequate area open when in the closed position. Spaces in which stoves are installed are to be provided with ventilators of sufficient area to provide adequate combustion-air for the stove.
(3) Open flame gas appliances, except cooking stoves and water heaters, are not to be permitted. Spaces containing any such stoves or water heaters are to have adequate ventilation to remove fumes and possible gas leakage to a safe place. All pipes conveying gas from container to stove or water heater are to be of steel or other approved material. Automatic safety gas shut-off devices are to be fitted to operate on loss of pressure in the gas main pipe or flame failure on any appliance.

5.8.6.4 Miscellaneous items

(1) Exposed surfaces within accommodation spaces, service spaces, control stations, corridor and stairway enclosures and the concealed surfaces behind bulkheads, ceilings, panellings and linings in accommodation spaces, service spaces and control stations are to have low flame-spread characteristics.
(2) Paints, varnishes and other finishes used on exposed interior surfaces are not to be capable of producing excessive quantities of smoke or toxic gases or vapours.
(3) Primary deck coverings within accommodation and service spaces and control stations, are to be of approved material which will not readily ignite or give rise to toxic or explosive hazards at elevated temperatures.
(4) In accommodation and service spaces and control stations, pipes penetrating "A" or "B" class divisions are to be of approved materials capable of withstanding the temperature required by the division. Due to arrangement reasons, the pipes conveying oil or combustible liquids that pass through accommodation and service spaces are to be approved fire-resistant material.
(5) Materials readily rendered ineffective by heat are not to be used for overboard scuppers, sanitary discharges and other outlets which are close to the waterline and where the failure of the material in the event of fire would give rise to danger of flooding.
(6) All waste receptacles, other than those used in fish processing, are to be constructed of non-combustible materials with no openings in the sides and bottom.
(7) Machinery driving fuel oil transfer pumps, fuel oil unit pumps and other similar fuel pumps are to be fitted with remote controls situated outside the space concerned so that they can be stopped in the event of a fire arising in the space in which they are located.
(8) Drip trays are to be fitted, where necessary, to prevent oil leaking into bilges.

5.8.6.5 The storage of gas cylinders and dangerous materials is to meet the requirements of 5.8.5.5 of this Section.

5.8.6.6 Means of escape

(1) At least one entrance together with necessary stairways or staircases from all accommodation spaces and in spaces in which the crew is normally employed, other than machinery spaces, are to be so arranged as to lead to the open deck.
(2) At least one means of escape is to be provided from every machinery space of category A.
(3) A corridor or a part of a corridor from which there is only one route of escape is not to exceed 5 m in length.

5.8.6.7 Fire pump

(1) At least one power fire pump is to be provided, which can be driven by independent power or driven by main machinery.
(2) The capacity of fire pump is to be at least calculated according to the following formula, but it is not to be less than 16m^3/h and not to exceed 30 m^3/h in any case.

$$Q=(0.15\sqrt{L(B+D)}+2.25)^2 \quad m^3/h$$

Where: L——Length, m
B——Breadth, m
D——Depth, m.

(3) Sanitary, bilge, ballast or general service pumps may be used as fire pumps if they cannot be often used for pumping oil. If they are occasionally used for lightering or pumping fuel oil, suitable conversion devices are to be installed.

5.8.6.8 Fire mains

(1) Where more than one hydrant is required to provide the number of jets specified in 5.8.6.9 (1) of this Section, a fire main is to be provided.

(2) Materials readily rendered ineffective by heat are not to be used for fire mains, unless adequately protected.

(3) Where fire pump delivery pressure can exceed the designed working pressure of fire mains, relief valves is to be fitted.

(4) Fire mains are not to have any connection to any system other than those required for fire fighting, except for the purpose of washing the deck and anchor chains and operation of bilge ejectors, subject to the efficiency of the fire-fighting system being maintained.

(5) Where fire mains are not self-draining, suitable drain cocks is to be fitted where frost damage may be expected.

5.8.6.9 Fire hydrant, fire hose and water nozzles

(1) Fire hydrants are to be positioned so as to allow easy and quick connection of fire hoses and so that at least one jet can be directed into any part of the vessel which is normally accessible during navigation.

(2) The jet required in 5.8.6.9 (1)of this Section is to be from a single length of fire hose.

(3) In addition to the requirements of 5.8.6.9 (1) of this Section, machinery spaces of category A are to be provided with at least one hydrant complete with fire hose and dual purpose nozzle. The fire hydrant is to be located outside the space and near the entrance.

(4) For every required fire hydrant, there is to be one fire hose. At least one spare fire hose is to be provided in addition to this requirement.

(5) Single length of fire hose is not to exceed 20 m.

(6) Fire hoses is to be of an approved material. Each fire hose is to be provided with couplings and a jet /water mist dual-purpose nozzle.

(7) Except where fire hoses are permanently attached to the fire main, the couplings of fire hoses and nozzles are to be completely interchangeable.

(8) The nozzles, as required by 5.8.6.9 (6) of this Section are to be appropriate to the delivery capacity of the fire pumps fitted, but in any case are to have a diameter of not less than 12 mm.

5.8.6.10 A sufficient number of approved portable fire extinguishers are to be provided in control stations and accommodation and service spaces to ensure that at least one extinguisher of a suitable type is readily available for use in any part of such spaces. The total number of extinguishers in these spaces is not to be less than three.

5.8.6.11 Fire-extinguishing appliances in machinery spaces

(1) Water fire-extinguishing system is to be provided in machinery spaces.

(2) Machinery spaces are to be provided with two foam extinguishers or its equivalent equipment, so that foam or its equivalent can be directed onto parts of fire hazards.

5.8.6.12 One of the portable fire extinguishers intended for use in any space is to be stowed near an entrance to that space.

5.8.6.13 Fire-extinguishing appliances are to be kept in good order and available for immediate use at all times.

CHAPTER 6 ADDITIONAL REQUIREMENTS FOR OPEN-TOP CONTAINER SHIPS

Section 1 OPEN-TOP CONTAINER SHIPS ENGAGED IN UNRESTRICTED SERVICE

6.1.1 Application

6.1.1.1 This Section applies to open-top container ships of 500 gross tonnage and over, engaged in unrestricted service.

6.1.1.2 Open-top container ships are to be designed in compliance with IMO MSC/Circ.608/Rev.1.

6.1.1.3 Open-top container ships are to comply with the requirements of this Chapter and in addition, the applicable requirements of the Rules and the requirements of ISC Rules for Materials and Welding.

6.1.2 Definitions

6.1.2.1 For the purpose of this Chapter:

(1) Open-top container ship means a containership especially designed so that one or more of the cargo holds need not be fitted with hatch covers.

(2) Freeboard is the distance between the assigned load line and freeboard deck.

(3) Freeboard deck of open-top container ships engaged on international voyages, for the purposes of Chapters I and II of Annex I of the International Convention on Load Lines, 1966 (hereinafter referred to as the LL 1966), is the freeboard deck according to the LL 1966 as if hatch covers are fitted on top of the hatch coamings.

(4) Maximum sustained speed is defined as the maximum service speed taking into account speed loss due to resistance increase in regular waves. Voluntary speed loss is not taken into consideration.

(5) Minimum ship manoeuvring speed is defined to be the minimum speed which maintains directional control and is consistent with the operating characteristics of the ship.

(6) Green water is sea water other than spray shipped aboard the ship under normal operating conditions.

(7) Hold freeing ports are openings penetrating the hull on both sides of the ship above full load waterline within hold area, fitted with non-return valves through which water in a hold overflows outboard while external seawater will not enter the hold in any case.

(8) Permeability of a space is the percentage of that space which can be occupied by water.

6.1.3 Class notation

6.1.3.1 Open-top container ships complying with the requirements of this Chapter are to be assigned the Open-Top Container Ship class notation.

6.1.4 Plans and documents

6.1.4.1 In addition to the plans and documents specified in the relevant PARTs and Chapters of the Rules, the following are to be submitted for approval:

(1) Calculations of general and local strength of hull in full-load flooded condition;

(2) Calculations of capacity of bilge pumping system.

6.1.5 Freeboard and ship arrangement

6.1.5.1 Minimum freeboard is to be determined by seakeeping characteristics, stability (both intact and damage stability) and structural strength, and the greatest value obtained thereby is to be taken.

6.1.5.2 Seakeeping characteristics are to be obtained by model tests, and the following are to be submitted:

(1) measured data for the maximum hourly rate of ingress of green water likely to be shipped into each cargo hold;

(2) evaluation of the adequacy of the discharge rates from cargo hold freeing ports (if they are fitted).

6.1.5.3 In all loading conditions other than those assuming the hold being flooded, the assigned freeboard and the bow height are to be not less than the corresponding ones determined from the LL 1966 assuming hatch covers being fitted.

6.1.5.4 The assigned freeboard and the bow height according to 6.1.5.3 are to be not less than the corresponding ones for which the model tests are carried out. The maximum hourly rate of ingress of green

water in any one open hold determined from model testing is not to exceed the open hatch area multiplied by 400 mm/h.

6.1.5.5 All seasonal freeboards are to be omitted unless any corresponding seasonal freeboards for which the ship is eligible are greater than the freeboard for which the model tests are carried out.

6.1.5.6 Where an individual hold is fitted with hatch covers, the hold may be simulated as having containers being carried on the hatch covers with no seawater being shipped into the hold during the model test.

6.1.5.7 Container cell guides are to be fitted in the hold, except for ships engaged on short international voyages.

6.1.5.8 The stowage of containers with dangerous goods in ships carrying such containers is to comply with the requirements of 6.1.12 and 6.1.13 of this Section.

6.1.5.9 No freeing port is to be fitted on the hatch coaming of an open hold.

6.1.6 Procedure of model tests

6.1.6.1 The model experiments are to be carried out in long-crested, irregular waves.

6.1.6.2 The Pierson–Moskovitz, JONSWAP or Bretschneider spectrum is to be used for these experiments. Other spectra may be allowed for ships operating in restricted areas only.

6.1.6.3 The wave spectrum generated for the purpose of these experiments is to have a significant wave height of approximately 8.5 m at the most unfavorable realistic wave period (zero crossing).

6.1.6.4 The effect of wind generated spray need not be simulated during the tests.

6.1.6.5 The model experiments are to be carried out for at least the following wave directions:

(1) following seas (0°/360°);

(2) quarter following seas (45°/315°);

(3) beam seas (90°/270°);

(4) quarter head seas (135°/225°);

(5) head seas (180°).

6.1.6.6 The model experiments are to be carried out for at least the following speeds:

(1) maximum sustained speed in head seas and quarter head seas;

(2) minimum ship manoeuvring speed in quarter following seas and following seas;

(3) zero ship speed (dead ship condition) in beam seas.

6.1.6.7 The model experiments are to be carried out with a self-propelled, unrestrained model without the necessity to change course and the time period of each experiment is to correspond to at least one hour real time.

6.1.6.8 The loading condition used for the tests is to correspond at least to the maximum loaded draught with designed trim. If operational trim values differ substantially from designed trim, additional trim values are to be included in the model test programme.

6.1.6.9 The height of centre of gravity (*KG* value) selected is to correspond to the actual value most likely to be encountered during the ship's service. If *KG* values which may be expected during the operation of the ship differ substantially from this selected *KG* value, additional *KG* values are to be included in the model test programme.

6.1.6.10 For each test condition, the cargo hold which ships most water is to be determined by preliminary tests for each combination of heading, trim and *KG*. In running tests for the full duration specified above, this least favorable hold is to be simulated as having no containers, whilst other cargo holds (each cargo hold as a separate entity) may be simulated as completely fully loaded with containers above the line of the weather deck (or hatch coaming where applicable). Containers are not to be used as a means to prevent shipping of water into an empty hold where they are stacked outboard of the open hold. Rain covers for the open holds are not to be simulated in the model tests.

6.1.6.11 In addition to the usual parameters measured (ship motions, ship speed, relative motions, rudder angles, etc.), the volume of water entering all open cargo holds is to be measured for each experiment. The quantities of water taken aboard the model are to be removed and measured after each test run so that the metacentric height, moment of inertia and displacement are not appreciably disturbed by any accumulation of water during the testing programme.

6.1.6.12 Where freeing ports are fitted, an additional model test to comply with 6.1.5.2(2) is to be conducted at a draught which corresponds to the condition of a departing ship fully loaded with cargo and open holds flooded to the static equilibrium level with freeing ports open. A hold permeability of 70% by volume is to be assumed. Tests are to be conducted at zero speed in beam seas to verify that the capacity of freeing ports is such that the ship will not capsize.

6.1.7 Strength and construction

6.1.7.1 The hull strength and structure of open-top container ships are to be calculated and checked in accordance with Chapters 2 and 7 of PART TWO of the Rules.
6.1.7.2 The general and local strength of the hull is to be sufficient in all loading conditions (including those indicated in 6.1.8.2). In loading conditions indicated in 6.1.8.2, the following requirements are to be satisfied:
(1) Where the still water bending moment in flooded condition exceeds the allowable value, or the draught in flooded condition is greater than the scantling draught, the actual still water bending moment and/or draught in flooded condition is to prevail. Hull girder longitudinal strength (including ultimate strength) is to be checked in accordance with Section 2, Chapter 7, PART TWO of the Rules.
(2) Where the draught in flooded condition is greater than the scantling draught, the former is to prevail. Local strength is to be checked in accordance with relevant sections of Chapters 2 and 7, PART TWO of the Rules.
(3) For hull structures forming watertight boundaries of open-top holds, requirements in Section 13 Deep Tanks, Chapter 2, PART TWO of the Rules are to be satisfied, where the design pressure head h is the vertical distance from the calculation point to the highest point of down flooding height specified in 6.1.8.2.
6.1.7.3 When checking the general strength of open-top container ships, the hatch deformation due to hydrodynamic torque need not be considered.

6.1.8 Intact stability
6.1.8.1 The intact stability of the ship is to meet the relevant requirements for container ships of IMO resolution MSC.267(85) "The International Code on Intact Stability, 2008" and the amendments thereto.
6.1.8.2 Unless specified in 6.1.8.1, with all open holds completely filled with water (permeability of 0.70 for container holds) to the level of the top of the hatch side or hatch coaming or, in the case of a ship fitted with cargo hold freeing ports, to the level of those ports, the stability of the fully laden ship in the intact condition is to meet the survival criteria (with factor $S = 1$) in SOLAS II-1, Part B-1, as amended.
6.1.8.3 The intermediate conditions of hold flooding are also to be considered.

6.1.9 Damage stability
6.1.9.1 The damage stability is to comply with the subdivision and damage stability criteria in SOLAS II-1, Part B to B-4, as amended. The top of coamings of open-top holds is to be considered as the location from which downflooding begins.

6.1.10 Open hold bilge dewatering system and freeing ports
6.1.10.1 The bilge pumping system is to have sufficient capacity to pump:
(1) the maximum hourly rate of green water shipped in seagoing conditions as established by the comprehensive model testing;
(2) an amount equal to rainfall of 100 mm/hour regardless of the installation of rain covers;
(3) the hourly amount of shipped green water measured during the seakeeping model tests for the dead ship condition in beam seas, multiplied by safety factor 2;
(4) four-thirds of the amount of water required for fire-fighting purposes in the largest hold;
(5) an amount equal to the capacity required for ships with closed cargo holds,
whichever is the greater.
6.1.10.2 The pumping of hold bilges is to be possible by at least three bilge pumps.
6.1.10.3 At least one of these pumps is to have a capacity of not less than the required capacity as defined in 6.1.10.1 and is to be dedicated to bilge and ballast service only. The pump is to be located in such a way that it will not be affected by a fire or other casualty to the space containing the pumps required in 6.1.10.4 below or the space containing the main source of power and is to be supplied from the emergency switchboard required by SOLAS Reg. II-1/43, as amended.
6.1.10.4 The combined output of at least two further pumps is not to be less than the required capacity as defined in 6.1.10.1. These pumps are to be supplied from the main source of electrical power required by SOLAS Reg. II-1/41, as amended, or any other source of power independent of the emergency switchboard required by SOLAS Reg. II-1/43, as amended.
6.1.10.5 The bilge pumping system, including the piping system, is to incorporate sufficient redundancy features so that the system will be safely operational and capable of dewatering the hold spaces at the required capacity in the event of failure of any one system component.
6.1.10.6 The bilge pumping system is to be arranged to be effective within the limiting angles of inclination required for the emergency source of electrical power by SOLAS, as amended, and bilge wells are to be readily accessible for cleaning.

6.1.10.7 All open cargo holds are to be fitted with high bilge level alarms. The alarms are to initiate visual and audible warnings in the engine room and the manned control locations (navigation bridge, control stations or machinery space) and be independent of bilge pump controls.
6.1.10.8 If the loss of suction prevents the proper functioning of the bilge system, special measures to prevent this are to be considered, for instance, the installation of level indicators.
6.1.10.9 Open cargo hold drain wells are to be designed to ensure unobstructed discharge of water and easy access for cleaning under all conditions.
6.1.10.10 If provided, freeing ports are to be fitted on both sides of each open cargo hold, subject to the following:
(1) The number, size and location of the freeing ports on each side of each open hold are to be sufficient to prevent the accumulation of water above the level defined in 6.1.6.12 of this Section.
(2) Efficient means of closure to prevent the accidental ingress of water are to be provided. Such means are to be operated from above the freeboard deck. In the case of a ship operating in areas where icing is likely to occur, these arrangements are to be suitable to enable the ports to operate efficiently under such conditions.

6.1.11 Fire protection requirements

6.1.11.1 The fire protection system for open-top container holds is to be based on the philosophy of containing the fire in the bay of origin and to cool adjacent areas to prevent structural damage.
6.1.11.2 Open-top container holds are to be protected by a fixed water spray system. The system is to be capable of spraying water into the cargo hold from deck level downward. The system is to be designed and arranged to take account of the specific hold and container configuration. Where necessary a full-scale test may be required.
6.1.11.3 The water spray system is to be able to effectively contain a fire in the container bay of origin. The spray system is to be subdivided, with each subdivision to consist of a ring-line at deck level in an open cargo hold around a container bay.
6.1.11.4 The water spray system is to be capable of spraying the outer vertical boundaries of each container bay in an open cargo hold and of cooling the adjacent structure. The uniform application density is to be not less than 1.1 l/min/m^2. At least one dedicated fire-extinguishing pump for the hold water spray system with a capacity to serve all container bays in any one open-top container hold simultaneously is to be provided. These pumps are to be installed outside the open-top area. The availability of water to the water spray system is to be at least 50% of the total capacity, with adequate spray patterns in the open-top container hold, and with any one dedicated pump inoperable. For the case of a single dedicated water spray pump this may be accomplished by an interconnection to an alternative source through a hose from the weather deck.
6.1.11.5 Whenever a fire detection system is required in the open hold area, the fire detection system is to be designed and arranged to take account of the specific hold and container configuration and ventilation arrangement.

6.1.12 Carriage of dangerous goods

6.1.12.1 Dangerous goods for which “on deck only” stowage is specified in the International Maritime Dangerous Goods Code (IMDG Code), are not to be carried in or vertically above open-top container holds.
6.1.12.2 In addition to the requirements of 6.1.12.1 above, containers with dangerous goods extending more than 1 m above the top of the watertight upper boundary around an open-top container hold and containing liquids, gases or vapors heavier than air and for which “on deck only” stowage is specified, are not to be carried within one container space① horizontally from the boundary of the open-top container holds.
6.1.12.3 Dangerous goods other than those described in 6.1.12.1 above are not to be carried in or vertically above open-top container holds unless such holds are in full compliance with SOLAS Reg. II-2/19, as amended, applicable to enclosed container cargo spaces, as appropriate for the cargo carried.

6.1.13 Segregation of dangerous goods

6.1.13.1 The segregation of dangerous goods for open-top container holds is to comply with Table 6.1.13.1 instead of the table of segregation of freight containers on board container ships contained in section 7.4.3.3 of the IMDG Code.

---

① Defined in 7.4.3.1.1 of the International Maritime Dangerous Goods Code (IMDG Code), i.e. container space is a space of at least 6 m lengthways and at least 2.4 m athwart. See also the latest definition in the IMDG Code.

Table of Segregation of Freight Containers in Holds of Open-Top Container Ships① **Table 6.1.13.1**

Segregation requirement	Vertical			Horizontal							
					Closed versus closed		Closed versus open		Open versus open	
	Closed versus closed	Closed versus open	Open versus open		On deck	Under deck	On deck	Under deck	On deck	Under deck
1 " Away from"	Superimposition allowed	Open above closed allowed, otherwise as open versus open	Not on the same vertical line	Fore and aft	No restriction	No restriction	No restriction	No restriction	One container space	One container space or one bulkhead
				Athwartships	No restriction	No restriction	No restriction	No restriction	One container space	One container space
2 " Separated from"	Not on the same vertical line	As open versus open		Fore and aft	One container space	One container space or one bulkhead	One container space	One container space or one bulkhead	One container space and not in or above the same hold	One bulkhead
				Athwartships	One container space	One container space	Two container spaces	Two container spaces	Two container spaces and not in or above the same hold	One bulkhead
3 " Separated by a complete compartment or hold from"				Fore and aft	One container space and not in or above the same hold	One bulkhead	One container space and not in or above the same hold	One bulkhead	Two container spaces and not in or above the same hold	Two bulkheads
				Athwartships	Two container spaces and not in or above the same hold		Two container spaces and not in or above the same hold		Three container spaces and not in or above the same hold	Two bulkheads
4 " Separated longitudinally by an intervening complete compartment or hold from"	Prohibited			Fore and aft	At least 24 m horizontally and not in or above the same hold	One bulkhead and at least 24 m horizontally ②	At least 24 m horizontally and not in or above the same hold	Two bulkheads	At least 24 m horizontally and not in or above the same hold	Two bulkheads
				Athwartships	Prohibited	Prohibited	Prohibited	Prohibited	Prohibited	Prohibited

Note: ① All bulkheads and decks are to be resistant to fire and liquid.
② Containers are to be at least 6 m from the bulkhead.

CHAPTER 7 ADDITIONAL REQUIREMENTS FOR PUSHER TUG-BARGE COMBINATIONS

Section 1 GENERAL PROVISIONS

7.1.1 Application

7.1.1.1 Additional requirements for pusher tug-barge combinations are given in Section 2, Chapter 7, PART TEN of the Rules.

CHAPTER 8 ADDITIONAL REQUIREMENTS FOR PUBLIC AFFAIR SHIPS

Section 1 GENERAL PROVISIONS

8.1.1 General requirements

8.1.1.1 This Chapter applies to public affair ships. Public affair ships mean ships used for the purpose of government administrative management.

8.1.1.2 Public affair ships are, in addition to provisions of this Chapter, to comply with applicable provisions of other PARTs and Chapters of the Rules.

8.1.1.3 Where special provisions for public affair ships are specified by the Administration of the flag State, such provisions are to be implemented.

8.1.2 Class notation

8.1.2.1 Public affair ships complying with requirements of this Chapter are to be assigned the following class notation:

Public Affair Ship

8.1.3 Hull structures

8.1.3.1 Hull structures are to satisfy the requirements of ISC Guidelines for Hull Structures of Public Affair Ships at Sea.

CHAPTER 9 ADDITIONAL REQUIREMENTS FOR SHIPS HAVING INDEPENDENT ICEBREAKING CAPABILITY

Section 1 GENERAL PROVISIONS

9.1.1 General requirements

9.1.1.1 This Chapter applies to ships not specially designed for icebreaking duties and navigating in first year ice conditions, complying with the ice strengthening requirements of PART TWO and PART THREE of the Rules for B1*, B1, B2 and B3 notations and having an independent icebreaking capability. Ships assigned ice class notation B1* in accordance with the provisions of Section 2, Chapter 4, PART TWO of the Rules, already have the capability of independent navigation in ice corresponding to the ice class notation without the assistance of an icebreaker. For ships complying with the requirements of this Chapter, their independent icebreaking capability is to be better than that of the ships assigned B1* notation in accordance with the provisions of PART TWO and PART THREE of the Rules, i.e. having the icebreaking capacity of removing obstacles for other ships navigating in ice.

9.1.1.2 When approaching ice-infested waters, the ship's speed is to be reduced appropriately. The vertical extent of ice strengthening for ships intended to operate at speeds exceeding 15 kn in areas containing isolated ice floes is to be increased appropriately.

9.1.1.3 The ship is to have a hull form at the fore end adapted to break ice effectively. Bulbous bows are not to be fitted for ships having higher ice class notations. The stern of the ship is to have a form such that broken ice is effectively displaced. Whenever practicable, transverse framing is to be selected. Where it is desired to make provision for tow operations, the bow area is to be suitably reinforced. In addition, local reinforcement is to be made in way of the stern fork.

9.1.2 Class notations

9.1.2.1 For a ship complying with the requirements for ice strengthening and the requirements of this Chapter, the special features notation "Icebreaking" is to be added before its type notation, together with a corresponding ice class notation, e.g. Icebreaking Tug, Ice Class B1.

Section 2 ENGINE OUTPUT

9.2.1 Output of propulsion machinery

9.2.1.1 The output of propulsion machinery of the ship is to be greater than that required for icebreaking as determined in accordance with 9.2.1.2.

9.2.1.2 The output N_1 required for icebreaking is not to be less than that determined in accordance with the following formula:

$$N_1 = 0.736 f_1 f_2 f_3 f_4 [240 B h_0 (1 + h_0 + 0.035 v^2) + 70 S_c \sqrt{L}] \quad \text{kW}$$

where: B — breadth of the ship, in m;

L — length of the ship, in m;

f_1 — coefficient, to be calculated as below and taken not less than 1.0:

$$f_1 = \frac{1.2\,B}{\sqrt[3]{\Delta}}$$

where Δ means displacement, in t, see 4.2.2.2 of Section 2, Chapter 4 of PART TWO of the Rules;

f_2 — coefficient, to be taken as 0.9 for controllable pitch propeller and 1.0 for fixed pitch propeller;

f_3 — coefficient, to be taken as 0.9 when entry angle of the portion of the fore-body below the waterline is 45°or less, and 1.0 when the angle is greater than 45°, and the product $f_2 f_3$ is not to be taken less than 0.85;

f_4 — coefficient, to be taken as 1.1 with bulbous bow and 1.0 without bulbous bow;

h_0 — ice thickness, in m, see Table 4.2.4.2(1) of Section 2, Chapter 4 of PART TWO of the Rules;

v — ship speed, in kn, when breaking ice of thickness h_0, not to be taken less than 5 kn;

S_c — depth of snow cover, in m, not to be taken less than 0.3 m.

Section 3 HULL STRUCTURE

9.3.1 General requirements

9.3.1.1 In respect to the strengthening requirements for ships having an icebreaking capability where the ice load is calculated in accordance with Section 2, Chapter 4 of PART TWO of the Rules, the actual output power of the main engine at MCR is not to be less than that required for icebreaking in Section 2 of this Chapter.

9.3.2 General requirements for side framing

9.3.2.1 Where a frame or longitudinal frame intersects a boundary between two of the hull regions (see Section 2, Chapter 4 of PART TWO of the Rules), the scantling requirements applicable will be those for the greater region.

9.3.2.2 Extent of tripping brackets: B1* — all regions; B1— forward and midship regions; B1 and B3 — forward region.

9.3.2.3 The effective weld area attaching ice frames or longitudinal frames to primary members is not to be less than the shear area for the frames or longitudinal frames.

9.3.3 Ice stringers

9.3.3.1 The webs of primary longitudinal members supporting transverse ice frames are to be stiffened and connected to the main or intermediate frames so that the distance *s* between such stiffeners is not greater than that determined in accordance with the following formula:

$$s = 17.06 \frac{t}{\eta} \sqrt{\frac{t}{F_l}} \qquad \text{mm}$$

where: t — thickness, in mm, of the primary longitudinal member adjacent to the shell plating.

F_l — longitudinal distribution coefficient, see Table 9.3.3.1.

Table 9.3.3.1

Ice class	F_l		
	Fore	Midship	Aft
B1*	1.00	0.98	0.89
B1	0.87	0.75	0.64
B2	0.78	0.64	0.51
B3	0.68	0.53	0.37

η — coefficient,

for forward region, one of the following values is to be taken, whichever is the least:

$$\eta_1 = 0.653 + 3.217 \frac{\sqrt{P\Delta}}{10^5}$$

$$\eta_2 = 0.876 + 9.908 \frac{\sqrt{P\Delta}}{10^6}$$

$\eta_3 = 1$;

for midship and aft regions, one of the following values is to be taken, whichever is less:

$$\eta_1 = 0.653 + 9.908 \frac{\sqrt{P\Delta}}{10^6}$$

$\eta_2 = 1$.

P — actual output power of the main engine at MCR, not to be less than that required for icebreaking in Section 2 in this Chapter.

Δ — displacement, in t, see 4.2.2.2, Section 2, Chapter 4 of PART TWO of the Rules.

9.3.4 Stem

9.3.4.1 The section moduls W of the stem in the fore and aft direction is not to be less than that determined in accordance with the following formula:

$$W = 1500 F_l^{1.5} \eta^3 \qquad \text{cm}^3$$

where: F_l, η — see 9.3.3.1.

9.3.4.2 The thickness t of side plates of a welded stem constructed as shown in Figure 9.3.4.2 is to be determined in accordance with the following formula:

$$t = 31\eta\sqrt{F_l} \qquad \text{mm}$$

where: F_l, η — see 9.3.3.1.

The dimension of a welded stem is to be determined in accordance with Figure 9.3.4.2.

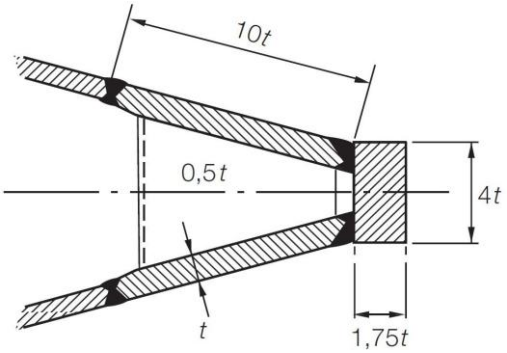

Figure 9.3.4.2 Welded Stem

CHAPTER 10 ADDITIONAL REQUIREMENTS FOR PETROLEUM ASPHALT CARRIERS

Section 1 GENERAL PROVISIONS

10.1.1 Application

10.1.1.1 These requirements apply to ships having one of the class notations specified in 10.1.2, specialized in carrying melted petroleum asphalt in bulk in unrestricted service.

10.1.1.2 Unless specified otherwise, asphalt carriers are to comply with the requirements for tankers carrying petroleum products having a flash point exceeding 60℃. Where the maximum cargo temperature cannot be at least 15℃ lower than the flash point of petroleum asphalt, the requirements for tankers carrying petroleum products having a flash point less than 60℃are to be complied with.

10.1.1.3 Calculation of temperature field and analysis of thermal stress required by this Chapter are to comply with the relevant requirements of Section 24, Chapter 2 of PART TWO of the Rules.

10.1.1.4 In the structural calculation of asphalt carriers, the sloshing loads of asphalt cargo need not be considered.

10.1.2 Class notations

10.1.2.1 For classed asphalt carriers fitted with integral tanks and complying with the requirements of this Chapter, the following notation is to be assigned: Asphalt Carrier (Integral tank, Max. Cargo Temperature ≤ XXX℃), F.P. > 60℃, ESP, or Asphalt Carrier (Integral tank, Max. Cargo Temperature ≤×××℃), F.P. ≤ 60℃, ESP.

10.1.2.2 For classed asphalt carriers fitted with independent tanks and complying with the requirements of this Chapter, the following notation is to be assigned: Asphalt Carrier (Independent tank, Max. Cargo Temperature ≤×××℃), F.P. > 60℃ or Asphalt Carrier (Independent tank, Max. Cargo Temperature ≤×××℃), F.P. ≤ 60℃.

10.1.2.3 If requirements of Section 24 of Chapter 2, PART TWO of the Rules are complied with, notation for thermal stress calculation "Thermal stress calculation" may be added.

10.1.2.4 If the arrangement of cargo tanks, including independent and integral tanks, of asphalt carriers comply with the following requirements, Double Hull notation may be assigned:

(1) for asphalt carriers of 5,000 tonnes deadweight and above, the distance *W* between the side plate of the cargo tank or the inner shell of the side tank and the shell plating as well as the distance h between the bottom plate or inner double plate of the cargo tank and the bottom plating comply with the requirements of 1.12.12.1, Section 12, Chapter 1, PART TWO of the Rules;

(2) for asphalt carriers of less than 5,000 tonnes deadweight, the distance *W* between the side plate of the cargo tank or the inner shell of the side tank and the shell plating complies with the requirements of 1.12.12.4, Section 12, Chapter 1, PART TWO of the Rules, and the distance *h* between the bottom plate or inner double plate of the cargo tank and the bottom plating complies with the requirements of 1.12.12.2, Section 12, Chapter 1, PART TWO of the Rules.

10.1.3 Definitions

10.1.3.1 For the purpose of this Chapter:

(1) Petroleum asphalt means co-product of petroleum crude oil extracted to petroleum product such as gasoline, coal oil, diesel oil and lubricating oil, and then treated.

(2) Independent tank means a cargo tank which is not connected with or is not a component part of the hull structure. The independent tank is not necessary to the structural integrity of hull. The independent tank is to be connected to the hull by means of supporting structures to prevent slippage and deflection of the tank. Supporting structures are to include vertical supports, anti-rolling arrangements, anti-pitching arrangements and anti-flotation arrangements.

(3) Integral tank means a cargo tank which is a component part of the hull structure and is subjected to the same load with adjacent portions of the hull structure in the same manner. It is usually necessary to the structural integrity of hull.

(4) Hold space is the space enclosed by the ship's structure in which an independent cargo tank is fitted.

10.1.4 Plans and documents

10.1.4.1 For all petroleum asphalt carriers, the following plans and documents are to be submitted for approval:

(1) Structural plan of cargo tank;

(2) Arrangement plan of cargo tank;
(3) Arrangement plan of heat-insulating material on cargo tank;
(4) Arrangement of means of access for inspections;
(5) Drawing of thermal oil heating system;
(6) Drawings and arrangement diagrams of monitoring and alarm systems related to liquid cargo;
(7) Arrangement of thermal oil boiler room;
(8) Diagram of control system of remotely controlled valve of thermal oil system;
(9) Diagram of fuel oil system of thermal oil boiler.
In addition, the following documents are to be submitted for information:
(1) Cargo information (type and property of cargoes allowed to be carried, e.g. specific gravity, flash point, temperature of cargo being carried, are to be indicated in the "Hull Specification");
(2) Calculations of heat-insulating performance of cargo tank.
10.1.4.2 For petroleum asphalt carriers fitted with integral tanks, the following plans and documents are to be additionally submitted for information:
(1) Calculations for thermal stress analysis of hull structural members (in full and half load conditions), in respect to the temperature of cargo being carried over 80℃.
10.1.4.3 For petroleum asphalt carriers fitted with independent tanks, the following plans and documents are to be additionally submitted for approval:
(1) Arrangement plan of cargo tank and its supporting structures (vertical supports, anti-rolling arrangements, anti-pitching arrangements and anti-flotation arrangements);
(2) Drawing and arrangement diagram of high level alarm system for cargo tank bilge well.
In addition, the following documents are to be submitted for information:
(1) Strength calculations for cargo tank supporting structures;
(2) When temperature of cargo being carried is over 180℃, thermal field distribution calculation of cargo tank is to be submitted. Where the thermal field analysis shows that temperature transmitting to main hull structure is over 80℃, analysis of thermal stress of cargo tank area is to be submitted.

10.1.5 Direct calculation of hull structural strength

10.1.5.1 For longitudinally framed single bottom asphalt carriers 90 m or over in length with independent cargo tanks, primary members (longitudinal and transverse) of the cargo area are to be directly calculated according to Appendix 1 of this Chapter.
10.1.5.2 For asphalt carriers of 150 m or above in length with independent cargo tanks, primary members (longitudinal and transverse) of the cargo area are to be directly calculated according to Appendix 1 of this Chapter.

Section 2 CONSTRUCTION AND ARRANGEMENT OF SHIP

10.2.1 Hull structure

10.2.1.1 The hull structure of asphalt carriers fitted with independent tanks is to comply with the relevant requirements in Chapter 2 of PART TWO of the Rules.
10.2.1.2 The hull structure of asphalt carriers fitted with integral tanks is, as appropriate, to comply with the relevant requirements in Chapters 5 and 6 of PART TWO of the Rules.
10.2.1.3 For asphalt carriers fitted with independent tanks and also with the single bottom of which is longitudinally framed and double sides of which are longitudinally framed, the following requirements are to be complied with:
(1) the minimum thickness: within the cargo tank region, the minimum thickness of primary member webs and face plates, shell plating, deck plating, and inner hull plating is not to be less than that obtained from the following formula:

$$t = 6.5 + L/50 \quad \text{mm, but not less than 7.5 mm}$$

where: L — length of ship, in m, taken not greater than 300 m.
The minimum thickness of secondary structural members are also to comply with the requirements mentioned above, but need not be greater than 11 mm.
The minimum thickness of the members in pump rooms, cofferdams and other void spaces may be 1 mm less than that required above, but not less than 7.5 mm.
(2) shell plating and deck plating: the longitudinally framed shell plating and deck plating of the cargo tank region are to comply with the requirements of Sections 3 and 4, Chapter 2, PART TWO of the Rules respectively;

(3) bottom framing:
(a) The section modulus W of bottom longitudinals is not to be less than that obtained from the following formula:

$$W = \frac{8.5}{1.73 - F_b}(d + h_1)sl^2K \qquad \text{cm}^3$$

where: s — spacing of longitudinals, in m;
l — span of longitudinal, in m, but not less than 1.5 m;
d — draught, in m;
F_b — reduction factor, see 2.2.5.6 of Chapter 2 of PART TWO;
h_1 — see 2.3.1.2 of Chapter 2 of PART TWO;
K — material factor.

The connections of bottom longitudinals to bulkheads are to provide adequate fixity and continuity of longitudinal strength. Where higher tensile steels are adopted, longitudinals are to be continuous through the transverse bulkheads. Where the bottom longitudinals are cut in way of the bulkheads, the longitudinals are to be bracketed to the bulkheads. The scantlings of the bracket are to comply with the requirements of 1.2.6 of Chapter 1 of PART TWO, and the flange width of the bracket is not to be less than 8 times the thickness of the bracket.
Bottom longitudinals are to be welded to the web and vertical stiffeners of bottom transverses.
(b) The solid floor is to be spaced not greater than 3.6 m, in line with side transverse web, to form a ring system. The spacing between the center and side keelsons is in general not to be greater than 2.5 m;
The size of solid floors, bottom centerline girder and bottom side girders are to be determined by direct calculation method, which is to comply with the requirements of Appendix 1 of this Chapter.
(c) The web depth of the solid floors is not to be less than 2.5 times the depth of the slot for the bottom longitudinals. The web thickness is not to be less than s/80 (s being the spacing of stiffeners).
The face plate of the solid floor is, within two frame spacing, to be gradually widened to not less than twice its original width at the longitudinal bulkhead, and to be welded to the bulkhead.
(d) The web depth of the bottom centerline girder is not to be greater than that of the bottom transverses. The web thickness of the bottom centerline girder is not to be less than that of the bottom transverses plus 2 mm. The web thickness and face plate scantlings of the intercostal bottom side girders are to be the same as those of the bottom transverses in way, while the depth may be half of that of the bottom transverses. Strengthening and end connections of bottom centreline girder are to comply with the requirements of 6.3.5 of Section 3 of Chapter 6 of PART TWO.
(4) side framing: for double side framing, where the side tanks are used as ballast tanks, the inner hull structure, watertight diaphragms and stiffeners are also to comply with the deep tank requirements of Section 13, PART TWO of the Rules.

10.2.2 Arrangement of ship

10.2.2.1 The hold type of independent tank is recommended.
10.2.2.2 For asphalt carriers fitted with integral tanks carrying cargo at a temperature over 80℃, tank boundaries are not to be in direct contact with seawater.
10.2.2.3 Passages for inspection in independent cargo areas are to comply with the following requirements:
(1) where it is required to pass between the surface to be inspected, flat or curved, and structures such as deck beams, stiffeners, frames, girders, etc., the distance between that surface and the free edge of the structural elements is to be at least 380 mm. The distance between the surface to be inspected and the surface to which the above structural elements are fitted, e.g. deck, bulkhead or shell, is to be at least 450 mm for a curved tank surface, or 600 mm for a flat tank surface (see Figure 10.2.2.3(1));

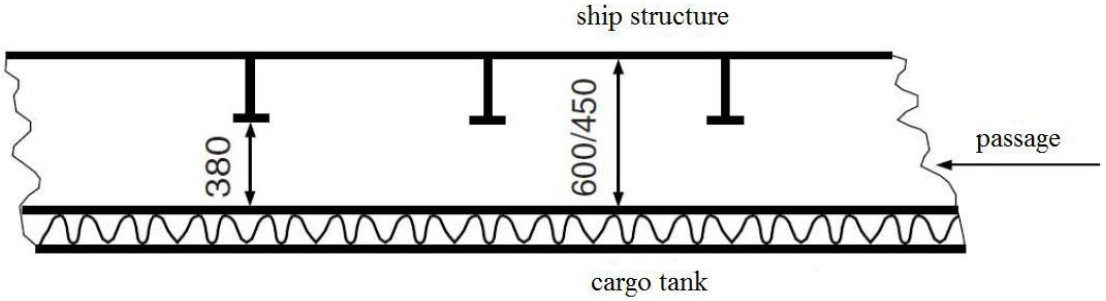

Figure 10.2.2.3(1)

(2) where it is not required to pass between the surface to be inspected and any part of the structure, for visibility reasons the distance between the free edge of that structural element and the surface to be inspected is to be at least 50 mm or half the breadth of the structure's face plate, whichever is the larger (see Figure 10.2.2.3(2));

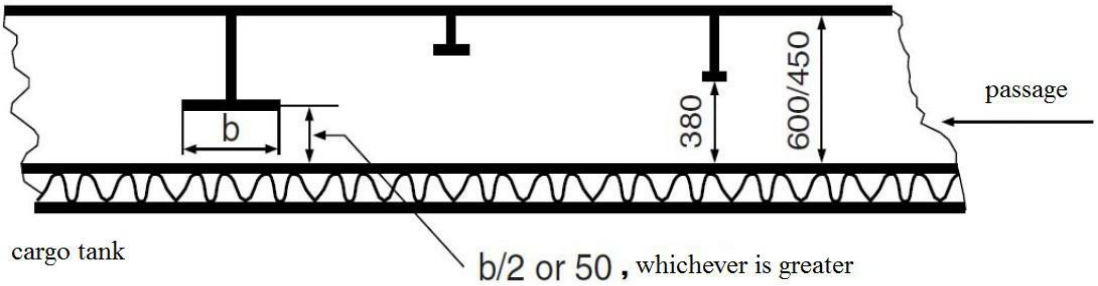

Figure 10.2.2.3(2)

(3) if for inspection of a curved surface where it is required to pass between that surface and another surface, flat or curved, to which no structural elements are fitted, the distance between both surfaces is to be at least 380 mm (see Figure 10.2.2.3(3)). Where it is not required to pass between that curved surface and another surface, a smaller distance than 380 mm may be accepted taking into account the shape of the curved surface;

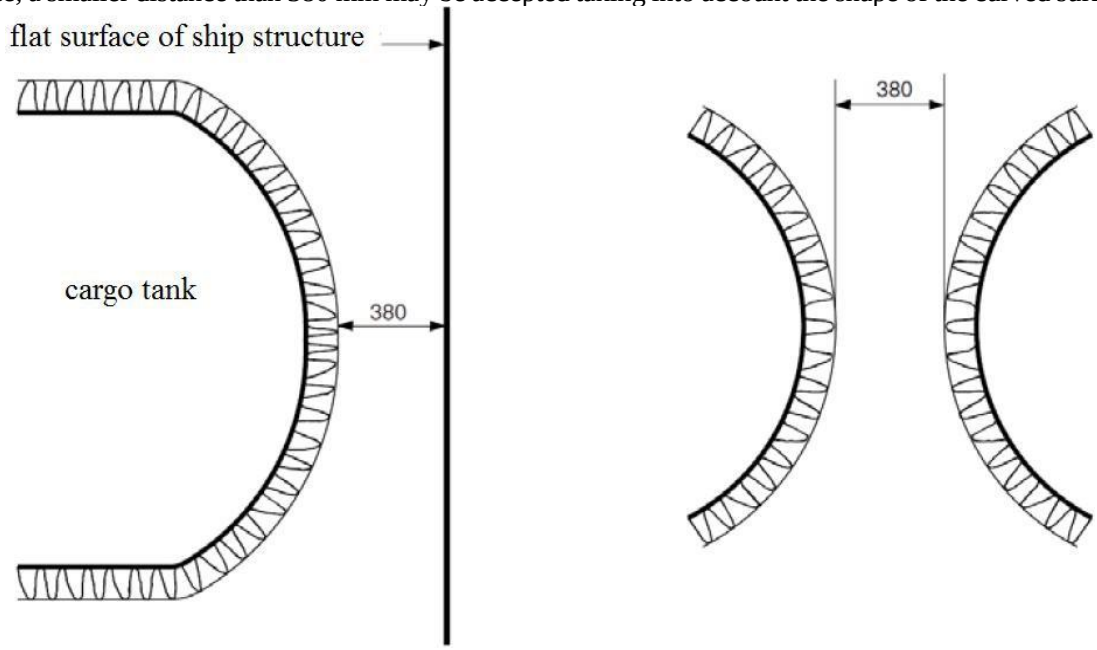

Figure 10.2.2.3(3)

(4) if for inspection of an approximately flat surface where it is required to pass between two approximately flat and approximately parallel surfaces, to which no structural elements are fitted, the distance between those surfaces is to be at least 600 mm. If the plane of inner shell plating (including upper and lower sloping plate) within the double hull has been subject to strict rust cleaning, painted with epoxy resin or other equivalent anti-corrosion paint, and the condition of inner shell plating can be inspected within the double hull, the above mentioned minimum distance may be reduced. Where fixed access ladders are fitted, a clearance of at least 450 mm is to be provided for access (see Figure 10.2.2.3(4));

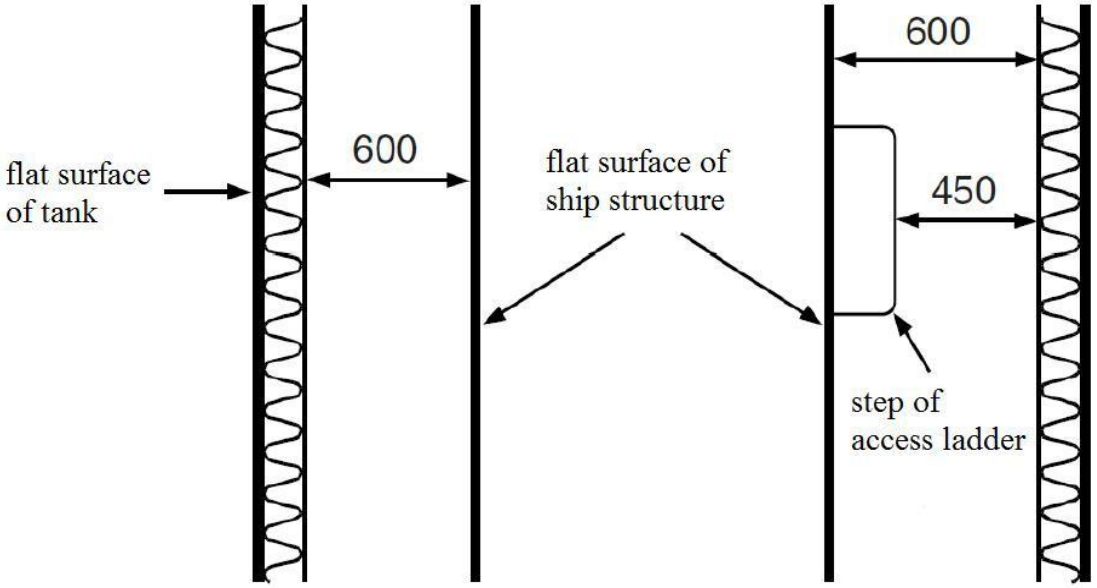

Figure 10.2.2.3(4)

(5) the minimum distances between a cargo tank sump and adjacent double bottom structure in way of a suction well are not to be less than those shown in figure 3.5 (Figure 10.2.2.3(5) shows that the distance between the plane surfaces of the sump and the well is a minimum of 150 mm and that the clearance between the edge between the inner bottom plate, and the vertical side of the well and the knuckle point between the spherical or circular surface and sump of the tank is at least 380 mm). If there is no suction well, the distance between the cargo tank sump and the inner bottom is not to be less than 50 mm;

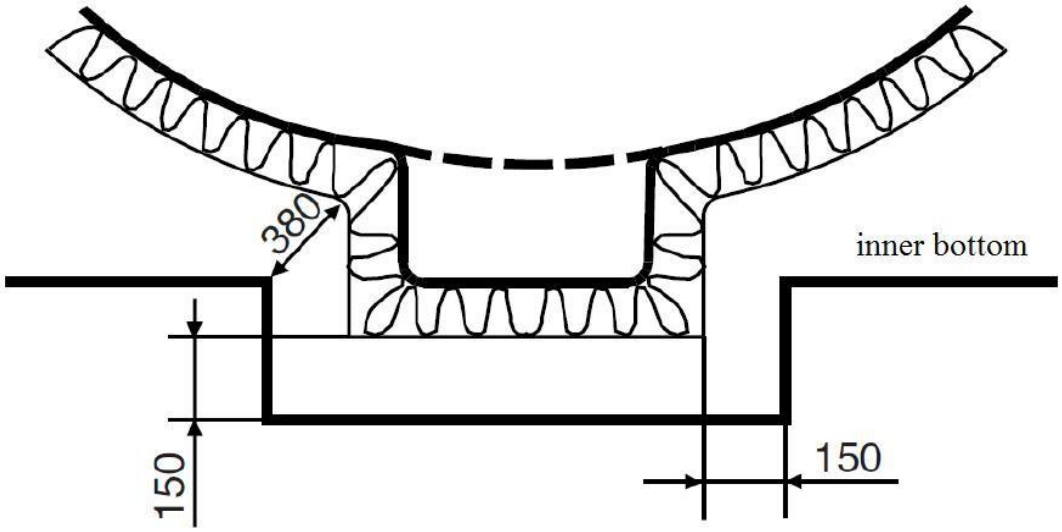

Figure 10.2.2.3(5)

(6) the distance between a cargo tank dome and deck structures is not to be less than 150 mm (see Figure 10.2.2.3(6));

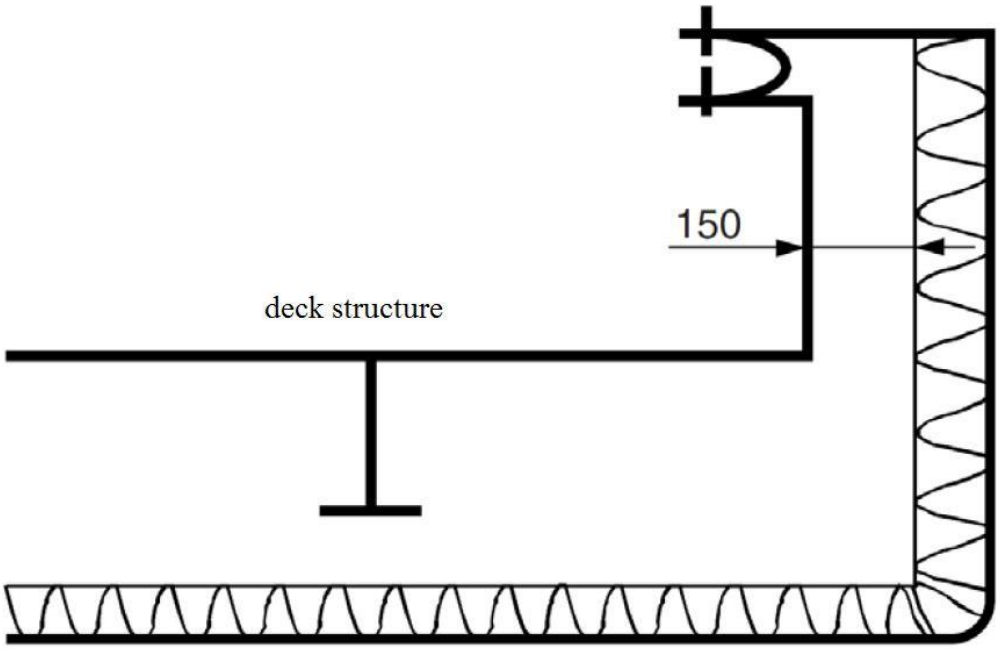

Figure 10.2.2.3(6)

(7) fixed or portable staging is to be installed as necessary for inspection of cargo tanks, cargo tank vertical supports, anti-rolling arrangements, anti-pitching arrangements, anti-flotation arrangements, cargo tank insulation etc. This staging is not to impair the clearances specified in 10.2.2.3(1) to 10.2.2.3(4);

(8) if fixed or portable ventilation ducting is to be fitted, such ducting is not to impair the distances required under 10.2.2.3(1) to 10.2.2.3(4).

10.2.2.4 The corrosion protection of ballast tanks is to satisfy the requirements of Section 6, Chapter 1 of PART TWO of the Rules. In addition, if a ballast tank is adjacent to a cargo tank, epoxy resin or other equivalent anti-corrosion paint is to be coated on the inside bulkheads of such ballast tank.

10.2.2.5 A separate cargo pump room may not be arranged in an asphalt carrier. For asphalt carriers fitted with independent tanks, cargo pumps may be arranged in hold space. For asphalt carriers fitted with integral tanks, if the cargo pump room is adjacent to a cargo tank, heat insulation means or an empty tank is to be provided.

The space where cargo pumps are located is to have good ventilation, normally with 30 to 45 air changes per hour.

10.2.3 Constructional material

10.2.3.1 The independent tank may be of low carbon or higher tensile steel. Considering the decrease of mechanical properties of material caused by high temperature, for members under high temperatures (100℃ and above), the high temperature material coefficient K_T is to be taken as the material coefficient K in the design and is to be calculated as follows:

$$K_T = max\left\{K, \frac{235}{R_{eH}^T}\right\}$$

where: K — material coefficient, see Table 1.3.1.7, Chapter 1, PART TWO of the Rules;

R_{eH}^T — high temperature yield stress, in N/mm², see Table 10.2.3.1.

If the independent tank is of any other material, tensile test is to be carried out to determine the high temperature yield stress R_{eH}^T.

High Temperature Yield Stress under Design Working Temperature R_{eH}^T **Table 10.2.3.1**

	Tensile strength under room temperature R_{eH} (N/mm²)	R_{eH}^T (N/mm²)				
		100℃	150℃	200℃	250℃	300℃
Carbon steel and carbon manganese steel	235	220	210	200	190	180
	315	295	280	265	250	235
	355	330	313	297	282	267
	390	364	344	327	311	295

Note: Intermediate values of the temperature may be obtained by linear interpolation.

10.2.4 Independent tank

10.2.4.1 If the independent tank is mainly of plane construction, its boundary structure is to be designed according to the requirements of 10.2.6, and the design vapor pressure (gauge pressure) is not to be more than 0.07 MPa.

10.2.4.2 Externally insulated independent tanks are to be supported and keyed so as to permit free expansion in all directions and eliminate heat bridges which may transmit thermal stresses to the hull of the ship.

10.2.4.3 The independent tank is to be insulated with an approved heat-insulating material. After the heat-insulating material is laid, the temperature in hold space at ambient temperature (with atmospheric pressure being 1 HPA, air temperature being 0℃ and seawater temperature being 0℃) is not to exceed 180℃.

10.2.4.4 If cargo pumps are located outside the hold space, not less than 20 air changes per hour are to be given in the hold space.

10.2.4.5 Heat-insulating material is to be fixed on the outside surface of the independent tank with welts and wrapped with galvanized steel plate or other equivalent material. Prior to the laying of heat-insulating material, the outside surface of the independent tank is to be coated with high-temperature resistant antirust paint.

10.2.4.6 The independent tank is to be supported by adequate vertical supports such that it is not connected with the hull structure directly. The vertical supports are generally to be of a material with good heat insulation. If the mechanical and physical properties of such material may change at high temperature, effective measures are to be taken to ensure that the mechanical and physical properties will not be decreased significantly.

10.2.4.7 Multi-fulcrum supporting is recommended for the supporting of bottom of the independent tank so as to evenly transfer the weight of the independent tank and the cargo therein to the bottom structure. Supports are to be fitted on primary structural members of the independent tank and hull.

10.2.4.8 Longitudinal and transverse limiting devices are to be provided at suitable positions of the independent tank so that the tank expansion at high temperature will extend in the expected direction.

10.2.4.9 Suitable anti-pitching arrangements are to be provided to withstand a longitudinal collision force acting on the independent tank corresponding to the total weight of the tank and 1/2 cargo in the forward direction and the total weight of the tank and 1/4 cargo in the aft direction without deformation likely to endanger the tank structure. On calculating supporting force, friction force is to be included.

The above-mentioned supports may be taken into consideration together with locating devices.

10.2.4.10 Suitable anti-rolling arrangements are to be provided to prevent the independent tank from slipping transversely and turning over. In general, supports are to be provided at high level to prevent the tank from turning over and stoppers to be provided at low level to prevent the tank from slipping. The stress calculation may be referred to the calculation of cargo securing force as specified in ISC Guidelines for Preparation of Cargo Securing Manual.

The above-mentioned supports may be taken into consideration together with locating devices.

10.2.4.11 In design, loads mentioned in 10.2.4.9 and 10.2.4.10 need not be combined with other stresses.

10.2.4.12 Anti-flotation arrangements are to be provided for independent tanks. The anti-flotation arrangements are to be suitable to withstand an upward force caused by an empty tank in a hold space flooded to the summer load draught of the ship.

The design clearance between anti-flotation arrangements and hull is generally taken between 40 to 60 mm.

10.2.5 Integral tank

10.2.5.1 The boundary structure of the integral cargo tank is to be designed according to the requirements of 10.2.6.

10.2.5.2 For asphalt carriers fitted with integral tanks, hull structural members are to be subject to thermal stress analysis to check the local strength and longitudinal stress in each loading condition. The hull is also to be subject to analysis of temperature field and thermal transmission in full load or half load condition. In the analysis, properties changes of material at high temperature are to be taken into consideration.

10.2.5.3 For spaces of heat-insulating layers of asphalt carriers fitted with integral tanks, provision is to be made to prevent over- or under-pressure caused by temperature variations.

10.2.6 Boundary structure of cargo tanks

10.2.6.1 The thickness t of the tank top plates forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formula:

$$t = t_0\sqrt{K} + t_c \qquad \text{mm}$$

where: t_0 — thickness, in mm, and whichever greater in the following formulae is to be taken:

$$t_0 = 39.5s\sqrt{P_V - 0.02}$$

$$t_0 = 2.8s\sqrt{\rho h}$$

$$t_0 = 4.5s$$

K — material factor, and the effect of high temperature on the material yield strength is to be considered as appropriate, see 10.2.3.1 of this Chapter;

t_c — corrosion addition, in mm, for carbon steel, t_c = 2.5 mm;

s — spacing of longitudinals, in m;

P_V — maximum pressure (gauge pressure), in MPa, to be taken as not less than 0.02 MPa;

ρ — the maximum cargo density, in t/m^3, to be taken as not less than 1.025 t/m^3;

h — height measured from top of the overflow to the deck, in m.

10.2.6.2 The thickness t of the tank bottom plates and plane bulkhead plates forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formula:

$$t = t_0\sqrt{K} + t_c \qquad \text{mm}$$

where: t_0 — thickness, in mm, and whichever greater in the following formulae is to be taken:

$$t_0 = 3.95s\sqrt{\rho h_1 + 100(P_V - 0.02)}$$

$$t_0 = 2.8s\sqrt{\rho h}$$

$$t_0 = 2.9s\sqrt{2.45 + h_1}$$

K — material factor, see 10.2.6.1 of this Section;

t_c — corrosion addition, in mm, t_c = 2.5 mm;

s — spacing of stiffeners, in m;

ρ — the maximum cargo density, in t/m^3, to be taken as not less than 1.025 t/m^3;

h_1 — vertical distance measured from the lower edge of the plate to the tank top, in m;

P_V — maximum pressure (gauge pressure), in MPa, to be taken as not less than 0.02 MPa;

h — vertical distance measured from the lower edge of the plate to top of the overflow, in m.

10.2.6.3 The section modulus W of stiffeners forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formulae:

$$W = 8Ksl^2\left[\rho h_1 + 100(P_V - 0.02)\right] \qquad \text{cm}^3$$

$$W = 4Ks\rho hl^2 \qquad \text{cm}^3$$

$$W = 4.2Ksl^2(2.45 + h_1) \qquad \text{cm}^3$$

where: K — material factor, see 10.2.6.1 of this Section;

s — spacing of stiffeners, in m;

l — span of stiffeners, in m;

ρ — the maximum cargo density, in t/m^3, to be taken as not less than 1.025 t/m^3;

h_1 — vertical distance measured from the mid-point of span of stiffener to the tank top, in m;

P_V — maximum pressure (gauge pressure), in MPa, to be taken as not less than 0.02 MPa;

h — vertical distance measured from the mid-point of span of stiffener to top of the overflow, in m.

10.2.6.4 The section moment of inertia I of stiffeners forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formula:

$$I = 2.3\frac{Wl}{K} \qquad \text{cm}^4$$

where: W — section modulus of stiffeners obtained in accordance with 10.2.6.3, in cm^3;

l — see 10.2.6.3;

K — material factor, see 10.2.6.1 of this Section.

10.2.6.5 The section modulus W of plane bulkhead girders forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formulae

$$W = 11.7Kbl^2\left[\rho h_1 + 100(P_V - 0.02)\right] \qquad \text{cm}^3$$

$$W = 6Kb\rho hl^2 \qquad \text{cm}^3$$

$$W = 6.3Kbl^2(2.45 + h_1) \qquad \text{cm}^3$$

l — span of girders, in m;

where: K — material factor, see 10.2.6.1 of this Section;

b — breadth of area supported by the girder, in m;

ρ— the maximum cargo density, in t/m^3, to be taken as not less than 1.025 t/m^3;

h_1— vertical distance measured from the mid-point of span of girder to tank top, in m;

P_V— maximum pressure (gauge pressure), in MPa, to be taken as not less than 0.02 MPa;

h— vertical distance measured from the mid-point of span of girder to top of the overflow, in m.

10.2.6.6 The section moment of inertia I of plane bulkhead girders forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formula:

$$I = 2.5\frac{Wl}{K} \qquad \text{cm}^4$$

where: W— section modulus of girders obtained in accordance with 10.2.6.5, in cm^3;

l— see 10.2.6.5;

K— material factor, see 10.2.6.1 of this Section.

10.2.6.7 The thickness t of symmetrical corrugated bulkheads forming part of the boundary structure of cargo tanks is not to be less than the values obtained according to 10.2.6.1. In calculation, s is to be substituted by breadth of corrugation plane a or breadth of corrugation bevel face b, whichever is the greater, and in addition, the following formula is to be complied with:

$$t \geq \frac{s}{70\sqrt{K}} \qquad \text{mm}$$

where: s— breadth of corrugation plane a or breadth of corrugation bevel face b, whichever is the greater, in mm, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

K— material factor, see 10.2.6.1 of this Section. For high strength steel grade, the K value of the lower strength steel may be taken from the formula in 10.2.3.1 of this Chapter provided that the plate buckling check requirements (see Section 5, Chapter 1, PART TWO of the Rules) in direct calculation with that lower K value are satisfied.

10.2.6.8 The section modulus W of symmetrical corrugated bulkheads forming part of the boundary structure of cargo tanks is not to be less than the values obtained from the following formulae:

$$W = KCsl^2\left[\rho h_1 + 100(P_V - 0.02)\right] \qquad \text{cm}^3$$

$$W = 0.50KCs\rho hl^2 \qquad \text{cm}^3$$

$$W = 0.53KCsl^2(2.45 + h_1) \qquad \text{cm}^3$$

where: $W = d_w t(a + \frac{b}{3})$, in cm^3, section modulus of breadth of one corrugation;

s— breadth of one corrugation, in m, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

a— breadth of corrugation plane, in m, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

b— breadth of corrugation bevel face, in m, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

d_w— depth of corrugation, in mm, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

t— thickness of corrugated bulkheads, in mm, see Figure 1.2.4.3, Chapter 1, PART TWO of the Rules;

K— material factor, see 10.2.6.1 of this Section;

C— coefficient, to be taken according to the end fixity as specified in Table 2.13.3.1, Section 13, Chapter 2, PART TWO of the Rules;

l— span of corrugations, i.e. distance between supporting points, in m;

ρ— the maximum cargo density, in t/m^3, to be taken as not less than 1.025 t/m^3;

P_V— maximum pressure (gauge pressure), in MPa, to be taken as not less than 0.02 MPa;

h_1— vertical distance measured from the mid-point of span of corrugation to tank top, in m;

h— vertical distance measured from the mid-point of span of corrugation to top of the overflow, in m.

Where the corrugated bulkhead span is more than 15 m, a diaphragm plate is to be fitted near the mid-span point.

10.2.6.9 Where lower stools are fitted, scarfing brackets aligned with vertical webs of corrugated bulkheads are to be provided in the lower stools as far as practicable. Where lower stools are not provided, double bottom floors are generally to be aligned with face plates of vertical corrugated transverse bulkheads, and double bottom girders are generally to be aligned with face plates of vertical corrugated longitudinal bulkheads; scarfing brackets aligned with vertical corrugated webs are to be provided under the inner bottom and hopper as far as practicable. Where transverse bulkheads are in the form of horizontal corrugation, primary members are generally to be aligned with face plates of corrugated bulkheads at the intersection of corrugated bulkheads and inner shell, and longitudinal bulkheads; and scarfing brackets aligned with vertical webs of corrugated bulkheads are to be provided as far as practicable.

10.2.7 Piping

10.2.7.1 Bilge water of hold space is to be discharged overboard by a pump and the pump may be the bilge pump in the machinery space. High-level alarm is to be provided near the bilge suction, audible and visual high-level alarms and controls are to be provided in the navigation bridge and cargo control room (if provided), and it is recommended that such alarm signal and control extend to the central control cabin of the engine room.

10.2.7.2 When the temperature of asphalt needed to be heated is more than that of the saturated vapor, the heating medium is to be hot oil.

10.2.7.3 Cargo pump, cargo piping and cargo operating valve, etc., outside cargo tanks are to be heated.

10.2.8 Electrical installations

10.2.8.1 Electrical installations (except for sensors), cables and attachments are not to be installed in cargo tanks.

10.2.8.2 Cables in the cargo tank necessary to be connected with electrical installations (such as sensors) are not to contact with liquid cargo but to be laid in a gastight steel tube with thick wall.

10.2.9 Monitoring alarm related to liquid cargo

10.2.9.1 The fixed liquid cargo depth detector may be of radar type, capacitance type or pressure type. If radar type depth detector is adopted, other devices or structural members are not to be arranged in depth detecting area.

10.2.9.2 High temperature alarms for liquid cargo are to be provided. When the temperature exceeds the set value, audible and visual alarm is to be given.

10.2.9.3 High level alarms for cargo tanks are to be provided. When the loading level exceeds the high level of normal full loading, an audible and visual alarm is to be given.

10.2.9.4 Temperature monitoring indicator is to be provided outside heat-insulating layer at the bottom of independent cargo tank.

10.2.9.5 Alarm controls and temperature monitoring indicator are to be installed in the liquid cargo control station, and each alarm signal is to extend to the navigation bridge one by one or in a group.

Appendix 1 DIRECT CALCULATION OF STRUCTURAL STRENGTH OF ASPHALT CARRIERS FITTED WITH INDEPENDENT CARGO TANKS

1 General provisions

1.1 Application

1.1.1 This Appendix is applicable to direct calculation of structural strength of asphalt carriers fitted with independent cargo tanks as required in 10.1.5 of this Chapter.

1.1.2 For asphalt carriers to which this Appendix is applicable, the direct strength analysis for cargo tank hull structure, independent tanks as well as supporting structures is to be carried out according to this Appendix.

1.1.3 Where the temperature of carried liquid cargo is above 180℃, the distribution of temperature field of cargo tanks and associated structures is to be calculated through heat transferring analysis. If temperature field analysis indicates that the temperature that is transferred to the main hull structure exceeds 80 ℃ , thermal stress in cargo tank area is to be further calculated, as given in Section 24, Chapter 2, PART TWO of the Rules. Where the actual means of loading may cause relatively big temperature difference for the cargo tank structure (such as asymmetrical loading of two adjacent cargo tanks along the ship breadth, remarkable level difference between two adjacent cargo tanks during loading and unloading operations, as well as alternate cargo loading along the ship's length), thermal stress analysis and calculation may be required in cargo tank area.

1.1.4 For cargo tanks to be partially loaded with other petroleum products, sloshing assessment is to be carried out for cargo tank boundary structure according to ISC Guidelines for Assessment of Sloshing Loads and Structural Scantling of Tanks. The approved loading limits are to be included in the Loading Manuel as the operation guides.

1.1.5 For those not specified by this Appendix, the applicable requirements in Section 5, Chapter 1 and Appendix 1, Chapter 5 of PART TWO of the Rules are to be complied with.

2 Structural modelling

2.1 Model and element

2.1.1 Normally, the longitudinal extent of the model is to cover the length of 1/2 cargo tank + 1 cargo tank + 1/2 cargo tank within the cargo area amidships, the transverse extent is the full breadth, and the vertical extent is the moulded depth.

2.1.2 The model is to include hull structure, independent tanks as well as supporting structures. However, the global load condition model does not need to include the independent tanks in the fore and aft cargo tank areas as well as supporting structures.

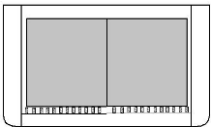
2.1.3 The element is to be meshed according to the provisions in 1.5.6.3 to 1.5.6.6, Chapter 1, PART TWO of the Rules. The supporting structures of the independent tanks are normally designed as not carrying any tension. Therefore, the rigidity of the supporting structures is to be simulated by rod elements but the tensile stress is not to occur in these rod elements.

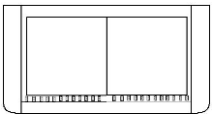
2.2 Boundary condition

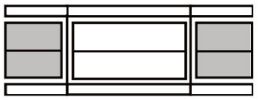
2.2.1 The boundary conditions depend on the model extent and calculation conditions. As the application methods of the global load condition and the local load condition are different, paragraph 4.2, Appendix 1, Chapter 5, PART TWO of the Rules is to be referred to.

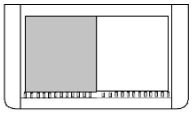
3 Loads and conditions

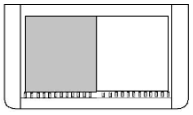
3.1 General requirements

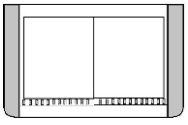




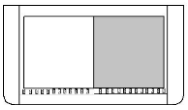


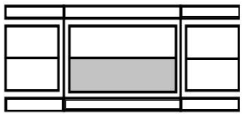


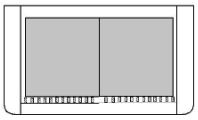


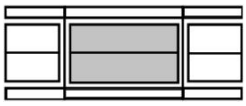


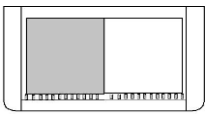
3.1.1 In the assessment condition of cargo tank structure, global load and local load are to be considered, including vertical bending moment, external sea water pressure, liquid pressure of the cargo tank; in the assessment of the supporting structure, the local loads are considered, the inertia force in the forward and aft direction generated by the cargo tank and the cargo due to the collision of hull is assumed, and the upward force acting on the independent tank due to flooding of hull is assumed.











3.1.2 Normally, the hull structure and independent tank structure are to be checked according to the assessment conditions listed in Tables 3.2.1 and 3.2.3. For more severe loading conditions in the loading manual not covered by the tables above, direct calculation of structural strength in those more severe loading conditions are to be carried out.

3.2 Calculation conditions

3.2.1 The tank structural assessment is to be carried out according to the applicable conditions in Table 3.2.1. For conditions LC3, LC4, LC6 and LC8, where the centerline bulkhead has asymmetrical structure, cargo tanks at port and starboard sides are to be calculated separately for separate loading modes.

Assessment Conditions of Cargo Tank Structure **Table 3.2.1**

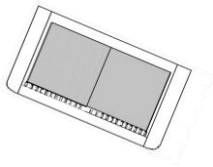
Note: For conditions LC3, LC4, LC6 and LC8, where the centerline bulkhead has asymmetrical structure, cargo tanks at port and starboard sides are to be calculated separately for separate loading modes.						



3.2.2 Fine mesh assessment is to be carried out for areas with supporting structures. For possible high stress areas, the element size is to accurately simulate the structural shape. It is recommended that the size is not greater than *s*/8, where *s* is the spacing of members.

3.2.3 The assessment of supporting structures is also to be carried out according to the applicable conditions in Table 3.2.3. All conditions are local load conditions, among which LC1 and LC2 are anti-pitching conditions, LC3 is anti-rolling condition and LC4 is anti-flotation condition.

Assessment Conditions of Supporting Structures

Table 3.2.3

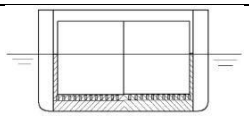
Assessment conditions of supporting structures					
Condition	Draught	Bending moment	External pressure	Internal pressure	Pattern of loading
LC1	NA	NA	NA	P_i	 
Internal pressure $P_i = \rho g(h+2.5f_r) + \rho \times (0.5g)x$, for aft bulkhead, *x* is 0, for forward bulkhead, *x* is to be taken as the length of the independent tank					
Condition	Draught	Bending moment	External pressure	Internal pressure	Pattern of loading
LC2	NA	NA	NA	P_i	 
Internal pressure $P_i = \rho g(h + 2.5f_r) + \rho \times (0.25g)x$, for aft bulkhead, *x* is to be taken as the length of the independent tank, for forward bulkhead, *x* is 0					
Condition	Draught	Bending	External	Internal	Pattern of loading

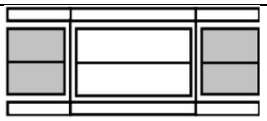
		moment	pressure	pressure		
LC3	*d*	NA	P_e	P_i		

NA—Not applicable;

External pressure $P_e = \rho g\left[(d-z)\cos\varphi + |y|\sin\varphi\right]$ starboard side (water entry side)

$= \rho g\left[(d-z)\cos\varphi - |y|\sin\varphi\right]$ port side (water exit side), and not less than 0;





where:

y — transverse distance measured from the considered point to the centreline;

z — vertical distance measured from the considered point to the baseline.

φ — the maximum roll angle, to be taken as not greater than 30°.

Internal pressure $P_i = \rho g(h + 2.5f_r) + \rho \times (0.5g)h_y$, where h_y is the transverse distance from the pressure calculation point to the highest point of the top left corner of the independent tank.

Condition	Draught	Bending moment	External pressure	Internal pressure	Pattern of loading	
LC4	d	NA	NA	P_i		

Internal pressure $P_i = \rho g d$

4 Yield and buckling strength assessment

4.1 Yield strength assessment

4.1.1 For hull structures, the stress components generated by the global load condition and local load condition are to be combined to check the strength. For independent cargo tank structures, strength assessment is carried out only to the stress of the local load condition.

4.1.2 See Table 5.1.2, Appendix 1, Chapter 5, PART TWO of the Rules for the permissible stress of each primary member. The permissible equivalent stress of independent cargo tank structures is to be taken as $175/K_T$, for K_T see 10.2.3.1 of this Chapter.

4.1.3 For the refined analysis of the supporting structures assessment condition, the permissible stress is to be taken as follows:

$$\text{permissible equivalent membrane stress} = \begin{cases} 1.4 \text{ times the permissible stress of the cargo tank model,} \\ \quad \text{the element size of the fine area is } s/8 \\ 1.6 \text{ times the permissible stress of the cargo tank model,} \\ \quad \text{the element size of the fine area is } s/16 \end{cases}$$

4.2.1 See paragraph 6, Appendix 1, Chapter 5, PART TWO of the Rules for the requirements for buckling strength assessment.

CHAPTER 11 DYNAMIC POSITIONING SYSTEMS

Section 1 GENERAL PROVISIONS

11.1.1 General requirements

11.1.1.1 This Chapter applies to dynamic positioning (DP) systems installed on board ships or offshore units (hereinafter referred to as vessels).

11.1.1.2 A vessel with a dynamic positioning system, for which no class notation is requested, may be designed and equipped by reference to the applicable requirements of this Chapter.

11.1.1.3 For the equipment or system not complying with the requirements for the class notations, ISC may issue upon request a Declaration of Compliance showing general or partial compliance of the vessel/system with this Chapter. ISC will not monitor or follow up the condition of the vessel thereafter.

11.1.1.4 ISC will give appropriate consideration to novel designs and special functions of dynamically positioned vessels or relevant equipment. If such designs and functions comply with the intention of this Chapter, they are to be accepted.

11.1.1.5 This Chapter is based on the assumption that operation and maintenance of the dynamic positioning system is carried out by qualified crew. This Chapter specifies requirements for drawing submission and technical design.

11.1.2 Class notations

11.1.2.1 When dynamic positioning systems have been designed, constructed and tested in accordance with the requirements of this Chapter and relevant chapters, upon request of the owner and in accordance with different redundancy degrees of the dynamic positioning systems, the following class notations will be assigned:

(1) DP-1: Vessels with dynamic positioning systems can automatically keep their position and heading within specified environmental conditions. Vessels are allowed to lose their position and heading in case of a single failure.

(2) DP-2: Vessels with dynamic positioning systems can automatically keep their position and heading in case of a single failure (excluding loss of a compartment or compartments) within specified environmental conditions and operating limits. Detailed redundancy design principles are given in 11.2.2 of this Chapter.

(3) DP-3: Vessels with dynamic positioning systems can automatically keep their position and heading in case of any single failure, including total loss of a compartment caused by fire or flooding, within specified environmental conditions and operating limits. Detailed redundancy design principles are given in 11.2.2 of this Chapter.

11.1.3 Definitions

11.1.3.1 For the purpose of this Chapter, the following definitions apply:

(1) Dynamic positioning means the provision of a hydrodynamic system with automatic and/or manual control capable of maintaining the heading and position of the ship during operation within specified operating limits and environmental conditions.

(2) Specified operating limits are those for specified allowable position deviations from a set point.

(3) Specified environmental conditions are the specified wind speed, sea current and wave height under which the vessel is designed to carry out its intended operations. Ice load, if any, may be specially considered.

(4) Dynamically positioned vessel is a vessel which automatically maintains its position and heading (fixed location, relative location or predetermined track) exclusively by means of thruster force.

(5) Dynamic positioning system means the complete installation necessary for dynamically positioning a vessel, comprising the following sub-systems:

① thruster system;

② power system;

③ control system and measuring system.

(6) Thruster system means the thrusters and their controls used for dynamic positioning, including:

① thrusters with drive units, including main propellers and rudders if these are under the control of the DP system;

② thruster control system and manual controls;

③ associated cabling and cable routing;

④ auxiliary systems supporting the systems above.

(7) Power system means all components and systems necessary to supply the DP system with power, comprising the following components or systems:

① prime movers;

② generators;

③ switchboards;

④ uninterruptible power supplies (UPSs) and batteries;

⑤ distribution system including cabling and cable routing;

⑥ for DP-2 and DP-3 notations: power management system;

⑦ auxiliary systems supporting the systems above.

(8) DP control system means all control components and systems, hardware and software necessary to dynamically position the vessel. The DP control system consists of the following:

① computer system;

② control stations and display system (operator panels);

③ position reference system;

④ sensor system;

⑤ associated cabling and cable routing;

⑥ networks.

(9) Computer system means a system consisting of one or more computers, including hardware, software, peripherals and interfaces.

(10) Position reference system means the system to measure the ship's position.

(11) Sensor system means a system used to measure parameters such as heading, ship's motion (e.g. rolling, pitching, heaving, etc.), wind velocity and direction.

(12) Position keeping means maintaining a desired position within the normal operating limits of the control system and the environmental conditions.

(13) Loss of position means that the vessel's position and/or heading is outside the limits set for carrying out the DP activity in progress.

(14) Reliability means the ability of a system or component to perform its required function without failure during a specified time interval.

(15) Redundancy means the ability of a component or system to maintain or restore its function when a single failure has occurred. Redundancy can be achieved, for instance, by installation of multiple components, systems or alternative means of performing a function.

(16) Redundancy group means systems simultaneously affected by a single failure, usually categorized as thruster group, power generator group or switchboard group.

(17) Single failure means a failure in a component causing one or both of the following effects:

① function loss of a component or system;

② deterioration of functional capability to such an extent that the safety of the vessel, personnel, or environment is significantly reduced.

(18) Worst-Case Failure (WCF) means the identified single fault in the DP system resulting in maximum detrimental effect on DP capability as determined through the failure mode and effect analysis (FMEA) for class notations DP-2 and DP-3.

(19) Worst-Case Failure Design Intent (WCFDI) means the specified minimum DP system capabilities to be maintained following the worst-case failure. The positioning-keeping capability of a dynamically positioned vessel usually relates to the number of thrusters and generators that can simultaneously fail.

(20) Hidden failure means a failure that is not immediately evident during normal operations or maintenance and has the potential for failure of equipment to perform an on-demand function.

(21) Safe termination time means the minimum amount of time required in an emergency to safely cease and/or evacuate DP operations in process.

(22) Consequence analysis means a software function continuously verifying that the vessel will remain in position if the WCF occurs. An alarm is to be released if positioning is not possible.

(23) Joystick is a device for readily setting of vectorial thrust output including turning moment.

(24) Operational mode is the manner of control under which the DP system may be operated, e. g.:

① automatic operation mode (automatic position and heading control);

② joystick operation mode (manual position control with selectable automatic or manual heading control);

③ manual operation mode (individual control of pitch and speed, azimuth, start and stop of each

thruster);

④ other operation modes, such as autopilot, etc.

11.1.4 Plans and documents

11.1.4.1 For dynamically positioned vessels, the following plans and documents are to be submitted for approval:

(1) Technical description of the DP system, at least including the following:

① function description of the power system and power management;

② system arrangement and configuration: physical separation (DP-3), thruster, switchboard, power generator set, auxiliary system;

③ redundancy groups (DP-2/3);

④ WCFDI (DP-2/3);

⑤ safe termination time (DP-2/3, if applicable).

(2) System diagram of the DP system, including the power arrangement and connection between systems (at least including power unit, control unit, auxiliary system etc.).

(3) Load balance calculations in DP operation. For class notations DP-2 and DP-3, power consumption after the WCF is to be indicated.

(4) Arrangement of the DP control station; arrangement of the back-up control station is also to be included for class notation DP-3.

(5) List of indication and alarm items at DP control consol.

(6) For class notation DP-3, categorization plan of redundancy groups; equipment or systems of different redundancy groups are to be identified in the general arrangement plan in different colours and fire and watertight division between different areas are to be marked in the plan.

(7) For class notation DP-3, cable routing drawing and cable list, where all cables related to the DP system are to be included.

(8) For class notations DP-2 and DP-3, function description of consequence analysis.

(9) For class notations DP-2 and DP-3, failure mode and effect analysis (FMEA) reports.

(10) FMEA redundancy test procedure for class notations DP-2 and DP-3 (to be reviewed by the attending Surveyor).

11.1.4.2 The following plans and documents are to be submitted for information:

(1) Operation manual for the DP system.

(2) Capability analysis of position-keeping, including:

① DP capability when all thrusters are operational, illustrated through description and capability plot;

② for class notations DP-2 and DP-3, DP capability after WCF, illustrated through description and capability plot;

③ environmental conditions are to be categorized using the standard Beaufort scale or other recognized methods;

④ environmental forces (wind, waves, current) and thruster force are to be evaluated by wind tunnel and tank tests or other recognized methods.

11.1.4.3 For novel designs, ISC may raise additional requirements for drawing approval according to the specific design.

11.1.5 Failure mode and effect analysis (FMEA)

11.1.5.1 For class notations DP-2 and DP-3, DP FMEA is required.

11.1.5.2 The purpose of DP FMEA is to analyse and demonstrate whether a DP vessel can keep its position in case of a single failure and whether the system can satisfy the redundancy design intention.

11.1.5.3 The FMEA report is to be a complete and detailed document covering but not restricted to the following:

(1) basic particulars and information of the vessel;

(2) description of system boundary and acceptance criteria;

(3) description of system arrangement and configuration, categorization of redundancy groups, description WCFDI, requirement for safe termination time;

(4) description of all main components of the system and functional block diagram showing interactions between them;

(5) analysis of single failure (including common mode failure, hidden failure), the causes for failures, methods for failure detection, impacts of failures on the DP system locally and globally;

(6) for class notation DP-3, compartment failure analysis (or equivalent methods);

(7) conclusion, which is to include summary of each sub-system and the overall DP system.

11.1.5.4 The test of system redundancy is to be tested under each failure mode. The test program is to be based on the simulation of failure modes, and the tests are to be carried out in the actual DP operation mode.
11.1.5.5 The as-built FMEA(s) and redundancy test program(s) is(are) to be kept on board. The FMEA(s) and redundancy test program(s) is (are) at all times to be updated to cover alterations to the DP system hardware or software, according to the actual condition.

Section 2 SYSTEM ARRANGEMENT

11.2.1 General requirements

11.2.1.1 This Section specifies the requirements for system arrangement of a general type and unless expressly stated otherwise, these requirements apply to all vessels with DP class notations. Specific requirements for each sub-system will be specified below.
11.2.1.2 In accordance with different class notations, the design of DP arrangement is to meet the requirements of Table 11.2.1.2.

Arrangement of DP System **Table 11.2.1.2**

Equipment \ Class notation		DP-1	DP-2	DP-3	
Thruster system	Thruster arrangement	Non-redundant	Redundant	Redundant, separate compartments	
	Manuel control of thrusters	Yes	Yes	Yes (main DP control station)	
Power system	Generator & prime mover	Non-redundant	Redundant	Redundant, separate compartments	
	Switchboard	1	1	2, separate compartments	
	Power management system	-	Redundant	Redundant, separate compartments	
	UPS	1	2	2+1, separate compartments	
Control system and measurement system	Automatic control, number of computer systems	1	2	3 (one located in back-up control station)	
	Independent joystick system	1	1	1	
	Position reference systems	2	3	2 + 1	one located in back-up control station
	Vertical reference systems	1	3	2 + 1	
	Heading sensor systems	1	3	2 + 1	one connected to back-up control station
	Wind speed & direction sensor systems	1	2	1+1	
Back-up DP control station		-	-	Yes	
Alarm printer		1	1	1	

11.2.1.3 Under special environmental conditions for operation, the DP system may be so designed that it has remote control of the length and tension of individual chains where position mooring equipment is used to assist in DP. In accordance with the operation conditions, the consequence of chain fracture or thruster failure is to be analyzed.
11.2.1.4 If external forces from mission-related system (lifting, pipe lay, external fire extinguishing, etc.) have a direct impact on DP performance, the influence of these systems is to be considered and factored into the DP system design.

11.2.2 Redundancy design principles for class notations DP-2 and DP-3

11.2.2.1 To realize the redundancy requirements for the class notations specified in 11.1.2, the DP system is to be arranged as follows:
(1) for class notation DP-2, redundancy of all active components or systems;
(2) for class notation DP-2, redundancy of static components that may immediately affect position keeping capabilities upon failure and is not properly documented with respect to protection;
(3) Active components or systems normally include generator set, switchboard, UPS, thruster, control system, etc. Static components normally include cables, piping, etc.;
(4) If a single operation results in the result exceeding WCFDI, the operation is to be protected, such as double - clicking or additional mechanical protection;
(5) for class notation DP-3, redundancy of all active or static components and A-60 fire separation between the redundancy groups. If such separation is below the damaged waterline, the corresponding watertight separation requirements are also to be met, and the area above the damaged waterline is subject to the FMEA to determine the flooding effect on redundancy and whether watertight separation is required.
(6) When redundancy is considered unnecessary or impossible for some components or systems, further consideration is to be given to the reliability of these components or systems and the effects of failures of them. Where the reliability of these components or systems is sufficient or the effects of failures are

negligible, such specific arrangement may be accepted upon analysis and test results.

11.2.2.2 The system is to be composed of at least two redundancy groups. In case of a single failure (including WCF), redundancy groups are to be immediately available (i.e. hot standby required) and with such quantity, capacity and capability that the DP operation can be continued and/or safely terminated.

11.2.2.3 Restarting the system after it has been fully stopped is not to be considered as the contribution to redundancy concept, which includes but is not limited to thrusters, generator sets, auxiliary systems directly connected to the DP system. Redundancy groups are to be immediately available without the need for manual intervention The transfer of control is to be smooth and changes in position and heading are within acceptable limitations of the operation(s).

11.2.2.4 To prevent failure propagation between different redundant sets, different redundant sets are to be mutual independent from each other, for DP-2 common connections of electrical and pipe systems should be avoided, furthermore for DP-3 common spatial connections should be avoided. If such connections are unavoidable, the influence of fault propagation on different redundant groups is to subject to the FMEA analysis and conclusion is subject to test.

11.2.2.5 For systems which are not directly forming part of the DP system, but may affect the DP system (HVAC systems, common fire suppression systems, ventilator and oil pump remote shutoff, emergency shutdown systems, fire and gas control system, etc.) in the event of activation or failure, they are also to be arranged with adequate redundancy and reliability.

11.2.2.6 If the WCF is obtained according to the FMEA and test result, the result is to be input into the consequence analysis software of the DP control system. Only modes that have been subject to the FMEA and test can be input into consequence analysis.

11.2.2.7 Where the FMEA shows that a hidden failure will result in a loss of redundancy, sufficient and effective measures are to be taken to remind the crew to avoid hidden failures.

11.2.3 Dynamic positioning control station

11.2.3.1 The DP control station for DP operating and controlling is to be fitted on dynamically positioned vessels. The relevant indicators, alarms, control panel and communication system are to be fitted at the control station.

11.2.3.2 The DP control station is to be located such as to suit main operational activities of the vessel and so arranged that the operator has a good view of the vessel's exterior limits and surrounding areas and is aware of any activity relevant to the DP operation.

11.2.3.3 The main DP control station where the DP operator normally operates is to be provided with the following equipment:

(1) DP control system operator station;
(2) independent joystick operator station;
(3) thruster control mode selection devices;
(4) manual thruster levers and indication;
(5) thruster emergency stops;
(6) internal communications; and
(7) position reference systems' HMI.

11.2.3.4 For class notation DP-3, a back-up DP control station is to be fitted. The separation between the back-up control station and the main control station is to meet the requirement of A-60 class fire division. In an emergency, the operator is to be able to easily move from the main DP control station to the back-up DP control station.

11.2.3.5 The back-up control station is to provide a good view of the vessel's exterior limits and surrounding areas. Where physical arrangement cannot satisfy the field of vision requirement, alternative measures such as CCTV may be used, which are to be functional in case that the main DP control station needs to be evacuated.

11.2.3.6 Consideration is to be given to the environmental conditions of the DP control station. If the normal DP operation can be kept only upon necessary measures, redundancy of these measures is required for class notations DP-2 and DP-3.

11.2.4 Display and alarm arrangements

11.2.4.1 The DP control station is to display information from the DP system, to ensure the normal operation of these systems. Information necessary to safely operate the DP system is to be available at all times.

11.2.4.2 Failures of the DP system and the equipment controlled by it are to initiate audible and visual alarms. The occurrence and status of these failures are to be permanently recorded. The record is to be made by means of an alarm printer. If other means are to be used, they are to be subject to special

consideration and with the approval of ISC.

11.2.4.3 Each DP control station is to be fitted with alarms and displays as specified in Table 11.2.4.3.

Alarm and Display at DP Control Station **Table 11.2.4.3**

System	Monitored parameters	Alarm	Display
Thruster system	Combined thrusters force, direction and turning moment(mimic showing the relative position on the vessel)		√
	Individual thruster force, percentage and direction of each thruster (mimic showing the relative position on the vessel)		√
	Thruster allocation mode (fixed, bias, etc.)		√
	Thruster order and feedback indication (including pitch, speed, azimuth etc.)		√
	Load limitation on thruster (overload, insufficient available power, system failure, etc.)	√	
	Thruster status (running, stopped, ready, in command, failure)	√	√
Power system	Status of ACB (including thruster, generator, bus tie as a minimum)		√
	Consumed power and available power of the on-line generator		√
Control system and measurement system	Set points, present position and heading, including the deviation in between		√
	Exceeding operating limits/set point (position, heading)	√	
	Operation status of and position information from position reference system		√
	Position reference system failure	√	
	Operation status of and heading information from heading reference system		√
	Heading reference system failure	√	
	Operation status of and motion information from vertical reference system		√
	Vertical reference system failure	√	
	Operation status of and wind speed/direction information from anemometer		√
	Anemometer failure	√	
	Operation status of consequence analysis software (DP-2/DP-3)		√
	Alarm provided by consequence analysis (DP-2/DP-3)	√	
	Thruster control mode selection device (if computer system) failure, DP control system failure, independent joystick control system failure	√	

11.2.4.4 Where alarms and displays required in 11.2.4.3 are impracticable or unnecessary or equivalent arrangements are available, they may be reduced as appropriate, subject to agreement by ISC.

11.2.4.5 Alarms and displays specified in 11.2.4.3 may be realized by different systems. If one display is used for alarms and other functions, the alarm information is to have higher priority than other information, and is not to be inhibited/overlapped by other information and operations.

11.2.4.6 If the alarms at the DP control station are slave signals of other alarm systems, there is to be a local acknowledgement and silencing device. If the alarms of the thruster system and power system at the DP control station shown in Table 11.2.4.3 are presented as group alarms, the individual alarm is to be indicated locally, however the shutdown alarm is to be separated from other alarm groups. The silence device is not to cause inhibiting of any new alarms.

11.2.5 Arrangement of control panels

11.2.5.1 Indicators and control panels of the DP control station are to be based on ergonomic principles. Indicators and control panels are to be arranged in logical groups, and to be coordinated with the geometry of the vessel when this is relevant. The requirement also applies to indication on displays.

11.2.5.2 Easy switch-over between operational modes are to be provided. Active mode is to be positively indicated. Consistent indications of the operational status of the different sub-systems are to be given.

11.2.5.3 If control of the system and its sub-systems can be carried out from alternate control stations, positive indication of the station in charge is to be provided.

11.2.5.4 The information sources like displays, indicators, etc. are to provide information in a readily usable form. The operator is to be provided with immediate information of the effect of his actions. Generally, feedback signals or other confirmations of actions carried out are to be displayed, not only the initial command.

11.2.5.5 Precautions are to be taken to avoid inadvertent operation of control panels if this may result in a critical situation. Such precautions may be proper location of handles etc, recessed or covered switches, or logic requirements to operations.
11.2.5.6 Interlocks are to be arranged, if erroneous sequence of operation may lead to a critical situation or damage of equipment.
11.2.5.7 Controls and indicators placed in the navigation bridge are to be sufficiently illuminated. Lights for such purpose are to be provided with dimming facilities. Alarm indications is not to be dimmed to zero.

11.2.6 Arrangement of data communication

11.2.6.1 When two or more thrusters and their manual controls are using the same data communication link, this link is to be arranged with redundancy.
11.2.6.2 When the automatic DP control system uses a data communication link, this link is to be separate from the communication link(s) for manual control.
11.2.6.3 For class notations DP-2 and DP-3, the data communication link of the DP control system is to be arranged with technical redundancy and physical separation.
11.2.6.4 The independent joystick system may share the data link with the manual control, but not with the automatic DP control system.
11.2.6.5 For class notations DP-2 and DP-3, a single failure is not to affect the redundant data communication link.

11.2.7 Physical separation arrangement for class notation DP-3

11.2.7.1 A-60 division is to be kept between redundancy groups. If such redundancy groups are below the damaged waterline, adequate watertight separation is also to be ensured. Redundancy groups are composed of equipment, cables and piping systems.
11.2.7.2 For common spaces connected to different redundancy groups, the effects of fire and flooding in such spaces are to be considered. Requirements equivalent to 11.2.7.1 are to be met.
11.2.7.3 Cables for redundant equipment or systems are not to be routed together with those for the main systems through the same compartments. Where this is unavoidable, such cables may run together in ducts of A-60 class fire division provided that this applies only to cables arranged in spaces without high fire risk. Cable connection boxes are not allowed in such ducts.
11.2.7.4 Redundant piping systems (for fuel, lubrication, hydraulic oil, cooling water and pneumatic control) are not to be routed through the same compartment together with the main system. Where this is unavoidable, such pipes may run together in ducts of A-60 class fire division. Such method is only applicable to piping systems not arranged in spaces with high fire risks.
11.2.7.5 The systems, which are not directly part of the DP system, but which in the event of failure could cause failure of the DP system (e.g. common fire suppression systems, engine ventilation systems, shut-down systems, etc.), are also to comply with the relevant requirements of this Chapter.

11.2.8 Internal communication system

11.2.8.1 Two way communication is to be provided between the DP control station and the following locations:
(1) navigation bridge;
(2) engine control room;
(3) control rooms related to DP operations, e.g. cargo control room, drilling control cabin, etc.
11.2.8.2 The power supply of the communication system is to be independent of the main power of the vessel.

Section 3 THRUSTER SYSTEM

11.3.1 General requirements

11.3.1.1 The thrusters mentioned in this Section are pipe tunnel thrusters, azimuth thrusters, thrusters for fixed or variable pitch blades, driven by electric motors, diesel engines, or hydraulically. Other types of thrusters will be specially considered in each case.
11.3.1.2 Unless expressly provided otherwise in this Section, the design and manufacture of the thruster system including prime mover, gearbox, shafting and propeller are to comply with the applicable requirements of PART THREE of the Rules. Electrical installations and automation are to comply with the applicable requirements of PARTs FOUR and SEVEN of the Rules.

11.3.1.3 Thruster systems used in dynamic positioning are to meet the requirements for long-time operations.
11.3.1.4 When the steering gear is included under DP control, it is also to be designed for continuous operation. In DP automatic operation mode, if the rudder is not under control of DP system (not on-line) and not in zero position, an alarm is to be released at the DP control system.

11.3.2 Thruster arrangement
11.3.2.1 The location of thrusters is to be arranged to minimize interference with other thrusters and hull.
11.3.2.2 Thruster intakes are to be located at sufficient depth to reduce the possibility of ingesting floating debris and vortex formation.
11.3.2.3 The number and capacity of thrusters are to meet the following requirements:
(1) In the specified environmental conditions, the thruster system is to provide adequate thrust in longitudinal and lateral directions and yawing moment for heading control;
(2) For class notations DP-2 and DP-3, where the arrangement of thrusters is provided with redundancy, there are to be adequate thrust in longitudinal and lateral directions and yawing moment for heading control after failure of any one of the redundant thrusters.
11.3.2.4 If necessary, the values of the thruster forces used in the consequence analysis are to be corrected for interference between thrusters and other effects which will reduce the effective force.

11.3.3 Manual thruster control
11.3.3.1 Manual operation of each thrusters for start, stop, azimuth and pitch/speed control is to be arranged at the DP control station. Azimuth, pitch and speed control are to be non-follow up control.
11.3.3.2 Running, stopped, operation mode, azimuth feedback, pitch feedback and speed feedback status for each thruster is to be continuously and clearly displayed at the DP control station.
11.3.3.3 Failure of the closed loop control system (including feedback devices) is not to affect the indication of azimuth, pitch and speed.
11.3.3.4 It is to be possible to control thrusters manually at all times, also in case failure of DP and independent joystick control systems.
11.3.3.5 Failure of a manual thruster control system including azimuth, pitch, speed control, is not to cause a change in thrust direction and/or an increase in thrust force.
11.3.3.6 It is to be possible to stop thrusters individually from the main DP control station by independent emergency stop devices. The emergency stop of any thruster is not to affect other thrusters. The emergency stop device is to be independent of the DP control system, independent joystick control system and manual thruster control system. The emergency stop is to be arranged with separate cables and control circuit for each thruster.
11.3.3.7 For class notations DP-2 and DP-3, the emergency stop device is to have loop monitoring, including monitoring of power loss, broken wire and short circuit as a minimum. An alarm is to be initiated upon loop failure which is not to affect the running thrusters. For class notation DP-3, the design of the emergency stop device is also to consider the effects of fire and flooding.
11.3.3.8 Alarms related to the thruster system are to be continuously displayed at the manual thrusters control location. Such alarms may arranged to be group alarms, however the shutdown alarm point (if provided) is to be separated from other alarm points.

Section 4 POWER SYSTEM

11.4.1 General requirements
11.4.1.1 Unless expressly provided otherwise in this Chapter, the power system is to comply with the applicable requirements for electrical installations in PARTs THREE and FOUR of the Rules.
11.4.1.2 Automatic load limitation or other automatic measures are to be taken to prevent the active or reactive overload of the power system, in order to prevent partial or total loss of power. This requirement is also applicable to scenario when a single failure leads to tripping of more than one generators (unless there is no generator connected to the bus-bar after the failure). If this requirement is realized by multiple systems, the settings of each system are to be coordinated with each other.
11.4.1.3 For class notation DP-1, the power system needs not to be designed with redundancy.
11.4.1.4 For class notation DP-2, the power system should be divisible into two or more systems so that, in the event of failure of one sub-system, at least one other system will remain in operation and provide sufficient power for station keeping. The power system(s) may be run as one system during operation, but should be arranged by bus-tie breakers(s) to separate the system automatically upon failures which could be

transferred from one system to another, including, but not limited to, overloading, grounding and short circuits, which is to be identified by failure mode and impact analysis.

11.4.1.5 For class notation DP-3, the power system should be divisible into two or more systems so that, in the event of failure of one system, at least one other system will remain in operation and provide sufficient power for station keeping. The divided power system should be located in different spaces separated by A-60 class divisions. Where the power systems are located below the damage waterline, the separation should also be watertight. But-tie breakers of systems should be open unless equivalent integrity of power operation can be accepted, for detailed principles refer to 11.4.4.7.

11.4.2 Number and capacity of generators

11.4.2.1 When starting thruster motors, especially when one generator is out of service, transient voltage drop caused in the main bus-bar system during starting periods is not to be in excess of 15% of the rated voltage.

11.4.2.2 The high reactive load demands which may occur in DP thruster operation are to be considered when selecting number and type of generators.

11.4.2.3 For class notations DP-2 and DP-3, the redundancy is to be based on the running generator sets, and the number and capacity of generator sets are to meet the requirement for redundancy and capacity after a single failure.

11.4.2.4 Special considerations are to be made when energy storage facilities, such as battery systems, are used to power thrusters during DP operation. Where the energy storage facilities are used as one of the power system redundancy groups of the power system, the corresponding redundancy design principles are to be complied with.

11.4.3 Power management system

11.4.3.1 For class notations DP-2 and DP-3, an automatic power management control system is to be arranged to perform load-dependent starting and stop of generators. This system is to block starting of large consumers when there is not adequate running generator capacity, and to start up back-up generators as required, and hence to permit requested loads start to proceed.

11.4.3.2 The power management system is to satisfy the redundancy requirement of the corresponding notations and is able to maintain power management function after a single failure.

11.4.3.3 An alarm is to be initiated when the total electrical load exceeds a preset percentage of the running generator(s) capacity. This alarm is to be adjustable between 50% and 100% of the running capacity and is to be set with regard to the number of generators in service and the effect of the loss of any one generator.

11.4.3.4 A failure in the power management system is not to cause alteration to the online power generation, and is to initiate an alarm at the crew normal on-watch position in the.

11.4.3.5 It is to be possible to operate the switchboards manually after the power management system stops operation.

11.4.4 Switchboard arrangement for class notations DP-2 and DP-3

11.4.4.1 For class notation DP-2, the switchboard is to be so arranged that no single failure will give a total blackout. A single failure in this case is defined as any system or component breakdown of technical nature. The possibility of short circuit on the bus-bar is to be considered. For vessels with class notation DP-3, single failures also include the failures caused by flooding and fire incidents. The immediate consequence of this is that physical separation of redundant components/systems must be used to limit the effects of flooding and fire incidents.

11.4.4.2 A main bus-bar system is to consist of at least two sections (or parts). Where a circuit breaker is capable of breaking the maximum short circuit current in the system, the sections may be connected with the breaker. This breaker is to be appropriately protected and is to comply with the requirements for selectivity.

11.4.4.3 For class notation DP-2, the switchboard sections of different redundancy groups may be so arranged in one switchboard that adequate capacity is available in case of loss of any section due to any reason and that the vessel's position can be kept within specified environmental conditions and operating limits.

11.4.4.4 For class notation DP-3, switchboards of different redundancy groups are to be isolated from the other(s) by A-60 class fire division. If the switchboards are located below the waterline, the separation is also to be watertight. Adequate capacity is to be available to keep the vessel's position within specified operating limits after loss of any compartments due to fire or flooding. For switchboards of different redundancy groups, there is to be a bus-tie breaker on each side.

11.4.4.5 Power supply for the power system and thruster system need to be originated from their respective redundancy groups and their arrangements need to satisfy the redundancy design principles of the corresponding notations.
11.4.4.6 The online power reserve, i.e. the difference between online generator capacity and consumed power at any time is to be continuously displayed at the DP control station. For split-bus power arrangements, indications are to be provided for individual bus-bar sections.
11.4.4.7 For class notation DP-3, to realize the equivalent integrity required by 11.4.1.5, the following analysis and tests are to be carried out as a minimum:
(1) It is FMEA's responsibility to identify all possible failure modes, failure propagation, consequence of failure; the definition of failure mode is unlimited, including any active, static components failure, common mode failure, hidden failure, loss of an entire compartment due to fire or flooding (including failures of all systems inside the compartment). Computer simulation and other methods are needed to simulate the dynamic response of the DP system during failure condition.
(2) When the FMEA identifies that the occurrence of some failure modes will directly affect positioning, at least two sets of protection are to be provided for this failure mode, and the two sets of protection are to be mutual independent from each other. When both protection are performed, the result cannot exceed the WCFDI.
(3) Automatic blackout recovery of bus-bar of each section and start of all thrusters (except for the faulty bus-bar) need to be arranged. Except manual enabled thrusters into DP control, all other functions must be automatic. The recovery times is to be as fast as possible, and in any case should not exceed 60 seconds, such function is to be verified onboard.
(4) Test need to be carried out according to the FMEA conclusion, in order to verify the functionality of the protection, failure ride through capability, independence between protection function, coordination between various protection and failure monitoring. The test scope is to be defined according to the result of the FMEA, computer simulation and calculation, is to include at least live test such as short circuit, earth fault, governor fault, AVR fault, phase imbalance and PMS fault. The test results need to be recorded and compared with the theoretical analysis to determine whether each case can be accepted.

11.4.5 Control power

11.4.5.1 The computer system, operator station, position reference system, sensor system and printers for DP control system are to be supplied from UPSs. The arrangement and number of UPSs are to be in accordance with Table 11.2.1.2 of this Chapter.
11.4.5.2 For class notation DP-1, at least one UPS is to be provided. For class notations DP-2 and DP-3, the number of UPS is to be determined according to the FMEA results. For class notation DP-2, at least two UPSs are to be provided; for class notation DP-3, at least three UPSs are to be provided, one of which is to be located in a separate compartment separated by A-60 class division from other UPSs.
11.4.5.3 For class notations DP-2 and DP-3, the power supply to the computer system, operator station, position reference system, sensors are to be distributed according to the redundancy design principle to ensure the capability to keep DP position in case of a single failure of the UPS system.
11.4.5.4 For class notation DP-2, the power supply to the redundant UPS is to be derived from different parts of the main switchboard. For class notation DP-3, the power supply to the redundant UPS for the main DP control system is to be derived from different parts of the main switchboard. A single failure cannot cause simultaneous power loss of main and back-up DP control systems.
11.4.5.5 The power supply for the independent joystick system is to be independent of UPS for the DP control system.
11.4.5.6 For the thruster system and power system, the power supply for UPS is to be derived from different redundancy groups if the control power of such systems is supplied by UPS.
11.4.5.7 The battery capacity of each UPS is to be maintained at least 30 min. Alarms are to be initiated in case of charging failure.

Section 5 CONTROL SYSTEM AND MEASURING SYSTEM

11.5.1 General requirements

11.5.1.1 Unless expressly provided otherwise in this Chapter, control systems and measuring systems are to comply with the applicable requirements for automation system in PART SEVEN of the Rules.
11.5.1.2 The control systems and measuring systems of this Chapter includes the following equipment and functions:
(1) DP control system;

(2) independent joystick controls;
(3) thruster control mode selection device.

11.5.2 Arrangement of control systems

11.5.2.1 For class notation DP-1, one DP control system and one independent joystick system with automatic heading control are to be fitted.

11.5.2.2 For class notation DP-2, a redundant DP control system and one joystick system with automatic heading control are to be fitted. Should one automatic DP control system fail, control is to be automatically transferred to another one.

11.5.2.3 For class notation DP-3, triple redundant DP control systems and one joystick system with automatic heading control are to be fitted. The two automatic DP control systems are to be arranged such that, should one fail, control is automatically transferred to another one. The third automatic DP control system is to be located in the back-up control station and transfer of control to it is to be initiated in case of failure of both main control systems.

11.5.2.4 Where two or more computer systems are operated simultaneously, means are to be provided for self-monitoring and comparison between systems so as to initiate an alarm when any significant difference is detected in orders for thrusters or positions or heading. This function is not to endanger the independence of each system or cause any risk of the common mode failure.

11.5.3 Automatic DP control

11.5.3.1 The DP control system is to have thrusters automatic operation mode and is able to keep vessel's position/heading, the set points for position/heading can be selected individually.

11.5.3.2 The DP control system located in the main DP control station is to have joystick operation mode.

11.5.3.3 The relative or absolute position and heading of the ship are to be displayed, including deviations from set points. Audible and visual alarms are to be initiated when the ship deviates from the set points.

11.5.3.4 The automatic DP control is to consist of one or more computer system, comprising processing units, input/output devices, and storage devices.

11.5.3.5 The computer systems are to perform self-check routines for detection of failure. Alarms are to be initiated when critical failures are detected.

11.5.3.6 Each DP computer system is to be isolated from other on-board computer systems and communication systems to ensure the integrity of the DP system. This isolation may be fulfilled via hardware, software systems or physical separation which based on specific design.

11.5.3.7 For class notation DP-1, the following requirements are to be complied with:

(1) The computer system for automatic thruster control is to give pitch/speed and azimuth commands. These commands are transmitted to the individual thruster control units.

(2) The computer system is to perform self-check routines that are to bring the computer system to stop when critical failure conditions are detected.

(3) When stopped, either by automatic or manual means, the computer system is to set speed/pitch commands to zero.

(4) The computer system and operator station of the DP control system is not required to be redundant.

11.5.3.8 For class notation DP-2, the following requirements are to be complied with:

(1) applicable requirements under 11.5.3.7.

(2) Redundant computer systems are to be arranged with automatic command transfer after a detected failure in one of the computer systems and an alarm is to be initiated. Common facilities, such as self-checking routines, data transfer arrangements and interfaces, are not to cause the failure of two/all systems.

(3) One computer system may be selected as the on-line system and other systems are in hot standby condition. The changeover from one system to another is able to be manually and automatically. In case of automatic changeover upon failure detection, the system that was online is to remain unavailable after repair, and it can be selected to be online only manually.

(4) The automatic transfer of control from one computer system to another is to be smooth and the position/heading excursion is to be within the acceptable limitations of the operation.

(5) The above requirements are also applicable to the operator station located at the DP control station.

(6) If any failure of a standby DP control system, the standby sensors or position reference systems connected to it, an alarm is to be initiated.

(7) When a computer system consists of three or more computers, an online voting algorithm maybe used to determine the failed computer and automatically switchover is to be carried out.

11.5.3.9 For class notation DP-3, the following requirements are to be complied with:

(1) applicable requirements under 11.5.3.8.

(2) The back-up DP control system is to be located in a compartment, separated by A-60 division from the main DP control system.
(3) If three independent computer systems are chosen for the main system, one of these computers may serve as the back-up, provided that the necessary independence as required for the back-up is achieved.
(4) There is to be at least one position reference system and one sensor system connected to the back-up system, independent of the main system.
(5) During DP operation, this back-up control system is to be continuously updated by input from the sensors, position reference systems, thruster feedback, etc., and to be ready to take over control.
(6) The back-up computer control system is to have real-time communication with the computer system of the main DP control system. An alarm is to be initiated if any significant difference of parameter is detected or the back-up control station is not ready to take control.
11.5.3.10 For class notations DP-2 and DP-3, the computer system is to include a software function, known as online consequence analysis which at least fulfills with the following requirements:
(1) to continuously verify that the vessel will remain in position even if the WCF occurs under the current environmental conditions. If the left thrusters cannot generate the same resultant thruster force and moment as required before the failure, the consequence analysis is to initiate an alarm.
(2) to calculate the effects of available power of the generator sets and thruster sets on positioning after the WCF, and the principles in 11.2.2.7 of the Chapter need to be followed.
(3) For operations which will take a long time to safely terminate, the consequence analysis is to include a function which simulates the thrust and power remaining after the WCF, based on manual input of weather information.
(4) When other forms of energy storage devices are used as redundancy groups of the DP system, such as battery systems to power thrusters, consequence analysis is to consider the relationship between the time required to safely terminate the operation and the duration of energy storage devices, and the consequence analysis alarm setting is to be less than the expected discharge time.
(5) The operation status of the online consequence analysis is to be continuously and clearly displayed at the DP control station.

11.5.4 Independent joystick control

11.5.4.1 The joystick is to enable the control of longitudinal and transverse thruster forces, turning moments, and all combinations of these thruster force components. The system is to include selectable automatic heading control.
11.5.4.2 The independent joystick control system is to be independent of the DP control system. In case of any failure of the DP control system, independent joystick control of all thrusters is still to be able to be performed.
11.5.4.3 Any failure in the independent joystick control system is to initiate an alarm.
11.5.4.4 Any failure causing operator loss of control of the thrusters in the independent joystick control system is to set the thrust commands to zero. If the failure affects only a limited number of thrusters, the command to these affected thrusters is to be automatically set to zero, while keeping the other unaffected thrusters in joystick control.

11.5.5 Thruster control mode selection device

11.5.5.1 The command transfer between different control systems (e.g. manual thruster control system, DP control system, independent joystick control system, etc.) for thrusters is to be selectable by a simple device located in the DP control station. The device may consist of a single selector switch, or individual selectors for each thruster.
11.5.5.2 In the DP or independent joystick mode, the mode selection device is to be so arranged that it is always possible to select manual controls of thrusters after any single failure in the DP control mode.
11.5.5.3 For class notations DP-2 and DP-3, the mode selection device is to be so designed that no single failure will deselect all thrusters from the automatic operation mode. The results are not to exceed the WCF defined by the system.
11.5.5.4 For class notation DP-3, it is to be possible to transfer the command responsibility to the back-up control at the DP back-up control station, and the mode selection device failure (electrical failure, fire, etc.) will not result in simultaneous failure of the main or back-up DP control.

11.5.6 Position reference systems

11.5.6.1 The position reference systems are to produce position data with adequate accuracy for the intended DP operation to satisfy the corresponding operational requirements.
11.5.6.2 For class notation DP-1, at least two independent position reference systems are to be provided.

11.5.6.3 For class notations DP-2 and DP-3, at least three position reference systems are to be installed. For class notation DP-3, one of the position reference systems is to be connected to the back-up DP control station and separated by A-60 class fire division from other position reference systems.
11.5.6.4 The position reference systems' HMI is to be arranged at the DP control station, which can display the position information and operation status. The HMI is to be independent from the DP operator station. For class notations DP-2 and DP-3, the arrangement for the HMI is to meet the corresponding redundancy requirements. For class notation DP-2, at least two sets of HMI are to be arranged, and for class notations DP-3, one more set of HMI is to be arranged in the back-up control station.
11.5.6.5 For class notations DP-2 and DP-3, the position reference systems' power supply, signal transmission and interface with the DP control system are to meet the system's redundancy arrangement and separation requirements.
11.5.6.6 When two or more position reference systems are required, they are to be based on different principles. For class notation DP-1, if only one principle is used, the design is subject to special consideration and approval from ISC.
11.5.6.7 The data of the position reference systems are to be processed. In case of abnormal conditions such as freezing, jumping, fluctuation or decreased accuracy, such data are to be rejected by the control system through certain means and an alarm is to be initiated. This requirement applies to all online and stand-by position reference systems.
11.5.6.8 The operating status of the position reference systems are to be clearly indicated, such as running, online, failure, and rejected by the control system.
11.5.6.9 When one or more position reference systems are selected/dis-selected, the output of the thrusters should not change significantly. When the last reference system is lost, the output of the thrusters should not change significantly immediately.
11.5.6.10 When an acoustic reference system is used, a hydrophone is to be chosen to minimize the influence of mechanical and acoustic disturbance on transmission channels.
11.5.6.11 When a taut wire system is used, materials used for wire rope, tensioning and auxiliary equipment are to be appropriate for marine service.
11.5.6.12 When the signals from the position reference system are changed by the movement of the vessel (rolling, pitching), the position is to be automatically corrected.
11.5.6.13 The electrical and mechanical parameters of the position reference systems, such as energy, pressure and temperature, are to be monitored and the failure of the position reference systems are to be monitored in so far as practicable.

11.5.7 Sensor systems

11.5.7.1 The sensor systems are to produce heading and other necessary data with adequate accuracy for the DP operation to satisfy the corresponding operational requirements.
11.5.7.2 Sensors are to be provided in accordance with the requirements of Table 11.2.1.2 of this Chapter.
11.5.7.3 For class notations DP-2 and DP-3, where the DP control system relies on the correction signals of sensors, at least three systems are necessary for the same type of sensors.
11.5.7.4 For class notation DP-3, one of the sensor systems is to be directly connected to the back-up control system and separated from the other sensors by A-60 class fire division.
11.5.7.5 For class notations DP-2 and DP-3, the sensor systems' power supply, signal transmission and interface with the DP control system are to meet the system redundancy arrangement and separation requirements.
11.5.7.6 The data of the sensor systems are to be processed. In case of abnormal conditions such as freezing, jumping, fluctuation or decreased accuracy, such data are to be rejected by control system and an alarm is to be initiated. This requirement applies to all online and stand-by sensor systems.
11.5.7.7 The operating status of the position reference systems are to be clearly indicated, such as running, online, failure, and rejected by the control system.
11.5.7.8 The electrical and mechanical parameters of the sensor systems, such as energy, pressure and temperature, are to be monitored and the failure of the sensor systems are to be monitored in so far as practicable.

CHAPTER 12 IN-WATER SURVEY ARRANGEMENTS OF SHIPS

Section 1 GENERAL PROVISIONS

12.1.1 Application

12.1.1.1 This Chapter applies to ships classed with ISC and intended to be assigned the In-Water Survey class notation.

Section 2 DOCUMENTATION TO BE SUBMITTED

12.2.1 Plans/Manuals

12.2.1.1 Detailed plans of the hull and hull appendages below the waterline are to be submitted for approval. These plans are to indicate the location and/or general arrangement of:

(1) all shell openings;
(2) stem and sternpost;
(3) rudder and fittings;
(4) propeller, including the means used for identifying each blade;
(5) anodes, including securing arrangements;
(6) bilge keel;
(7) welded seams and butts;
(8) marking system.

12.2.1.2 The drawings are also to include the necessary instructions to facilitate the divers' work, especially for taking clearance measurements.

12.2.1.3 A plan for evaluating rudder pintle and bearing clearances while the ship is afloat is to be submitted for examination and approval.

12.2.2 Photographs

12.2.2.1 As far as practicable, a photographic documentation, used for reference during in-water surveys, of the following hull parts is to be submitted:

(1) propeller boss;
(2) rudder pintles, where clearance is measured;
(3) typical sea connection;
(4) adjustable propeller, if any;
(5) other details, as deemed necessary on a case by case basis.

12.2.3 Documentation on board

12.2.3.1 The plans and photographs required in 12.2.1 and 12.2.2 are to be kept on board by the owner and made available to the Surveyor and the divers when an in-water survey is carried out.

Section 3 STRUCTURAL DESIGN PRINCIPLES

12.3.1 Marking

12.3.1.1 Identification marks and system are to be supplied to facilitate the in-water survey. The following positions are at least to be included:

(1) ship bottom: connections of bulkhead or watertight floors and girders;
(2) both sides: in way of watertight transverse bulkheads and connections of inner bottom plating to watertight floors.
(3) all shell plating openings below the waterline.

12.3.1.2 The marking is at least to be 300 mm in length and 30 mm in width, which is to be painted in a contrasting colour. The marking may be made in the form of a raised character or made using any other equivalent method which ensures that the marking is not easily expunged. The marking may be replaced by the anodes (e.g. zinc blocks) or external appendages on the hull, provided that they are indicated accordingly in the plans/manuals submitted for approval in accordance with 12.2.1.

12.3.2 Rudder arrangements

12.3.2.1 Rudder arrangements are to be such that rudder pintle clearances can be checked while the ship is afloat.

12.3.3 Oil sealing glands of propeller shafts or tube shafts

12.3.3.1 The oil sealing glands of propeller shafts or tube shafts is to be such that clearances between propeller shafts or tube shafts and bearings can be checked while the ship is afloat.

12.3.4 Sea water inlet grating

12.3.4.1 The grating of sea chest are to be connected by hinges or equivalent means, so as to facilitate the examination of internal conditions of the sea chest.

CHAPTER 13 ADDITIONAL REQUIREMENTS FOR POLAR CLASS SHIPS

Section 1 GENERAL REQUIREMENTS FOR POLAR CLASS SHIPS

13.1.1 Application

13.1.1.1 This Chapter for Polar Class applies to ships constructed of steel and intended for independent navigation in ice-infested polar waters.

13.1.1.2 Ships that comply with the requirements of Sections 2 and 3 of this Chapter can be considered for a Polar Class notation “PC x” (where x is the corresponding class number) as listed in Table 13.1.2.1. The requirements of Sections 2 and 3 are in addition to the open water requirements. If the hull and machinery are constructed such as to comply with the requirements of different polar classes, then both the hull and machinery are to be assigned the lower of these classes in the classification certificate. Compliance of the hull or machinery with the requirements of a higher Polar Class is also to be indicated in the classification certificate or the equivalent.

13.1.1.3 Ships which are assigned a Polar Class notation and complying with the relevant requirements of Sections 2 and 3 of this Chapter may be given the additional notation “Icebreaker”. “Icebreaker" refers to any ship having an operational profile that includes escort or ice management functions, having powering and dimensions that allow it to undertake aggressive operations in ice-covered waters, and having a class certificate endorsed with this notation.

13.1.1.4 For ships which are assigned a Polar Class notation, the hull form and propulsion power are to be such that the ship can operate independently and at continuous speed in a representative ice condition, as defined in Table 13.1.2.1 for the corresponding Polar Class. For ships and ship-shaped units which are intentionally not designed to operate independently in ice, such operational intent or limitations are to be explicitly stated in the classification certificate or the equivalent.

13.1.1.5 For ships which are assigned a Polar Class notation PC 1 through PC 5, bows with vertical sides, and bulbous bows are generally to be avoided. Bow angles should in general be within the range specified in 13.2.3.1(5).

13.1.1.6 For ships which are assigned a Polar Class notation PC 6 and PC 7, and are designed with a bow with vertical sides or bulbous bows, operational limitations (restricted from intentional ramming) in design conditions are to be stated in the classification certificate or the equivalent.

13.1.2 Polar class

13.1.2.1 The Polar Class (PC) notations and descriptions are given in Table 13.1.2.1. It is the responsibility of the owner to select an appropriate Polar Class. The descriptions in Table 13.1.2.1 are intended to guide owners, designers and administrations in selecting an appropriate Polar Class to match the requirements for the ship with its intended voyage or service.

Polar Class Description **Table 13.1.2.1**

Polar Class	Ice Description (based on WMO Sea Ice Nomenclature)
PC1	Year-round operation in all polar waters
PC2	Year-round operation in moderate multi-year ice conditions
PC3	Year-round operation in second-year ice which may include multi-year ice inclusions
PC4	Year-round operation in thick first-year ice which may include old ice inclusions
PC5	Year-round operation in medium first-year ice which may include old ice inclusions
PC6	Summer/autumn operation in medium first-year ice which may include old ice inclusions
PC7	Summer/autumn operation in thin first-year ice which may include old ice inclusions

13.1.2.2 The Polar Class notation is used throughout this Chapter for Polar Class ships to convey the differences between classes with respect to operational capability and structural strength.

13.1.3 Upper and lower ice waterlines

13.1.3.1 The upper and lower ice waterlines upon which the design of the vessel has been based are to be indicated in the classification certificate. The upper ice waterline (UIWL) is to be defined by the maximum draughts fore, amidships and aft. The lower ice waterline (LIWL) is to be defined by the minimum draughts fore, amidships and aft.

13.1.3.2 The lower ice waterline (LIWL) is to be determined with due regard to the ship's ice-going capability in the ballast loading conditions. The propeller is to be fully submerged at the lower ice waterline(LIWL).

13.1.3.3 When the upper ice waterline (UIWL) is lower than the summer fresh water loadline draught, an ice class draught mark is to be provided in accordance with the requirements of 4.2.1.4, Section 2, Chapter 4, PART TWO of the Rules.

Section 2 STRUCTURAL REQUIREMENTS

13.2.1 Application and definitions

13.2.1.1 This Section applies to Polar Class ships as specified in Section 1 of this Chapter.

13.2.1.2 The length L_{UI} is the distance, in m, measured horizontally from the fore side of thestem at the intersection with the upper ice waterline (UIWL) to the after side of the rudder post, or the centre of the rudder stock if there is no rudder post. L_{UI} is not to be less than 96%, and need not be greater than 97%, of the extreme length of the upper ice waterline (UIWL) measured horizontally from the fore side of the stem. In ships with unusual stern and bow arrangement the length L_{UI} will be specially considered.

13.2.1.3 The ship displacement D_{UI} is the displacement, in kt, of the ship corresponding to the upper ice waterline (UIWL). Where multiple waterlines are used for determining the UIWL, the displacement is to be determined from the waterline corresponding to the greatest displacement.

13.2.2 Hull areas

13.2.2.1 The hull of all Polar Class ships is divided into areas reflecting the magnitude of the loads that are expected to act upon them. In the longitudinal direction, there are four regions: bow, bow intermediate, midbody and stern. The bow intermediate, midbody and stern regions are further divided vertically into the bottom, lower and ice belt regions. The extent of each hull area is illustrated in Figure 13.2.2.1.

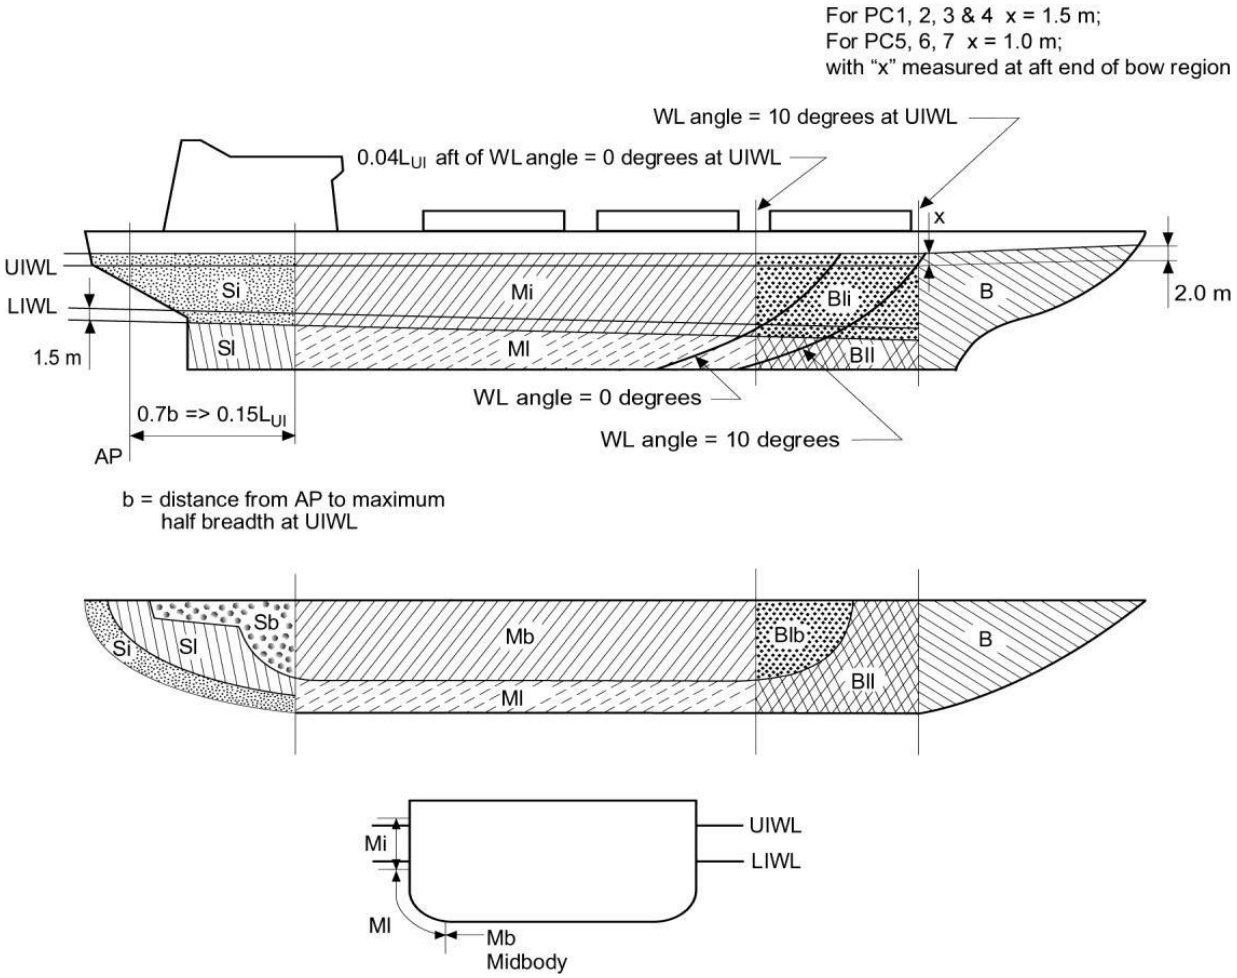


Figure 13.2.2.1 Extent of Hull Areas

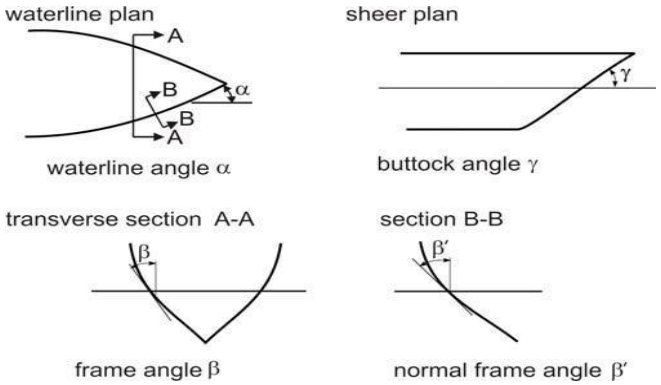
13.2.2.2 The upper ice waterline (UIWL) and lower ice waterline (LIWL) are as defined in 13.1.3.
13.2.2.3 Figure 13.2.2.1 notwithstanding, at no time is the boundary between the bow and bow intermediate regions to be forward of the intersection point of the line of the stem and the ship baseline.
13.2.2.4 Figure 13.2.2.1 notwithstanding, the aft boundary of the bow region need not be more than 0.45 L_{UI} aft of the fore side of the stem at the intersection with the upper ice waterline (UIWL).
13.2.2.5 The boundary between the bottom and lower regions is to be taken at the point where the shell is inclined 7° from horizontal.
13.2.2.6 If a ship is intended to operate astern in ice regions, the aft section of the ship is to be designed using the bow and bow intermediate hull area requirements.
13.2.2.7 Figure 13.2.2.1 notwithstanding, for ships assigned the additional notation "Icebreaker", the forward boundary of the stern region is to be at least 0.04L_{UI} forward of the section where the parallel ship side at the upper ice waterline (UIWL) ends.

13.2.3 Design ice loads

13.2.3.1 General
(1) For all Polar Class ships, a glancing impact on the bow is the design scenario for determining the scantlings required to resist ice loads.
(2) The design ice load is characterized by an average pressure (P_{avg}) uniformly distributed over a rectangular load patch of height (b) and width (w).
(3) Within the bow area of all Polar Class ships, and within the bow intermediate ice belt area of Polar Class PC6 and PC7, the ice load parameters are functions of the actual bow shape. To determine the ice load parameters (P_{avg}, b and w), it is required to calculate the following ice load characteristics for sub-regions of the bow area; shape coefficient (fa_i), total glancing impact force (F_i), line load (Q_i) and pressure (P_i).
(4) In other ice-strengthened areas, the ice load parameters (P_{avg}, b_{NonBow} and w_{NonBow}) are determined independently of the hull shape and based on a fixed load patch aspect ratio, AR = 3.6.
(5) Design ice forces calculated according to 13.2.3.2(1)③ are applicable for bow forms where the buttock angle γ at the stem is positive and less than 80°, and the normal frame angle β' at the centre of the foremost sub-region, as defined in 13.2.3.2 (1)①, is greater than 10°.
(6) Design ice forces calculated according to 13.2.3.2(1)④ are applicable for ships which are assigned the Polar Class PC6 or PC7 and have a bow form with vertical sides. This includes bows where the normal frame angles β' at the considered sub-regions, as defined in 13.2.3.2(1)①, are between 0° and 10°.
(7) For ships which are assigned the Polar Class PC6 or PC7, and equipped with bulbous bows, the design ice forces on the bow are to be determined according to 13.2.3.2(1)④. In addition, the design forces are not to be taken less than those given in 13.2.3.2(1)③, assuming fa = 0.6 and AR = 1.3.
(8) For ships with bow forms other than those defined in (5) to (7), design forces are to be specially considered by ISC.
(9) Ship structures that are not directly subjected to ice loads may still experience inertial loads of stowed cargo and equipment resulting from ship/ice interaction. These inertial loads, as referred to acceleration calculation in 13.3.6 of Section 3, are to be considered in the design of these structures.
13.2.3.2 Glancing impact load characteristics
The parameters defining the glancing impact load characteristics are reflected in the class factors listed in Tables 13.2.3.2(1) and 13.2.3.2(2).

Class Factors To Be Used in 13.2.3.2(1)③ **Table 13.2.3.2(1)**



Polar Class	Crushing failure class factor (CF_C)	Flexural failure class factor (CF_F)	Load patch dimensions class factor (CF_D)	Displacement class factor (CF_{DIS})	Longitudinal strength class factor (CF_L)
PC1	17.69	68.60	2.01	250	7.46
PC2	9.89	46.80	1.75	210	5.46
PC3	6.06	21.17	1.53	180	4.17
PC4	4.50	13.48	1.42	130	3.15
PC5	3.10	9.00	1.31	70	2.50
PC6	2.40	5.49	1.17	40	2.37
PC7	1.80	4.06	1.11	22	1.81

Class Factors To Be Used in 13.2.3.2(1)④ **Table 13.2.3.2(2)**

Polar Class	Crushing failure class factor (CF_{CV})	Line load class factor (CF_{QV})	Pressure class factor (CF_{PV})
PC6	3.43	2.82	0.65
PC7	2.60	2.33	0.65

(1) Bow area

① In the Bow area, the force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) associated with the glancing impact load scenario are functions of the hull angles measured at the upper ice waterline (UIWL). The influence of the hull angles is captured through calculation of a bow shape coefficient (fa). The hull angles are defined in Figure 13.2.3.2.

Notes: β' — normal frame angle at upper ice waterline [°];
α — upper ice waterline angle [°];
γ — buttock angle at upper ice waterline (angle of buttock line measured from horizontal) [°];
$\tan(\beta) = \tan(\alpha)/\tan(\gamma)$;
$\tan(\beta') = \tan(\beta)\cdot\cos(\alpha)$.

Figure 13.2.3.2 Definition of Hull Angles

② The waterline length of the bow region is generally to be divided into 4 sub-regions of equal length. The force (F), line load (Q), pressure (P) and load patch aspect ratio (AR) are to be calculated with respect to the mid-length position of each sub-region (each maximum of F, Q and P is to be used in the calculation of the ice load parameters P_{avg}, b and w).

③ The bow area load characteristics for bow forms defined in 13.2.3.1(5) are determined as follows:

(a) Shape coefficient, fa_i, is to be taken as:

$$fa_i = \min(fa_{i,1}, fa_{i,2}, fa_{i,3})$$

where:
$$fa_{i,1} = \frac{\left[0.097 - 0.68\left(\frac{x}{L_{UI}} - 0.15\right)^2\right]\alpha_i}{(\beta_i')^{0.5}};$$

$$fa_{i,2} = \frac{1.2CF_F}{[\sin(\beta_i')\cdot CF_C \cdot D_{UI}{}^{0.64}]};$$

$$fa_{i,3} = 0.60;$$

(b) Force, F:

$$F_i = fa_i \cdot CF_C \cdot D_{UI}{}^{0.64} \quad \text{MN}$$

(c) Load patch aspect ratio, AR:

$$AR_i = 7.46\sin(\beta_i') \geq 1.3$$

(d) Line load, Q:

$$Q_i = F_i^{0.61} \cdot CF_D / AR_i^{0.35} \quad \text{MN/m}$$

(e) Pressure, P:

$$P_i = F_i^{0.22} \cdot CF_D^2 \cdot AR_i^{0.3} \quad \text{MPa}$$

where: i — sub-region considered;
L_{UI} — length, in m, as defined in 13.2.1.2;

x — distance from the fore side of the stem at the intersection with the upper ice waterline (UIWL) to station under consideration, in m;
α — waterline angle [°], see Figure 13.2.3.2;
β' — normal frame angle [°], Figure 13.2.3.2;
D_{UI} — displacement as defined in 13.2.1.3, in kt, not to be taken less than 5 kt;
CF_C — crushing failure class factor from Table 13.2.3.2(1);
CF_F — flexural failure class factor from Table 13.2.3.2(1).
CF_D — load patch dimensions class factor from Table 13.2.3.2(1);

④ The bow area load characteristics for bow forms defined in 13.2.3.1(6) are determined as follows:

(a) Shape coefficient, fa_i, is to be taken as:

$$fa_i=\alpha_i/30$$

(b) Force, F_i:

$$F_i = fa_i \cdot CF_{CV} \cdot D_{UI}^{0.47} \quad \text{[MN]}$$

(c) Line load, Q_i:

$$Q_i=F_i^{0.22}\cdot CF_{QV} \quad \text{[MN/m]}$$

(d) Pressure, P_i:

$$P_i=F_i^{0.56}\cdot CF_{PV} \quad \text{[MPa]}$$

where: i — sub-region considered;
α — waterline angle [°], see Figure 13.2.3.2;
β' — normal frame angle [°], Figure 13.2.3.2;
D_{UI} — displacement as defined in 13.2.1.3, in kt, not to be taken less than 5 kt;
CF_{CV} — crushing failure class factor from Table 13.2.3.2(2);
CF_{QV} — line load class factor from Table 13.2.3.2(2).
CF_{PV} — pressure class factor from Table 13.2.3.2(2);

(2) Hull areas other than the bow

① In the hull areas other than the bow, the force (F_{NonBow}) and line load (Q_{NonBow}) used in the determination of the load patch dimensions (b_{NonBow}, w_{NonBow}) and design pressure (P_{avg}) are calculated as follows:

(a) Force, F_{NonBow}:

$$F_{\text{NonBow}}=0.36CF_C\cdot DF \quad \text{MN}$$

(b) Line load, Q_{NonBow}:

$$Q_{\text{NonBow}} = 0.639(F_{\text{NonBow}})^{0.61}\cdot CF_D \quad \text{MN/m}$$

where: CF_C — crushing force class factor from Table 13.2.3.2(1);
DF — ship displacement factor, taken as follows:

$$D_{UI}^{0.64} \quad \text{if } D_{UI} \le CF_{DIS}$$

$$CF_{DIS}^{0.64} + 0.10(D_{UI} - CF_{DIS}) \quad \text{if } D_{UI} > CF_{DIS}$$

D_{UI} — displacement as defined in 13.2.1.3, in kt, not to be taken less than 10 kt;
CF_{DIS} — displacement class factor from Table 13.2.3.2(1);
CF_D — load patch dimensions class factor from Table 13.2.3.2(1).

13.2.3.3 Design load patch

(1) In the bow area, and the ice belt area of intermediate bow for ships with class notation PC6 and PC7, the design load patch has dimensions of width, w_{Bow}, and height, b_{Bow}, defined as follows:

$$w_{\text{Bow}} = F_{\text{Bow}} / Q_{\text{Bow}} \quad \text{m}$$
$$b_{\text{Bow}} = Q_{\text{Bow}} / P_{\text{Bow}} \quad \text{m}$$

where: F_{Bow} — maximum F_i in the bow area, in MN;
Q_{Bow} — maximum Q_i in the bow area, in MN/m;
P_{Bow} — maximum P_i in the bow area, in MPa.

(2) In hull areas other than those covered by 13.2.3.3(1), the design load patch has dimensions of width, w_{Bow}, and height, b_{Bow}, defined as follows:

$$w_{NonBow}=F_{NonBow}/Q_{NonBow} \quad \text{m}$$

$$b_{NonBow} = w_{NonBow}/3.6 \qquad \text{m}$$

where: F_{NonBow} — force determined using 13.2.3.2(2)①(a), in MN;

Q_{NonBow} — line load determined using 13.2.3.2(2)①(b), in MN/m.

13.2.3.4 Pressure within the design load patch

(1) The average pressure, P_{avg}, within a design load patch is determined as follows:

$$P_{avg} = F/(b \cdot w) \qquad \text{MPa}$$

where: F — F_{Bow} or F_{NonBow} as appropriate for the hull area under consideration, in MN;

b — b_{Bow} or b_{NonBow} as appropriate for the hull area under consideration, in m;

w — w_{Bow} or w_{NonBow} as appropriate for the hull area under consideration, in m.

(2) Areas of higher, concentrated pressure exist within the load patch. In general, smaller areas have higher local pressures. Accordingly, the peak pressure factors listed in Table 13.2.3.4 are used to account for the pressure concentration on localized structural members.

Peak Pressure Factors **Table 13.2.3.4**

Structural member		Peak pressure factor (PPF_i)
Plating	Transversely-framed	$PPF_p = (1.8 - s) \geq 1.2$
	Longitudinally-framed	$PPF_p = (2.2 - 1.2\ s) \geq 1.5$
Frames in transverse framing systems	With load distributing stringers	$PPF_t = (1.6 - s) \geq 1.0$
	With no load distributing stringers	$PPF_t = (1.8 - s) \geq 1.2$
Frames in bottom structures		$PPF_s = 1.0$
Load carrying stringers Side longitudinals Web frames		$PPF_s = 1.0$, if $S_w \geq 0.5w$ $PPF_s = 2.0 - 2.0\ S_w/w$, if $S_w < (0.5w)$

where: s — frame or longitudinal spacing, in m;

S_w — web frame spacing, in m;

w — ice load patch width, in m.

13.2.3.5 Hull area factors

(1) Associated with each hull area is an area factor that reflects the relative magnitude of the load expected in that area. The area factor (*AF*) for each hull area is listed in Table 13.2.3.5(1).

(2) In the event that a structural member spans across the boundary of a hull area, the largest hull area factor is to be used in the scantling determination of the member.

(3) Due to their increased manoeuvrability, ships having propulsion arrangements with azimuthing (geared and podded) thrusters are to have stern ice belt (S_i) and stern lower (S_l) hull area factors *AF* listed in Table 13.2.3.5(3).

(4) For ships assigned the additional notation "Icebreaker", the area factor (*AF*) for each hull area is listed in Table 13.2.3.5(4)-1. For propulsion arrangements with azimuthing (geared and podded) thrusters, the area factor (*AF*) for each hull area is listed in Table 13.2.3.5(4)-2.

Hull Area Factors **Table 13.2.3.5(1)**

Hull Area		Area	Polar Class						
			PC1	PC2	PC3	PC4	PC5	PC6	PC7
Bow (*B*)	All	*B*	1.00	1.00	1.00	1.00	1.00	1.00	1.00

13.2.4 Shell plate requirements

13.2.4.1 The required minimum shell plate thickness, *t*, is given by:

$$t = t_{net} + t_s \quad \text{mm}$$

where: t_{net} — plate thickness required to resist ice loads according to 13.2.4.2, in mm;

t_s — corrosion and abrasion allowance according to 13.2.11, in mm.

13.2.4.2 The thickness of shell plating required to resist the design ice load, t_{net}, depends on the orientation of the framing.

In the case of transversely-framed plating ($\Omega \geq 70°$), and all bottom plating, i.e. plating in hull areas B_{Ib}, M_b and S_b, the net thickness is given by:

$$t_{net} = 500s[(AF \cdot PPF_p \cdot P_{avg})/R_{eH}]^{0.5}/[1+s/(2b)] \quad \text{mm}$$

In the case of longitudinally-framed plating ($\Omega \geq 20°$), when $b \geq s$, the net thickness is given by:

$$t_{net} = 500s[(AF \cdot PPF_p \cdot P_{avg})/R_{eH}]^{0.5}/[1+s/(2l)] \quad \text{mm}$$

In the case of longitudinally-framed plating ($\Omega \leq 20°$), when $b < s$, the net thickness is given by:

$$t_{net} = 500s[(AF \cdot PPF_p \cdot P_{avg})/R_{eH}]^{0.5} \cdot [2b/s - (b/s)^2]^{0.5}/[1+s/(2l)] \quad \text{mm}$$

In the case of obliquely-framed plating ($70° > \Omega > 20°$), linear interpolation is to be used.

where: Ω — smallest angle between the chord of the waterline and the line of the first level framing, [°], illustrated in Figure 13.2.4.2;

s — transverse frame spacing in transversely-framed ships or longitudinal frame spacing in longitudinally-framed ships, in m;

AF — hull area factor from Table 13.2.3.5(1) or Table 13.2.3.5(4);

PPF_p — peak pressure factor from Table 13.2.3.4;

P_{avg} — average patch pressure according to 13.2.3.4, in MPa;

R_{eH} — yield stress of the material, in N/mm^2;

b — height of design load patch, in m, where b is to be taken not greater than (l – s/4) in the case of determination of the net thickness for transversely-framed plating;

l — distance between frame supports, in mm, i.e. equal to the frame span as given in 13.2.5.5, but not reduced for any fitted end brackets. When a load-distributing stringer is fitted, the length l need not be taken larger than the distance from the stringer to the most distant frame support.

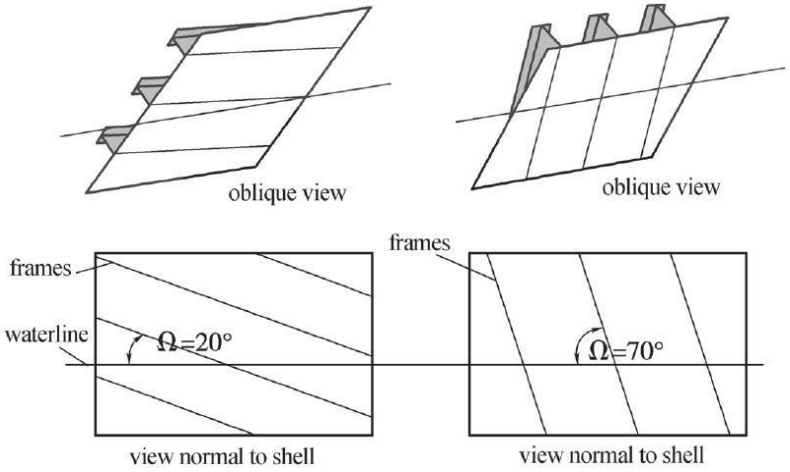

Figure 13.2.4.2 Shell Framing Angle Ω

13.2.5 Framing – General

13.2.5.1 Framing members of Polar Class ships are to be designed to withstand the ice loads defined in 13.2.3.

13.2.5.2 The term "framing member" refers to transverse and longitudinal local frames, load-carrying stringers and web frames in the areas of the hull exposed to ice pressure, see Figure 13.2.2.1. Where load-distributing stringers have been fitted, they are generally fitted at or near the midpoint of the span of the frame, and web height of stringers is not to be less than 0.8 times the web height of the frame.

13.2.5.3 The strength of a framing member is dependent upon the fixity that is provided at its supports. Fixity can be assumed where framing members are either continuous through the support or attached to a supporting section with a connection bracket. In other cases, simple support is to be assumed unless the connection can be demonstrated to provide significant rotational restraint. Fixity is to be ensured at the support of any framing which terminates within an ice-strengthened area.

13.2.5.4 The details of framing member intersection with other framing members, including plated structures, as well as the details for securing the ends of framing members at supporting sections, are to be in accordance with the relevant requirements of Chapter 1, PART TWO of the Rules.

13.2.5.5 The effective span of a framing member is to be determined on the basis of its moulded length. If brackets are fitted, the effective span may be reduced in accordance with the relevant requirements of Chapter 1, PART TWO of the Rules. Brackets are to be configured to ensure stability in the elastic and post-yield response regions.

13.2.5.6 When calculating the section modulus and shear area of a framing member, net thicknesses of the web, flange (if fitted) and attached shell plating are to be used. The shear area of a framing member may include that material contained over the full depth of the member, i.e. web area including portion of flange, if fitted, but excluding attached shell plating.

13.2.5.7 The actual net effective shear area, A_w, of a transverse or longitudinal local frame is given by:

$$A_w = h\, t_{wn} \sin\varphi_w / 100 \qquad \text{cm}^2$$

where: h — height of stiffener, in mm, see Figure 13.2.5.7;

t_{wn} — net web thickness, in mm:

$t_{wn} = t_w - t_c$

where: t_w —as-built web thickness, in mm, see Figure 13.2.5.7;

t_c —corrosion deduction to be subtracted from the web and flange thickness, in mm, as specified in 13.2.11.3;

φ_w — smallest angle between shell plate and stiffener web, [°], measured at the midspan of the stiffener, see Figure 13.2.5.7. The angle φ_w may be taken as 90° provided the smallest angle is not less than 75°.

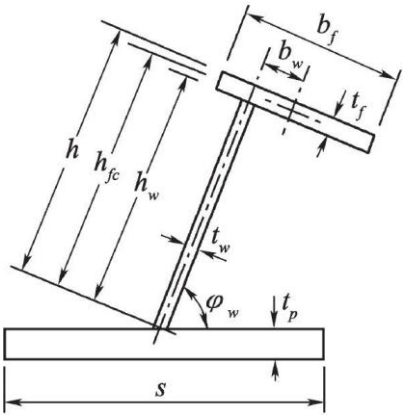

Figure 13.2.5.7 Stiffener Geometry

13.2.5.8 When the cross-sectional area of the attached plate flange exceeds the cross-sectional area of the local frame, the actual net effective plastic section modulus, Z_p, of a transverse or longitudinal frame is given

$$Z_p = (A_{pn} t_{pn}/20) + \frac{h_w^2 t_{wn} \sin\varphi_w}{2000} + A_{fn}(h_{fc}\sin\varphi_w - b_w \cos\varphi_w)/10 \qquad \text{cm}^3$$

by:

where: h, t_{wn}, t_c and φ_w — as given in 13.2.5.7, s — as given in 13.2.4.2;

A_{pn} — net cross-sectional area of attached plate, in cm^2;

t_{pn} — net thickness of fitted shell plate, in mm (complying with t_{net} as required by 13.2.4.2);

h_w — height of local frame web, in mm, see Figure 13.2.5.7;

A_{fn} — net cross-sectional area of local frame flange, in cm^2;

h_{fc} — height of local frame measured to center of the flange area, in mm, see Figure 13.2.5.7;

b_w — distance from mid thickness plane of local frame web to the center of the flange area, in mm, see Figure 13.2.5.7.

When the cross-sectional area of the local frame exceeds the cross-sectional area of the attached plate flange, the plastic neutral axis is located a distance z_{na} above the attached shell plate, given by:

$$z_{na} = \left(100A_{fn} + h_w t_{wn} - 1000 t_{pn} s\right)/\left(2t_{wn}\right) \qquad \text{mm}$$

and the net effective plastic section modulus, Z_p, of a transverse or longitudinal frame is given by:

$$Z_p = t_{pn} \cdot s \cdot \left(z_{na} + \frac{t_{pn}}{2}\right)\sin\phi_w + \left\{ \begin{array}{l} \dfrac{[(h_w - z_{na})^2 + z_{na}^2]t_{wn}\sin\phi_w}{2000} \\ +A_{fn}[(h_{fc} - z_{na})\sin\phi_w - b_w\cos\phi_w]/10 \end{array} \right\} \qquad \text{cm}^3$$

13.2.5.9 In the case of oblique framing arrangement (70° > Ω > 20°, where Ω is defined as given in 13.2.4.2), linear interpolation is to be used.

13.2.6 Framing – Local frames in bottom structures and in transversely-framed side structures

13.2.6.1 The local frames in bottom structures (i.e. hull areas B_{lb}, M_b and S_b) and in transversely-framed side structures (i.e. hull areas B_{lb}, M_b and S_b) are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism. For bottom structure the patch load is to be applied with the dimension (b) parallel with the frame direction.

13.2.6.2 The actual net effective shear area of the frame, A_w, as defined in 13.2.5.7, is to comply with the following condition: $A_w \geq A_t$, where:

$$A_t = 100^2 \cdot 0.5LL \cdot s\left(AF \cdot PPF_t \cdot P_{avg}\right) / \left(0.577 R_{eH}\right) \qquad \text{cm}^2$$

where: LL — length of loaded portion of span, in m, to be taken as the lesser of a and b;
a — local frame span as defined in 13.2.5.5, in m;
b — height of design ice load patch according to 13.2.3.3(1) or (2), in m;
s — spacing of local frame, in m;
AF — hull area factor from Table 13.2.3.5(1) or Table 13.2.3.5(4);
PPF_t — peak pressure factor, PPF_t or PPF_s as appropriate, from Table 13.2.3.4;
P_{avg} — average pressure within load patch according to 13.2.3.4, in MPa;
R_{eH} — yield stress of the material, in N/mm^2.

13.2.6.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 13.2.5.8, is to comply with the following condition: $Z_p \geq Z_{pt}$, where Z_{pt} is to be the greater calculated on the basis of two load conditions: a) ice load acting at the midspan of the local frame, and b) the ice load acting near a support. The A_1 parameter in the equation below reflects the two conditions:

$$Z_{pt} = 100^3 \cdot LL \cdot Y \cdot s\left(AF \cdot PPF_t \cdot P_{avg}\right) a \cdot A_1 / \left(4 R_{eH}\right) \qquad \text{cm}^3$$

where: AF, PPF_t, P_{avg}, LL, s, a and R_{eH} — as given in 13.2.6.2;
Y = 1 − 0.5(LL/a);

$$A_{1A} = 1/\{1 + j/2 + (k_w j/2)\,[\,(1 - a_1^2)^{0.5} - 1]\}$$
$$A_{1B} = [1 - 1/(2a_1 \cdot Y)\,]/(0.275 + 1.44 k_z^{0.7})$$

A_1 — maximum of:
where:
j = 1 for a local frame with one simple support outside the ice-strengthened areas;
= 2 for a local frame without any simple supports;

$a_1 = A_t / A_w$

where:
A_t — minimum shear area of the local frame as given in 13.2.6.2, in cm^2;
A_w — effective net shear area of the local frame (calculated according to 13.2.5.7), in cm^2;

$k_w = 1/(1 + 2A_{fn}/A_w)$, with A_{fn} as given in 13.2.5.8;

k_z — z_p / Z_p, in general;
= 0.0, when the frame is arranged with end bracket;
where:

$$= (b_f \; t_{fn}^2/4 + b_{eff} \; t_{pn}^2/4)/1000$$

z_p — sum of individual plastic section moduli of flange and shell plate as fitted, cm^3;

where:
b_f — flange breadth, in mm, see Figure 13.2.5.7;
t_{fn} — net flange thickness, in mm, see Figure 13.2.5.7;
= $t_f - t_c$ (t_c as given in 13.2.5.7)
where:
t_f — as-built flange thickness, in mm, see Figure 13.2.5.7;
t_{pn} — the fitted net shell plate thickness, in mm, (not to be less than as t_{net} given in 13.2.4);
b_{eff} — effective width of shell plate flange, in mm:
= 500 s;

Z_p — net effective plastic section modulus of the local frame (calculated according to 13.2.5.8), in cm^3.

13.2.6.4 The scantlings of the local frame are to meet the structural stability requirements of 13.2.9.

13.2.7 Framing – Longitudinal local frames in side structures

13.2.7.1 Longitudinal local frames in side structures are to be dimensioned such that the combined effects of shear and bending do not exceed the plastic strength of the member. The plastic strength is defined by the magnitude of midspan load that causes the development of a plastic collapse mechanism.

13.2.7.2 The actual net effective shear area of the frame, A_w, as defined in 13.2.5.7, is to comply with the following condition: $A_w \geq A_{L,}$ where:

$$A_L = 100^2 (AF \cdot PPF_s \cdot P_{avg}) 0.5 b_1 \cdot a / (0.577 R_{eH}) \quad \text{cm}^2$$

where: AF — hull area factor from Table 13.2.3.5(1) or Table 13.2.3.5(4);
PPF_s — peak pressure factor from Table 13.2.3.4;
P_{avg} — average pressure within load patch according to13.2.3.4, in MPa;
b_1 $= k_0 b_2$, in m
where: $k_0 = 1 - 0.3/b'$;
where: $b' = b/s$
where: b — height of design ice load patch from 13.2.3.3 (1) or (2), in m;
s — spacing of longitudinal frames, in m;
$b_2 = b(1 - 0.25b')$, in m, if $b' < 2$;
$= s$, in m, if $b' \geq 2$;
a — effective span of longitudinal local frame as given in 13.2.5.5, in m;
R_{eH} — yield stress of the material, in N/mm^2.

13.2.7.3 The actual net effective plastic section modulus of the plate/stiffener combination, Z_p, as defined in 13.2.5.8, is to comply with the following condition: $Z_p \geq Z_{pL}$, where:

$$Z_{pL} = 100^3 (AF \cdot PPF_s \cdot P_{avg}) b_1 \cdot a^2 \cdot A_4 / (8 R_{eH}) \quad \text{cm}^3$$

where: AF, PPF_s, P_{avg}, b_1, a and R_{eH} — as given in 13.2.7.2;

$$A_4 = 1/\{2 + k_{wi}[(1 - a_4^2)^{0.5} - 1]\};$$

$$a_4 = A_L / A_w$$

where: A_L — minimum shear area for longitudinal, in cm^2, as given in 13.2.7.2;
A_w — net effective shear area of longitudinal (calculated according to 13.2.5.7), in cm^2;
$k_{wi} = 1/(1 + 2A_{fh}/A_w)$, with A_{fh} as given in 13.2.5.8.

13.2.7.4 The scantlings of the longitudinals are to meet the structural stability requirements of 13.2.9.

13.2.8 Framing – Web frame and load-carrying stringers

13.2.8.1 Web frames and load-carrying stringers are to be designed to withstand the ice load patch as defined in 13.2.3. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimized.

13.2.8.2 Web frames and load-carrying stringers are to be dimensioned such that the combined effects of shear and bending do not exceed the yield strength of the material. Where these members form part of a structural grillage system, appropriate methods of analysis are to be used. Where the structural configuration is such that members do not form part of a grillage system, the appropriate peak pressure factor (*PPF*) from Table 13.2.4.3 is to be used. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

13.2.8.3 For determination of scantlings of load carrying stringers, web frames supporting local frames, or web frames supporting load carrying stringers forming part of a structural grillage system, appropriate methods as outlined in 13.2.17 are normally to be used.

13.2.8.4 The scantlings of web frames and load-carrying stringers are to meet the structural stability requirements of 13.2.9.

13.2.9 Framing – Structural stability

13.2.9.1 To prevent local buckling in the web, the ratio of web height (h_w) to net web thickness (t_{wn}) of any framing member is not to exceed:

For flat bar sections: $h_w/t_{wn} \leq 282/(R_{eH})^{0.5}$

For bulb, tee and angle sections: $h_w/t_{wn} \leq 805/(R_{eH})^{0.5}$

where: h_w — web height;
t_{wn} — net web thickness;
R_{eH} — yield stress of the material, in N/mm^2.

13.2.9.2 Framing members for which it is not practicable to meet the requirements of 13.2.9.1 (e.g. load carrying stringers or deep web frames) are required to have their webs effectively stiffened. The scantlings of the web stiffeners are to ensure the structural stability of the framing member. The minimum net web thickness for these framing members is given by:

$$t_{wn} = 2.63\times10^{-3} c_1\sqrt{R_{eH}/(5.34+4(c_1/c_2)^2)} \quad \text{mm}$$

where: c_1 $= h_w - 0.8h$, in mm;

where: h_w—web height of stringer / web frame, in mm, see Figure 13.2.9.2;

h — height of framing member penetrating the member under consideration (0 if no such framing member), in mm, see Figure 13.2.9.2;

c_2 — spacing between supporting structure oriented perpendicular to the member under consideration, in mm, see Figure 13.2.9.2;

R_{eH} — yield stress of the material, in N/mm^2.

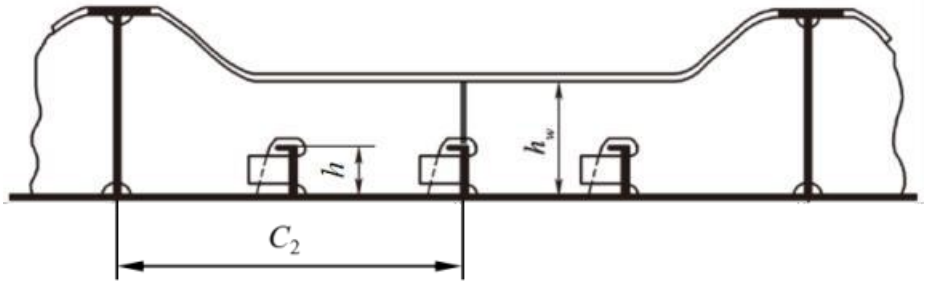

Figure 13.2.9.2 Parameter Definition for Web Stiffening

13.2.9.3 In addition, the following is to be satisfied:

$$t_{wn} \geq 0.35 t_{pn} (R_{eH}/235)^{0.5}$$

where: R_{eH} — yield stress of the shell plate in way of the framing member, in N/mm^2;

t_{wn} — net thickness of the web, in mm;

t_{pn} — net thickness of the shell plate in way the framing member, in mm.

13.2.9.4 To prevent local flange buckling of welded profiles, the following are to be satisfied:

(1) the flange width, b_f, in mm, is not to be less than five times the net thickness of the web, t_{wn};

(2) the flange outstand, b_{out}, in mm, is to meet the following requirement:

$$b_{out}/t_{fn} \leq 155/(R_{eH})^{0.5}$$

where: t_{fn}— net thickness of flange, in mm;

R_{eH} — yield stress of the material, in N/mm^2.

13.2.10 Plated Structures

13.2.10.1 Plated structures are those stiffened plate elements in contact with the hull and subject to ice loads. These requirements are applicable to an inboard extent which is the lesser of:

(1) web height of adjacent parallel web frame or stringer; or

(2) 2.5 times the depth of framing that intersects the plated structure.

13.2.10.2 The thickness of the plating and the scantlings of attached stiffeners are to be such that the degree of end fixity necessary for the shell framing is ensured.

13.2.10.3 The stability of the plated structure is to adequately withstand the ice loads defined in 13.2.3.

13.2.11 Corrosion/abrasion additions and steel renewal

13.2.11.1 Effective protection against corrosion and ice-induced abrasion is recommended for all external surfaces of the shell plating for all Polar Class ships.

13.2.11.2 The values of corrosion/abrasion additions, t_s, to be used in determining the shell plate thickness for each polar class are listed in Table 13.2.11.2.

Corrosion/Abrasion Additions for Shell Plating Table 13.2.11.2

Hull area	t_s (mm)					
	With effective protection			Without effective protection		
	PC1 to PC3	PC4 & PC5	PC6 & PC7	PC1 to PC3	PC4 & PC5	PC6 & PC7
Bow; bow intermediate ice belt	3.5	2.5	2.0	7.0	5.0	4.0
Bow intermediate lower; midbody & stern ice belt	2.5	2.0	2.0	5.0	4.0	3.0
Midbody & stern lower; bottom	2.0	2.0	2.0	4.0	3.0	2.5

13.2.11.3 Polar Class ships are to have a minimum corrosion/abrasion addition of t_s = 1.0 mm applied to all internal structures within the ice-strengthened hull areas, including plated members adjacent to the shell, as well as stiffener webs and flanges.
13.2.11.4 Steel renewal for ice strengthened structures is required when the gauged thickness is less than t_{net} + 0.5 mm.

13.2.12 Materials

13.2.12.1 Steel grades of plating for hull structures are to be not less than those given in Table 13.2.12.4 based on the as-built thickness, the Polar Class and the material class of structural members according to 13.2.12.2.

Material Classes for Structural Members **Table 13.2.12.1**

Structural Members	Material Class
Shell plating within the bow and bow intermediate ice belt hull areas (*B*, *BI*$_i$)	II
All weather and sea exposed SECONDARY and PRIMARY, as defined in Table 1.3.2.2(1) of PART TWO of the Rules, structural members outside 0.4 L_{UI} amidships	I
Plating materials for stem and stern frames, rudder horn, rudder, propeller nozzle, shaft brackets, ice skeg, ice knife and other appendages subject to ice impact loads	II
All inboard framing members attached to the weather and sea-exposed plating including any contiguous inboard member within 600 mm of the shell plating	I
Weather-exposed plating and attached framing in cargo holds of ships which by nature of their trade have their cargo hold hatches open during cold weather operations	I
All weather and sea exposed SPECIAL, as defined in Table 1.3.2.2(1) of PART TWO of the Rules, structural members within 0.2 L_{UI} from FP	II

13.2.12.2 Material classes specified in Table 1.3.2.2(1) of Section 3, Chapter 1 of PART TWO of the Rules are applicable to Polar Class ships regardless of the ship's length. In addition, material classes for weather and sea exposed structural members and for members attached to the weather and sea exposed shell plating of Polar Class ships are given in Table 13.2.12.1. Where the material classes in Table 13.2.12.1 and those in Table 1.3.2.2(1) of Section 3, Chapter 1 of PART TWO of the Rules differ, the higher material class is to be applied.
13.2.12.3 Steel grades for all plating and attached framing of hull structures and appendages situated below the level of 0.3 m below the lower waterline, as shown in Figure 13.2.12.3, are to be obtained from Table 1.3.2.2(6) and Table 1.3.2.2(7) of Section 3, Chapter 1 of PART TWO of the Rules based on the material class for structural members in Table 13.2.12.1 above, regardless of Polar Class.

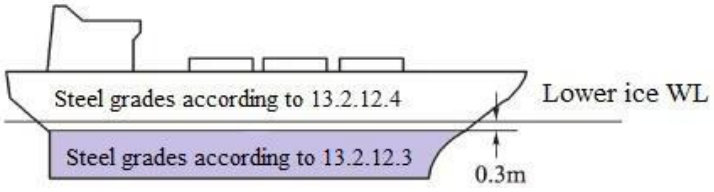

Figure 13.2.12.3
Steel Grade Requirements for Submerged and Weather Exposed Shell Plating

13.2.12.4 Steel grades for all weather exposed plating of hull structures and appendages situated above the level of 0.3 m below the lower ice waterline (LIWL), as shown in Figure 13.2.12.3, are to be not less than that given in Table 13.2.12.4.

Steel Grades for Weather Exposed Plating **Table 13.2.12.4**

Thickness *t* [mm]	Material Class I				Material Class II				Material Class III					
	PC1 to PC5		PC6 & PC7		PC1 to PC 5		PC6 & PC 7		PC1 to PC 3		PC4 & PC 5		PC6 & PC 7	
	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT
$t \leq 10$	B	AH	B	AH	B	AH	B	AH	E	EH	E	EH	B	AH
$10 < t \leq 15$	B	AH	B	AH	D	DH	B	AH	E	EH	E	EH	D	DH
$15 < t \leq 20$	D	DH	B	AH	D	DH	B	AH	E	EH	E	EH	D	DH
$20 < t \leq 25$	D	DH	B	AH	D	DH	B	AH	E	EH	E	EH	D	DH
$25 < t \leq 30$	D	DH	B	AH	E	EH(2)	D	DH	E	EH	E	EH	E	EH
$30 < t \leq 35$	D	DH	B	AH	E	EH	D	DH	E	EH	E	EH	E	EH
$35 < t \leq 40$	D	DH	D	DH	E	EH	D	DH	F	FH	E	EH	E	EH
$40 < t \leq 45$	E	EH	D	DH	E	EH	D	DH	F	FH	E	EH	E	EH

45< t ≤50	E	EH	D	DH	E	EH	D	DH	F	FH	F	FH	E	EH

Notes:

(1) Includes weather-exposed plating of hull structures and appendages, as well as their outboard framing members, situated above a level of 0.3 m below the lowest ice waterline.

(2) Grades D, DH are allowed for a single strake of side shell plating not more than 1.8 m wide from 0.3 m below the lowest ice waterline.

13.2.12.5 Castings are to have specified properties consistent with the expected service temperature for the cast component.

13.2.13 Longitudinal strength

13.2.13.1 Application

(1) A ramming impact on the bow is the design scenario for the evaluation of the longitudinal strength of the hull.

(2) Intentional ramming is not considered as a design scenario for ships which are designed with vertical or bulbous bows, see 13.1.1.6. Hence the longitudinal strength requirements given in 13.2.13 are not to be considered for ships with stem angle γ_{stem} equal to or larger than 80°.

(3) Ice loads are only to be combined with still water loads. The combined stresses are to be compared against permissible bending and shear stresses at different locations along the ship's length. In addition, sufficient local buckling strength is also to be verified.

13.2.13.2 Design vertical ice force at the bow

(1) The design vertical ice force at the bow, F_{IB}, is to be taken as:

$$F_{IB} = \min(F_{IB,1}, F_{IB,2}) \qquad \text{MN}$$

where: $F_{IB,1} = 0.534 K_I^{0.15} [\sin(\gamma_{stem})]^{0.2} (D_{UI} \cdot K_h)^{0.5} CF_L$ MN;

$F_{IB,2} = 1.20 CF_F$ MN;

where: K_I — indentation parameter, $= K_f / K_h$;

(a) for the case of a blunt bow form:

$$K_f = \left[2CB_{UI}^{1-e_b} / (1 + e_b) \right]^{0.9} \tan(\gamma_{stem})^{-0.9(1+e_b)}$$

(b) for the case of wedge bow form ($\alpha_{stem} < 80^\circ$), $e_b = 1$ and the above simplifies to:

$$K_f = \left\{ \tan(\alpha_{stem}) / [\tan(\gamma_{stem})]^2 \right\}^{0.9};$$

$K_h = 0.01 A_{wp}$ MN/m;

CF_L — longitudinal strength class factor from Table 13.2.3.2;

e_b — bow shape exponent which best describes the waterplane (see Figures 13.2.13.2(1) and 13.2.13.2(2))
= 1.0 for a simple wedge bow form
= 0.4 to 0.6 for a spoon bow form
= 0 for a landing craft bow form;
An approximate e_b determined by a simple fit is acceptable;

γ_{stem} — stem angle, [°], to be measured between the horizontal axis and the stem tangent at the upper ice waterline (UIWL) (buttock angle as per Figure 13.2.3.2 measured on the centerline);

α_{stem} — waterline angle measured in way of the stem at the upper ice waterline (UIWL) (°) (see Figure 13.2.3.2(1));

$$C = 1 / [2(L_B / B_{UI})^{e_b}]$$

where: B_{UI} — moulded breadth corresponding to the upper ice waterline (UIWL), in m;

L_B — bow length used in the equation $y = (B_{UI} / 2)(x / L_B)^{e_b}$, in m, (see Figures 13.2.13.2(1) and 13.2.13.2(2));

D_{UI} — displacement as defined in 13.2.1.3, in kt, not to be taken less than 10 kt;

A_{wp} — waterplane areacorresponding to the upper ice waterline (UIWL), in m^2;

CF_F — flexural failure class factor from Table 13.2.3.2(1).

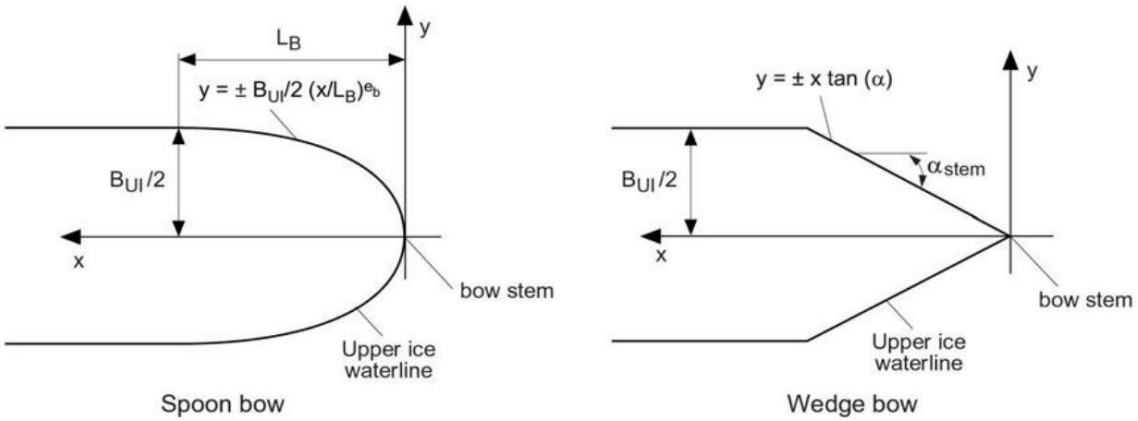

Figure 13.2.13.2(1) Bow Shape Definition

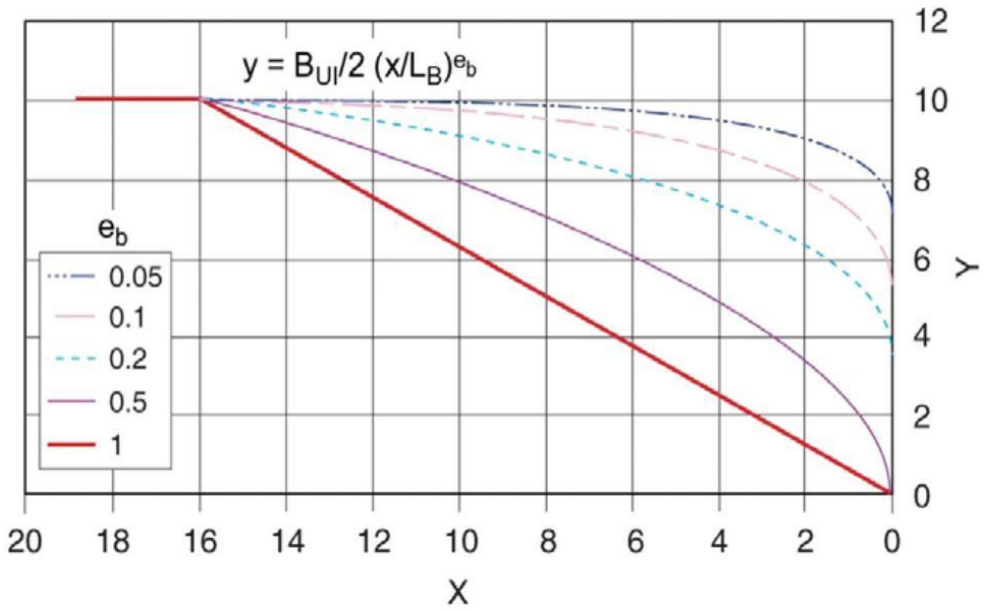

Figure 13.2.13.2 (2) Illustration of e_b Effect on the Bow Shape for B = 20 and L_B =16

13.2.13.3 Design vertical shear force

(1) The design vertical ice shear force, F_I, along the hull girder is to be taken as:

$$F_I = C_f F_{IB} \qquad \text{MN}$$

where: C_f — longitudinal distribution factor to be taken as follows:

(a) positive shear force

C_f = 0.0 between the aft end of L_{UI} and 0.6L_{UI} from aft;

C_f = 1.0 between 0.9L_{UI} from aft and the forward end of L_{UI};

(b) negative shear force

C_f = 0.0 at the aft end of L_{UI};

C_f = –0.5 between 0.2L_{UI} and 0.6L_{UI} from aft;

C_f = 0.0 between 0.8L_{UI} from aft and the forward end of L_{UI};

intermediate values are to be determined by linear interpolation.

(2) The applied vertical shear stress, τ_a, is to be determined along the hull girder in a similar manner as in 2.2.6 of Section 2, Chapter 2 of PART TWO of the Rules by substituting the design vertical ice shear force for the design vertical wave shear force.

13.2.13.4 Design vertical ice bending moment

(1) The design vertical ice bending moment, M_I, along the hull girder is to be taken as:

$$M_I = 0.1 C_m L_{UI} [\sin(\gamma_{stem})]^{-0.2} F_{IB} \qquad \text{MN·m}$$

where: L_{UI} — length, in m, as defined in 13.2.1.2;

γ_{stem} — as given in 13.2.13.2(1);

F_{IB} — design vertical ice force at the bow, in MN;

C_m — longitudinal distribution factor for design vertical ice bending moment to be taken as follows:

C_m = 0.0 at the aft end of L_{UI};

C_m = 1.0 between $0.5L_{UI}$ and $0.7L_{UI}$ from aft;

C_m = 0.3 at $0.95L_{UI}$ from aft;

C_m = 0.0 at the forward end of L_{UI};

intermediate values are to be determined by linear interpolation.

(2) The applied vertical bending stress, σ_a, is to be determined along the hull girder in a similar manner as in 2.2.5 of Section 2, Chapter 2 of PART TWO of the Rules, by substituting the design vertical ice bending moment for the design vertical wave bending moment. The ship still water bending moment is to be taken as the permissible still water bending moment in sagging condition.

13.2.13.5 Longitudinal strength criteria

The strength criteria provided in Table 13.2.13.5 are to be satisfied. The design stress is not to exceed the permissible stress.

Longitudinal Strength Criteria **Table 13.2.13.5**

Failure mode	Applied stress	Permissible stress when $R_{eH}/\sigma_u \leq 0.7$	Permissible stress when $R_{eH}/\sigma_u > 0.7$
Tension	σ_a	ηR_{eH}	$0.41\eta\ (\sigma_u + R_{eH})$
Shear	τ_a	$\eta R_{eH} / (3)^{0.5}$	$0.41\eta\ (\sigma_u + R_{eH}) / (3)^{0.5}$
Buckling	σ_a	σ_c for plating and for web plating of stiffeners σ_c /1.1 for stiffeners	
	τ_a	τ_c	

Notes: σ_a — applied vertical bending stress, in N/mm^2;

τ_a— applied vertical shear stress, in N/mm^2;

R_{eH} — yield stress of the material, in N/mm^2;

σ_u— ultimate tensile strength of material, in N/mm^2;

σ_c— critical buckling stress in compression, according to 2.2.7 of Section 2, Chapter 2 of PART TWO of the Rules, in N/mm^2;

τ_c— critical buckling stress in compression, according to 2.2.7 of Section 2, Chapter 2 of PART TWO of the Rules, in N/mm^2;

η = 0.8;

η = 0.6 for ships which are assigned the additional notation “Icebreaker”.

13.2.14 Stem and stern frames

13.2.14.1 The stem and stern frame are to be designed according to the relevant requirements of Section 14, Chapter 2 of PART TWO of the Rules. For PC6/PC7 vessels requiring ISC ice class notations B1*/B1 equivalency, the stem and stern requirements of the ice class notations by Chapter 4, PART TWO of the Rules are to be complied with.

13.2.15 Appendages

13.2.15.1 All appendages are to be designed to withstand forces appropriate for the location of their attachment to the hull structure or their position within a hull area.

13.2.15.2 Load definition and response criteria are to be determined by practical situations.

13.2.16 Local details

13.2.16.1 For the purpose of transferring ice-induced loads to supporting structure (bending moments and shear forces), local design details are to comply with the requirements of Chapter 1, PART TWO of the Rules.

13.2.16.2 The loads carried by a member in way of cut-outs are to maintain stability. Where necessary, the structure is to be stiffened.

13.2.17 Direct calculations

13.2.17.1 Direct calculations are not to be utilized as an alternative to the analytical procedures prescribed for the shell plating and local frame requirements given in 13.2.4, 13.2.6, and 13.2.7 of this Chapter.

13.2.17.2 Direct calculations are to be used for load carrying stringers and web frames forming part of a grillage system.

13.2.17.3 Where direct calculation is used to check the strength of structural systems, the load patch specified in 13.2.3 is to be applied, without being combined with any other loads. The load patch is to be applied at locations where the capacity of these members under the combined effects of bending and shear is minimized. Special attention is to be paid to the shear capacity in way of lightening holes and cut-outs in way of intersecting members.

13.2.17.4 The strength evaluation of web frames and stringers may be performed based on linear or non-linear analysis. Recognized structural idealization and calculation methods are to be applied, but the detailed requirements are to be specified by ISC. In the strength evaluation, the guidance given in 13.2.17.5 and 13.2.17.6 may generally be considered.

13.2.17.5 If the structure is evaluated based on linear calculation methods, the following are to be considered:

(1) web plates and flange elements in compression and shear to fulfil relevant buckling criteria as specified by ISC;

(2) nominal shear stresses in member web plates to be less than $R_{eH}/\sqrt{3}$;

(3) nominal von Mises stresses in member flanges to be less than $1.15\,R_{eH}$.

13.2.17.6 If the structure is evaluated based on non-linear calculation methods, the following are to be considered:

(1) the analysis is to reliably capture buckling and plastic deformation of the structure;

(2) the acceptance criteria are to ensure a suitable margin against fracture and major buckling and yielding causing significant loss of stiffness;

(3) permanent lateral and out-of plane deformation of considered member are to be minor relative to the relevant structural dimensions;

(4) detailed acceptance criteria to be decided by ISC.

13.2.18 Welding

13.2.18.1 All welding within ice-strengthened areas is to be of the double continuous type.

13.2.18.2 Continuity of strength is to be ensured at all structural connections.

Section 3 MACHINERY INSTALLATIONS

13.3.1 General requirements

13.3.1.1 The contents of this Section apply to main propulsion, steering gear, emergency and auxiliary systems essential for the safety of the ship and the crew.

13.3.1.2 Systems subject to damage by freezing, shall be drainable.

13.3.1.3 Vessels classed PC1 to PC5 inclusive shall have means provided to ensure sufficient vessel operation in the case of propeller damage including the Controllable Pitch (CP) mechanism. Sufficient vessel operation means that the vessel should be able to reach safe haven (safe location) where repairs can be undertaken. This may be achieved either by a temporary repair at sea, or by towing, assuming assistance is available.

13.3.1.4 Means shall be provided to free a stuck propeller by turning it in reverse direction. This shall also be possible for a propulsion plant intended for unidirectional rotation.

13.3.1.5 The propeller shall be fully submerged at the ship's LIWL.

13.3.2 Drawings and particulars to be submitted

13.3.2.1 Details of the intended environmental operational conditions and the required ice strengthening for the machinery, if different from ship's ice class.

13.3.2.2 Detailed drawings and descriptions of the main propulsion, steering, emergency and auxiliary machinery and information on the essential main propulsion load control functions. The descriptions are to include operational limitations.

13.3.2.3 Description detailing where main, emergency and auxiliary systems are located and how they are protected to prevent problems from freezing, ice and snow accumulation and evidence of their capability to operate in the intended environmental conditions.

13.3.2.4 Calculations and documentation indicating compliance with the requirements of this Section.

13.3.3 Materials

13.3.3.1 Materials shall be of an approved ductile material. Ferritic nodular cast iron may be used for parts other than bolts. For nodular cast iron an averaged impact energy value of 10 J at testing temperature is regarded as equivalent to the Charpy V test requirements defined below.

13.3.3.2 Materials exposed to sea water

Materials exposed to sea water, such as propeller blades, propeller hubs and cast thruster bodies shall have an elongation not less than 15% on a test specimen according to ISC Rules for Materials and Welding.

Charpy V-notch impact testing is to be carried out for materials other than bronze and austenitic steel. The

tests shall be carried out on three specimens at minus 10 ºC, and the average energy value is to be not less than 20 J. However, Charpy V impact test requirements of ISC Rules for Materials and Welding as applicable for ships with ice class notation, shall also be applied.

13.3.3.3 Materials exposed to sea water temperature

Charpy V-notch impact testing is to be carried out for materials other than bronze and austenitic steel. The tests shall be carried out on three specimens at minus 10 ºC, and the average energy value is to be not less than 20 J. However, the Charpy V impact test requirements of ISC Rules for Materials and Welding as applicable for ships with ice class notation, shall also be applied.

This requirement applies to components such as but not limited to blade bolts, CP mechanisms, shaft bolts, propeller shaft, strut-pod connecting bolts, etc. This requirement does not apply to surface hardened components, such as bearings and gear teeth or sea water cooling lines (heat exchangers, pipes, valves, fittings etc.).

For a definition of structural boundaries exposed to sea water temperature see Figure 13.2.12.3, Section 2 of this Chapter.

13.3.3.4 Material exposed to low air temperature

Materials of exposed machinery and foundations shall be manufactured from steel or other approved ductile material. An average impact energy value of 20 J taken from three Charpy V tests is to be obtained at 10 ºC below the lowest design temperature. Charpy V impact tests are not required for bronze and austenitic steel. This requirement does not apply to surface hardened components, such as bearings and gear teeth.

For a definition of structural boundaries exposed to air temperature see Figure 13.2.12.3, Section 2 of this Chapter.

13.3.4 Definition of main parameters and loads

13.3.4.1 The symbols, names, and units of parameters used in this Section are as follows:

c —— chord length of blade section, m;

$c_{0.7}$ —— chord length of blade section at 0.7R propeller radius, in m;

$c_{LE0.8}$ ——leading edge portion of chord length of blade section at 0.8R propeller radius, in m;

$c_{TE0.8}$ ——trailing edge portion of chord length of blade section at 0.8R propeller radius, in m;

D —— propeller diameter, in m;

d —— external diameter of propeller hub (at propeller plane), in m;

D_{pin} —— diameter of shear pin, in m;

D_{limit} —— limit value for propeller diameter, in m;

EAR —— expanded blade area ratio;

F_b —— maximum backward blade force for the ship's service life (negative sign), in kN;

F_{ex} —— ultimate blade load resulting from blade failure through plastic bending, abbreviated as blade failure load, in kN;

F_f —— maximum forward blade force for the ship's service life (positive sign), in kN;

F_{ice} —— ice load, in kN;

$(F_{ice})_{max}$—— maximum ice load for the ship's service life , in kN;

h_0 —— depth of the propeller centreline from lower ice waterline (LIWL), in m;

H_{ice} —— ice block dimension for propeller load definition, in m;

I —— equivalent mass moment of inertia of all parts on engine side of component under consideration , in kgm^2;

I_t —— equivalent mass moment of inertia of the whole propulsion system, in kgm^2;

$LIWL$ —— lower ice waterline, in m;

m —— slope for S-N curve in log/log scale;

M_{BL} —— blade bending moment, in kNm;

n —— propeller rotational speed, in r/s;

n_n —— nominal propeller rotational speed at MCR in free running condition, in r/s;

N —— number of ice load cycles;

N_{class} —— reference number of ice impacts per propeller revolution per ice class;

N_{ice} —— total number of ice load cycles on propeller blade for the ship's service life;

N_R —— reference number of ice load cycles for equivalent fatigue stress (10^8 cycles);

N_Q —— number of propeller revolutions during a milling sequence;

$P_{0.7}$ —— propeller pitch at 0.7R radius, in m;

$P_{0.7n}$ —— propeller pitch at 0.7R radius at MCR in free running condition, in m;

$P_{0.7b}$ —— propeller pitch at 0.7R radius at MCR in bollard condition, in m;

PCD —— pitch circle diameter, in m;

$Q(\varphi)$ —— torque, in kNm;

Q_{Amax} —— maximum response torque amplitude as a simulation result, in kNm;

Q_{emax} —— maximum engine torque, in kNm;

$Q_{F}(\varphi)$ —— Ice torque excitation for frequency domain calculations, in kNm;

Q_{fr} —— friction torque in pitching mechanism; reduction of spindle torque, in kNm;

Q_{max} —— maximum torque on the propeller resulting from propeller/ice interaction , in kNm;

Q_{motor} —— electric motor peak torque, in kNm;

Q_n —— nominal torque at MCR in free running condition, in kNm;

$Q_r(t)$ —— response torque along the propeller shaft line, in kNm;

Q_{peak} —— maximum of the response torque $Q_r(t)$, in kNm;

Q_{smax} —— maximum spindle torque of the blade for the ship's service life, in kNm;

Q_{sex} —— extreme spindle torque corresponding to the blade failure load F_{ex}, in kNm;

Q_{vib} —— Vibratory torque at considered component, taken from frequency domain open water TVC, in kNm;

r —— blade section radius, in m;

R —— propeller radius, in m;

$R_{p0.2}$ —— yield strength of the selected material (when the plastic strain is 0.2%), in MPa, to be selected according to ISC Rules for Materials and Welding;

R_m —— tensile strength of blade material, in MPa, to be selected according to ISC Rules for Materials and Welding;

S —— safety factor;

S_{fat} —— Safety factor for fatigue;

S_{ice} —— Ice strength index for blade ice force;

T —— Hydrodynamic propeller thrust in bollard condition, in kN;

T_b —— maximum backward propeller ice thrust for the ship's service life, in kN;

T_f —— maximum forward propeller ice thrust for the ship's service life, in kN;

T_n —— propeller thrust at MCR in free running condition, in kN;

T_r —— maximum response thrust along the shaft line, in kN;

T_{kmax} —— maximum torque capacity of flexible coupling, in kNm;

T_{kmax2} —— T_{kmax} at N= 1 load cycle, in kNm;

T_{kmax1} —— T_{kmax} at N= 5×10^4 load cycles, in kNm;

T_{kv} —— vibratory torque amplitude at N= 10^6 load cycles, in kNm;

ΔT_{kmax} —— maximum range of T_{kmax} at N=5×10^4 load cycles, in kNm;

t —— maximum blade section thickness, in m;

Z —— number of propeller blades;

z_{pin} —— number of shear pins;

α_i —— duration of propeller blade/ice interaction expressed in rotation angle, in ° ;

α_1 —— phase angle of the blade order excitation component for the propeller ice torque, in ° ;

α_2 —— phase angle of the blade order excitation component for the propeller ice torque, in ° ;

γ_ε —— the reduction factor for fatigue; scatter and test specimen size effect;

γ_v —— the reduction factor for fatigue; variable amplitude loading effect;

γ_m —— the reduction factor for fatigue; mean stress effect;

ρ —— a reduction factor for fatigue correlating the maximum stress amplitude to the equivalent fatigue stress for 10^8 stress cycles;

σ_{exp} —— mean fatigue strength of blade material at 10^8 cycles to failure in sea water, in MPa;

σ_{fat} —— equivalent fatigue ice load stress amplitude for 10^8 stress cycles, in MPa;

σ_{fl} —— characteristic fatigue strength for blade material, in MPa;

σ_{ref1} —— reference stress, $\sigma_{ref1} = 0.6 \cdot R_{p0.2} + 0.4 \cdot R_m$, in MPa;

σ_{ref2} —— reference stress, $\sigma_{ref2} = 0.7 \cdot R_m$ or $\sigma_{ref2} = 0.6 \cdot R_{p0.2} + 0.4 \cdot R_m$, whichever is less, in MPa;

σ_{st} —— maximum stress resulting from F_b or F_f, in MPa;

$(\sigma_{ice})_{bmax}$—— principal stress caused by the maximum backward propeller ice load, in MPa;

$(\sigma_{ice})_{fmax}$—— principal stress caused by the maximum forward propeller ice load, in MPa;

$(\sigma_{ice})_{Amax}$—— maximum ice load stress amplitude at the considered location on the blade, in MPa;

σ_{mean} —— mean stress, in MPa;

$(\sigma_{ice})_A(N)$—— blade stress amplitude distribution, in MPa.

13.3.4.2 The definition and use of loads used in this Section are given in Table 13.3.4.2:

Definition and use of loads **Table 13.3.4.2**

Load	Definition	Use of the load in design process
F_b	The maximum lifetime backward force on a propeller blade resulting from propeller/ice interaction, including hydrodynamic loads on that blade. The direction of the force is perpendicular to 0.7R chord line. Ice contact pressure at leading edge is shown with small arrows. See Figure 13.3.4.2.	Design force for strength calculation of the propeller blade.
F_f	The maximum lifetime forward force on a propeller blade resulting from propeller/ice interaction, including hydrodynamic loads on that blade. The direction of the force is perpendicular to 0.7R chord line.	Design force for calculation of strength of the propeller blade.
Q_{smax}	The maximum lifetime spindle torque on a propeller blade resulting from propeller/ice interaction, including hydrodynamic loads on that blade.	In designing the propeller strength, the spindle torque is automatically taken into account because the propeller load is acting on the blade as distributed pressure on the leading edge or tip area.
T_b	The maximum lifetime thrust on propeller (all blades) resulting from propeller/ice interaction. The direction of the thrust is the propeller shaft direction and the force is opposite to the hydrodynamic thrust.	Is used for estimation of the response thrust T_r. T_b can be used as an estimate of excitation for axial vibration calculations. However, axial vibration calculations are not required in the rules.

Load	Definition	Use of the load in design process
T_f	The maximum lifetime thrust on propeller (all blades) resulting from propeller/ice interaction. The direction of the thrust is the propeller shaft direction acting in the direction of hydrodynamic thrust.	Is used for estimation of the response thrust T_r. T_f can be used as an estimate of excitation for axial vibration calculations. However, axial vibration calculations are not required in the rules.
Q_{max}	The maximum ice-induced torque resulting from propeller/ice interaction on one propeller blade, including hydrodynamic loads on that blade.	Is used for estimation of the response torque Q_r along the propulsion shaft line and as excitation for torsional vibration calculations.
F_{ex}	Ultimate blade load resulting from blade loss through plastic bending. The force that is needed to cause total failure of the blade so that plastic hinge is caused to the root area. The force is acting on 0.8R.	Blade failure load is used to dimension the blade bolts, pitch control mechanism, propeller shaft, propeller shaft bearing and trust bearing. The objective is to guarantee that total propeller blade failure should not cause damage to other components.
Q_{sex}	Maximum spindle torque resulting from blade failure load	Is used to ensure pyramid strength principle for the pitching mechanism
Q_r	Maximum response torque along the propeller shaft line, taking into account the dynamic behaviour of the shaft line for ice excitation (torsional vibration) and hydrodynamic mean torque on propeller.	Design torque for propeller shaft line components.
T_r	Maximum response thrust along shaft line, taking into account the dynamic behaviour of the shaft line for ice excitation (axial vibration) and hydrodynamic mean thrust on propeller.	Design thrust for propeller shaft line components.

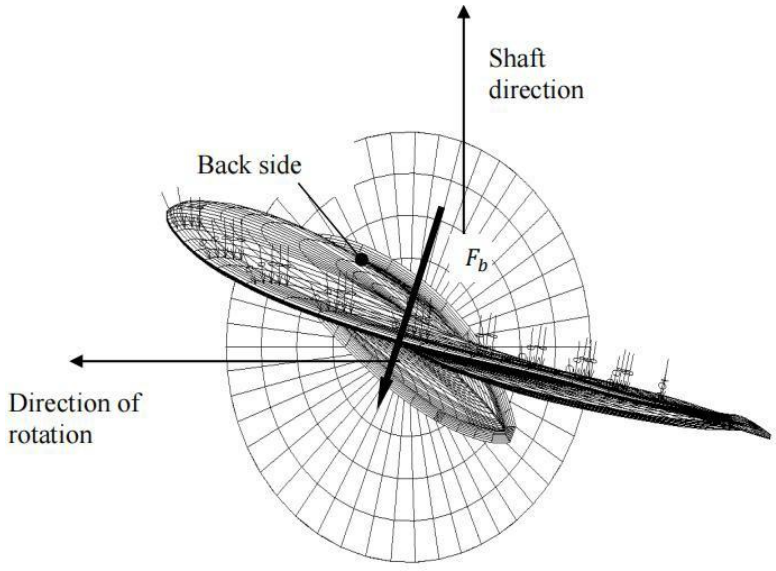

Figure 13.3.4.2 Direction of the backward blade force

13.3.5 Ice interaction loads

13.3.5.1 Propeller/ice interaction

These Rules cover open and ducted type propellers situated at the stern of a vessel having controllable pitch or fixed pitch blades. Ice loads on bow-mounted propellers shall receive special consideration. The given loads are expected, single occurrence, maximum values for the whole ship's service life for normal operational conditions, including loads resulting from directional change of rotation where applicable. These loads do not cover off-design operational conditions, for example when a stopped propeller is dragged through ice. These Rules also cover loads due to propeller ice interaction for azimuthing and fixed thrusters with geared transmission or an integrated electric motor ("geared and podded propulsors"). However, the load models of the regulations do not include propeller/ice interaction loads when ice enters

the propeller of a turned azimuthing thruster from the side (radially) or loads when ice blocks hit on the propeller hub of a pulling propeller. Ice loads resulting from ice impacts on the body of thrusters shall be estimated on a case by case basis, however are not included within the following section.
The loads given in section 13.3.5 are total loads including ice-induced loads and hydrodynamic loads (unless otherwise stated) during ice interaction and are to be applied separately (unless otherwise stated) and are intended for component strength calculations only.
F_b is the maximum force experienced during the lifetime of the ship that bends a propeller blade backwards when the propeller mills an ice block while rotating ahead.
F_f is the maximum force experienced during the lifetime of the ship that bends a propeller blade forwards when the propeller mills an ice block while rotating ahead.

13.3.5.2 Ice class factors

The dimensions of the considered design ice block are $H_{ice} \times 2H_{ice} \times 3H_{ice}$. The design ice block H_{ice} and ice strength index S_{ice} used for the estimation of propeller ice loads are defined for each Ice class in Table 13.3.5.2 below.

Design ice block and ice strength index **Table 13.3.5.2**

Ice class	H_{ice}[m]	S_{ice}[−]
PC1	4.0	1.2
PC2	3.5	1.1
PC3	3.0	1.1
PC4	2.5	1.1
PC5	2.0	1.1
PC6	1.75	1
PC7	1.5	1

13.3.5.3 Design ice loads for open propellers

(1) Maximum backward blade force F_b

when $D<D_{limit}$:

$$F_b = -27 S_{ice} \left(\frac{EAR}{Z} \right)^{0.3} (nD)^{0.7} D^2 \qquad \text{kN}$$

when $D \geq D_{limit}$:

$$F_b = -23 S_{ice} \left(\frac{EAR}{Z} \right)^{0.3} (nD)^{0.7} H_{ice}^{1.4} D \qquad \text{kN}$$

where: $D_{limit} = 0.85 H_{ice}^{1.4}$;

S_{ice} and H_{ice} are selected in accordance with Table 13.3.5.2;

n —— the nominal rotational speed at MCR in the free running open water condition for CP-propellers and 85% of the nominal rotational speed (at MCR free running condition) for a FP-propeller (regardless driving engine type), in r/s.

For vessels with the additional notation Icebreaker, the above stated backward blade force F_b shall be multiplied by a factor of 1.1.

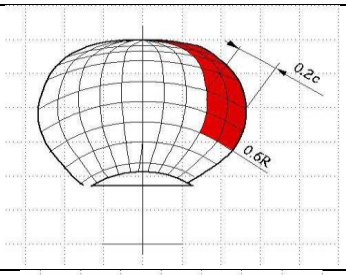
(2) Maximum forward blade force F_f

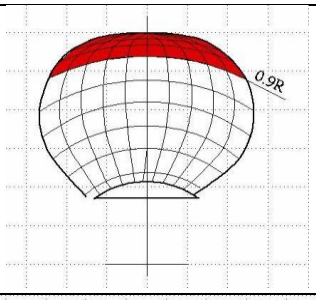
when $D<D_{limit}$:

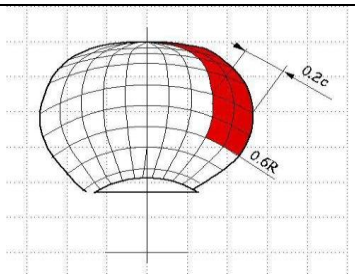
$$F_f = 250 \frac{EAR}{Z} D^2 \qquad \text{kN}$$

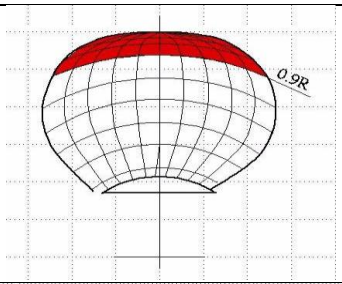
when $D \geq D_{limit}$:

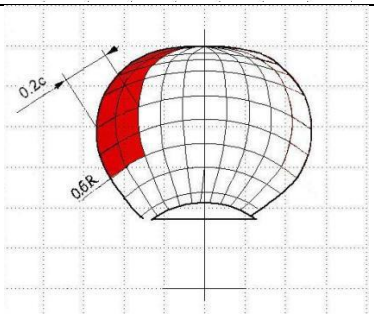
$$F_f = 500 \left(\frac{1}{1 - \frac{d}{D}} \right) H_{ice} \frac{EAR}{Z} D \qquad \text{kN}$$











where: $D_{limit} = \left(\frac{2}{1 - \frac{d}{D}} \right) H_{ice}$, in m;

H_{ice} is selected in accordance with Table 13.3.5.2;

(3) Load cases

Load cases 1-4 shall be covered, as given in Table 13.3.5.3(3), for CP and FP propellers. In order to obtain blade ice loads for a reversing propeller, load case 5 shall also be covered for propellers where reversing is possible.

Load cases for open propellers **Table 13.3.5.3(3)**

Load case	Force	Loaded area	Right-handed propeller blade seen from behind
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from 0.6*R* to the tip and from the leading edge to 0.2 times the chord length.	
Load case 2	50 % F_b	Uniform pressure applied on the back of the blade (suction side) on the propeller tip area outside 0.9*R* radius.	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0.6*R* to the tip and from the leading edge to 0.2 times the chord length.	
Load case 4	50%F_f	Uniform pressure applied on propeller face (pressure side) on the propeller tip area outside 0.9*R* radius.	
Load case 5	60%F_f or 60%F_b, whichever is greater	Uniform pressure applied on propeller face (pressure side) to an area from 0.6*R* to the tip and from the trailing edge to 0.2 times the chord length	

13.3.5.4 Design ice loads for ducted propellers

(1) Maximum backward blade force F_b

when $D < D_{limit}$:

$$F_b = -9.5 S_{ice} \left(\frac{EAR}{Z} \right)^{0.3} (nD)^{0.7} D^2 \quad \text{kN}$$

when $D \geq D_{limit}$:

$$F_b = -66 S_{ice} \left(\frac{EAR}{Z} \right)^{0.3} (nD)^{0.7} H_{ice}^{1.4} D^{0.6} \quad \text{kN}$$

where: D_{limit} = 4 H_{ice}, in m;

S_{ice} and H_{ice} are selected in accordance with Table 13.3.5.2;

n is the same as 13.3.5.3(1).

For vessels with the additional notation Icebreaker, the above stated backward blade force F_b shall be multiplied by a factor of 1.1.

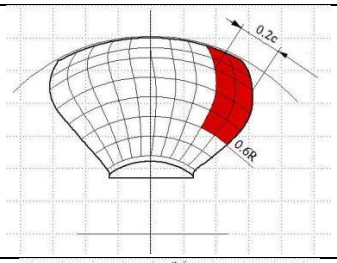
(2) Maximum forward blade force F_f

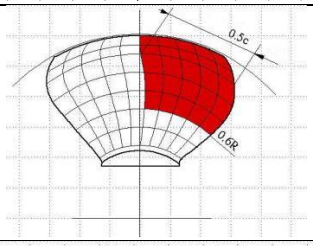
when $D < D_{limit}$:

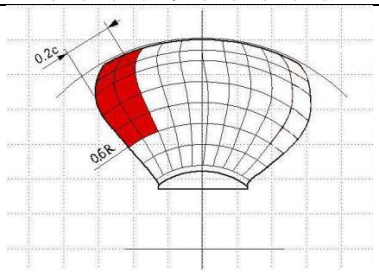
$$F_f = 250 \frac{EAR}{Z} D^2 \qquad \text{kN}$$

when $D \geq D_{limit}$:

$$F_f = 500 \left(\frac{1}{1 - \frac{d}{D}} \right) H_{ice} \frac{EAR}{Z} D \qquad \text{kN}$$







where: $D_{limit} = \left(\frac{2}{1 - \frac{d}{D}} \right) H_{ice}$, in m;

H_{ice} is selected in accordance with Table 13.3.5.2;

(3) Load case

Load cases 1 and 3 shall be covered as given in Table 13.3.5.4(3) for all propellers. In order to obtain blade ice loads for a reversing propeller, load case 5 shall also be covered for propellers, where reversing is possible.

Load cases for ducted propellers **Table 13.3.5.4(3)**

Load case	Force	Loaded area	Right-handed propeller blade seen from behind
Load case 1	F_b	Uniform pressure applied on the back of the blade (suction side) to an area from 0.6*R* to the tip and from the leading edge to 0.2 times the chord length.	
Load case 3	F_f	Uniform pressure applied on the blade face (pressure side) to an area from 0.6*R* to the tip and from the leading edge to 0.5 times the chord length.	
Load case 5	60%F_f or 60%F_b, whichever is greater	Uniform pressure applied on propeller face (pressure side) to an area from 0.6*R* to the tip and from the trailing edge to 0.2 times the chord length.	

13.3.5.5 Design ice loads for both open and ducted propellers

(1) Maximum blade spindle torque Q_{smax} for CP mechanism designing

The spindle torque Q_{smax} around the axis of the blade fitting shall be determined both for the maximum backward blade force F_b and forward blade force F_f, which are applied as per Table 13.3.5.3(3) and Table 13.3.5.4(3). If the above method gives a value which is less than the default value given by the formula below, the default value shall be used.

$$Q_{smax} = 0.25Fc_{0.7} \qquad \text{kNm}$$

where: F is taken as either F_b or F_f, whichever has the greater absolute value.

The blade failure spindle torque Q_{sex} is defined under 13.3.5.6.

(2) Load distributions (spectra) for blade loads

The Weibull-type distribution (probability that F_{ice} exceeds $(F_{ice})_{max}$), as given in Figure 13.3.5.5(2) is used for the fatigue design of the blade.

$$P\left(\frac{F_{ice}}{(F_{ice})_{\max}} \geqslant \frac{F}{(F_{ice})_{\max}}\right) = e^{\left(-\left(\frac{F}{(F_{ice})_{\max}}\right)^{k} \ln(N_{ice})\right)}$$

where: k —shape parameter of the spectrum, for open propeller, k=0.75; for ducted propeller, k=1.0;

N_{ice} —number of load cycles in the spectrum, see 13.3.5.5(3);

F_{ice} —random variable for ice loads on the blade, $0 \leq F_{ice} \leq (F_{ice})_{max}$.

This results in a blade stress amplitude distribution:

$$(\sigma_{ice})_A(N) = (\sigma_{ice})_{A\max}\left\{1 - \frac{\log(N)}{\log(N_{ice})}\right\}^{\frac{1}{k}}$$

where: $(\sigma_{ice})_{A\max} = \dfrac{(\sigma_{ice})_{f\max} - (\sigma_{ice})_{b\max}}{2}$.

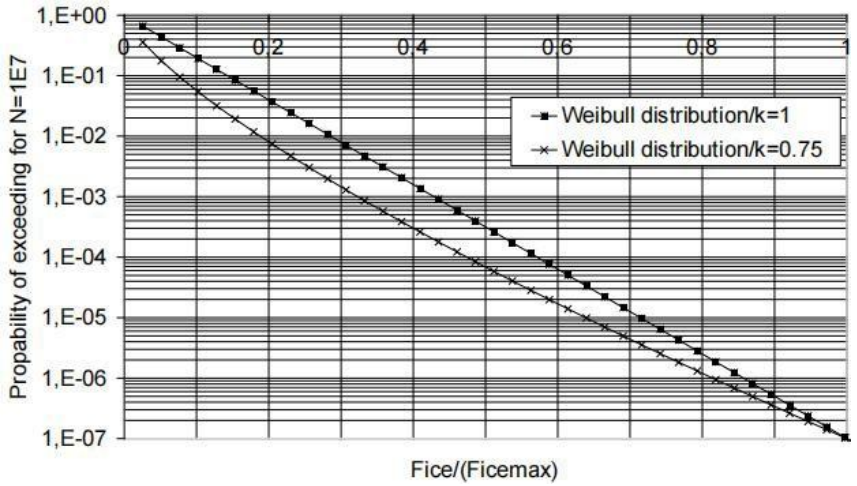


Figure 13.3.5.5(2) The Weibull-type distribution (probability of exceedance) that is used for fatigue design

(3) Number of ice loads

Number of load cycles in the load spectrum per blade is to be determined according to the formula:

$$N_{ice} = k_1 k_2 N_{class} n$$

where: N_{class} — reference number of impacts per propeller revolution for each ice class (Table 13.3.5.5(3));

k_1 — propeller position coefficient, to be taken as 1 for centre propeller; 2 for wing propeller; 3 for pulling propeller (wing and centre);

k_2 — immersion coefficient, to be determined as follows:

when $f < 0$, $k_2 = 0.8 - f$;

when $0 \leqslant f \leqslant 1$, $k_2 = 0.8 - 0.4f$;

when $1 < f \leqslant 2.5$, $k_2 = 0.6 - 0.2f$;

when $f > 2.5$, $k_2 = 0.1$;

where: $f = \dfrac{h_0 - H_{ice}}{D/2} - 1$, if h_0 is not known, h_0 may be taken as *D/2*.

k_3 — thruster type coefficient, to be taken as 1 for fixed thrusters and 1.2 for azimuthing thrusters;

For vessels with the additional notation Icebreaker, the above stated number of load cycles N_{ice} shall be multiplied by a factor of 3.

For components that are subject to loads resulting from propeller/ice interaction with all the propeller blades, the number of load cycles (N_{ice}) is to be multiplied by the number of propeller blades (Z).

Reference number of impacts **Table 13.3.5.5(3)**

Ice class	PC1	PC2	PC3	PC4	PC5	PC6	PC7
N_{class}	21×10^6	17×10^6	15×10^6	13×10^6	11×10^6	9×10^6	6×10^6

13.3.5.6 Blade failure load for both open and ducted Propellers

(1) Bending force F_{ex}

The minimum load required resulting in blade failure through plastic bending. This shall be calculated iteratively along the radius of the blade from blade root to 0.5*R* using the equation below with the ultimate load assumed to be acting at 0.8*R* in the weakest direction.

$$F_{ex} = \frac{0.3ct^2\sigma_{ref1}}{0.8D - 2r} \times 10^3 \qquad \text{kN}$$

where:c, t and r are respectively the actual chord length, maximum thickness and radius of the cylindrical root section of the blade, which is the weakest section outside the root fillet located typically at the termination of the fillet into the blade profile.

The failure load may be calculated alternatively by means of an appropriate stress analysis reflecting the non-linear plastic material behaviour of the actual blade. A blade is regarded as having failed, if the tip is bent by more than 10% of the propeller diameter.

(2) Spindle torque Q_{sex}

The maximum spindle torque due to a blade failure load acting at 0.8R shall be determined.

The force that causes blade failure typically reduces when moving from the propeller centre towards the leading and trailing edges. At a certain distance from the blade centre of rotation the maximum spindle torque will occur. This maximum spindle torque shall be defined by an appropriate stress analysis or using equation below.

$$Q_{sex} = \max(c_{LE0.8}, 0.8c_{TE0.8}) C_{spex} F_{ex}$$

where: $C_{spex} = C_{sp} C_{fex} = 0.7\left[1 - \left(4\frac{EAR}{Z}\right)^3\right]$, to be taken not less than 0.3;

C_{sp} —non-dimensional parameter taking into account the spindle arm;

C_{fex} —non-dimensional parameter taking into account the reduction of blade failure force at the location of maximum spindle torque;

Figure 13.3.5.6(2) illustrates the spindle torque values due to blade failure loads across the whole chord length.

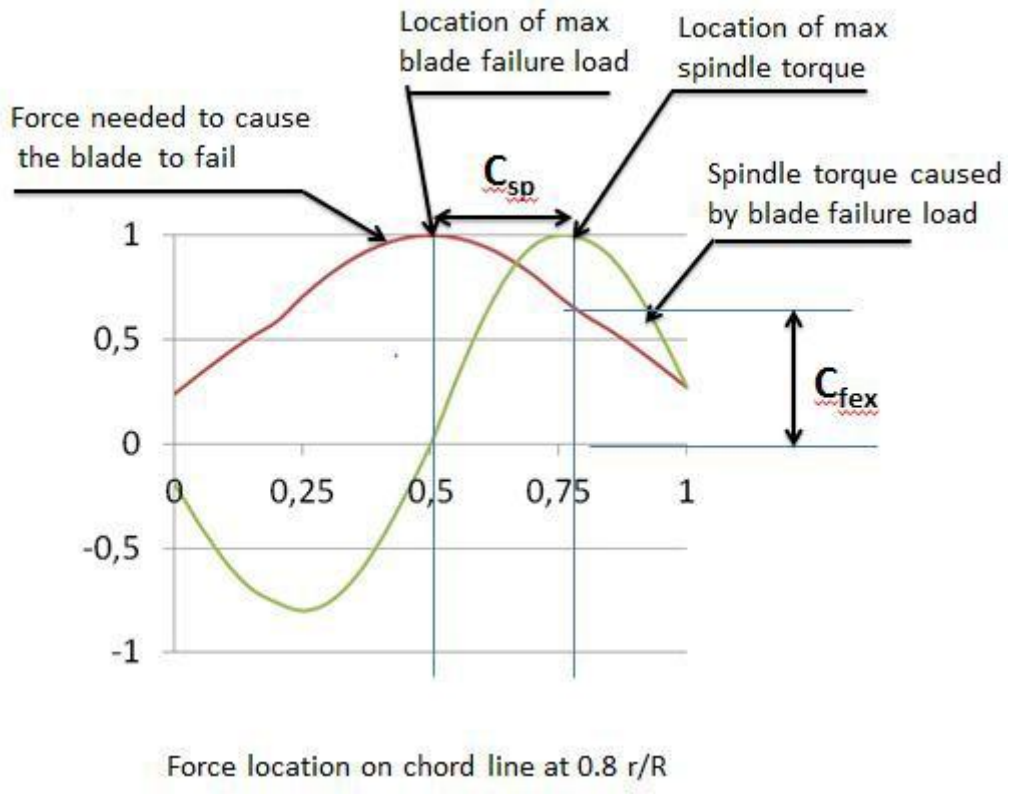

Figure 13.3.5.6(2) Schematic figure showing blade failure load and related spindle torque when the force acts at different location on the chord line at radius 0.8R

13.3.5.7 Axial design loads acting on open and ducted propellers

(1) Maximum ice thrust on propeller

Forward thrust T_f:

$$T_f = 1.1F_f \qquad \text{kN}$$

Backward thrust T_b:

$$T_b = 1.1F_b \qquad \text{kN}$$

However, the load models within this Section do not include propeller/ice interaction loads where an ice block hits the propeller hub of a pulling propeller.

(2) Design thrust along the propulsion shaft line for propellers

The design thrust along the propeller shaft line is to be calculated with the formulae below. The greater value of the forward and backward directional load shall be taken as the design load for both directions. The factors 2.2 and 1.5 take into account the dynamic magnification resulting from axial vibration.

In a forward direction:

$$T_r = T + 2.2T_f \qquad \text{kN}$$

In a backward direction:

$$T_r = 1.5T_b \qquad \text{kN}$$

If the hydrodynamic bollard thrust, T, is not known, T is to be taken as follows:

Value of T **Table 13.3.5.7(2)**

Propeller type	***T***
CP propellers (open)	$1.25T_n$
CP propellers (ducted)	$1.1\ T_n$
FP propellers driven by turbine or electric motor	T_n
FP propellers driven by diesel engine (open)	$0.85\ T_n$
FP propellers driven by diesel engine (ducted)	$0.75\ T_n$

Note: T_n is the nominal propeller thrust at MCR in the free running open water condition, in kN.

For pulling type propellers ice interaction loads on propeller hub must be considered in addition to the above. These will be specially considered by ISC.

13.3.5.8 Torsional design loads acting on open and ducted propellers

(1) Design ice torque on propeller for open propellers

when $D < D_{limit}$:

$$Q_{\max} = k_{open}\left(1-\frac{d}{D}\right)\left(\frac{P_{0.7}}{D}\right)^{0.16}(nD)^{0.17}D^3 \qquad \text{kNm}$$

when $D \geq D_{limit}$:

$$Q_{\max} = 1.9k_{open}H_{ice}^{1.1}\left(1-\frac{d}{D}\right)\left(\frac{P_{0.7}}{D}\right)^{0.16}(nD)^{0.17}D^{1.9} \qquad \text{kNm}$$

where: $D_{limit} = 1.8\ H_{ice}$, in m;

H_{ice} is selected in accordance with Table 13.3.5.2;

k_{open} ——14.7 for PC1~PC5; 10.9 for PC6~PC7;

$P_{0.7}$ ——propeller pitch at 0.7R, in m; (For CP propellers, $P_{0.7}=P_{0.7b}$; if $P_{0.7b}$ is not known, $P_{0.7}=0.7P_{0.7n}$)

n —— the rotational propeller speed in r/s in bollard condition. If not known, n is to be taken as follows:

Value of *n* **Table 13.3.5.8(1)**

Propeller type	*n*
CP propellers	n_n
FP propellers driven by turbine or electric motor	n_n
FP propeller driven by diesel engine	$0.85n_n$

Note: n_n is the nominal propeller rotational speed at MCR in the free running open water condition, in r/s.

(2) Design ice torque on propeller for ducted propellers

when $D<D_{limit}$:

$$Q_{\max} = k_{ducted}\left(1-\frac{d}{D}\right)\left(\frac{P_{0.7}}{D}\right)^{0.16}(nD)^{0.17}D^3 \qquad \text{kNm}$$

when $D\geq D_{limit}$:

$$Q_{\max} = 1.9k_{ducted}H_{ice}^{1.1}\left(1-\frac{d}{D}\right)\left(\frac{P_{0.7}}{D}\right)^{0.16}(nD)^{0.17}D^{1.9} \qquad \text{kNm}$$

where: D_{limit} = 1.8 H_{ice}, in m;

H_{ice} is selected in accordance with Table 13.3.5.2;

k_{ducted} ——10.4 for PC1~PC5; 7.7 for PC6~PC7;

$P_{0.7}$ and n are selected in accordance with 13.3.5.8(1).

(3) Ice torque excitation for open and ducted propellers

The given excitations are used to estimate the maximum torque likely to be experienced once during the service life of the ship. The following load cases are intended to reflect the operational loads on the propulsion system when the propeller interacts with ice and the corresponding reaction of the complete system. The ice impact and system response cause loads in the individual shaft line components. The ice torque Q_{max} may be taken as a constant value in the complete speed range. When considerations at specific shaft speeds are performed a relevant Q_{max} may be calculated using the relevant speed.

Diesel engine plants without an elastic coupling shall be calculated at the least favourable phase angle for ice versus engine excitation, when calculated in time domain. The engine firing pulses shall be included in the calculations and their standard steady state harmonics can be used. A phase angle between ice and gas force excitation does not need to be regarded in frequency domain analysis. Misfiring does not need to be considered.

If there is a blade order resonance just above MCR speed, calculations shall cover the rotational speeds up to 105% of MCR speed.

See also Guidelines for calculations given in 13.3.5.9

① Excitation for the time domain calculation

The propeller ice torque excitation for shaft line transient dynamic analysis (time domain) is defined as a sequence of blade impacts which are of half sine shape and occur at the blade.

The torque due to a single blade ice impact as a function of the propeller rotation angle is then defined as:

when $\varphi = 0\ldots a_i$,

$$Q(\varphi) = C_q Q_{max} sin[\varphi(180/a_i)] \qquad \text{kNm}$$

when $\varphi = a_i\ldots 360$,

$$Q(\varphi) = 0 \qquad \text{kNm}$$

where: φ is rotation angle starting when the first impact occurs.

Parameters C_q and α_i for different blade numbers are given in Table 13.3.5.8(3)①.

Ice impact magnification C_q and duration α_i factors for different blade numbers

Table 13.3.5.8(3)①

Torque excitation	Propeller/ ice interaction	C_q	α_i (°)			
			Z=3	Z=4	Z=5	Z=6
Excitation case 1	Single ice block	0.75	90	90	72	60
Excitation case 2	Single ice block	1.0	135	135	135	135
Excitation case 3	Two ice blocks （phase shift=360°/(2Z)）	0.5	45	45	36	30
Excitation case 4	Single ice block	0.5	45	45	36	30

The total ice torque is obtained by summing the torque of single blades, taking into account the phase shift 360°/Z.

At the beginning and at the end of the milling sequence (within calculated duration) linear ramp functions shall be used to increase C_q to its maximum within one propeller revolution and vice versa to decrease it to zero (see Figure 13.3.5.8(3)①).

The number of propeller revolutions during a milling sequence shall be obtained from the formula:

$$N_Q = 2H_{ice}$$

The number of impacts for blade order excitation:

$$ZN_Q$$

where: H_{ice} is selected in accordance with Table 13.3.4.2.

An illustration of all excitation cases for different blade numbers is given in Figure 13.3.5.8(3)①.

The dynamic simulation shall be performed for all excitation cases starting at MCR nominal, MCR bollard condition and just above all resonance speeds (1st engine and 1st blade harmonic), so that the resonant vibration responses can be obtained. For a fixed pitch propeller plant the dynamic simulation shall also cover bollard pull condition with a corresponding speed assuming maximum possible output of the engine. If a speed drop occurs down to stand still of the main engine, it indicates that the engine may not be sufficiently powered for the intended service task. For the consideration of loads, the maximum occurring torque during the speed drop process shall be applied. On these cases, the excitation shall follow the shaft speed.

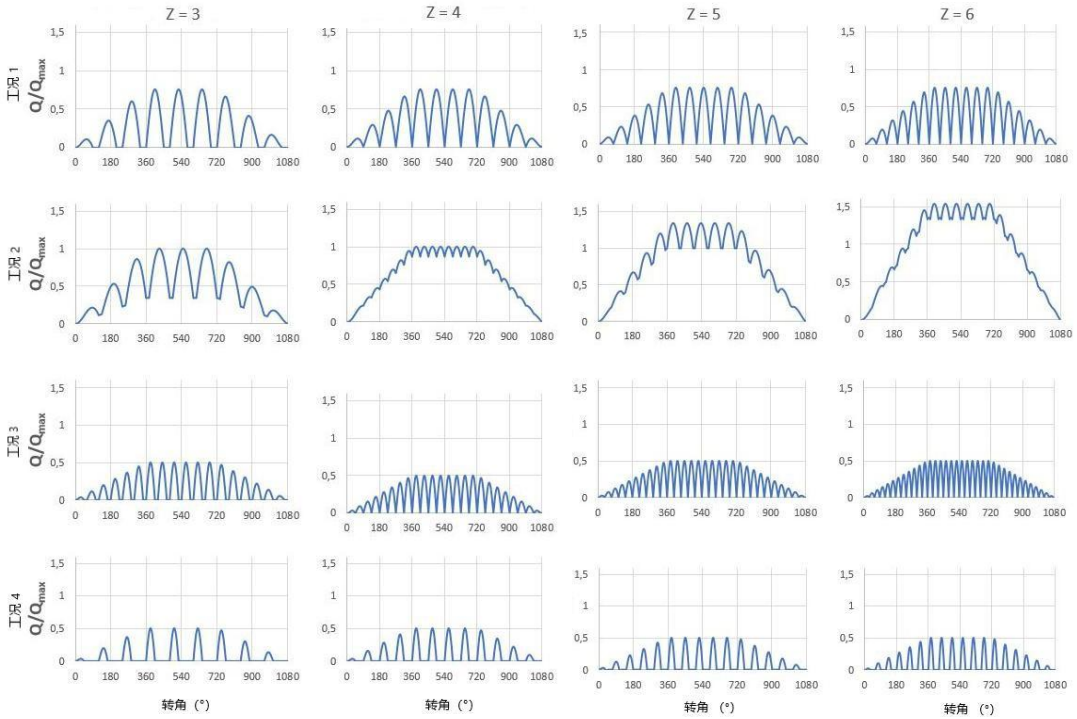

Figure 13.3.5.8(3)①　Ice block torque excitation cases for 3~6 blade propellers

② Frequency domain excitation

For frequency domain calculations the following torque excitation may be used. The excitation has been derived so that the time domain half sine impact sequences have been assumed to be continuous and the Fourier series components for blade order and twice the blade order components have been derived. The frequency domain analysis is generally considered as conservative compared to the time domain simulation provided there is a first blade order resonance in the considered speed range.

$$Q_F(\varphi) = Q_{\max} \cdot \left[C_{q0} + C_{q1} \cdot \sin\left(Z \cdot E_0 \cdot \varphi + \alpha_1\right) + C_{q2} \cdot \sin\left(2Z \cdot E_0 \cdot \varphi + \alpha_2\right) \right] \quad \text{kNm}$$

where: φ ——angle of rotation;

C_{q0} ——mean torque component;

C_{q1} ——first blade order excitation amplitude;

C_{q2} ——second blade order excitation amplitude;

E_0 ——Number of ice blocks simultaneously participating in the impact.

Coefficients for simplified excitation torque estimation are given in Table 13.3.5.8(3)②.

Coefficients for simplified excitation torque estimation **Table 13.3.5.8(3)②**

Torque excitation	Z=3					
	C_{q0}	C_{q1}	α_1	C_{q2}	α_2	E_0
Case 1	0.375	0.375	-90	0	0	1
Case 2	0.7	0.33	-90	0.05	-45	1
Case 3	0.25	0.25	-90	0	0	2
Case 4	0.2	0.25	0	0.05	-90	1
Torque excitation	Z=4					
	C_{q0}	C_{q1}	α_1	C_{q2}	α_2	E_0
Case 1	0.45	0.36	-90	0.06	-90	1
Case 2	0.9375	0	-90	0.0625	-90	1
Case 3	0.25	0.251	-90	0	0	2
Case 4	0.2	0.25	0	0.05	-90	1
Torque excitation	Z=5					
	C_{q0}	C_{q1}	α_1	C_{q2}	α_2	E_0
Case 1	0.45	0.36	-90	0.06	-90	1
Case 2	1.19	0.17	-90	0.02	-90	1
Case 3	0.3	0.25	-90	0.048	-90	2
Case 4	0.2	0.25	0	0.05	-90	1
Torque excitation	Z=6					
	C_{q0}	C_{q1}	α_1	C_{q2}	α_2	E_0
Case 1	0.45	0.375	-90	0.05	-90	1
Case 2	1.435	0.1	-90	0	0	1
Case 3	0.3	0.25	-90	0.048	-90	2
Case 4	0.2	0.25	0	0.05	-90	1

Torsional vibration responses shall be calculated for all excitation cases.

The results of the relevant excitation cases at the most critical rotational speeds are to be used in the following way:

The highest response torque (between the various lumped masses in the system) is in the following referred to as peak torque Q_{peak}, see Figure 13.3.5.8(3)②.

The highest torque amplitude during a sequence of impacts is to be determined as half of the range from max to min torque and is referred to as Q_{Amax}, see Figure 13.3.5.8(3)②.

Q_{Amax} can by determined by:

$$Q_{\text{Amax}} = \left[\max(Q_r(t)) - \min(Q_r(t))\right] / 2 \quad \text{kNm}$$

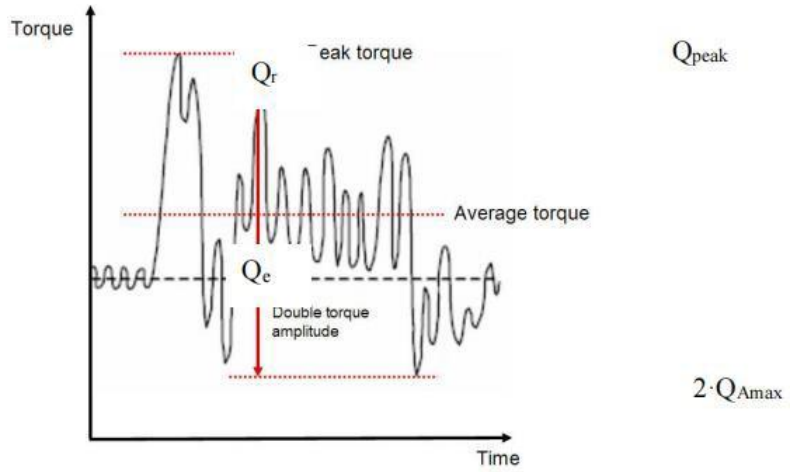

Figure 13.3.5.8(3)② Interpretation of different torques in a measured curve, as example

(4) Design torque along shaft line

① If there is no relevant first order propeller torsional resonance in the range 20% (of n_n) above and 20% below the maximum operating speed in bollard condition, the following estimation of the maximum response torque can be used to calculate the design torque along the propeller shaft line.

$$Q_r = Q_{e\max} + Q_{vib} + Q_{\max}\frac{I}{I_t} \qquad \text{kNm}$$

$$Q_r = Q_{e\max} + Q_{\max}\frac{I}{I_t} \qquad \text{kNm}$$

The above equation is to be applied for directly coupled two stroke Diesel engines without flexible coupling. For all other plants:

where: all the torques and the inertia moments shall be reduced to the rotation speed of the component being examined.

If the maximum torque Q_{emax} is not known, it shall be taken as follows:

Value of Q_{emax} **Table 13.3.5.9(1)**

Propeller type	Q_{emax}
Propellers driven by electric motor	Q_{motor}
CP propellers not driven by electric motor	Q_n
FP propellers driven by turbine	Q_n
FP propellers driven by diesel engine	$0.75Q_n$

Note: Q_{motor} is the electric motor peak torque.

② If there is a first blade order torsional resonance in the range 20% (of n_n) above and 20% below the maximum operating speed (bollard condition), the design torque (Q_r) of the shaft component shall be determined by means of a dynamic torsional vibration analysis of the entire propulsion line in the time domain or alternatively in the frequency domain. It is then assumed that the plant is sufficiently designed to avoid harmful operation in barred speed range.

13.3.5.9 Torsional vibration calculation

(1) The aim of torsional vibration calculations is to estimate the torsional loads for individual shaft line components over the life time in order to determine scantlings for safe operation. The model can be taken from the normal lumped mass elastic torsional vibration model (frequency domain) including the damping. Standard harmonics may be used to consider the gas forces. The engine torque - speed curve of the actual plant shall be applied.

(2) For time domain analysis the model should include the ice excitation at propeller, the mean torques

provided by the prime mover and the hydrodynamic mean torque produced by the propeller as well as any other relevant excitations. The calculations should cover the variation of phase between the ice excitation and prime mover excitation. This is extremely relevant for propulsion lines with direct driven combustion engines.
(3) For frequency domain calculations the load should be estimated as a Fourier component analysis of the continuous sequence of half sine load peaks. The first and second order blade components should be used for excitation. The calculation should cover the whole relevant shaft speed range. The analysis of the responses at the relevant torsional vibration resonances may be performed for open water (without ice excitation) and ice excitation separately. The resulting maximum torque can be obtained for directly coupled plants by the following superposition:

$$Q_{peak} = Q_{e\max} + Q_{opw} + Q_{ice} \qquad \text{kNm}$$

where: Q_{emax} ——the maximum engine torque at considered rotational speed;
Q_{opw} ——the maximum open water response of engine excitation at considered shaft speed and determined by frequency domain analysis;
Q_{ice} ——the calculated torque using frequency domain analysis for the relevant shaft speeds, ice excitation cases 1-4, resulting in the maximum response torque due to ice excitation.

13.3.6 Design

13.3.6.1 Design principle

The propulsion line shall be designed according to the pyramid strength principle in terms of its strength. This means that the loss of the propeller blade shall not cause any significant damage to other propeller shaft line components.

The propulsion line components shall withstand maximum and fatigue operational loads with the relevant safety margin. The loads do not need to be considered for shaft alignment or other calculations of normal operational conditions.

13.3.6.2 Fatigue design in general

The design loads shall be based on the ice excitation and where necessary (shafting) dynamic analysis, described as a sequence of blade impacts (13.3.5.8(3)①). The shaft response torque shall be determined according 13.3.5.8(4).

The propulsion line components are to be designed so as to prevent accumulated fatigue failure when considering the relevant loads using the linear elastic Miner's rule as defined below.

$$D_{mds} = \frac{n_1}{N_1} + \frac{n_2}{N_2} + \cdots + \frac{n_k}{N_k} \le 1 \qquad \text{or} \qquad D_{mds} = \sum_{J=1}^{j=k} \frac{n_j}{N_j} \le 1$$

where: k —— the number of stress levels;
$N_{1\ldots k}$——the number of load cycles to failure of the individual stress level class;
$n_{1\ldots k}$——the accumulated number of load cycles of the case under consideration, per class;
D_{mds}——Miners damage sum.

The stress distribution should be divided into a frequency load spectrum having minimum 10 stress blocks (every 10 % of the load). Calculation with 5 stress blocks has been found to be too conservative. The maximum allowable load is limited by σ_{ref2} for propeller blades and yield strength for all other components. The load distribution (spectrum) should be in accordance with the Weibull distribution.

13.3.6.3 Propeller blades

(1) Calculation of blade stresses due to static loads

The blade stresses (equivalent and principal stresses) shall be calculated for the design loads given in 13.3.5.3 and 13.3.5.4. Finite element analysis (FEA) shall be used for stress analysis as part of the final approval for all propeller blades. The von Mises stresses, taken as σ_{st}, shall comply with criteria in (2).

Alternatively, the following simplified equation can be used in estimating the blade stresses for all propellers in the root area (r/R < 0.5) for final approval.

$$\sigma_{st} = A_1 \frac{M_{BL}}{100 \times ct^2} \qquad \text{MPa}$$

where: constant A_1 is the $\frac{actual\ stress}{stress\ obtained\ with\ beam\ equation}$. If the actual value is not available, A_1 should be taken as 1.6. $M_{BL} = (0.75 - r/R)RF$, for relative radius r/R<0.5, where F is the maximum of F_b and F_f, whichever is greater.

(2) Acceptability criterion for static loads

The following criterion for calculated blade stresses shall be fulfilled:

$$\frac{\sigma_{ref\,2}}{\sigma_{st}} \geq 1.3$$

where:σ_{st} ——calculated stress for the design loads. If FE analysis is used in estimating the stresses, von Mises stresses shall be used.

(3) Fatigue design of propeller blade

For materials with a two slope S-N curve the fatigue calculations defined in this chapter are not required if the following criterion is fulfilled.

$$\sigma_{\exp} \geqslant B_1 \cdot \sigma_{ref\,2}^{B_2} \cdot \log\left(N_{ice}\right)^{B_3}$$

where: B_1, B_2 and B_3 are coefficients for propellers given in Table 13.3.6.2(3).

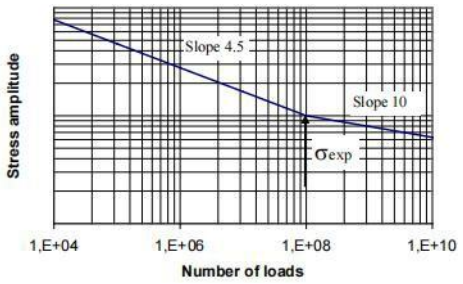
Value of B_1, B_2 and B_3 **Table 13.3.6.3(3)**

Coefficient	Open propeller	Ducted propeller
B_1	0.00328	0.00223
B_2	1.0076	1.0071
B_3	2.101	2.471

Where the above criterion is not fulfilled the fatigue requirements defined below shall be applied:

The fatigue design of the propeller blade is based on an estimated load distribution for the service life of the ship and the S-N curve for the blade material. An equivalent stress σ_{fat} that produces the same fatigue damage as the expected load distribution shall be calculated according to Miner's rule and the acceptability criterion for fatigue should be fulfilled as given in this section. The equivalent stress is normalised for 100 million cycles.

The blade stresses at various selected load levels for fatigue analysis are to be taken proportional to the stresses calculated for maximum loads given in section 13.3.5.



The peak principal stresses σ_f and σ_b are determined from F_f and F_b using FEA. The peak stress range $\Delta\sigma_{max}$ and the maximum stress amplitude σ_{Amax} are determined on the basis of load cases 1 and 3, 2 and 4.

$$\Delta\sigma_{\max} = 2 \cdot \sigma_{A\max} = \left|(\sigma_{ice})_{f\max}\right| + \left|(\sigma_{ice})_{b\max}\right| \qquad \text{MPa}$$

The load spectrum for backward loads is normally expected to have a lower number of cycles than the load spectrum for forward loads. Taking this into account in a fatigue analysis introduces complications that are not justified considering all uncertainties involved.

For the calculation of equivalent stress two types of S-N curves are available. Two slope S-N curve (slopes 4.5 and 10), see Figure 13.3.6.3(3)-1. One slope S-N curve (the slope can be chosen), see Figure 13.3.6.3(3)-2.

The type of the S-N-curve shall be selected to correspond with the material properties of the blade. If the S-N-curve is not known the two slope S-N curve shall be used.

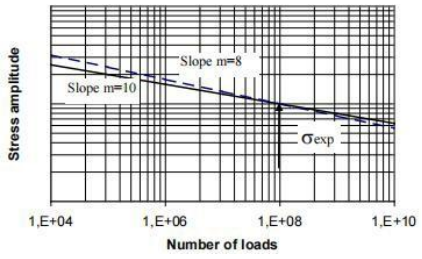


Figure 13.3.6.3(3)-1 Two-slope *S-N* curve **Figure 13.3.6.3(3)-2 Constant-slope *S-N* curve**

① Equivalent fatigue stress

A more general method of determining the equivalent fatigue stress of propeller blades is described in 13.3.6.5, where the principal stresses are considered according to 13.3.5.3 and 13.3.5.4 using the Miner's rule. For a total number of load blocks $n_{bl} > 100$, both methods deliver the same result. Therefore, they are regarded as equivalent.

The equivalent fatigue stress for 10^8 cycles which produces the same fatigue damage as the load distribution is:

$$\sigma_{fat} = \rho \cdot (\sigma_{ice})_{\max} \quad \text{MPa}$$

where:$(\sigma_{ice})_{\max}$ —— mean value of the principal stress amplitudes resulting from design forward and backward blade forces at the location being studied, to be determined as follows:

$$(\sigma_{ice})_{\max} = 0.5 \cdot \left((\sigma_{ice})_{f\max} - (\sigma_{ice})_{b\max} \right) \quad \text{MPa}$$

where: $(\sigma_{ice})_{f\max}$ is principal stress resulting from forward load, $(\sigma_{ice})_{b\max}$ is principal stress resulting from backward load.

In the calculation of $(\sigma_{ice})_{\max}$, case 1 and case 3 or case 2 and case 4 are considered as pairs for $(\sigma_{ice})_{f\max}$ and $(\sigma_{ice})_{b\max}$. Case 5 is excluded from the fatigue analysis.

② Calculation of parameter ρ for two-slope S-N curve

When $5 \times 10^6 \le N_{ice} \le 1 \times 10^8$, the error of the following method to determine the parameter ρ is sufficiently small.

The parameter ρ relates the maximum ice load to the distribution of ice loads according to the regression formula.

$$\rho = C_1 \cdot (\sigma_{ice})_{\max}^{C_2} \cdot \sigma_{fl}^{C_3} \cdot \log(N_{ice})^{C_4}$$

where: $\sigma_{fl} = \gamma_{\varepsilon 1} \cdot \gamma_{\varepsilon 2} \cdot \gamma_v \cdot \gamma_m \cdot \sigma_{exp}$, is the blade material fatigue strength at 10^8 load cycles, see 13.3.6.3(3)④.

The coefficients C_1, C_2, C_3 and C_4 are given in Table 13.3.6.3(3)②.

Value of C_1, C_2, C_3 and C_4 **Table 13.3.6.3(3)②**

Coefficient	Open propeller	Ducted propeller
C_1	0.000747	0.000534
C_2	0.0645	0.0533
C_3	−0.0565	−0.0459
C_4	2.22	2.584

③ Calculation of parameter ρ for constant-slope S-N curve

For materials with a constant-slope S-N curve, see Figure 13.3.6.3(3)-2, the factor ρ shall be calculated from the following formula:

$$\rho = \left(G \frac{N_{ice}}{N_R} \right)^{1/m} \left[\ln(N_{ice}) \right]^{-1/k}$$

where: k —— shape parameter of the Weibull distribution, k=1.0 for ducted propellers and k=0.75 for open propellers;

N_R —— reference number of load cycles (=10^8);

G —— Values for the parameter G are given in Table 13.3.6.3(3) ③ below. Linear interpolation may be used to calculate the value of G for m/k ratios other than those given in the Table 13.3.6.3(3)③.

Value for the parameter *G* for different m/k ratios **Table 13.3.6.3(3)③**

m/k	*G*	*m/k*	*G*	*m/k*	*G*	*m/k*	*G*
3	6	5.5	287.9	8	40320	10.5	11.899E6
3.5	11.6	6	720	8.5	119292	11	39.917E6
4	24	6.5	1871	9	362880	11.5	136.843E6
4.5	52.3	7	5040	9.5	1.133E6	12	479.002E6
5	120	7.5	14034	10	3.623E6		

④ Acceptability criterion for fatigue

The equivalent fatigue stress σ_{fat} at all locations on the blade shall fulfil the following acceptability criterion:

$$\frac{\sigma_{fl}}{\sigma_{fat}} \geqslant 1.5$$

where: $\sigma_{fl} = \gamma_{\varepsilon 1} \cdot \gamma_{\varepsilon 2} \cdot \gamma_v \cdot \gamma_m \cdot \sigma_{exp}$, in MPa;

$\gamma_{\varepsilon 1}$—— reduction factor due to scatter (equal to one standard deviation);

$\gamma_{\varepsilon 2}$ —— reduction factor for test specimen size effect;

σ_{exp} in Table 13.3.6.3(3)④ has been defined from the results of constant amplitude loading fatigue tests at 10^7 load cycles and 50% survival probability and has been extended to 10^8 load cycles. Fatigue strength values and correction factors other than those given in Table 13.3.6.3(3)④ may be used, provided the values are determined under conditions approved by ISC.

Mean fatigue strength σ_{exp} for different material types at 10^8 load cycles and stress ratio r = -1 with a survival probability of 50%

Table 13.3.6.3(3)④

Bronze and brass（a=1.0）		Stainless steel（a=0.05）	
Mn-Bronze, Cu1 (high tensile brass)	84 MPa	Ferritic (12Cr 1Ni)	144 MPa①
Mn-Ni-Bronze, Cu2 (high tensile brass)	84 MPa	Martensitic (13Cr 4Ni/13Cr 6Ni)	156 MPa
Ni-Al-Bronze, Cu3	120 MPa	Martensitic (16Cr 5Ni)	168 MPa
Mn-Al-Bronze, Cu4	113 MPa	Austenitic (19Cr 10Ni)	132 MPa

Note: ① This value may be used, provided a perfect galvanic protection is active. Otherwise a reduction of about 30 MPa shall be applied.

The S-N curve characteristics are based on two slopes, the first slope 4.5 is from 1000 to 10^8 load cycles; the second slope 10 is above 10^8 load cycles.

The maximum allowable stress for one or low number of cycles is limited to σ_{ref2}/S, with S =1.3 for static loads.

The fatigue strength σ_{fat} is the fatigue limit at 100 million load cycles.

The geometrical size factor ($\gamma_{\varepsilon 2}$) is:

$$\gamma_{\varepsilon 2} = 1 - a \cdot \ln\left(\frac{t}{0.025}\right)$$

where:a —— as given in Table 13.3.6.3(3)④;

t —— the maximum blade thickness at the considered point.

The mean stress effect γ_m is:

$$\gamma_m = 1.0 - \left(\frac{1.4 \cdot \sigma_{mean}}{R_m}\right)^{0.75}$$

The following values should be used for the reduction factors if actual values are not available:

$\gamma_{\varepsilon 1}$ = 0.85, γ_v = 0.75, γ_m=0.75.

13.3.6.4 Blade bolts, propeller hub and CP mechanism

(1) General

The blade bolts, CP mechanism, propeller boss and the fitting of the propeller to the propeller shaft shall be designed to withstand the maximum static and fatigue design loads (as applicable), as defined in 13.3.5.3, 13.3.5.4, 13.3.5.5 and 13.3.6.3. The safety factor against yielding due to static loads and against fatigue shall be greater than 1.5, if not stated otherwise. The safety factor for loads, resulting from propeller blade failure as defined in 13.3.5.6 shall be greater than 1.0 against yielding.

Provided that calculated stresses duly considering local stress concentrations are less than yield strength, or maximum of 70% of tensile strength of respective materials, detailed fatigue analysis is not required. In all other cases components shall be analysed for cumulative fatigue. An approach similar to that used for shafting assessment may be applied (13.3.6.5).

(2) Blade bolts

Blade bolts shall withstand the following bending moment considered around a tangent on bolt pitch circle, or any other relevant axis for non-circular joints, parallel to considered root section:

$$M_{bolt} = S \cdot F_{ex}(0.8\frac{D}{2} - \mathrm{r}_{bolt}) \qquad \text{kNm}$$

where: r_{bolt} —— radius to the bolt plane;

S —— 1.0 safety factor.

Blade bolt pre-tension shall be sufficient to avoid separation between mating surfaces when the maximum forward and backward ice loads defined in 13.3.5.3 and 13.3.5.4 (open and ducted propellers respectively) are applied. For conventional arrangements, the following formula may be applied:

$$d_{bb} = 41 \cdot \sqrt{\frac{F_{ex}(0.8D - d) \cdot \mathrm{S} \cdot \alpha}{R_{p0.2} \cdot z_{bb} \cdot PCD}} \qquad \text{mm}$$

where: α —— 1.6 torque guided tightening; 1.3 elongation guided; 1.2 angle guided; 1.1 elongated by other additional means; other factors may be used, if evidence is demonstrated;

d_{bb}—— effective diameter of blade bolt in way of thread, in mm;

z_{bb}—— number of blade bolts;

S —— 1.0 safety factor.

(3) CP mechanism

Separate means, e.g. dowel pins, shall be provided in order to withstand the spindle torque resulting from blade failure Q_{sex} (see 13.3.5.6(2)) or ice interaction Q_{smax} (see 13.3.5.5(1)) whichever is greater. Other components of the CP mechanism shall not be damaged by the maximum spindle torques (Q_{smax}, Q_{sex}). One third of the spindle torque is assumed to be consumed by friction, if not otherwise documented trough further analysis.

The diameter of fitted pins between the blade and blade carrier can be calculated using the formula:

$$d_{fp} = 66 \cdot \sqrt{\frac{Q_s - Q_{fr}}{PCD \cdot z_{pin} \cdot R_{p0.2}}} \qquad \text{mm}$$

where: Q_s —— $\max(S \cdot Q_{s\max}, S \cdot Q_{sex})$, in kNm;

S —— 1.3 for $Q_{s\max}$, 1.0 for Q_{sex};

Q_{fr} —— friction between connected surfaces,= $0.33 \cdot Q_s$, in kNm. ISC may approve alternative Q_{fr} calculation according to reaction forces due to F_{ex}, or F_f, F_b whichever is relevant, utilising a friction coefficient = 0.15.

The stress in the actuating pin can be estimated by:

$$\sigma_{vMises} = \sqrt{\left(\frac{F_m \cdot \frac{h_{pin}}{2}}{\frac{\pi \cdot d_{pin}^{\ 3}}{32}}\right)^2 + 3 \cdot \left(\frac{F_m}{\frac{\pi}{4} \cdot d_{pin}^{\ 2}}\right)^2} \qquad \text{MPa}$$

where: F_m —— $\left(Q_s - Q_{fr}\right) / l_m$, in kN;

l_m —— distance pitching centre of blade – axis of pin, in m;

h_{pin}—— height of actuating pin, in mm;

d_{pin}—— diameter of actuating pin, in mm;

Q_{fr}—— friction torque in blade bearings acting on the blade palm and caused by the reaction forces

due to F_{ex} , or F_f , F_b whichever is relevant; taken to one third of spindle torque Q_s, in kNm.

The blade failure spindle torque Q_{sex} shall not lead to any consequential damage.

Fatigue strength is to be considered for parts transmitting the spindle torque from the blade to a servo system considering the ice spindle torque acting on one blade. The maximum amplitude Q_{samax} is defined as:

$$Q_{samax} = \frac{Q_{sb} + Q_{sf}}{2} \quad \text{kNm}$$

where: Q_{sb} —— spindle torque due to $|F_b|$, in kNm;

Q_{sf} —— spindle torque due to $|F_f|$, in kNm.

(4) Servo pressure

The design pressure for the servo system shall be taken as the pressure caused by Q_{smax} or, Q_{sex} when not protected by relief valves on the hydraulic actuator side, reduced by relevant friction losses in bearings caused by the respective ice loads. The design pressure shall in any case not be less than relief valve set pressure.

13.3.6.5 Propulsion line components

The ultimate load resulting from total blade failure F_{ex} as defined in 13.3.5.6 shall consist of combined axial and bending load components, wherever this is significant. The minimum safety factor against yielding is to be 1.0 for all shaft line components.

The shafts and shafting components, such as bearings, couplings and flanges shall be designed to withstand the operational propeller/ice interaction loads as given in 13.3.5.

The given loads are not intended to be used for shaft alignment calculation.

Cumulative fatigue calculations shall be conducted according to the Miner's rule. A fatigue calculation is not necessary, if the maximum stress is below fatigue strength at 10^8 load cycles.

The torque and thrust amplitude distribution (spectrum) in the propulsion line is to be taken as (because Weibull exponent k = 1), with Figure 13.3.6.5-1 as an example:

$$Q_A(\mathrm{N}) = Q_{A\max} \cdot \left[1 - \frac{\log(N)}{\log(Z \cdot N_{ice})}\right]$$

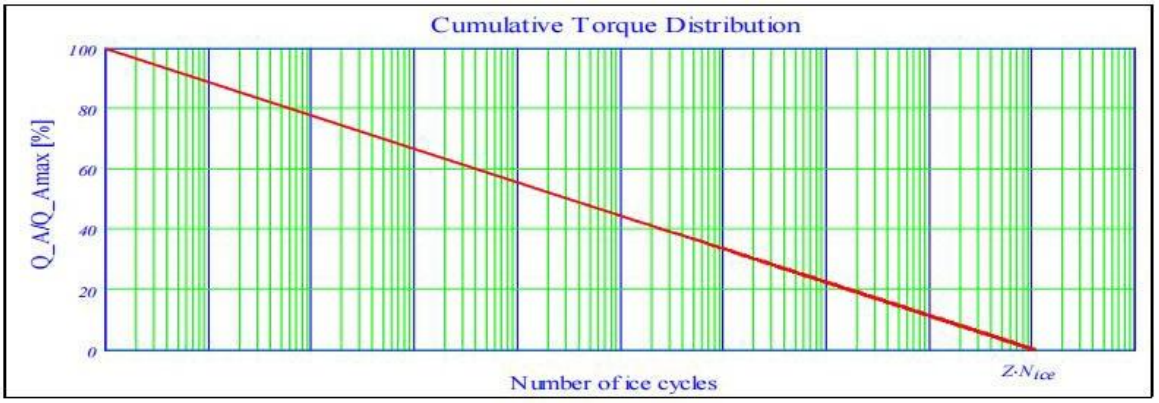

Figure 13.3.6.5-1 Cumulative torque distribution

The number of load cycles in the load spectrum is defined as $Z \cdot N_{ice}$.

The Weibull exponent should be considered as k = 1.0 for both open and ducted propeller torque and bending forces. The load distribution is an accumulated load spectrum, and the load spectrum should be divided into a minimum of ten load blocks when using the Miner summation method.

The load spectrum used counts the number of cycles for 100% load to be the number of cycles above the next step, e.g. 90 % load. This ensures that the calculation is on the conservative side. Consequently, the fewer stress blocks used the more conservative the calculated safety margin, see Figure 13.3.6.5-2.

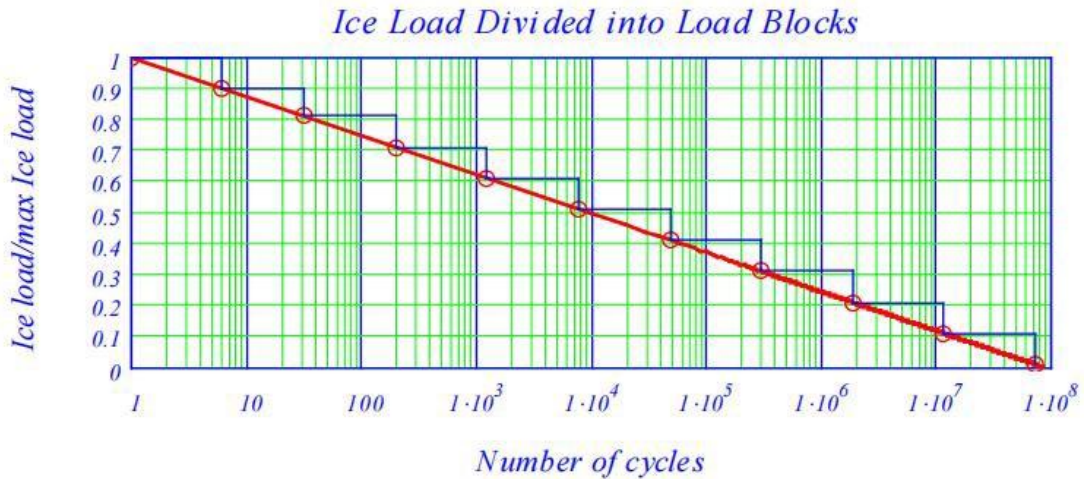

Figure 13.3.6.5-2 Example of ice load distribution (spectrum) for the shafting (k = 1)

The load spectrum is divided into n_{bl}-number of load blocks for the Miner summation method.
The following formula can be used for calculation of the number of cycles for each load block.

$$n_i = N_{ice}^{1-\left(1-\frac{i}{n_{bl}}\right)^k} - \sum_{i=1}^{i} n_{i-1}$$

where:i —— single load block, n_{bl} is the number of load blocks.
(1) Propeller fitting to the shaft
Keyless cone mounting or flange mounting may be generally used for propeller fitting to the shaft. Key mounting alone is not permitted.

① Keyless cone mounting

The friction capacity (at 0℃) shall be at least S = 2.0 times the highest peak torque Q_{peak} as determined in 13.3.5.9 without exceeding the permissible hub stresses.
The necessary surface pressure can be determined as:

$$p_{0°C} = \frac{2 \cdot S \cdot Q_{peak}}{\pi \cdot \mu \cdot D_S^2 \cdot L \cdot 10^3} \qquad \text{MPa}$$

where: μ —— 0.15 for steel-steel; 0.13 for steel-bronze;
D_S —— the shrinkage diameter at the mid-length of the taper, in m;
L —— the effective length of taper, in m.
Above friction coefficients may be increased by 0.04 if glycerine is used in wet mounting.

② Flange mounting

The flange thickness is to be at least 25% of the required aft end shaft diameter.
Any additional stress raisers such as recesses for bolt heads shall not interfere with the flange fillet unless the flange thickness is increased correspondingly.
The flange fillet radius is to be at least 10% of the required shaft diameter.
The diameter of shear pins shall be calculated according to the following equation:

$$d_{pin} = 66 \cdot \sqrt{\frac{Q_{peak} \cdot S}{PCD \cdot z_{pin} \cdot R_{p0.2}}} \qquad \text{mm}$$

where:Z_{pin}—— number of shear pins;
S —— 1.3 safety factor.

The bolts are to be designed so that the blade failure load F_{ex} (13.3.5.6) in backward direction does not cause yielding of the bolts. The following equation should be applied:

$$d_b = 41 \cdot \sqrt{\frac{F_{ex} \cdot (0.8 \cdot D / PCD + 1) \cdot \alpha}{R_{p0.2} \cdot z_b}} \qquad \text{mm}$$

where: α —— 1.6 torque guided tightening, 1.3 elongation guided, 1.2 angle guided, 1.1 elongated by other additional means, other factors may be used, if evidence is demonstrated;

d_b —— diameter flange bolt, in mm;

z_b —— number of flange bolts.

(2) Propeller shaft

The propeller shaft is to be designed to fulfil the following:

① The blade failure load F_{ex} (13.3.5.6) applied parallel to the shaft (forward or backwards) shall not cause yielding. The bending moment need not to be combined with any other loads. The diameter in way of the aft stern tube bearing shall not be less than:

$$d_p = 160 \cdot \sqrt[3]{\frac{F_{ex} \cdot D}{R_{p0.2} \cdot \left(1 - \frac{d_i^4}{d_p^4}\right)}} \quad \text{mm}$$

where:d_p —— propeller shaft diameter, in mm;

d_i —— propeller shaft inner diameter, in mm, 0 for solid shaft.

Forward from the aft stern tube bearing the shaft diameter may be reduced based on direct calculation of the actual bending moment, or by the assumption that the bending moment caused by F_{ex} is linearly reduced to 25% at the next bearing and in front of this linearly to zero at third bearing.

Bending due to maximum blade forces F_b and F_f have been disregarded since the resulting stress levels are much lower than the stresses caused by the blade failure load.

② The stresses due to the peak torque Q_{peak} shall have a minimum safety factor of S =1.5 against yielding in plain sections and S =1.0 in way of stress concentrations in order to avoid bent shafts.

Considering peak torque, the minimum shaft diameter is not to be less than that calculated from the following formulae:

Plain shaft:

$$d_p = 210 \cdot \sqrt[3]{\frac{Q_{peak} \cdot S}{R_{p0.2} \cdot \left(1 - \frac{d_i^4}{d_p^4}\right)}} \quad \text{mm}$$

Notched shaft:

$$d_p = 210 \cdot \sqrt[3]{\frac{Q_{peak} \cdot S \cdot \alpha_t}{R_{p0.2} \cdot \left(1 - \frac{d_i^4}{d_p^4}\right)}} \quad \text{mm}$$

where:α_t —— local stress concentration factor in torsion.

Notched shaft diameter shall in any case not be less than the required plain shaft diameter.

③ The torque amplitudes (13.3.5.8(4)) with the corresponding number of load cycles shall be used in an accumulated fatigue evaluation where the safety factor is S_{fat} =1.5. If the plant has high engine excited torsional vibrations (e.g. direct coupled 2-stroke engines), this shall also be considered.

④ The fatigue strengths σ_F and τ_F (3 million cycles) of shaft materials may be assessed on the basis of the material's yield or 0.2% proof strength as:

$$\sigma_F = 0.436 \cdot R_{p0.2} + 77 = \tau_F \cdot \sqrt{3} \quad \text{MPa}$$

This is valid for small polished specimens (no notch) and reversed stresses, see "VDEH 1983 Bericht Nr. ABF11 Berechnung von Wöhlerlinien für Bauteile aus Stahl".

The high cycle fatigue (HCF) is to be assessed based on the above fatigue strengths, notch factors (i.e. geometrical stress concentration factors and notch sensitivity), size factors, mean stress influence and the required safety factor of 1.6 at 3 million cycles increasing to 1.8 at 10^9 cycles.

The low cycle fatigue (LCF) representing 10^4 cycles is to be based on the smaller value of yield or 0.7 of tensile strength/√3. The criterion utilises a safety factor of 1.25.

The LCF and HCF as given above represent the upper and lower knees in a stress-cycle diagram. Since the required safety factors are included in these values, a Miner sum of unity is acceptable.

(3) Intermediate shaft

The intermediate shafts are to be designed to fulfil the requirements of 13.3.6.5(2)②~④.

(4) Shaft connections

Shaft connections are to satisfy the following requirements. Keyed connections (except for splined shaft) are not to be used.

① Shrink fit couplings (keyless)

See 13.3.6.5(1)①. A safety factor of S = 1.8 shall be applied.

② Flange mounting

The flange thickness is to be at least 20% of the required shaft diameter.

Any additional stress raisers such as recesses for bolt heads shall not interfere with the flange fillet unless the flange thickness is increased correspondingly.

The flange fillet radius is to be at least 8% of the shaft diameter.

The diameter of ream fitted (light press fit) bolts shall be chosen so that the peak torque is transmitted with a safety factor of 1.9. This accounts for a prestress. Pins shall transmit the peak torque with a safety factor of 1.5 against yielding (see the formula in 13.3.6.5(1)②) .

The bolts are to be designed so that the blade failure load F_{ex} (13.3.5.6) in backward direction does not cause yielding.

③ Splined shaft connections

Splined shaft connections can be applied where no axial or bending loads occur. A safety factor of S = 1.5 against allowable contact and shear stress resulting from peak torque shall be applied.

(5) Gear transmissions

① Shafts

Shafts in gear transmissions shall meet the same safety level as intermediate shafts, but where relevant, bending stresses and torsional stresses shall be combined (e.g. by von Mises for static loads). Maximum permissible deflection in order to maintain sufficient tooth contact pattern shall be considered for the relevant parts of the gear shafts.

② Gearing

The gearing shall fulfil following three acceptance criteria: tooth root stresses, pitting of flanks, and scuffing. In addition to above 3 criteria subsurface fatigue may need to be considered.

Common for all criteria is the influence of load distribution over the face width. All relevant parameters are to be considered, such as elastic deflections (of mesh, shafts and gear bodies), accuracy tolerances, helix modifications, and working positions in bearings (especially for multiple input single output gears).

The load spectrum (see 13.3.6.5) may be applied in such a way that the numbers of load cycles for the output wheel are multiplied by a factor of (number of pinions on the wheel / number of propeller blades Z). For pinions and wheels operating at higher speeds the numbers of load cycles are found by multiplication with the gear ratios. The peak torque (Q_{peak}) is also to be considered during calculations.

Cylindrical gears can be assessed on the basis of the international standard ISO 6336 Pt. 1-6, provided that “method B” is used. Equivalent requirements in Appendix 1, Chapter 10, PART THREE of the Rules can also be applied.

For Bevel Gears the methods or standards used or acknowledged by ISC can be applied provided that they are properly calibrated.

Tooth root safety shall be assessed against the peak torque, torque amplitudes (with the pertinent average torque) as well as the ordinary loads (open water free running) by means of accumulated fatigue analyses. The resulting factor of safety is to be at least 1.5. (Ref ISO 6336 Pt 1, 3 and 6 and Appendix 1, Chapter 10, PART THREE of the Rules)

The safety against pitting shall be assessed in the same way as tooth root stresses, but with a minimum resulting safety factor of 1.2. (Ref ISO 6336 Pt 1, 2 and 6 and Appendix 1, Chapter 10, PART THREE of the Rules)

The scuffing safety (flash temperature method – ref. ISO/TR 13989-1 and ISO/TR 13989-2) based on the peak torque shall be at least 1.2 when the FZG class of the oil is assumed one stage below specification.

The safety against subsurface fatigue of flanks for surface hardened gears (oblique fracture from active flank to opposite root) is to be assessed at the discretion of ISC. (It should be noted that high overloads can initiate subsurface fatigue cracks that may lead to a premature failure. In lieu of analyses UT inspection intervals may be used.)

③ Bearings

See 13.3.6.5(9).

④ Gear wheel shaft connections

The torque capacity shall be at least 1.8 times the highest peak torque Q_{peak} (at considered rotational speed) as determined in 6.5 without exceeding the permissible hub stresses of 80% yield.

(6) Clutches

Clutches shall have a static friction torque of at least 1.3 times the peak torque Q_{peak} and dynamic friction

torque 2/3 of the static.

Emergency operation of clutch after failure of e.g. operating pressure shall be made possible within reasonably short time. If this is arranged by bolts, it shall be on the engine side of the clutch in order to ensure access to all bolts by turning the engine.

(7) Elastic couplings

There shall be a separation margin of at least 20% between the maximum response torque and the torque where any mechanical twist limitation and/or the permissible maximum torque of the elastic coupling, valid for at least a single load cycle, is reached, expressed as follows:

$$Q_{peak} < 0.8 \cdot T_{k\max}(N=1) \qquad \text{kNm}$$

$$\frac{Q_r(N=x)}{Q_r(N=1)} = 1 - \frac{\log(x)}{\log(Z \cdot N_{ICE})} \qquad \text{and}$$

$$\frac{Q_A(N=x)}{Q_A(N=1)} = 1 - \frac{\log(x)}{\log(Z \cdot N_{ICE})}$$

where $Q_r(N=1)$ corresponds to Q_{peak} and $Q_A(N=1)$ to Q_{Amax}.

$$Q_r(\mathrm{N}=5\times10^4) \cdot S < T_{k\max}(\mathrm{N}=5\times10^4) \qquad \text{kNm}$$

$$Q_r(\mathrm{N}=1\times10^6) \cdot S < T_{kv} \qquad \text{kNm}$$

$$Q_A(\mathrm{N}=5\times10^4) \cdot S < \Delta T_{k\max}(\mathrm{N}=5\times10^4) \qquad \text{kNm}$$

where $Q_r(N=1)$ corresponds to Q_{peak} and $Q_A(N=1)$ to Q_{Amax}.

A sufficient fatigue strength shall be demonstrated at design torque level $Q_r(N=x)$ and $Q_A(N=x)$. This may be demonstrated by interpolation in a Weibull torque distribution (similar to Figure 13.3.6.5-1):

S is the general safety factor for fatigue, equal to 1.5.

See figures below when using the above formulae:

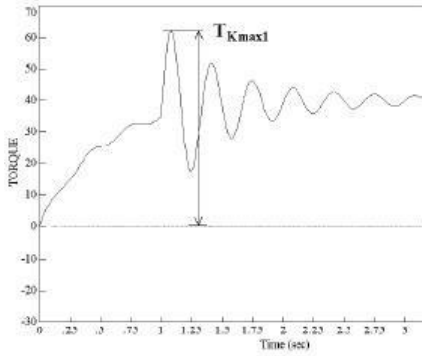

Figure 13.3.6.5(7)-1

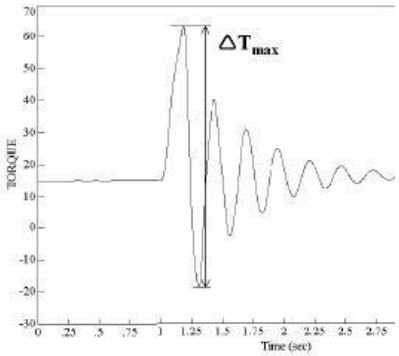

Figure 13.3.6.5(7)-2

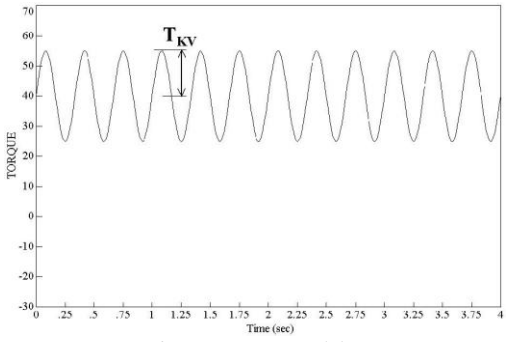

Figure 13.3.6.5(7)-3

The torque amplitude (or range Δ) shall not lead to fatigue cracking, i.e. exceeding the permissible vibratory torque. The permissible torque may be determined by interpolation in a Weibull torque distribution where T_{kmax1} respectively ΔT_{kmax} refer to 50000 cycles and T_{kv} refer to 10^6 cycles. See illustration in below Figures 13.3.6.5(7)-1, 13.3.6.5(7)-2 and 13.3.6.5(7)-3.

$$T_{k\max1}(\mathrm{N}=5\times10^4) \geq Q_r(\mathrm{N}=5\times10^4) \qquad \text{kNm}$$

(8) Crankshafts

Special considerations apply for plants with large inertia (e.g. flywheel, tuning wheel or PTO) in the non-driving end front of the engine (opposite to main power take off).

(9) Bearings

The aft stern tube bearing as well as the next shaft line bearing are to withstand F_{ex} as given in 13.3.5.6, in such a way that the ship can maintain operational capability. Rolling bearings are to have an L_{10a} lifetime of at least 40 000 hours according to ISO 281. Thrust bearings and their housings are to be designed to withstand with the maximum response thrust specified in 13.3.5.7 and the axial force resulting from the blade failure load specified in 13.3.5.6. For the purpose of calculation, except for F_{ex}, the shafts are assumed to rotate at rated speed. For pulling propellers special consideration is to be given to loads from ice interaction on the propeller hub.

(10) Seals

Seals are to prevent egress of pollutants and be suitable for the operating temperatures. Contingency plans for preventing the egress of pollutants under failure conditions are to be documented.

Seals installed are to be suitable for the intended application. The manufacturer is to provide service experience in similar applications and/or testing results for consideration by ISC.

13.3.6.6 Azimuthing main propulsors

In addition to the above requirements, special consideration shall be given to those loading cases which are extraordinary for propulsion units when compared with conventional propellers. The estimation of load cases shall reflect the way the thrusters are intended to operate on the specific ship. In this respect, for example, the loads caused by the impacts of ice blocks on the propeller hub of a pulling propeller shall be considered. Furthermore, loads resulting from the thrusters operating at an oblique angle to the flow shall be considered. The steering mechanism, the fitting of the unit, and the body of the thruster shall be designed to withstand the loss of a blade without damage. The loss of a blade shall be considered for the propeller blade orientation which causes the maximum load on the component being studied. Typically, top-down blade orientation places the maximum bending loads on the thruster body.

Azimuth thrusters shall also be designed for estimated loads caused by thruster body/ice interaction. The thruster body shall withstand the loads obtained when the maximum ice blocks, which are given in section 13.3.5.2, strike the thruster body when the ship is at a typical ice operating speed. In addition, the design situation in which an ice sheet glides along the ship's hull and presses against the thruster body should be considered. The thickness of the sheet should be taken as the thickness of the maximum ice block entering the propeller, as defined in section 13.3.5.2.

13.3.7 Prime movers

13.3.7.1 Engines are to be capable of being started and running the propeller in bollard condition. Propulsion plants with CP propeller are to be capable being operated even when the CP system is at full pitch as limited by mechanical stoppers.

13.3.7.2 The arrangement of compressed air for mechanical starting arrangements (including capacity of air receivers and charging capacity) is to satisfy relevant requirements of 9.5.1, Chapter 9, PART THREE of the Rules. In addition, for a ship with the ice class PC1~PC6, if its propulsion engine has to be reversed for going astern, the charging time required by 9.5.1.2, Chapter 9, PART THREE of the Rules is not to exceed 0.5h.

13.3.7.3 Provisions shall be made for heating arrangements to ensure ready starting from cold of the emergency power units at an ambient temperature applicable to the Polar Class of the ship. Emergency power units shall be equipped with starting devices with a stored energy capability of at least three consecutive starts at the above mentioned temperature. The source of stored energy shall be protected to preclude critical depletion by the automatic starting system, unless a second independent mean of starting is provided. A second source of energy shall be provided for an additional three starts within 30 min., unless manual starting can be demonstrated to be effective.

13.3.8 Equipment fastening loading accelerations

13.3.8.1 Essential equipment and supports shall be suitable for the accelerations as indicated in the following paragraphs. Accelerations are to be considered as acting independently.

13.3.8.2 Longitudinal Impact Accelerations, a_l

Maximum longitudinal impact acceleration at any point along the hull girder is calculated by the following formula:

$$a_l = (F_{IB} / \Delta)\ \{[1.1\ tan(\gamma + \varphi)] + [7\frac{H}{L}]\} \qquad \text{m/s}^2$$

where:φ ——maximum friction angle between steel and ice, normally taken as 10 degrees;

γ ——bow stem angle at waterline, in degrees;

Δ ——displacement, in kt;

L ——length between perpendiculars, in m;

H ——distance in meters from the water line to the point being considered, in m;

F_{IB} ——vertical impact force, defined in 13.2.13.2(1).

13.3.8.3 Vertical Accelerations, a_v

Combined vertical impact acceleration at any point along the hull girder is calculated by the following formula:

$$a_v = 2.5\ (F_{IB} / \Delta)F_X \qquad \text{m/s}^2$$

where: F_{IB} and Δ are the same as 13.3.8.2;

F_X——1.3 at FP, 0.2 at midships, 0.4 at AP, 1.3 at AP for vessels conducting ice breaking astern. Intermediate values to be interpolated linearly.

13.3.8.4 Transverse impact acceleration, a_t

Combined transverse impact acceleration at any point along hull girder is calculated by the following formula:

$$a_t = 3F_i \frac{F_X}{\Delta} \qquad \text{m/s}^2$$

where: Δ is the same as 13.3.8.2;

F_i ——total force normal to shell plating in the bow area due to oblique ice impact, defined in 13.2.3.2(2);

F_X—— 1.5 at FP, 0.25 at midships, 0.5 at FP, 1.5 at AP for vessels conducting ice breaking astern. Intermediate values to be interpolated linearly.

13.3.9 Auxiliary systems

13.3.9.1 Machinery shall be protected from the harmful effects of ingestion or accumulation of ice or snow. Where continuous operation is necessary, means should be provided to purge the system of accumulated ice or snow.

13.3.9.2 Means should be provided to prevent damage to tanks containing liquids due to freezing.

13.3.9.3 Vent pipes, intake and discharge pipes and associated systems shall be designed to prevent blockage due to freezing or ice and snow accumulation.

13.3.10 Sea Inlets and Cooling Water Systems

13.3.10.1 Cooling water systems for machinery that is essential for the propulsion and safety of the vessel, including sea chest inlets, shall be designed for the environmental conditions applicable to the ice class.

13.3.10.2 At least two sea chests are to be arranged as ice boxes (sea chests for water intake in severe ice conditions) for ice class PC1 to PC5 inclusive. The calculated volume for each of the ice boxes shall be at least $1m^3$ for every 750 kW of the totally installed power. For PC6 and PC7 there shall be at least one ice box located preferably near centre line.

13.3.10.3 Ice boxes are to be designed for an effective separation of ice and venting of air.

13.3.10.4 Sea inlet valves are to be secured directly to the ice boxes. The valve shall be a full bore type.

13.3.10.5 Ice boxes and sea bays are to have vent pipes and are to have shut off valves connected directly to the shell.

13.3.10.6 Means are to be provided to prevent freezing of sea bays, ice boxes, ship side valves and fittings above the load water line.

13.3.10.7 Efficient means are to be provided to re-circulate cooling seawater to the ice box. Total sectional area of the circulating pipes is not to be less than the area of the cooling water discharge pipe.

13.3.10.8 Detachable gratings or manholes are to be provided for ice boxes. Manholes are to be located above the deepest load line. Access is to be provided to the ice box from above.

13.3.10.9 Openings in ship sides for ice boxes are to be fitted with gratings, or holes or slots in shell plates. The net area through these openings is to be not less than 5 times the area of the inlet pipe. The diameter of holes and width of slot in shell plating is to be not less than 20 mm. Gratings of the ice boxes are to be provided with a means of clearing. The means of clearing is to be of a type using low pressure steam. Clearing pipes are to be provided with screw-down type non return valves.

13.3.11 Ballast tanks

13.3.11.1 Efficient means are to be provided to prevent freezing in fore and after peak tanks and wing

tanks located above the water line and where otherwise found necessary.

13.3.12 Ventilation systems

13.3.12.1 The air intakes for machinery and accommodation ventilation are to be located on both sides of the ship at locations where manual de-icing is possible. Anti-icing protection of the air inlets may be accepted as an equivalent solution (De-icing and anti-icing are defined in Chapter 23 of this PART) to location on both sides of the ship and manual de-icing. Notwithstanding the above, multiple air intakes are to be provided for the emergency generating set and are to be as far apart as possible.

13.3.12.2 The temperature of the inlet air shall be suitable for the safe operation of the machinery and the thermal comfort in the accommodation. Accommodation and ventilation air intakes shall be provided with means of heating, if needed.

13.3.13 Steering systems

13.3.13.1 The design ice force on rudder shall be transmitted to the rudder stops required by 13.1.5.8, Chapter 13, PART THREE of the Rules without damage to the steering system.

An ice knife shall in general be fitted to protect the rudder in centre position. The ice knife shall extend below BWL. Design forces shall be determined according to the 13.2.15 of this Chapter.

13.3.13.2 The rudder actuator is to be designed for a holding torque obtained by multiplying the open water torque (considering however a maximum speed of 18 knots), by following factors in Table 13.3.13.2:

Ice class factors of steering system **Table 13.3.13.2**

Ice class	PC1	PC2	PC3	PC4	PC5	PC6	PC7
Factor	5	5	3	3	3	1.5	1.5

13.3.13.3 The design pressure for calculations to determine the scantlings of the rudder actuator is to be at least 1.25 times the maximum working pressure corresponding to the holding torque defined above.

13.3.13.4 The rudder actuator is to be protected by torque relief arrangements, assuming the following turning speeds listed in Table 13.3.13.4 [deg/s] without an undue pressure rise (see 13.1.7.2(2), Chapter 13, PART THREE of the Rules for undue pressure rise). If the rudder and actuator design can withstand such rapid loads, this special relief arrangement is not necessary and a conventional one may be used instead (13.1.7.2, Chapter 13, PART THREE of the Rules).

Steering gear turning speeds **Table 13.3.13.4**

Ice class	PC1	PC2	PC3	PC4	PC5	PC6	PC7
Turning speeds (°/s)	10	10	7.5	7.5	7.5	6	6

13.3.13.5 Additionally for icebreakers, fast-acting torque relief arrangements are to be fitted in order to provide effective protection of the rudder actuator in case of the rudder being pushed rapidly hard over against the stops.

For hydraulically operated steering gear, the fast-acting torque relief arrangement is to be so designed that the pressure cannot exceed 115% of the set pressure of the safety valves when the rudder is being forced to move at the speed indicated in Table 13.3.13.5, also when taking into account the oil viscosity at the lowest expected ambient temperature in the steering gear compartment.

For alternative steering systems the fast-acting torque relief arrangement is to demonstrate an equivalent degree of protection to that required for hydraulically operated arrangements.

Steering gear turning speeds for icebreaker s **Table 13.3.13.5**

Ice class	PC1	PC2	PC3	PC4	PC5	PC6	PC7
Turning speeds (°/s)	40	40	20	20	20	15	15

13.3.14 Alternative design

13.3.14.1 As an alternative to this Section – a comprehensive design study may be submitted and may be requested to be validated by an agreed test programme.

CHAPTER 14 REDUNDANT PROPULSION SYSTEMS

Section 1 GENERAL PROVISIONS

14.1.1 General requirements

14.1.1.1 This Chapter applies to ships having one of the class notations specified in 14.1.3 below. Redundant propulsion systems are to comply with the provisions of this Chapter in addition to other relevant requirements of the Rules.

14.1.1.2 The system design is to ensure that at least the following functions are maintained in the event of a single failure as defined in 14.1.4.1:

(1) The propulsion system will enable the ship to maintain a full load speed not less than 7 knots while heading into BF 3 weather conditions with corresponding wave conditions. Adequate steering capability is also to be maintained at this speed.

(2) The propulsion system will enable the ship to maintain its position and heading while heading into BF 8 weather conditions with corresponding wave conditions. The results of model testing may be accepted.

(3) Availability of safety systems, including fire-fighting systems, bilge system, navigation lights, communication apparatus, life-saving appliances.

(4) Habitability conditions, including minimum lighting, ventilation, galleys, refrigerated stores, drinking water or evaporator services.

14.1.2 Definitions

14.1.2.1 For the purpose of this Section, the following definitions are applicable:

(1) Propulsion system is a system designed to provide thrust to a ship, consisting of one or more propulsion machines, one or more propulsors, one or more steering system, all necessary auxiliaries and associated control, alarm and safety systems.

(2) Propulsion machine is a device (e.g. diesel engine, turbine, electrical motor, etc.) which develops mechanical energy to drive a propulsor.

(3) Steering system is a system designed to control the direction of movement of a ship, including the rudder, steering gear, etc.

(4) Propulsor is a device (e.g. propeller, waterjet) which imparts force to a column of water in order to propel a ship, together with any equipment necessary to transmit the power from the propulsion machinery to the device (e.g. shafting, gearing, etc.).

(5) Auxiliary services system means all support systems (e.g. fuel oil system, lubricating oil system, cooling water system, compressed air and hydraulic systems, etc.) which are required to run propulsion machinery, propulsors, steering systems and generating sets.

14.1.3 Class notations

14.1.3.1 Where requested by the Owner, propulsion systems which are found to comply with the requirements specified in this Chapter may be assigned the following class notations, as appropriate.

(1) PR-1: A ship fitted with two or more propulsion machines but only a single propulsor and steering system.

(2) PR-2: A ship fitted with two or more propulsion machines and also two or more propulsors and steering systems.

(3) PR-1S: A ship fitted with only a single propulsor and steering system but having two or more propulsion machines arranged in separate compartments.

(4) PR-2S: A ship fitted with two or more propulsion machines and also two or more propulsors and steering systems, and having the propulsion machines and associated steering systems arranged in separate compartments.

14.1.4 Single failure

14.1.4.1 For the purpose of this Chapter, a single failure mainly includes but is not limited to the following:

(1) loss of a propulsion machine;

(2) any failure of a non-static component of systems which are necessary for the operation of the propulsion machine or steering gear, including prime movers, controls and monitoring of fuel oil system, lubricating oil system, cooling system, compressed air system;

(3) any failure of heat exchangers, including heat generators, necessary for propulsion (i.e. auxiliary boilers, fuel oil heaters, lubricating oil coolers, fresh water coolers, reduction gear oil coolers);
(4) any failure of any non-static component of fuel oil and lubricating oil transfer system;
(5) any failure of any of the power generating sets;
(6) any failure of any electric apparatus, including the main switchboard, electric motors, transformers, distribution switchboards, panels;
(7) any failure of the propulsor, including propeller, propeller shaft, intermediate shafts, bearings, couplings, reduction gears;
(8) any failure of any static component of the systems which are necessary for the operation of the propulsion machine or steering gear, including integrity of pipes, valves, pipe fittings, pipe supports, tanks;
(9) loss of one compartment due to fire or flooding;
(10) any failure of any component directly caused by a single failure of another component. For example, the complete loss of a main propulsion engine or of any part of the main switchboard is not to impair the proper functioning of the other machinery and equipment. Any of consequence failures are also to be considered.

14.1.4.2 A single failure concept is applied to the class notations as follows:
(1) For PR-1, the single failure concept is applied to the propulsion machines, its auxiliary service systems and its control systems. This notation does not consider failure of the propulsor or steering system, or total loss of the propulsion machinery compartment or steering gear room due to fire or flood.
(2) For PR-2, the single failure concept is applied to the propulsion system. This notation does not consider total loss of the propulsion machinery compartment or steering gear room due to fire or flood.
(3) For PR-1S, the single failure concept is applied as for PR-1**,** but total loss of one of the propulsion machinery compartments due to fire or flood is also considered.
(4) For PR-2S, the single failure concept is applied as for PR-2, but total loss of one of the propulsion machinery compartments or steering gear rooms due to fire or flood is also considered.
(5) For PR-1 and PR-2, any single failure described in 14.1.4.1(8) may not be considered.

14.1.5 Plans and documents

14.1.5.1 The following plans and documents are to be submitted for approval:
(1) Technical specifications for the redundant propulsion system, including all design details to achieve functional objectives;
(2) All plans of arrangement, piping and electrical system and calculations related to the redundant propulsion system;
(3) An Failure Mode and Effect Analysis (FMEA) report;
(4) A testing plan.

14.1.5.2 An operating manual for the redundant propulsion system is to be submitted for reference. The operating manual is to include the following, as a minimum:
(1) ship's name and ISC class number;
(2) simplified diagram and descriptions of the propulsion systems in normal condition;
(3) simplified diagram and descriptions of the propulsion redundancy features;
(4) step-by-step instructions for the use of the redundancy features;
(5) description of the communication systems;
(6) detailed instructions for local propulsion machinery control;
(7) model test and full-scale test report;
(8) propulsion capability in terms of estimated worst sea states.

14.1.5.3 The above required plans and documents, except for the FMEA report, need not be resubmitted if they have been fully covered in plans and documents submitted in compliance with other relevant requirements of the Rules.

14.1.6 Failure Mode and Effect Analysis (FMEA)

14.1.6.1 An FMEA is to be carried out in accordance with the requirements of 14.1.6.2 to 14.1.6.4 for the propulsion systems and their auxiliary service systems to demonstrate that a single failure, as specified in 14.1.4, will not cause loss of all propulsion capability, and that the redundancy design is able to achieve the functions specified in 14.1.1.2. Typical sub-systems to be analyzed include associated control and monitoring arrangements, data communications, power supplies (electrical, hydraulic or pneumatic), fuel, lubricating, cooling, etc.

14.1.6.2 Methods and procedures for the FMEA may also be referred to the relevant requirements in Appendix 4 of the International Code for the Safety of High-Speed Craft, 2000 adopted by IMO and ISC Guidelines for Application of Failure Mode and Effects Analysis.

14.1.6.3 The FMEA is to be organized in terms of system, equipment and function, and to cover main components of all relevant systems as far as possible. The failure modes and the measures in response to them are to be determined.
14.1.6.4 An FMEA report is to generally cover but not restricted to the following:
(1) description of main components of all relevant systems and functional block diagram showing interactions between them;
(2) all potential failure modes and their causes;
(3) the effects on the system of each failure mode and the severity of consequences;
(4) measures to detect failures;
(5) measures or corrective actions in response to failures; and
(6) testing procedures to verify conclusions of the FMEA, etc.

Section 2 SYSTEM ARRANGEMENT AND DESIGN

14.2.1 Propulsion machinery and propulsors

14.2.1.1 For PR-1 notation, at least two propulsion machines are to be provided. The propulsion machines and auxiliary service systems may be located in the same propulsion machinery compartment.
14.2.1.2 For PR-2 notation, at least two propulsion machines and two propulsors are to be provided. The propulsion machines, shafting, gearing and auxiliary service systems may be located in the same propulsion machinery compartment.
14.2.1.3 For PR-1S notation, at least two propulsion machines are to be provided. The propulsion machines and auxiliary service systems are to be arranged in separate compartments segregated by bulkheads of A-60 class. The gearing and shafting systems are to be separated from the propulsion machines in such a way that a fire or flood in the propulsion machinery compartment does not impair any function specified in 14.1.1.2. The bulkhead segregating gearing and propulsion machinery compartments is to be watertight with at least A-0 class.
14.2.1.4 For PR-2S notation, at least two propulsion machines and two propulsors are to be provided. The propulsion machines, shafting, gearing and auxiliary service systems are to be arranged in separate compartments segregated by watertight bulkheads of A-60 class.
14.2.1.5 For PR-1 and PR-1S notations where only two propulsion machines and one propulsor are provided, efficient means, e.g. clutches, are to be provided to disconnect propulsion machines from the propulsor.

14.2.2 Steering systems

14.2.2.1 For PR-1 and PR-1S notations, the steering system, including rudder and steering gear, only need comply with other relevant requirements of the Rules.
14.2.2.2 For PR-2 notation, at least two steering systems are to be provided. The steering gear and auxiliary service systems may be arranged in the same compartment.
14.2.2.3 For PR-2S notation, at least two steering systems are to be provided. The steering gear and auxiliary service systems are to be arranged in separate compartments segregated by bulkheads of at least A-0 class.

14.2.3 Auxiliary service systems

14.2.3.1 At least two independent auxiliary service systems, including fuel oil service tanks, are to be provided. These two systems may be designed to be completely independent, or with interconnections between them provided that effective means to disconnect or isolate the systems from each other are fitted.
14.2.3.2 For PR-1S and PR-2S notations, a fire or flood in any of the compartments is not to affect auxiliary service systems in continuously supporting the redundant propulsion.
14.2.3.3 Interconnections of auxiliary service systems arranged in separate compartments are not to compromise the fire and watertight integrity of the separating bulkhead, and effective disconnection or isolation means are to be fitted at both sides of the bulkhead. Position status of the disconnection or isolation means is to be provided at the navigation bridge and the centralized control station.

14.2.4 Electrical power systems

14.2.4.1 The power system serving the propulsion system is to be so arranged that it will not accept total black-out as the consequence of any single failure. Single failure is defined as any system or component breakdown of technical nature. For ships with PR-1S and PR-2S notations, single failure is to also include a fire or flood in any of the compartments.

14.2.4.2 Where the ship's essential equipment is fed from one main switchboard, the sections of main bus bars are to be connected with circuit breakers capable of breaking the maximum short circuit current in the system. Such breakers are to be appropriately protected. For ships with PR-1S and PR-2S notations, the sections of main bus bars are to be located in separate compartments segregated by bulkheads of A-60 class. Both ends of the lines linking the sections of main bus bars are to be fitted with appropriately protected circuit breakers.

14.2.4.3 For PR-1S and PR-2S notations, the generating sets and their auxiliary systems, the distribution systems and the power management systems are to be located in separate compartments segregated by bulkheads of A-60 class. Interconnections of systems located in separate compartments are not to compromise the fire and watertight integrity of the segregating bulkhead, and effective disconnection or isolation means are to be fitted at both sides of the bulkhead. Position status of the disconnection or isolation means is to be provided at the navigation bridge and the centralized control station.

14.2.5 Control and monitoring systems

14.2.5.1 Two independent propulsion systems are to be provided with their respective independent control and monitoring systems. If arranged with common parts, these are to be arranged with redundancy so that any single failure can be effectively isolated.

14.2.5.2 For PR-1S and PR-2S notations, the control and monitoring system for the propulsor (e.g. controllable pitch propeller control), including all associated cabling, is to be duplicated in each compartment, and fire or flooding of one compartment is not to adversely affect operation of the propulsor from the other compartment.

14.2.5.3 For PR-2S notation, the control and monitoring system for the steering system, including all associated cabling, is to be duplicated in each compartment, and fire or flooding of one compartment is not to adversely affect control and monitoring of the redundant steering system.

14.2.5.4 Uninterrupted power supply (UPS) is to be provided as backup for the control and monitoring system. For PR-1S and PR-2S notations, at least two UPSs are to be provided.

14.2.6 Interior communication systems

14.2.6.1 For PR-1S and PR-2S notations, the communication cables to each control station are to be routed through an appropriate compartment, and fire or flooding of one compartment is not to adversely affect the interior communication from the control station in another compartment.

14.2.7 Other facilities

14.2.7.1 For PR-1S and PR-2S notations, piping and cabling serving the equipment or systems, which are redundant to each other, is not to be routed through the same compartment. Where this is unavoidable, such pipes could run together in ducts of A-60 class, and such cables in cable ducts of A-60 class. Cable connection boxes are not allowed in such ducts.

14.2.7.2 For PR-1S and PR-2S notations, in case of fire or flooding in one of the compartments arranged with the propulsion system equipment, the availability of fire-fighting systems, bilge system, lighting and ventilation serving another compartment is to be maintained.

14.2.7.3 For PR-1S and PR-2S notations, in case of fire or flooding in one of the compartments arranged with the propulsion system equipment, the availability of facilities related to ship safety and habitability conditions (e.g. fire-fighting, drainage, ventilation, lighting, galleys, refrigerated stores, drinking water, navigation lights, communication apparatus and life-saving appliances) is to be maintained.

CHAPTER 15 ADDITIONAL REQUIREMENTS FOR ELECTRICALLY PROPELLED SHIPS

Section 1 GENERAL PROVISIONS

15.1.1 General requirements

15.1.1.1 The requirements of this Chapter apply to ships using electric motors as main propulsion.

15.1.1.2 In addition to this Chapter, electrically propelled ships are to comply with the applicable provisions of other PARTs and Chapters of the Rules.

15.1.1.3 Ships complying with the provisions of this Chapter are assigned with the following notation: Electrical Propulsion System

15.1.2 Definitions

15.1.2.1 The definitions in this Chapter are as follows:

(1) propulsion motor means electrical motor intended to provide propulsion power.

(2) propulsion generator means generator mainly used for power supply of the propulsion system.

Section 2 ADDITIONAL REQUIREMENTS FOR ELECTRICAL PROPULSION INSTALLATIONS

15.2.1 General requirements

15.2.1.1 The torque available in the propulsion motors for manoeuvring is to be capable of stopping or reversing the ship in a reasonable time at the maximum service speed.

15.2.1.2 Adequate torque margin is to be provided in propulsion systems to guard against the motor from being pulled out of synchronism during rough weather or during turning in the case of multiple-screw ships, and to ensure a reliable start under all ambient conditions.

15.2.1.3 The lubrication of bearings of propulsion motors, gearing and shafting is to be effective at all normal speeds from creep speed upwards, either ahead or astern. The above shafts and bearings are not to be damaged by slow rotation caused by motor(s) or propeller(s) under all predictable oil temperature conditions.

15.2.1.4 The electric power for the propulsion system may be derived from generating sets dedicated to propulsion duty or from a common power plant which serves both propulsion and ship service loads.

15.2.1.5 Under no circumstances should a single failure of the electrical or control system cause a permanent failure of the propulsion system.

15.2.1.6 If electric propulsion is the sole means of propulsion for the ship, at least two independent propulsion motors and converters are generally to be provided. When any stator or propulsion motor fails, the remaining propulsion power is to be sufficient to maintain the efficient propulsion of the ship.

15.2.1.7 If the ship is provided with a single shaft-line propulsion system with one electric motor, a separate propulsion system is to be installed, providing power sufficient to maintain efficient propulsion of the vessel.

15.2.1.8 Propulsion systems having two or more generators, or two or more semiconductor converters, or two or more motors on one propeller shaft is to be so arranged that any unit may be taken out of service and disconnected electrically without affecting the operation of the remaining units.

15.2.1.9 The common power plant is to meet the following requirements:

(1) The control system of the plant is to ensure a safe distribution of power between propulsion and ship services, with tripping of non-essential loads and/or reduction in the propulsion power if necessary.

(2) Where one generating set is out of action, the remaining sets are to be capable of providing all essential and normal ship service loads while maintaining an effective level of propulsion power, i.e. ensuring a speed of not less than 7 knots or half of the design speed, whichever is the greater. Special consideration may be given in exceptional circumstances subject to agreement of ISC.

15.2.2 Harmonics

15.2.2.1 The electric installations are to be so designed as to prevent the harmful effects of electromagnetic interference generated by semiconductor converters.

15.2.2.2 For an electrical network fitted with semiconductor converters, single order harmonics distortion and up to 15th harmonic are not to exceed 5% of the rated voltage, and the distortion is to be reduced with the higher order and gradually reduced to 1% at 100th harmonic. The total harmonic distortion at dedicated systems (e.g. switchboard for electrical propulsion) is not to exceed 10%, otherwise documentation from the manufacturer is to be submitted indicating that the equipment is designed for operation at a higher level of distortion. This may be specially considered by ISC upon agreement among all parties to the contract.
15.2.2.3 The effects of the harmonics of currents and voltages are to be taken into consideration for the design of the propulsion motors.
15.2.2.4 Means (e.g. suitable filters) are to be provided, where necessary, to limit the effects of the rate of harmonics to the system and to other semiconductor converters.
15.2.2.5 The total harmonic distortion (THD) of the voltage waveform is the ratio of the rms value of the harmonic content to the rms value of the fundamental, expressed in per cent and may be calculated using the expression:

$$V_{THD} = \frac{\sqrt{\sum_{h=2}^{\infty} V_h^2}}{V_1} \times 100\%$$

where: V_{THD} — the total harmonic distortion;

V_h — rms amplitude of a harmonic voltage of order h;
V_1 — rms amplitude of the fundamental voltage.

15.2.3 Power management system for common power plant

15.2.3.1 For ships fitted with a common power plant, a power management system having the following functions is to be provided:
(1) automatic start-up and parallel operation of standby generators;
(2) preventing overloading the generators, by reducing the propulsion load and/or tripping non-essential loads;
(3) heavy load inquiry;
(4) ensuring even load sharing between on-line generators.

15.2.4 Prime movers

15.2.4.1 Prime movers and their governors are to comply with the requirements of Chapter 7, 8 or 9 of PART THREE of the Rules. The rated power in conjunction with the overloading and load built-up capabilities are to be adequate to supply the power needed during transitional changes under operating conditions of the electrical equipment due to manoeuvring and the heavy sea and weather conditions.
15.2.4.2 Machinery piping systems for the prime movers are to comply with all the requirements specified in Chapter 4 of PART THREE of the Rules applicable to main engines.
15.2.4.3 In the case of parallel operation of propulsion generators, the governing systems used are to permit stable operation to be maintained over the entire operational speed range of the prime movers.
15.2.4.4 During manoeuvring of the ship, the regenerated power produced by the propulsion motor is not to cause tripping due to overspeed, neither to cause dangerous overload of the system. Where necessary, braking resistors are to be provided to absorb excess amounts of regenerated energy and to reduce the speed of rotation of the propulsion motor.
15.2.4.5 The overspeed protective device is to be set to a speed in excess of the highest possible speed during the periods of power regeneration, and the generating set including prime mover is to be so designed that no damage will be raised from an overspeed equal to that at which the governor is set.

15.2.5 Propulsion generators and propulsion motors

15.2.5.1 Variable speed propulsion motors fitted with an integral fan are to be capable of operating at speeds below the rated speed with full-load torque, full-load current, full-load excitation or in similar conditions, and temperature rises are not to exceed the limits given in 3.2.3 of PART FOUR of the Rules.
15.2.5.2 The temperature of the cooling air of propulsion generators and propulsion motors provided with forced air ventilation is to be continuously monitored by means of direct reading thermometers which are readable from outside the machine and a remote audible alarm actuated by suitable temperature detectors.
15.2.5.3 For propulsion generators and propulsion motors fitted with heat exchangers in closed cooling circuits, the flow of primary and secondary coolants is to be monitored. Alternatively, monitoring of winding temperatures plus alarms may be accepted in lieu of the flow monitoring. In addition, consideration is to be given, where necessary, to the provision of devices for detecting leakage of cooling liquid in the machine enclosure and the operation of an associated alarm.

15.2.5.4 The collector rings and commutators are to be suitably arranged for easy maintenance. For purposes of inspection, repair, withdrawal and replacement of the field coils, provision is to be made for easy access to all windings and bearings.
15.2.5.5 Effective means are to be provided for the propulsion motors to prevent condensation and accumulation of moisture when they are out of service. If steam is used for heating purpose, no joints of steam pipes are permitted within the motors.
15.2.5.6 Propulsion motors are to be capable of withstanding the effects of a sudden short circuit at their terminals under all conditions without suffering damage.
15.2.5.7 Stator windings of AC machines and interpole windings of DC machines, rated above 500 kW, are to be provided with embedded temperature sensors. These sensors are to be arranged to operate an alarm if the temperature exceeds a predetermined safe value.
15.2.5.8 Stator windings of AC propulsion motors supplied by varied-frequency semiconductor converters are to be capable of withstanding the voltage variation due to action of the high-frequency switch of inverters.
15.2.5.9 Stator windings of AC propulsion motors supplied by semiconductor converters are to be provided with means to restrict generation of shaft current so as to prevent early damage of bearings.
15.2.5.10 Propulsion generators and propulsion motors are to have a protection degree of at least IP 23. High voltage propulsion generators and propulsion motors are to have a protection degree of at least IP 44.
15.2.5.11 Propulsion generators and propulsion motors with semiconductor converters are to be designed for the expected harmonics of the system. A sufficient reserve is to be considered for the temperature rise due to total harmonic distortion.

15.2.6 Excitation

15.2.6.1 The output current and voltage of exciters and their supply are to be suitable for the output required during manoeuvring and overcurrent conditions including short circuit as well as stalling condition. For this reason, attention is to be paid to the strength of shafts and couplings of rotating sets and to the power of their driving machines.
15.2.6.2 Any single fault in the propulsion generators and propulsion motors excitation system is not to result in a total loss of propulsion power.
15.2.6.3 Field circuits are to be provided with means for suppressing voltage rise when a field switch is opened.
15.2.6.4 For Ward-Leonard systems, arrangements for generator and motor excitation are to be such that if the motor excitation circuit is opened by a switch or contactor, the generator excitation circuit is simultaneously interrupted, or the generator voltage is immediately reduced to zero.
15.2.6.5 In constant voltage systems with two or more independently controlled motors in parallel on the same generator(s), the armature circuit-breaker is to be tripped when an excitation circuit is opened by a switch or contactor.
15.2.6.6 If the protection device of the excitation system trips, the respective circuit breaker of the propulsion generator or motor is also to trip and is to be alarmed.
15.2.6.7 Where fuses are used for excitation circuit protection, it is essential that they do not interrupt the field discharge resistor circuit upon rupturing.

15.2.7 Propulsion control

15.2.7.1 Main and local controls are to be provided, independent of any remote or automatic system, to permit effective control of the propulsion equipment. Should the remote control system fail, local operation is to be possible within a reasonably short time and is to have the highest priority.
15.2.7.2 Either manual operation or operation with the aid of power or a combination of both may be used. All manoeuvring switches, field-regulators and controllers are to be operable effortlessly. If failure of the power supply occurs in systems with power-aided control (e.g. with electrical, pneumatic or hydraulic aid), the control of any such device is to be capable of being restored by other suitable means in a short time.
15.2.7.3 When two or more control stations are provided, a selector switch or other means is to be provided for transferring the manoeuvring controls to the designated station. Simultaneous control from more than one control station is not to be possible. Provision is to be made to prevent malfunction due to the transferring of the control stations. In addition, indication is to be located at each control station to indicate which station is in control.
15.2.7.4 Levers for operating contactors, line switches, field switches and similar devices of ahead and astern circuits are to be interlocked to prevent their improper operation causing ahead and astern circuits being energized simultaneously.

15.2.7.5 The reference value transmitters in the control stations and the control equipment are to be so designed that any defect in the desired value transmitters or in the cables between the control station and the propulsion system will not cause a substantial increase in the propeller speed.
15.2.7.6 Measures are to be taken that the control of the propulsion system can be activated only when the designated control lever is in zero position and the system is ready for operation.
15.2.7.7 Each control station is to have an emergency stop device which is independent of the control lever. The emergency stops are to be independent of the normal stop, and separate for each propulsion line. The emergency stop device is to be monitored against wire break and short circuit. The emergency stop device is to be protected against inadvertent action.
15.2.7.8 The control system is to limit the propulsion power if the power available from the generator(s) is not sufficient to supply the demand level of propulsion power. In the event of a power limitation, there is to be a visual indication at the control stations.
15.2.7.9 Propulsion control systems are to be stable throughout their normal operating range and arranged to attenuate any effects of cyclic propeller load fluctuations caused by wave action. The control system is to ensure that there is no dangerous overspeed of propulsion motors upon loss of load.
15.2.7.10 Failure of an automatic control system is not to result in the following consequences:
(1) substantial change in the propeller speed and propulsion direction;
(2) total breakdown of power supply system (i.e. blackout);
(3) changes in available power, that is, no start or stop of generators is to occur.

15.2.8 Cables

15.2.8.1 The conductors of cables external to the components of the propulsion plant, other than cables and interconnecting wiring for computers, data loggers or other automation equipment requiring currents of very small value, are to consist of not less than seven strands and have a cross-sectional area of not less than 1.5 mm^2.
15.2.8.2 Propulsion cables are not to have splices or joints, except terminal joints, and all cable terminals of the propulsion system are to be sealed.
15.2.8.3 For determination of current rating of main cables (cables connecting generators to semiconductor converters and cables connecting semiconductor converters to propulsion motors) of the propulsion system, the additional heating effects due to harmonics in the system are to be taken into account.

15.2.9 Protection

15.2.9.1 Over-current protective devices, if fitted in the main circuits, are to be set sufficiently high so that there is no possibility of their action due to the over-current caused by manoeuvring or normal operation in heavy seas, or in floating pack ice.
15.2.9.2 For DC systems in which overspeed of the propulsion motors may occur (due to light loads or loss of propeller, etc.), suitable overspeed protection is to be provided.
15.2.9.3 Where separately driven DC generators are connected electrically in series, means is to be provided to prevent rotation reversal of a generator upon failure of the driving power of its prime-mover.
15.2.9.4 In excitation circuits, there is to be no overload protection causing the opening of the circuit, except for excitation circuits with semiconductor converters.
15.2.9.5 Means are to be provided for discriminative tripping or rapid reduction of the magnetic fluxes of generators or motors to ensure that over-currents do not reach the value which may endanger the propulsion plant.
15.2.9.6 Means for earth leakage detection is to be provided for the main propulsion circuit and be arranged to operate an alarm upon the occurrence of an earth fault. Where fault current flowing is liable to cause damage, arrangements for opening the main propulsion circuit are also to be provided. If the neutral is earthed, it is to be through an arrangement which will limit the current not to exceed approximately 20 A upon a fault to earth in the propulsion system.
15.2.9.7 Means are to be provided for earth leakage detection in excitation circuits of propulsion machines, but may be omitted in circuits of brushless excitation systems and of motors rated up to 500 kW.
15.2.9.8 Upon detection of a failure in the generators' excitation systems, an alarm is to be given on the navigation bridge and in the engine control room and actions to bring the system into a safe operational mode are to be automatically executed.
15.2.9.9 In the design of DC machines and their protective systems, consideration is to be given to measures necessary to minimize any damage in the event of short circuit.
15.2.9.10 Direct-current propulsion circuits are not to have fuses. Each circuit is to be protected by overload relays to open the field circuits or by remote-controlled main-circuit interrupting devices.

15.2.9.11 If there is a possibility of blocking the propeller (e.g. during ice-breaking operation), a protection against damage to the propulsion plant is to be provided.
15.2.9.12 Fuses may be provided for filter circuits. Visual and audible alarms are to be provided at the control station for tripping of the fuse.
15.2.9.13 Differential protection or similar protection against internal short-circuit is to be provided for propulsion motors with an output of 1,500 kW or above.
15.2.9.14 The following protection of semiconductor converters is to be provided:
(1) protection against overvoltage in the supply systems to which converters are connected;
(2) protection against over-currents in semiconductor elements during normal operation;
(3) short-circuit protection.
15.2.9.15 Each propulsion transformer is to be protected against primary and secondary side short-circuit. If the primary side of transformers is protected for short-circuit only, overcurrent protection is to be arranged on the secondary side.

15.2.10 Monitoring instrumentation and alarms

15.2.10.1 Alarms and displays associated with the electrical propulsion system are given in Table 15.2.10.1. These alarms and displays are to be located in the centralized control station of the engine room (in the local station if without the centralized control station). Alarms and displays equivalent to those given in the Table may be accepted subject to agreement of ISC. Alarms for safety actions and group alarms for propulsion generators, motors and semiconductor converters are to be provided in the bridge.

Electric propulsion system monitoring, alarm and safety action item list Table 15.2.10.1

System	Monitored parameter	Without class notations			BRC, MCC & AUT-0 notations			Remark
		Alarm	Display	Auto shut-down	Alarm	Display	Auto shut-down	
Propulsion generator (AC & DC)	Bearing lub. oil inlet pressure – low or bearing temperature – high	√	√	√	√	√	√	Prime mover automatic shutdown
	Voltage – off-limits (high/low)		√		√	√		To read all phases
	Frequency – off-limits (high/low)		√		√	√		For AC propulsion generators only
	Current		√			√		To read all phases
	Power		√			√		To indicate power consumed and power available for propulsion in bridge and centralized control station
	Stator windings temperature – high	√	√		√	√		To read all phases; for generators > 500 kW
	Main generator circuit breakers – open/close					√		
	Generator running		√			√		
	Failure of on-line generator				√			
	Transfer of standby generator				√			
	Generator cooling medium temperature – high	√			√	√		If applicable
	Failure of generator cooling pump or fan motor				√			If applicable
	Field voltage and current		√			√		Applicable to electrical excitation system where provided
	Interpole windings temperature – high	√	√		√	√		For DC generators

15.2.10.2 Ships having machinery notation(s) are to comply with the automatic control and monitoring requirements applicable to diesel engines and gas turbines of propulsion generating sets as well as main boilers and auxiliary steam turbines, as specified in PART SEVEN of the Rules. Where two or more propulsion generating sets are provided and 100% design speed is still achieved upon the shutdown of any of them, only the automatic control and monitoring requirements of PART SEVEN of the Rules for auxiliary diesel engines, auxiliary gas turbines and auxiliary steam turbines are to be complied with.

15.2.11 Special requirements for podded propulsion system

15.2.11.1 Where a ship is fitted with one or more podded propulsion units, the unit used as steering manoeuvring system is to be supplied and controlled in compliance with the requirements of 13.1.8, PART THREE of the Rules.

15.2.11.2 Where the electric motor is supplied by a slip ring, the following checks and tests on the ring are to be considered:

(1) check of the IP protection degree, in accordance with the location of the slip ring;

(2) check of clearances and creepage distances;

(3) check of contact resistance of the slip ring;

(4) endurance test: After the contact pressure and rated current are set, the slip ring is subjected to a rotation test. The number of rotations is evaluated taking into consideration the ship operation and rotation speed control system. The possibility of turning the pod 180° to proceed astern and 360° to return to the original position is to be considered. The ring may be submitted to cycles comprising full or partial rotation in relation to the use of the pod as steering gear. The voltage drops and current are to be recorded. An overload test is to be carried out (minimum 150%, 15s);

(5) check of the behaviour of the slip ring when subjected to the vibration described in IEC Publication 60068-2-6;

(6) check of the behaviour of the slip ring, after damp heat test, as described in IEC Publication 60068-2-30;

(7) after the damp heat test, an insulation resistance test is to be carried out;

(8) dielectric strength test.

15.2.11.3 All system failure alarms are to be displayed in the bridge. Alarms are to be arranged for the pod under the following circumstances:

(1) overload of propulsion motors;

(2) power failure of propulsion motors;

(3) low pressure of hydraulic oil system;

(4) low pressure of lubricating oil supply;

(5) high temperature of lubricating oil;

(6) low level of lubricating oil tank for motor bearings;

(7) high temperature of motor cooling air inlet;

(8) high temperature of motor cooling air outlet;

(9) abnormal operation of bilge pump;

(10) high level of pod bilge.

15.2.11.4 Sensors for control, monitoring and alarm systems located within the pod are to be duplicated, one acting as a standby for the other.

15.2.11.5 An effective cooling system is to be provided for the propulsion motor within the pod, and a standby cooling arrangement is to be provided and available for immediate use.

15.2.11.6 Two independent means of automatic bilge drainage are to be provided for the pod. The number and location of bilge level detectors are to be such that accumulation of liquids will be detected at all design angles of heel and trim.

15.2.11.7 The pod connecting bolts and slewing ring bearings are to comply with recognized standards, as applicable.

15.2.12 Cooling and ventilation

15.2.12.1 Loss of ventilation to compartments with forced air cooling is not to cause loss of propulsion. To this end, two sets of ventilation fans are to be provided, one acting as a standby unit for the other.

15.2.12.2 If semiconductor converters are separately cooled, the plant is to be capable of continuing operation at reduced power level if the cooling system fails. Means to contain any leakage of cooling liquid are to be provided so that the liquid does not cause a failure of the converter or any other electrical equipment located near the converter.

Section 3 STRUCTURAL REQUIREMENTS FOR PODDED PROPULSION UNITS

15.3.1 General requirements

15.3.1.1 Members of the hull support structure for a podded propulsion unit comprise a pedestal girder and its face plate (if fitted) that support the strut, and an orthotropic grillage of webs and floors that are connected to or surround the pedestal girder, as shown in Figure 15.3.1.1. This grillage may be of single or double bottom construction, but normally of double bottom in way of the podded propulsion unit.

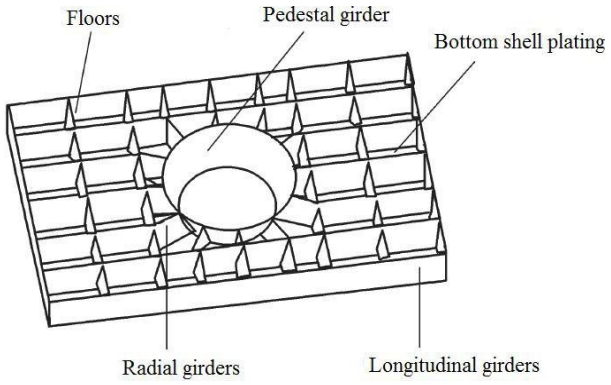

Figure 15.3.1.1

15.3.1.2 The outer ends of radial girders are generally to be connected to bottom longitudinal girders and floors and aligned with them both longitudinally and transversely, transferring the supported load to the hull structure. If the spacing of radial girders is too great, consideration is to be given to arranging supporting brackets between the slewing bearing outer races and pedestal girder to increase the rigidity of outer races. The thickness of the pedestal girder and its surrounding girders is not to be less than the minimum Rule thickness of solid floors or girders at the same positions. Where abutting plates are of dissimilar thickness, the applicable taper requirements of Chapter 2, PART TWO of the Rules are to be complied with.

15.3.1.3 In general, full penetration welding is to be applied in way of connections of the pedestal girder to the bottom shell plating and to the inner bottom plating or top outer races, and in way of the end connections between the radial girders and the pedestal girder. Radial girder webs are to be welded to the underside of the outer races at the top of the pedestal girder and its face plate, if fitted, is to be welded to the outer side of such outer races. Elsewhere, for primary members, double continuous fillet welding is to be applied using a minimum weld factor of 0.34.

15.3.1.4 The hull support structure is to be able to withstand the maximum loads transferred from the strut of podded propulsion unit and is to be sufficiently stiff that any deformation as a consequence of the maximum loads will not exceed the limits required for slewing bearing operation. The limits are to be based on the operational requirements for the pod.

15.3.1.5 The arrangement of the hull support structure and scantlings of its primary members are subject to direct strength analysis according to the following requirements:

(1) The support structure is to be modelled (e.g. elements and mesh size, etc.) by regular means of hull structure direct calculation, and the boundary conditions are to be obtained on the principle that response consequences of the members for assessment are not affected.

(2) Loads are to be provided by the pod manufacturer/designer, generally taking into consideration normal and ultimate conditions of the podded propulsion unit (see Note ① of Table 15.3.1.5).

(3) The calculated stress of the structural member is not to be greater than the permissible value. The permissible stress value is obtained by the material yield strength divided by the corresponding safety factor given in Table 15.3.1.5.

Safety Factor **Table 15.3.1.5**

Condition / Stress type	Normal condition	Ultimate condition
Normal stress	1.67	1.50
Shear stress	2.50	2.25
Equivalent Von Mises stress of plate elements	1.43	1.33

Notes:

① Normal condition means the normal operation condition, in which the structure does not fail while the ship is in normal service; ultimate condition means the most critical condition, in which the structure is subject to the maximum load expected due to accident.

② For check of the equivalent Von Mises stress of plate elements, only the equivalent stresses at the mid plane (membrane) at the element centroid are to be considered. However, high stress due to poor-shape elements may not be considered.

③ The safety factor for a plate element directly connected to the pedestal and located at the corner of a three-dimensional intersection may be appropriately reduced, but not to be less than 1.1. Where refined mesh analysis is applied here, the stress value of the element may be deducted by 5%.

15.3.1.6 In addition, scantlings of primary members are not to be less than those required for the stern structure in PART TWO of the Rules, as applicable.

CHAPTER 16 MEASUREMENT OF VIBRATION AND NOISE

Section 1 GENERAL PROVISIONS

16.1.1 General requirements

16.1.1.1 This Chapter applies to ships of 65 m or over in length applying for the class notations G-ECO,G-ECO VIBx and Gd-ECO NOIx specified in ISC Rules for Green Eco-Ships.

Section 2 NOISE

16.2.1 General requirements

16.2.1.1 Noise is to meet the requirements of Chapter 2, 2.2.1.1(3), 2.5.2 and Chapter 4, 4.3.2 of ISC Rules for Green Eco-Ships. Noise measurements are to be carried out in accordance with the requirements of Section 4.

Section 3 VIBRATION

16.3.1 General requirements

16.3.1.1 Vibration is to meet the requirements of Chapter 2,2.5.1 and Chapter 4, 4.3.1 of ISC Rules for Green Eco-Ships. Vibration measurements are to be carried out in accordance with the requirements of Section 4.

Section 4 MEASUREMENTS AND REPORTS

16.4.1 General requirements

16.4.1.1 The measurements of noise and vibration may be undertaken by ISC or an organization accepted by ISC. The measurements are to be witnessed by a ISC Surveyor.

16.4.2 Instrumentation

16.4.2.1 The vibration measurement and calibration equipment is to comply with ISO 6954:2000 and ISO 8041, and the instrumentation is to include at least a transducer with an appropriate amplifier, and a FFT analyser.

16.4.2.2 The instrumentation used is to be within a calibration validity period specified by the calibration authority, and copies of relevant documents are to be provided prior to measurements and together with the measurement report.

16.4.3 Test conditions for measurements

16.4.3.1 Prior to measurements, a measurement procedure is to be submitted to ISC for approval. This procedure is at least to contain details of the arrangement of measuring points, loading condition, weather condition, machinery operating condition, and measuring equipment. ISC may require additional measurements at the measuring points or locations.

16.4.3.2 Possible deviation from the required conditions may be accepted by ISC and this is to be clearly mentioned in the report.

16.4.3.3 Tests are to be conducted when the ship is fully outfitted and all systems contributing to noise and vibration levels are operational.

16.4.3.4 Generally the main engine is to operate with the power output corresponding to the designed normal seagoing condition, or at least 80% of the maximum continuous power available. All machineries and equipment that may operate simultaneously under normal operation conditions are to be run simultaneously.

16.4.3.5 In general, the tests are to be conducted in deep water, with a water depth not less than 5 times the mean draft and a distance from shore not less than 25 times the ship breadth. For ships usually

operating in shallow waters, the tests are to be performed with conditions corresponding to normal service conditions.

16.4.3.6 The tests are to be conducted in sea conditions not greater than sea state 3 on the WMO sea state code, with the wind force being not greater than 4 on the Beaufort scale.

16.4.3.7 Tests may generally be conducted in sea trial conditions. For cargo ships which may be operated over a large range of drafts, if the designed normal seagoing condition is different from the test conditions, additional measurements may be required.

16.4.3.8 Ship course is to be kept constant as far as possible, with rudder angle variations being within the range of ±2 degrees portside or starboard, for the duration of the measurement.

16.4.3.9 For offshore service ships to be operated at DP, measurements are to be carried out with the side thrusters in an operating condition corresponding to contractual conditions or with at least 40% power on the thrusters.

16.4.4 Vibration measurements

16.4.4.1 Vibration measurements are to be conducted in accordance with ISO 6954:2000 and ISO 20283-2.

16.4.4.2 Measurement locations are to be chosen so that the assessment represents the overall vibration environment on board the ship. In cabins, vibration readings are to be taken in the centre of the floor area. In large spaces, such as restaurants, sufficient measurements are required to define the vibration profile.

16.4.4.3 The vibration measurement report is to comply with ISO 6954:2000 and ISO 20283-2, containing measurement positions and directions indicated on a general arrangement plan, tabulated vibration levels, ship and machinery details, test conditions, and copies of the relevant instrument calibration certificates.

CHAPTER 17 ADDITIONAL REQUIREMENTS FOR GEOTEXTILES LAYERS

Section 1 GENERAL PROVISIONS

17.1.1 Application

17.1.1.1 This Chapter applies to ships provided with special equipment for laying geotextiles.

17.1.1.2 Geotextiles layers are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules as well as the relevant provisions of ISC Rules for Materials and Welding and of the flag State Administration, if any.

17.1.2 Notation

17.1.2.1 Ships complying with the provisions of this Chapter may be assigned the notation: Geotextiles Layer.

17.1.3 Definition

17.1.3.1 Geotextiles layers mean ships provided with special equipment for laying geotextiles, which are engaged in operations of laying soft mattress related to construction of cofferdams on land and floating structure projects under different environmental conditions such as coastal shoals and deep-water harbors.

17.1.4 Plans and documents

17.1.4.1 In addition to the plans and documents required in the relevant PARTs and Chapters of the Rules, the following plans and documents are to be submitted to ISC for approval (where applicable):

(1) Plan of reinforcement structure of geotextiles laying turning plate equipment;

(2) Plan of reinforcement structure of geotextiles laying positioning equipment.

17.1.4.2 The following plans and documents are to be submitted to ISC for information (where applicable):

(1) Information related to geotextiles laying equipment (such as turning plate, guide beam, coil drum and crane, etc.);

(2) Strength calculations of reinforcement structure of geotextiles laying equipment;

(3) Arrangement plan of positioning equipment of geotextiles laying operation;

(4) Strength calculations of reinforcement structure of geotextiles laying operation.

For special structures and arrangement, expansion of the submission scope of plans and documents may be required if deemed necessary by ISC.

Section 2 HULL STRUCTURE AND ARRANGEMENT

17.2.1 Hull structure

17.2.1.1 For hull structural strength, consideration is to be given to necessary reinforcement of the support structure of the equipment used in geotextiles laying operation.

17.2.2 Requirements for the support structure of geotextiles laying equipment

17.2.2.1 The strength of support and reinforcement structure of geotextiles laying equipment and geotextiles laying operation positioning equipment is to be checked by referring to the relevant requirements of Section 7, Chapter 3, PART TWO of the Rules.

17.2.3 Bunker

17.2.3.1 The bunker cannot be directly positioned under the working deck, unless a void hold or ballast tank etc. is arranged between the working deck and the bunker.

17.2.4 Hold arrangement

17.2.4.1 The working deck is to be distant from the engine room air inlet and outlet as far as possible.

Section 3 EQUIPMENT

17.3.1 General provisions

17.3.1.1 Geotextiles layers are to be capable of anchor mooring positioning or dynamic positioning.

17.3.2 Wheel house

17.3.2.1 A geotextiles layer is to be provided with a wheel house with good vision or a 360 ° video system for the whole ship, and communication by means of hardwired connection between the wheel house and the remote control station is to be provided.

CHAPTER 18 ADDITIONAL REQUIREMENTS FOR HEAVY EQUIPMENT CARRIER

Section 1 GENERAL PROVISIONS

18.1.1 Application

18.1.1.1 This Chapter applies to the carriers having larger deck areas and specially engaged in loading/unloading on decks and long-distance transporting the complete sets of heavy equipment and project facilities with the larger dimension/weight such as bridge cranes and heavy equipment at sea (hereinafter called the heavy equipment carriers).

18.1.1.2 The designer is to carry out the calculation and verification for longitudinal strength and the strength of deck and supporting structure below according to the heavy equipment intended to carry and submit the calculation information to ISC for information.

18.1.1.3 Besides the applicable requirements in this Chapter and the other Parts of the Rules as well as the ISC Rules for Materials and Welding, the heavy equipment carriers are to comply with the relevant provisions of the Administrations of flag States.

18.1.1.4 Where it complies with the requirements of this Chapter, the heavy equipment carrier may be assigned to the class notation of:

Bridge Crane and Heavy Equipment Carrier

Section 2 OUTFITTINGS

18.2.1 Equipment number

18.2.1.1 The equipment number for heavy equipment carriers is to comply with the requirements of 3.2.1 in Chapter 3 of PART TWO of the Rules, the total lateral windward area of the designed maximum complete sets of heavy equipment and project facilities is to be taken into consideration in the calculation of equipment number. Where such lateral windward area of the heavy equipment and project facilities can not be provided, the equipment number may be taken by increasing two grades.

18.2.2 Securing

18.2.2.1 The securing for the heavy equipment carriers carrying complete sets of heavy equipment and project facilities is to meet the requirements of ISC Guidelines for the Preparation of the Cargo Securing Manual. It may be acceptable that the ship's dynamic load is obtained by the seakeeping characteristics analysis and quasi-static force analysis under the worst sea conditions occurred possibly through the recognized software.

Section 3 INTACT STABILITY

18.3.1 Intact stability

18.3.1.1 The intact stability of heavy equipment carriers is to meet the requirements for dry cargo ships of the flag State Administrations.

18.3.1.2 The streamlined reduction is not to be considered when the wind area of complete sets of heavy equipment and project facilities is calculated, however, the lateral overlapping area may be deducted.

Section 4 SPECIAL REQUIREMENTS FOR EXTRA BALLAST OPERATION

18.4.1 General requirements

18.4.1.1 Extra ballast operation for heavy equipment carrier means:

(1) an operational condition for a ship with the draft not exceeding operational draft mark during the ballasting operation in order to load/unload the complete sets of heavy equipment and project facilities at port; and
(2) ship shifting at port with restrictions such as passing through bridge, etc., under the ballast condition of (1).
18.4.1.2 The extra ballast operation may be carried out provided that the heavy equipment carrier meets the requirements of this Section. The implementation of extra ballast operation is to be in compliance with the requirements of Extra Ballast Operational Procedure Manual in Section 5 of this Chapter.
18.4.1.3 During the extra ballast operation, the heavy equipment carrier is also to be in accordance with the following restricted meteorological/sea conditions:
(1) Beaufort scale not exceeding 5 for the extra ballast operation mentioned in 18.4.1.1(1);
(2) Beaufort scale not exceeding 4 and at the normal calm sea area (significant wave height less than 0.3 m) for the extra ballast operation mentioned in 18.4.1.1(2).
18.4.1.4 In order to ensure the ship draft and floating condition meet the relevant requirements during its extra ballast operation, ship draft meter is to be provided onboard and capable of indicating the forward draft, aft draft and amidship draft in the bridge.

18.4.2 Operational draft mark

18.4.2.1 Where the ship is ballasted to the maximum draft, the ratio between reserve buoyancy under freeboard deck and displacement at the draft is not to be less than 15%.
18.4.2.2 The maximum draft waterline mark which is allowable under extra ballast operation is to be assigned at the ship's both sides, refer to Figure 18.5.2.5 in Section 5 of this Chapter. The maximum extra ballast waterline mark is a horizontal line 400 mm in length and 25 mm in breadth. The upper edge of the line is to be in line with the maximum draft waterline and marked the letters of EB of 115 mm in height and 75 mm in width to indicate the extra ballast operational draft at both ends above the line.
18.4.2.3 Before the maximum draft waterline mark of extra ballast operation for heavy equipment carrier is assigned, it is to be verified that the requirements of reserve buoyancy, stability and strength of this Section have been met and marked in the Extra Ballast Operational Procedure Manual.

18.4.3 Intact stability and floating condition

18.4.3.1 The maximum angle of heel during the loading/unloading of complete set of heavy equipment and project facilities is not to exceed the following:
(1) where the ship affects the action of beam wind evenly with the load of 0.22 kPa (speed of 18 m/s), the angle of heel is not to exceed the emerging angle of freeboard deck edge, the level of wind moment is to be measured to the half draft from the centroid of wind area, for calculation, the wind area of complete set of heavy equipment and project facilities is to be in accordance with the requirement of 18.3.1.2 of this Chapter;
(2) 12°, whichever is the less.
18.4.3.2 The elements of each ballasting step under ship's extra ballast condition as corrected for free surface are to comply with the following:
(1) where the ship affects the action of beam wind evenly with the load of 0.22 kPa (speed of 18 m/s), the angle of heel is not to exceed the emerging angle of freeboard deck edge, the level of wind moment is to be measured to the half draft from the centroid of wind area, for calculation, the wind area of complete set of heavy equipment and project facilities is to be in accordance with the requirement of 18.3.1.2 of this Chapter;
(2) the initial metacentric height (GM) is not to be less than 0.5 m;
(3) the positive range of righting lever (GZ) curve is not to be less than 15°;
(4) the area under the righting lever (GZ) curve up to the angle of maximum GZ is not to be less than 0.035 m·rad.

18.4.4 Structural strength

18.4.4.1 The hull longitudinal strength under extra ballast condition is to meet the requirements of Longitudinal Strength in Section 2 of Chapter 2, PART TWO of the Rules, in which the wave load of hull beam is to be determined by direct calculation, or is obtained as 40% of the value calculated according to the formula in 2.2.3 of Section 2 in Chapter 2, PART TWO of the Rules.
18.4.4.2 The local strength of hull structure under extra ballast condition is to be verified.

Section 5 EXTRA BALLAST OPERATIONAL PROCEDURE MANUAL

18.5.1 General requirements

18.5.1.1 The purpose of Extra Ballast Operational Procedure Manual is to indicate that the ship meets with the requirements of extra ballast operation types and operational draft mark, stability and strength and provide the operational procedure and specification which the implementation for extra ballast operation – filling and discharging the ballast water is to be complied with to the master.

18.5.1.2 The Extra Ballast Operational Procedure Manual is to be submitted to ISC for approval.

18.5.2 Contents of the Extra Ballast Operational Procedure Manual

18.5.2.1 The initial condition of ship before extra ballast operation includes:

(1) loading conditions of complete sets of heavy equipment and project facilities, including the datum such as quantity, location, weight and center of gravity;

(2) datum such as quantity, location, weight and center of gravity of consumables carried onboard the ship;

(3) datum such as quantity, location, weight and center of gravity of ballast water loaded onboard the ship.

18.5.2.2 Steps for ballast operation such as filling of ballast water under full-loaded arrival condition are as follows:

Initial condition:

(1) loading condition of complete sets of heavy equipment and project facilities……

(2) condition of consumables carried onboard the ship……

(3) loading condition of ballast water……

Each steps of extra ballast operation:

(1) Step 1……

18.5.2.5 The sketch of maximum draft waterline mark (starboard) is given in Figure 18.5.2.5:

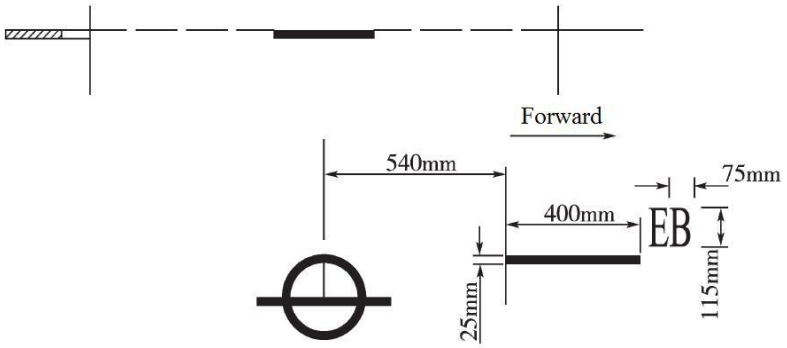

Figure 18.5.2.5 The Sketch of Maximum Draft Waterline Mark (starboard)

where: EB means the extra ballast.

CHAPTER 19 AC SHORE CONNECTION SYSTEMS

Section 1 GENERAL PROVISIONS

19.1.1 General requirements

19.1.1.1 This Chapter applies to AC shore connection systems with rated voltages (voltage between phases) of 15 kV or less for power supply to ships in port. Such systems are capable of transferring load between the shore supply and the ship's electrical power via blackout or temporary parallel running.

19.1.1.2 Guidelines for operations of shore connection are to be developed for ships to ensure operational safety for shore connection.

19.1.1.3 Where an HVSC system is arranged otherwise than specified in this Chapter, consideration may be given by ISC to acceptance of such arrangement, provided that it achieves an equivalent safety level.

19.1.1.4 During shore supply, proper measures are to be taken to avoid and minimize any harm to the safety of the ship and its personnel due to loss of electrical power.

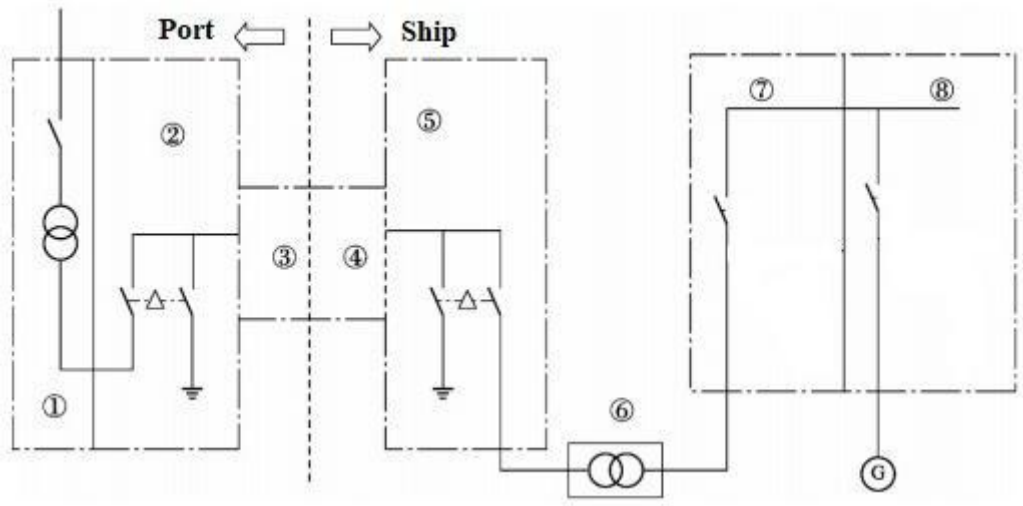
19.1.1.5 The shipside installations fitted in areas where flammable gas or vapour and/or combustible dust may be present are to be certified safe type as suitable for the flammable gas or vapour and/or combustible dust encountered, otherwise they are to be prohibited from being used.

19.1.1.6 A compatibility assessment is to be performed to verify the possibility to connect the ship to shore supply prior to the first arrival at a terminal, taking into account the compatibility of voltage, frequency, capacity and short-circuit current of the shore supply.

19.1.2 Class notation and product certificate

19.1.2.1 Ships fitted with shipside installations for HVSC systems and complying with the requirements of this Chapter may be, upon request, approval of drawings, survey and testing, assigned by ISC the following class notation: AMPS (AMPS: Alternative Maritime Power Supply). The maintenance, suspension, cancellation and reinstatement of the class notation are to be in compliance with Section 9, Chapter, PART ONE of the Rules.

19.1.2.2 Shipside installations for HVSC systems will be, upon survey, issued by ISC appropriate product certificates.



19.1.3 Definitions and terms

19.1.3.1 For the purpose of this Chapter, the following definitions apply:

(1) An **AC shore connection system** is the equipment used for power supply to ships in port, consisting of shipside and shore installations.

(2) An **AC low voltage shore connection system** is an AC shore connection system with rated voltages (voltage between phases) of 1 kV or less for power supply from port (shore supply) to ship's power distribution system.

(3) An **AC high voltage shore connection system** is an AC shore connection system with rated voltages (voltage between phases) of shore supply to ship's distribution system from 1 kV up to and including 15 kV. A typical AC HVSC system is shown in Figure 19.1.3.1(3).

① HV shore supply system (including transformers); ② HV shore distribution box; ③ Shore connection socket box; ④ Cable management system and cables (with plugs); ⑤ Shore connection switchboard; ⑥ Transformer; ⑦ Shore receiving control panel; ⑧ Generator panel of main switchboard

Figure 19.1.3.1(3) Diagram of a Typical AC High Voltage Shore Connection System

(4) **Shipside installations** are the equipment fitted on the ship for connection to shore supply, generally consisting of plugs/sockets, shore connection switchboards, transformers, shore receiving control panel (usually integrated into the main switchboard), shore connection cables and a cable management system.
(5) **Shore installations** are the equipment fitted at a terminal or port and used for power supply to ships, generally consisting of an HV shore distribution box, transformers, frequency converters (if applicable) and a shore connection socket box.
(6) A typical **cable management system** consists of cable winches, automatic controls of cable length or tension together with associated instrumentation. The ship's shore connection cables are picked and laid through the cable management system for connection to shore supply.
(7) **Equipotential bonding** provides electric connections between conductive parts, intended to achieve equipotentiality.

19.1.4 Drawings and information

19.1.4.1 Drawings and information specified in 19.1.4.2 and 19.1.4.3 of this Chapter are to be submitted to ISC for approval.
19.1.4.2 The following drawings and information for ship system are to be submitted for approval:
(1) Estimation of loads under shore connection;
(2) Evaluation of short-circuit currents under shore connection (applicable to ships provided with AC high voltage shore connection systems, and ships provided with AC low voltage shore connection systems for which short circuit current calculations are submitted in accordance with requirements of 1.1.3.1(2) of PART FOUR of the Rules);
(3) Drawing of the electrical system of shipside installations;
(4) Arrangement of shipside installations;
(5) Mooring test program for HVSC system (to be submitted to the ISC attending surveyor for review).
19.1.4.3 The following drawings and information for marine products of shipside installations of HVSC system are to be submitted for approval:
(1) Technical specifications of the system;
(2) Switchboards (including shore connection switchboard, transformer cabinet (if fitted), shore receiving control panel):
① electrical schematic diagram;
② list of components;
③ structural drawing (including external size, housing material, housing structure, coating, layout of faceplate, internal arrangement, rating plate, nameplate);
(3) Details of plugs/sockets;
(4) Details of shore connection cables;

(5) Details of cable management system;
(6) Test programs for the above equipment.
19.1.4.4 The following information are to be submitted to ISC for reference:
(1) Technical instructions of the system (for drawing approval of both ship and marine products);
(2) Instructions for fitting, using and maintenance (for drawing approval of marine products);
(3) List of system equipment (for drawing approval of marine products).

Section 2 SYSTEM DESIGN

19.2.1 General requirements

19.2.1.1 The AC shore connection system is to have a capacity sufficient for ensuring expected services (including emergency services) normally required for the ship while in port.
19.2.1.2 An equipotential bonding between the ship and the shore is to be established, and this bonding is not to change the earthing principle of the ship's power distribution system.
19.2.1.3 During shore supply, at least one of the ship's main generators is to be standby and, upon blackout of the shore supply, automatically started and connected to the main switchboard.

19.2.2 Emergency shutdown

19.2.2.1 Emergency shutdown facilities are to be provided to ensure instantaneously opening shore connection circuit breakers on shore and on board the ship. The emergency shutdown facilities are to be designed according to the fail-safe principle and so arranged as to prevent inadvertent activation.
19.2.2.2 The emergency shutdown facilities are to be activated automatically in any of the following cases:
(1) loss of equipotential bonding (applicable to AC high voltage shore connection system);
(2) alarm signal from the cable management system (mechanical stress of cable is too high, or remaining cable length is too short);
(3) loss of any control and monitoring circuits of HVSC system;
(4) disengaging of power plugs from any socket while the connection is live.
19.2.2.3 Emergency stop buttons that activate emergency shutdown facilities are to be provided at least at:
(1) the location of the shore connection switchboard;
(2) the position of operation of the cable management system;
(3) the location of the shore receiving control panel.
19.2.2.4 Activation of the emergency shutdown is to result in an audible and visual alarm at a manned location① of the ship in port.
19.2.2.5 Following the emergency shutdown, the circuit breaker is not to be closed until reset manually.

19.2.3 Safety interlocking

19.2.3.1 For the AC high voltage shore connection system, an earthing switch complying with the requirements of 5.3 of IEC 62271-200 is to be provided at the end of shore connection cable on board. While the shore connection circuit breakers are in the open position, the conductors of the cables are to be kept earthed by the earthing switch.
19.2.3.2 Arrangements are to be provided so that the shore connection circuit breaker (fitted in the shore connection switchboard) cannot be closed or automatically opened from its closed position in any of the following cases:
(1) equipotential bonding is not established (applicable to AC high voltage shore connection system);
(2) the pilot contact circuit of shore connection plugs/sockets is not established②;
(3) emergency shutdown facilities are activated;
(4) loss of any control and monitoring circuits of HVSC system;
(5) alarm signal from the cable management system (tension level of cable is too high, or remaining cable length is too short);
(6) earth fault on the ship's distribution system (applicable to AC high voltage shore connection system);
(7) the shore supply is not present.

19.2.4 Cable management system

---

① The location of the on-duty operator of shore connection as specified in the Guidelines for operations of shore connection.
② The connection is established by proper contact of the pilot contactors embedded in the plug and socket.

19.2.4.1 A cable management system is to be provided for shore connection cables to ensure that:
(1) the mechanical tension applied to the cables will not exceed the designed permissible value;
(2) the possibility of transmitting mechanical stresses to cables or terminals is excluded;
(3) the shore connection circuit breaker will be instantaneously opened where cables are excessively extended.

19.2.5 Load transfer

19.2.5.1 Load transfer between the shore supply and the shipstantaneously opened where cabcuted via blackout or temporary parallel running.
19.2.5.2 Where load transfer is executed via blackout, means are to be provided to prevent simultaneous supply from the ship's generators (including emergency ones) and the shore supply.
19.2.5.3 Where load transfer is executed via temporary parallel running of the shipboard generator and the shore supply, compliance of voltage and frequency variations with the requirements of 1.2.2, Chapter 1, PART FOUR of the Rules is to be ensured.
19.2.5.4 The temporary running in parallel is also to comply with the following requirements:
(1) Means are to be provided for automatic synchronization of the shipboard generator and the shore supply.
(2) Load transfer is to be automatic.
(3) The duration of the temporary parallel running is to be as short a period as practicable allowing for the safe transfer of the load.
(4) If the defined transfer time limit for load transfer is exceeded, the transfer is to be stopped, shore connection circuit breakers are to be opened, and an audible and visual alarm is to be activated at a manned location.

19.2.6 Short-circuit protection

19.2.6.1 Where only the shore supply is used, the short-circuit current calculation is to be referred to ISC guidance document GD021-1999 Calculation of Short-Circuit Current Fed through AC Shore Power System or other methods acceptable to ISC. For temporary parallel running of the shore supply and the ship's electrical power, the short-circuit current calculation is to be referred to IEC 60909 publications or other methods acceptable to ISC.
19.2.6.2 During shore supply, the prospective short-circuit current level at any point in the ship's power distribution system is not to exceed the short-circuit breaking and making capacities of circuit breakers installed onboard.
19.2.6.3 For assessment of short-circuit currents, the prospective short-circuit current level for both the shore supply and the ship's electrical power are to be taken into account. Consideration may be given to the following measures for restricting prospective short-circuit currents during connection to shore supplies:
(1) preventing parallel connection of shore supplies with the ship's sources of electrical power; or
(2) restricting the number of the ship's generating sets operating during parallel connection to transfer load; and/or
(3) restricting the short-circuit current level from shore supply to the ship's power distribution system.

Section 3 ELECTRICAL EQUIPMENT

19.3.1 General requirements

19.3.1.1 In addition to the requirements of this Chapter, shipside installations of the AC high voltage shore connection system are to comply with the requirements of 2.14.2.3, 2.14.2.4, 2.14.4, 2.14.6 and 2.14.7 of Chapter 2, PART FOUR of the Rules.
19.3.1.2 Equipment with voltage above 1 kV is not to be installed in the same enclosure with low voltage equipment, unless segregation or other suitable means are provided to ensure that access to low voltage equipment is obtained without danger.
19.3.1.3 In addition, shipside installations are to be arranged to prevent interference with the ship's mooring and cargo handling operations.
19.3.1.4 The degrees of protection provided by enclosures for components of shipside installations are to be appropriate to the location where they are situated, and comply with the requirements of 1.3.2.2 of Chapter 1 and 2.14.2.2 of Chapter 2, PART FOUR of the Rules.

19.3.2 Shore connection switchboard

19.3.2.1 The shore connection switchboard of the AC high voltage shore connection system is to be in

accordance with the publication IEC 62271-200, service continuity LSC1.

19.3.2.2 The shore connection switchboard is to be located as close as possible to shore connection cables on board.

19.3.2.3 The switchboard is to include a circuit-breaker for protection against undervoltage, overvoltage and short-circuit current.

19.3.2.4 The shore connection switchboard is to be fitted with the following instruments, indicators and alarms:

(1) one voltmeter: all three phases;
(2) one ammeter: all three phases;
(3) one frequency meter;
(4) one kilowatt-hour meter (optional);
(5) shore power indicator: power connected;
(6) circuit breaker tripping with alarm;
(7) earth-fault alarm (applicable to AC high voltage shore connection system);
(8) phase rotation indicator.

19.3.2.5 Where measures for restricting short-circuit currents are taken as required in 19.2.6.3(3), a corresponding device is to be provided in the shore connection switchboard.

19.3.3 Shore receiving control panel

19.3.3.1 The shore receiving control panel is to be in accordance with the applicable requirements in Section 3, Chapter 3, PART FOUR of the Rules.

19.3.3.2 The shore receiving control panel is in general to be a component of the main switchboard, which is to be provided with isolation switches or circuit breakers.

19.3.3.3 The shore receiving control panel is to be fitted with the following instruments:

(1) two voltmeters[①]: 1 for measuring the voltage in each phase of the shore supply, 1 for measuring the busbar voltage;
(2) one ammeter: all three phases of the shore supply;
(3) two frequency meters[①]: 1 for measuring the frequency of the shore supply, 1 for measuring the bus-bar frequency;
(4) phase rotation indicator;
(5) synchronizing device.

19.3.4 Transformers

19.3.4.1 Transformers are to be of the separate winding type for primary and secondary sides and comply with the applicable requirements of the series publications IEC 60076.

19.3.5 Cables

19.3.5.1 High voltage shore connection cables are to comply with the requirements of Annex A of the publication IEC 80005-1 or other acceptable standards. Low voltage shore connection cables are to comply with the requirements of Annex A of the publication IEC80005-3 or other acceptable standards.

19.3.5.2 Fixed high voltage cables on board are to comply with the requirements of publications IEC 60092-353 and IEC 60092-354 or other equivalent standards.

19.3.6 Plugs and socket outlets

19.3.6.1 The ship may be connected to the shore supply via suitable means or plugs and socket outlets. Plugs and socket outlets are to be designed so that an incorrect connection cannot be made and that plugs cannot be inserted or withdrawn while live. Plugs and socket outlets are to be in accordance with international[②] and/or national standards.

---

① Where the shore supply is connected to the bus bar and the voltage and frequency of the bus bar are easy to observe for the operator, only one voltmeter and one frequency meter may be fitted.

② For the standards for AC high voltage shore connection systems, refer to IEC 62613-1, Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC systems) – Part 1: General Requirements and IEC 62613-2, Plugs, socket-outlets and ship couplers for high-voltage shore connection systems (HVSC systems) – Part 2: Dimensional compatibility and interchangeability requirements for accessories to be used by various types of ships. For the standards for AC low voltage shore connection systems, refer to IEC 60309-1, Plugs, socket-outlets and couplers for industrial purposes – Part 1: General Requirements, IEC 60309-2, Plugs, socket-outlets and couplers for industrial purposes – Part 2: Dimensional interchangeability requirements for pin and contact-tube accessories and IEC 60309-5, Plugs, socket-outlets and couplers for industrial purposes – Part 5: Dimensional compatibility and interchangeability requirements for plugs, socket-outlets, ship connectors and ship inlets for low-voltage shore connection systems (LVSC).

Section 4 SURVEY AND TESTING

19.4.1 Inspections and tests of products

19.4.1.1 Shipside installations and their components are to be certified by ISC in accordance with Chapter 3, PART ONE of the Rules.

19.4.1.2 Components of shipside installations are to be inspected and tested according to approved drawings and relevant standards.

19.4.2 Ship surveys

19.4.2.1 The first survey of shipside installations after fitting onboard new ships or ships in service is to be carried out in accordance with 19.4.2.2 of this Chapter, and the subsequent surveys are to be carried out in accordance with 19.4.2.3 and 19.4.2.4 of this Chapter.

19.4.2.2 Initial survey

(1) Check of product certificates of shipside installations.

(2) Check of compliance of the arrangement and fitting of shipside installations with approved drawings.

(3) The installations are to be subjected to the following inspections and tests:

① visual examination;

② test of insulation resistance to earth;

③ voltage withstand test of high voltage cable installation (applicable to AC high voltage shore connection systems, refer to 2.14.7.2(6) of Chapter 2, PART FOUR of the Rules;

④ functional tests, including overcurrent protection test of the connected breakers, test of phase rotation, test of emergency shutdown facilities, test of safety interlocking, test of load transfer in parallel (if applicable);

⑤ measurement of insulation resistance in hot condition;

⑥ functional test of cable management system.

19.4.2.3 Annual survey

(1) Shipside installations are to be subjected to the following tests:

① visual examination;

② test of insulation resistance to earth;

③ if practicable, the connection to shore supply may be tested for shore-to-ship power supply. Where such test is impracticable, the availability of the equipment is to be confirmed by examining the records of shore supplies and/or the records of maintenance of shipside installations.

19.4.2.4 The requirements for intermediate survey are the same as those for annual surveys.

19.4.2.5 Special surveys include, in addition to the annual survey items, functional tests as required in 19.4.2.2(3)④ of this Section and functional test of cable management system as required in 19.4.2.2(3)⑥ of this Section.

CHAPTER 20 ADDITIONAL REQUIREMENTS FOR ANCHOR HANDLING

Section 1 GENERAL PROVISIONS

20.1.1 Application

20.1.1.1 The requirements of this Chapter apply to anchor-handling ships.

20.1.2 Class notation

20.1.2.1 Ships complying with the requirements of this Chapter will be assigned the following class notation:

(1) Anchor Handling.

20.1.3 Plans and documents

20.1.3.1 The following plans are to be submitted for approval:

(1) Foundation and supporting structure of anchor handling winch;

(2) Stern rollers, towing pins, shark jaws and their supporting structures;

(3) Stability booklet (additional requirements for anchor handling);

(4) Construction profile and shell expansion.

20.1.3.2 The following plans or documents are also to be submitted for information:

(1) Arrangement of anchor handling equipment;

(2) Type and rated parameters of the anchor handling winch.

Section 2 HULL STRUCTURE

20.2.1 General requirements

20.2.1.1 Where not provided in this Chapter, the hull structure of anchor-handling ships is to comply with the relevant requirements of Chapter 2, PART TWO of the Rules.

20.2.2 Shell plating

20.2.2.1 The side shell in way of the stern rollers immediately adjacent to high duty mooring bollards and in other high load areas is to be suitably reinforced. Where an anchor-handling ship is not provided with any fender, the thickness of shell plating is not to be less than that required in Section 3, Chapter 2, PART TWO of the Rules and not to be less than 11 mm.

20.2.3 Deck plating

20.2.3.1 The deck plating near the stern and that subject to concentrated loads are to be suitably increased in thickness. Where an anchor handling ship is an offshore supply ship, the increased thickness of deck plating is not to be less than 2 times that required by 11.3.2.1, Section 3, Chapter 11, PART TWO of the Rules.

20.2.3.2 Where the anchor and chain are kept on the deck, effective means (e.g. wooden sheathing) are to be provided to uniformly distribute their weight on the deck.

Section 3 ANCHOR HANDLING EQUIPMENT AND SUPPORTING STRUCTURES

20.3.1 Anchor handling arrangement

20.3.1.1 The following equipment is to be provided on anchor-handling ships:

(1) anchor handling winches;

(2) stern rollers;

(3) shark jaws;

(4) towing pins.

20.3.1.2 Anchor handling winches are to be designed in such a way as to allow an emergency release in

all operating conditions, and this is to be operable from the navigation bridge. After an emergency release, the braking of winches is to be capable of being restored to normal function immediately.

20.3.2 Equipment and supporting structures

20.3.2.1 The anchor handling winch and associated accessories are to be capable of sustaining the maximum load from the hoisting, rendering and braking including any dynamic loads as applicable without permanent deformation.

20.3.2.2 The foundation and supporting structures of anchor handling winches are to be capable of sustaining the maximum braking load or 1.5 times the maximum hoisting load, whichever is greater. The considered stress is not to be greater than the following permissible values:

normal stress $[\sigma] = 0.9R_{eH}$;

shear stress $[\tau] = 0.5R_{eH}$;

equivalent stress $[\sigma_e] = 1.0R_{eH}$;

where: R_{eH} is yield stress of material, in N/mm^2.

20.3.2.3 Stern rollers, shark jaws and towing pins are to be sized such that they, together with their supporting structures, are capable of sustaining 2 times the maximum static working load in all conditions of their arrangement, and the permissible stress under consideration is to be in accordance with 20.3.2.2 of this Section.

CHAPTER 21 HULL MONITORING SYSTEMS

Section 1 GENERAL PROVISIONS

21.1.1 General requirements

21.1.1.1 This Chapter applies to hull monitoring systems installed voluntarily on board ships.

21.1.1.2 The ships provided with hull monitoring systems in accordance with this Chapter may apply for a corresponding class notation.

21.1.1.3 The hull monitoring system may be used to collect and monitor hull stress, wave and operational parameters. The system is to give warning when changes of these data approach levels that require action.

21.1.1.4 For ships not complying with the requirements of this Chapter, other arrangements achieving safety level to the same extent as that specified by this Chapter may be used, subject to agreement of ISC.

21.1.1.5 In no case is the hull monitoring system (including sensors) to be installed to damage the hull structure and impair the performance of ship, or give rise to any potential safety hazard. The system is not intended as a substitute for correct judgment and responsibility of crew members.

21.1.2 Class notations

21.1.2.1 Upon request of the owner and in accordance with different sensors/components of the hull monitoring system, the following class notations may be assigned:

(1) HMS(×): Sensors monitoring the global longitudinal stress amidships are installed in the hull monitoring system, and also sensors/components monitoring other parameters may be selected, where within the brackets there will be letters specifying the selected sensors/components and multiple letters are separated by comma ","[①] and arranged in alphabetical order indicated in the table.

The following sensors/components in Table 21.1.2.1 may be selected for the hull monitoring system:

Letters Specifying Selected Sensors/Components Table 21.1.2.1

Letter	Description
Gn	Sensor monitoring the global hull strain
Dn	Sensor monitoring the local hull strain
On	Sensor monitoring the propulsion shaft(s) output
An	Sensor monitoring the axial acceleration
Mn	Device for monitoring of hull rigid body motions (six degrees of freedom)
Pn	Sensor monitoring the transient sea pressure acting on the hull (slamming)
Sn	Sensor monitoring the liquid motion pressures in tanks (sloshing)
Tn	Sensor monitoring the temperature
Bn	Device for monitoring the wave
Wn	Wind sensor
Nn	Navigation sensors
Ln	Backed up statistics and triggered time series to be sent to ISC periodically
Cn	Online link to loading instrument that is continuously up-dating the loading condition

Note: n denotes the number of sensors or devices.

(2) HMS-HSC (×): applicable to high speed craft and the sensors/components installed in the hull monitoring system are to comply with Table 21.4.3.2.

21.1.2.2 The class notations specified in 21.1.2.1 are to be assigned on the basis of approved drawings, certification of equipment and onboard survey.

21.1.2.3 The hull monitoring system (including sensors) is to be furnished with a type approval certificate of ISC or other equivalent documents acceptable to ISC.

21.1.3 Plans and documents

21.1.3.1 Documents containing the following information are to be submitted for approval:

---

① For example, a bulk carrier equipped with sensors monitoring the global longitudinal stress amidships and also sensors monitoring the axial acceleration and local hull strain may be assigned the class notation HMS (Gn, Dn, An) upon request of the owner.

(1) arrangement of sensors (including the information on each sensor);
(2) diagrams of power systems of the hull monitoring system.
21.1.3.2 The following documents are to be submitted for information:
(1) explanation on relevant software (including data processing unit);
(2) instruction manuals of the hull monitoring system.

21.1.4 Documents to be kept on board

21.1.4.1 Instruction manuals are to be kept on board. The manuals are at least to contain the following instructions on:
(1) operation;
(2) setting and calibration of sensors and system;
(3) identification of faults;
(4) repairs;
(5) systematic maintenance and function testing (showing how components and systems are to be tested and what is to be observed during the tests);
(6) interpretation of measuring results.
21.1.4.2 A log for maintenance and calibration of the hull monitoring system is to be kept on board.

Section 2 SYSTEM DESIGN

21.2.1 System composition and components

21.2.1.1 The hull monitoring system generally consists of a computer system (upper layer) and sensors installed in appropriate spaces (lower layer). Relevant information monitored by each sensor is transferred to the computer system. Upon receipt of such information, processing, display, alarm and storage are carried out by the computer system.
21.2.1.2 Sensors are to be so selected as to ensure that they are suitable for use in the marine environment and their type and accuracy are also suitable for use of the signal.
21.2.1.3 In the case that the ship already has installed a sensor for monitoring of a certain parameter, installation of a separate sensor for the hull monitoring system is not required.
21.2.1.4 Wave sensors may be used to monitor the wave condition, which produces a two dimensional spectrum (wave frequency and relative direction between wave and ship heading). Based on the spectrum, significant wave height, main wave direction and main wave period may be derived.
21.2.1.5 An anemometer giving speed and dominant direction of the wind may be used.
21.2.1.6 The speed of the ship may be taken from the GPS system or the speed log.
21.2.1.7 The course of the ship may be taken from the GPS system or the gyro compass.

21.2.2 System requirements

21.2.2.1 The hull monitoring system is to have functions of processing and display, and provide relevant information to ship's operators.
21.2.2.2 The system is to include a computer with sufficient capacity to perform the tasks required, e.g. process the sensor signals, display the information required on a screen, give alarms and store the data.
21.2.2.3 All electrical components that are exclusively used in the hull monitoring system, i.e. not sensors included in the navigation system, are to be powered through an UPS (un-interruptible power supply). In case of main power failure, the UPS is to have sufficient capacity to maintain normal operation of the hull monitoring system for at least 10 minutes.
21.2.2.4 The hull monitoring system is to automatically re-start for normal operation at return of main power.
21.2.2.5 In the case that the ship is equipped with a loading instrument, the still water shear forces and bending moments are to be transferred to the hull monitoring system. These data can be entered manually, read from a disk or transferred through an electronic link. The system may use this information to calculate the bending stress at the global strain positions.
21.2.2.6 The system is to be designed to give visual and audible alarm for at least the following incidents:
(1) power failure;
(2) sensor failure;
(3) signal from a sensor exceeding the alarm threshold value.
21.2.2.7 The programs and data held in the data recording system are to be protected from corruption by loss of power.
21.2.2.8 The user interface (display, keyboard and alarms) is at least to be installed on the bridge.

21.2.2.9 A data storage device suitable for saving time series and statistical information is to be used.
21.2.2.10 The system is to have minimum data storage capacity and functionality as specified in 21.3.9.
21.2.2.11 The hull monitoring system is to be configurable. The configuration is to include all settings that are relevant for a specific installation. Such settings will typically be calibration factors, sensors threshold values, filter cut-off frequencies, statistical calculations that are selected for the different sensors, etc.
21.2.2.12 The system is to have output port for providing Voyage Data Recorder with all IMO mandatory information (IMO resolution MSC.333(90) as amended by IMO resolution MSC.494 (104)) from the system. The port is to be compliant with IEC 61162.
21.2.2.13 Information on how to interpolate the vertical hull girder bending moment values from the loading instrument to the strain gauge positions is to be included in the computer programme of the system so that the loading instrument readings can be used for setting and checking the system.
21.2.2.14 Each strain gauge is initially to be set to a stress calculated in an agreed loading condition. This calculated stress is to be compatible with the output of the loading instrument and calculations made using the loading manual. The set-up is not to be carried out when dynamic stresses are present and is to be made when temperature effects are minimized and in absence of large gradients. The initial reading of the global strain gauge is to be checked against an agreed loading condition in calm water. In the event that the difference is greater than 5% of the approved value or 5 N/mm^2 occurs, whichever is the greater, the setup and subsequent checking are to be repeated.

21.2.3 System installation

21.2.3.1 The position of the strain gauges is to take account of the structural configuration of the ship and its mode of operation.
21.2.3.2 Deck-mounted strain gauges are to be protected from green seas on deck by appropriate siting or by using breakwaters or similar means. Strain gauges installed in other positions are to be suitably protected against external damages.
21.2.3.3 Motion sensors to measure motions are to be placed in positions where their functioning will not be affected by vibrations. Accelerometers and motion monitoring devices are to be mounted on a structural point where local structural vibration will be minimal. If resilient mounts are used, it is to be demonstrated that they have frequency characteristics that do not affect the signal in the frequency range of interest.
21.2.3.4 The rigid body motions are to be referred to the center of gravity in loaded condition.

21.2.4 Loads due to transient sea pressure (slamming)

21.2.4.1 Loads due to transient sea pressure (slamming) are preferably to be measured in terms of normal stress (strain) at the structure on which the pressure is acting, e.g. the pressure loads are to be measured as normal stress on longitudinal(s) or plating.
21.2.4.2 The loads may alternatively be measured using pressure transducer(s) mounted through the hull.
21.2.4.3 An accelerometer in the bow area may be used as an indicator of slamming incidents.

21.2.5 Loads due to liquid motions in tanks (sloshing)

21.2.5.1 Loads due to liquid motions in tanks (sloshing) are preferably to be measured in terms of stress (strain) in the structure on which the loads are acting.
21.2.5.2 The loads may alternatively be measured in terms of pressure using a pressure transducers mounted through the tank wall.

21.2.6 Structural temperature

21.2.6.1 Temperature sensors installed on the supporting structure① of cargo tanks containing cooled or heated cargo, are at least to have an operational range that covers the temperature of the cargo and the temperature in the structure when the cargo hold is empty.

Section 3 DATA PROCESSING AND STORAGE

21.3.1 General requirements

21.3.1.1 The parameters given in 21.4.3 are to be processed and made available for the hull monitoring

① For liquid tanks provided with the independent tank, the supporting structure means the saddle supporting the liquid tank; for the integral tank, the supporting structure mainly means the inner side of bulkhead.

display.
21.3.1.2 The measured signals are to be split into given time intervals for data processing. The results from the data processing for each time interval are to be stored. The time interval selected is to be set during the initial configuration of the software.
21.3.1.3 The type of processing each individual sensor's signal is to be defined during the initial configuration of the system. The configured information document can be accessed and consulted.

21.3.2 Data filtering

21.3.2.1 The software is to include high-pass and low-pass time domain digital filters. The cut-off frequency of the filters is to be configurable through the software.
21.3.2.2 The filters are to be designed to have a stop-band attenuation of at least 40 dB.
21.3.2.3 The filters are to be initiated at the start-up of the hull monitoring software, and be continuously active as long as the software is running during normal operation. The part of the filtered signal that is corrupted by the settling of the filter during start-up is not to be used in the subsequent data analyses.
21.3.2.4 The system is to have the capability to simultaneously perform filtering on all the measured time series of hull responses. The time series subjected to filtering are to be configurable through the software.
21.3.2.5 The system is to be able to put the time signal from all sensors measuring the ship responses through the following filtering processes, giving four different time series:
(1) no filtering (static value and both wave and vibrations responses are maintained);
(2) high-pass filtering (static value and low cycle temperature fluctuation are removed, the wave response and vibration responses of the signal are maintained);
(3) low-pass filtering (static value and the wave response is maintained);
(4) high-pass filtering (only the vibration response is maintained).
21.3.2.6 The software is to be able to display each of the four different time series described in 21.3.2.5.
21.3.2.7 The software is to be able to perform the data analyses described in 21.3.3 through 21.3.6 on each of the four different time series described in 21.3.2.5.

21.3.3 Statistical calculations

21.3.3.1 The software is to be able to perform the statistical calculations on the time series described in 21.3.1.2 and 21.3.2.5. The sensors selected for statistical calculations and statistical operation to be performed are to be configurable in the initial set-up of the software.
21.3.3.2 The following statistical parameters are to be calculated for each of the selected ship response parameters:
(1) maximum value;
(2) minimum value;
(3) mean value;
(4) standard deviation;
(5) skewness;
(6) kurtosis;
(7) mean zero crossing period.
21.3.3.3 For each of the ship responses, a histogram of all the peaks in the time history is to be established. The amplitude for each response is to be divided into pre-set intervals, and the number of peaks within each interval is to be counted. Hence, the histogram will contain the number of peak occurrences within each interval. The intervals are to be set during configuration of the software.
21.3.3.4 Similar histograms of the ship responses as described for the peaks in 21.3.3.3 are also to be established for the troughs.
21.3.3.5 For transient phenomena, such as liquid impacts (slamming and sloshing), the integrated energy of each impact is to be calculated.
21.3.3.6 For transient phenomena, such as liquid impacts (slamming and sloshing), the rise time of each impact is to be calculated. The limits for the calculation are to be configurable.
21.3.3.7 Based on assumptions of statistical distribution of the parameters derived in 21.3.3.2 to 21.3.3.5, a curve for the probability of exceeding a certain value within a given time period is to be estimated. The time period is to be configurable through the software.
21.3.3.8 Based on the probability curve, the probability of exceeding a predefined threshold value is to be found. The threshold value is to be configurable through the software.

21.3.4 Fatigue life estimation

21.3.4.1 The fatigue life of the structural elements equipped with strain sensors is to be estimated based on the measured time history.

21.3.4.2 The stress response histograms are to be established for each strain sensor using a type of cycle count method.

21.3.5 Loads due to transient sea pressure (slamming)

21.3.5.1 The number of transient peaks recorded by the sensor installed for the recording of slamming incidents exceeding the threshold level, is to be counted. The number count for a pre-defined time period is to be made available for the display. The threshold value and the time period are to be configurable through the software.

21.3.6 Hull stress

21.3.6.1 The hull girder strain (stress) may often be influenced by strain induced by temperature differences in the hull structure. This strain may be caused by temperature differences between the cargo and the environments or by partial heating of the hull structure due to sunshine. These effects may be reflected as low cycle variations of the measured strain. The strain due to these temperature differences is normally not to be included in the analyses performed by the hull monitoring system. The hull monitoring system is to have the capability to optionally remove the strain due to temperature differences in the hull girder.

21.3.6.2 The hull monitoring system is to have the capability to read the still water bending/torsion moments calculated by the loading instrument (if applicable). This information could either be typed manually into the hull monitoring system or be transferred electronically by disk or data link. Based on this information, the hull monitoring system is to be capable of computing the strain (stress) due to the still water bending moments at each position where a sensor measuring global hull strain (stress) is positioned. In the case when the sensor position does not correspond to a section for where the still water bending moments are computed, a linear interpolation between the moments on each side of the sensor position may be applied.

21.3.6.3 The hull monitoring system is to have the following three options for each individual strain sensor, to be selected independently, for input to the statistical analyses and the alarm handler. The option is to be selected during the initial installation of the hull monitoring system, with explanations given in the configuration file.

(1) measured strain as recorded (including possible effects due to temperature differences in the hull structure);

(2) measured strain high-passed filtered in order to remove low cycle temperature effects;

(3) measured strain high-passed filtered in order to remove low cycle temperature effects, and then have a strain offset added to the filtered strain signal, corresponding to the strain due to still water loading at each sensor position.

21.3.7 Threshold values and alarms

21.3.7.1 The hull monitoring software is to be designed to allow input of a minimum and a maximum threshold value for each sensor.

21.3.7.2 The measured values are to be compared to the given threshold values for each sensor. In the case that the computed value exceeds 80% of a threshold value, an alarm is to be given.

21.3.7.3 The cause of the alarm is to be automatically written to an alarm log that is to be stored on an electronic device.

21.3.8 Trend predictions

21.3.8.1 The results from the calculations for each time interval are to be arranged in such way that a sequence of the latest data from each individual sensor can be displayed as a trend.

21.3.8.2 A 4-hour data sequence from each individual sensors is to form the basis for a forecast trend prediction of the expected response from each individual sensor for at least the next hour. The measured and the predicted data is to be made available for the display.

21.3.8.3 When the signal from an individual sensor exceeds 80% of the specified threshold value for that sensor, the expected time to reach the threshold value is to be predicted based on trend analyses. The measured and the predicted data is to be made available for the display.

21.3.9 Data storage

21.3.9.1 The system is to have capacity to store at least one year of statistical data and 24 h of time series from all sensors. For sensors dedicated to slamming and sloshing measurements, it is sufficient to store the time sequences where the transients are exceeding a given threshold value.

21.3.9.2 The system is to have the capability to back-up the recorded data on a medium suitable to be

read on a personal computer (PC).

21.3.9.3 The data back-up files are to include all the recorded data presented on a suitable text format. The files are to include sufficient information to clearly describe the content of the files.

21.3.9.4 For each time interval, the system is to store the results from all the calculations for all the individual parameters recorded. The data is to be labelled with a time stamp (date and time) corresponding to the beginning of the time interval.

21.3.9.5 The system is to automatically store time series for all the measured parameters for a number of time intervals corresponding to at least a period of the last 4 h of recording. Time series older than this period is to automatically be deleted from the storage device.

21.3.9.6 The system is to have the functionality to permanently store the data specified in 21.3.9.5. The system is to have the storage capacity to permanently store at least 12 such periods.

Section 4 DISPLAY AND MONITORING

21.4.1 Display

21.4.1.1 The hull monitoring system is to have a display suitable for presentation of screen images.

21.4.1.2 The system is to have at least screens that display the following information:

(1) clearly visualize the position of each individual sensor;

(2) the status of each individual sensor, i.e. whether the sensor is operational or faulty;

(3) real time information of the measured time series of each individual sensor;

(4) signal level from each individual sensor compared to the threshold values;

(5) trends of the statistical parameters for each individual sensor, including forecast predictions;

(6) alarm status.

21.4.2 Manual input

21.4.2.1 The system is to be provided with means for manual input.

21.4.3 Extent of monitoring

21.4.3.1 For the class notation HMS(×), in addition to sensors monitoring the global longitudinal stress amidships which are installed port and starboard, other parameters may also be monitored. Recommended parameters to be monitored for the various types of ships and available sensors/components are given in Table 21.4.3.1.

Recommended Parameters to be Monitored for Types of Ships and Available Sensors/Components Table 21.4.3.1

No.	Parameter	Applicable ship type	Available sensors/ components	Remark
1	Vertical accelerations at forward perpendicular ($0.01L^{①}$) at centerline	a, b, c, d	A	① L is length of ship as defined in 1.1.2.1, Chapter 1, PART TWO of the Rules
2	Transverse acceleration in the 0.4L mid ship area	b, c, d	A	To monitor inertia loading on sensitive cargo. Sudden change in response may indicate irregular situations such as ingress of water in holds or at vehicle decks
3	Global longitudinal stress at the quarter length L/4 from mid ship (port and starboard)	$a^{②}$, $b^{②}$, $c^{②}$, $d^{③}$	G	② For ships with length L>180 m ③ For ships with hull girder sectional modulus < 1.5W_{rule} and with length L>180 m
4	Longitudinal stress close to bottom (L/2) amidships (port and starboard)	$b^{④}$, $c^{⑤}$	G	④ Longitudinal stresses (L/2) amidships below the neutral axis, e.g. at bilge area. Only for ships with large openings in deck ⑤ Longitudinal stresses (L/2) amidships below the neutral axis, e.g. at bilge area
5	Double bottom bending	$b^{⑥}$	D	⑥ For Bulk Carriers with class notation BC-B and BC-A, one strain sensor in inner bottom of each hold
6	Bending/shear stress in pillar bulkheads	$c^{⑦}$	D	⑦ For ships with operational limits with respect to draught with empty holds
7	Lateral loads at bottom near forward perpendicular	a, b, c, d	P	
8	Lateral loads at side	a, b, c, d	P	

No.	Parameter	Applicable ship type	Available sensors/ components	Remark
9	Lateral loads at the bow door	d⑧	P	⑧ For Ro-Ro Ships only
10	Loading instrument	a, b, c, d	C	Ship provided with a loading instrument may choose whether to establish an online link to the hull monitoring system
11	Position, speed/course	a, b, c, d	N	
12	Power output and revolutions of propulsor (s)	a, b, c, d	O	
13	Wave condition	a, b, c, d	B	
14	Wind condition	a, b, c, d	W	
15	Structural temperature	a	T	
16	Sloshing response of liquid in tanks	a	S	
17	Ship's attitude	a, b, c, d	M	
In the Table, a: oil tankers, petroleum asphalt tankers, chemical tanker, liquefied gas carriers; b: bulk carriers and ore carriers; c: container ships; d: general cargo ships, ro-ro ships, passenger ships and other ships.				

21.4.3.2 For the class notation HMS-HSC (×), the parameters to be monitored and corresponding types of sensors are given in Table 21.4.3.2.

Parameters to be Monitored for High Speed Craft and Corresponding Types of Sensors

Table 21.4.3.2

No.	Parameter	Available sensors	Remark
1	Vertical, transverse and longitudinal acceleration at the centerline of each hull in the fore body (fore of forward perpendicular)	A	Must be installed
2	Vertical, transverse and longitudinal acceleration at the longitudinal center of gravity (LCG)	A	Must be installed
3	Vertical, transverse and longitudinal acceleration at the centerline of each hull aft body (aft of aft perpendicular)	A	Must be installed
4	Global longitudinal stress amidships	G	Recommended to be installed
5	Global transverse stress in wet deck in center between each hull	D	Recommended to be installed (for multi-hull ships with length L>50 m)
6	Lateral loads at bottom near forward perpendicular	P	Recommended to be installed

Section 5 COMPONENT REQUIREMENTS

21.5.1 General requirements

21.5.1.1 All components are to be replaceable and designed for easy maintenance.

21.5.1.2 Electrical equipment and installation in hazardous areas are to be in accordance with PART FOUR of the Rules.

21.5.1.3 All equipment located at the navigation bridge is to be fitted with dimmers and has displays which do not interfere undue with the night vision of the officer of the watch.

21.5.2 Sensors

21.5.2.1 Strain sensors are to be designed in such way that the measured value is not influenced by changes in temperature.

21.5.2.2 Sensors for measuring global hull strain are to be mounted in such way that influence of local strain is minimized.

21.5.2.3 Sensors that are part of other systems, can be utilized in the hull monitoring system. Connections to such sensors are to be made in such way that they do not influence performance of the other systems. Failure of the hull monitoring system is not to influence the performance of other systems.

21.5.2.4 Accelerations are to be measured over a range of -20 m/s^2 to +20 m/s^2. The measurement uncertainty of the acceleration is to be less than 2% of the measured value, or 0.10 m/s^2, whichever is the greater.

21.5.2.5 The rigid body ship motions is to be measured by a device with integrated sensors, giving the 6º of freedom (3 translations and 3 rotations). The translations (accelerations) are to be measured over a range of -20 m/s^2 to +20 m/s^2. The angles are to be measured over a range of -90º to +90º, -45º to +45º and -180º to +180º, for the roll, pitch and yaw motions respectively. The measurement uncertainty is to be less than 2% of the measured value, or 0.10 m/s^2 for translations and 0.5º for angles, whichever is the greater.
21.5.2.6 The sea pressure acting on the hull is to be measured over a range of 0 – 2 MPa. The measurement uncertainty of the pressure is to be less than 2% of the measured value, or 0.01 MPa, whichever is the greater.
21.5.2.7 The liquid motion pressures in tanks (sloshing) is to be measured over a range of 0 – 4 MPa. The measurement uncertainty of the pressure is to be less than 4% of the measured value, or 0.02 MPa, whichever is the greater.
21.5.2.8 The structural strain is to be measured in a range related to the yielding strain of the material. The measurement uncertainty is to be less than 3% of the measured value or 20 micro strain, whichever is the greater. For ships made of steel or aluminium, a range from -2 000 micro strain to +2 000 micro strain can be assumed. For ships constructed using special material qualities or different types of materials, i.e. composite materials, the strain range is to be specially considered by ISC.
21.5.2.9 The sensors installations designed for low frequency responses, i. e. motions and wave loading are to record the physical quantities within the specified uncertainties within the frequency range 0.01 – 3 Hz. Installations designed to measure slamming responses are to record the physical quantity within the specified uncertainties in the frequency range 5 – 100 Hz. Installations designed to measure sloshing responses are to record the physical quantity within the specified uncertainties in the frequency range 30 – 1200 Hz. For the physical quantity recorded above, the uncertainty is to be within the specified range.
21.5.2.10 The data processing unit is to be capable of handling information supplied by all sensors including navigational instruments at the actual transfer rate.
21.5.2.11 The information from the sea-state parameters is at least to be updated and submitted every 10 minutes.

21.5.3 Signal conditioning units

21.5.3.1 The signal conditioning units are to be matched to the connected sensor.
21.5.3.2 The signals from analogue sensors are to be low-pass filtered prior to digitising to avoid signal noise. The filters are to be matched to the frequency range for the different sensors.
21.5.3.3 The sensors installations designed for low frequency responses, i.e. motions and wave loading are to be digitised with at least 20 Hz. Installations designed to measure slamming responses are to be digitised with at least 500 Hz. Installations designed to measure sloshing responses in tanks are to be digitised with at least 3 kHz.

CHAPTER 22 ADDITIONAL REQUIREMENTS FOR ERGONOMIC CONTAINER LASHING

Section 1 GENERAL PROVISIONS

22.1.1 Application

22.1.1.1 The provisions of this Chapter are voluntary and the aim of this Chapter is to ensure that persons engaged in carrying out container securing operations on deck have safe working conditions. This Chapter applies to container ships and ships which are specifically designed and fitted for the purpose of carrying containers on deck.

22.1.2 Class notation

22.1.2.1 The following class notation may be assigned to those complying with the requirements specified in this Chapter:
(1) Ergonomic Container Lashing: ECL

22.1.3 Definitions

22.1.3.1 Fencing is a generic term for guardrails, safety rails, safety barriers and similar structures that provide protection against the falls of persons.
22.1.3.2 Lashing positions include positions:
(1) in between container stows on hatch covers;
(2) at the end of hatches;
(3) on outboard lashing stanchions/pedestals;
(4) outboard lashing positions on hatch covers; and
(5) any other position where people work with container securing.
22.1.3.3 Stringers are the uprights or sides of a ladder.
22.1.3.4 Turnbuckles and lashing rods specified in this Chapter include similar cargo securing devices.

22.1.4 Plans and information

22.1.4.1 The following information is to be submitted:
(1) Details of container stowage arrangements;
(2) Details of working areas including means of access, fall protection arrangements and anti-slip surfaces;
(3) Details of lashing bridges including stowage arrangements for lashing bars, means of access and fall protection arrangements;
(4) Details of walkways and transit areas including fall protection and anti-slip surfaces;
(5) Details of access openings, ramps, ladders, steps, hatchways and coamings;
(6) Details of container securing fittings including fixed and loose fittings;
(7) Details of deck lighting;
(8) Details of reefer power outlets.

Section 2 SAFE ACCESS DESIGN

22.2.1 General provisions

22.2.1.1 The minimum clearance for transit areas is to be at least 2 m high and 600 mm wide. See dimensions "*B*" in Figure 22.2.1, "*J*" in Figure 22.2.4, "K_1" in Figure 22.2.2 and Table 22.2.1.
22.2.1.2 All relevant deck surfaces used for movement about the ship and all passageways and stairs are to have non-slip surfaces.
22.2.1.3 Where necessary for safety, walkways on deck are to be delineated by painted lines or otherwise marked by pictorial signs.
22.2.1.4 All protrusions in access ways, such as cleats, ribs and brackets that may give rise to a trip hazard are to be highlighted in a contrasting colour.

22.2.2 Lashing position design (platforms, bridges and other lashing positions)

22.2.2.1 Lashing positions are to be designed to eliminate the use of three high lashing bars and be positioned in close proximity to lashing equipment stowage areas. Lashing positions are to be designed to provide a clear work area which is unencumbered by deck piping and other obstructions and take into consideration:

(1) the need for containers to be stowed within safe reach of the personnel using the lashing position so that the horizontal operating distance from the securing point to the container does not exceed 1,100 mm and not less than 220 mm for lashing bridges and 130 mm for other positions, see dimensions "C_1" and "C_2" in Figure 22.2.2, "C_3" in Figure 22.2.1 and Table 22.2.1;

(2) the size of the working area and the movement of lashing personnel; and

(3) the length and weight of lashing gear and securing components used.

22.2.2.2 The width of the lashing positions is preferably to be 1,000 mm, but not less than 750 mm. See dimensions "*A*" in Figure 22.2.1, "*GL*" and "*GT*" in Figure 22.2.3, "*I*" in Figure 22.2.4, "*K*" in Figure 22.2.2 and Table 22.2.1.

22.2.2.3 The width of permanent lashing bridges is to be:

(1) 750 mm between top rails of fencing, see dimension "*F*" in Figure 22.2.2 and Table 22.2.1; and

(2) a clear minimum of 600 mm between storage racks, lashing cleats and any other obstruction, see dimension "F_1" in Figure 22.2.2 and Table 22.2.1.

22.2.2.4 Platforms on the end of hatches and outboard lashing stations are preferably to be at the same level as the top of the hatch covers.

22.2.2.5 Toe boards (or kick plates) are to be provided around the sides of elevated lashing bridges and platforms to prevent securing equipment from falling and injuring people. Toe boards are preferably to be 150 mm high, however, where this is not possible they are to be at least 100 mm high.

22.2.2.6 Any openings in the lashing positions through which people can fall are to be possible to be closed.

22.2.2.7 Lashing positions are not to contain obstructions, such as storage bins or guides to reposition hatch covers.

22.2.2.8 Lashing positions which contain removable sections are to be capable of being temporarily secured.

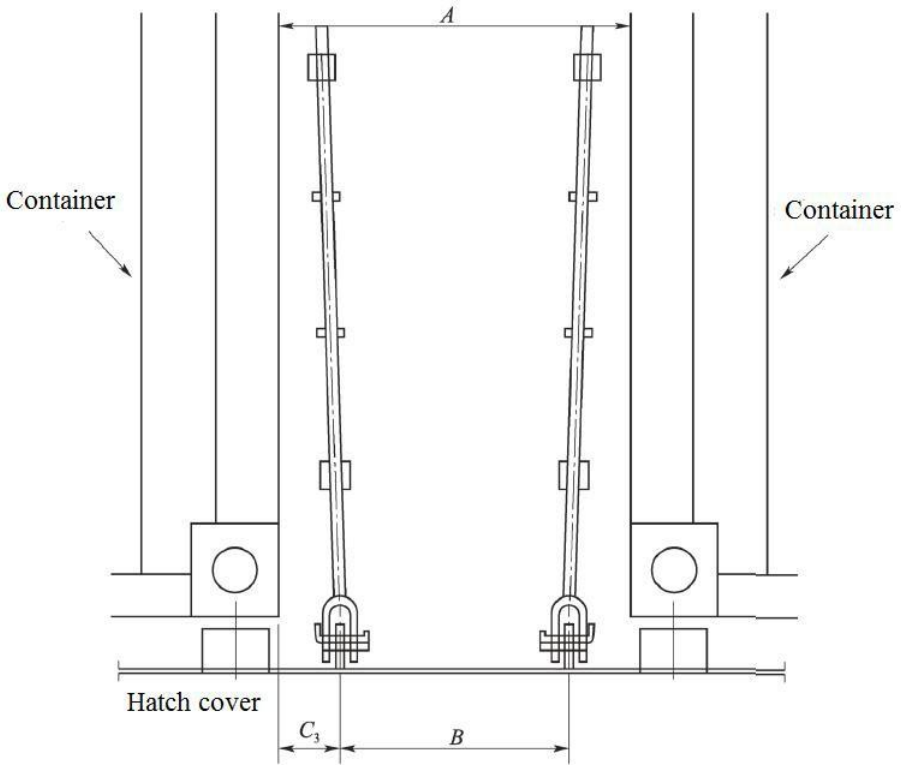


Figure 22.2.1

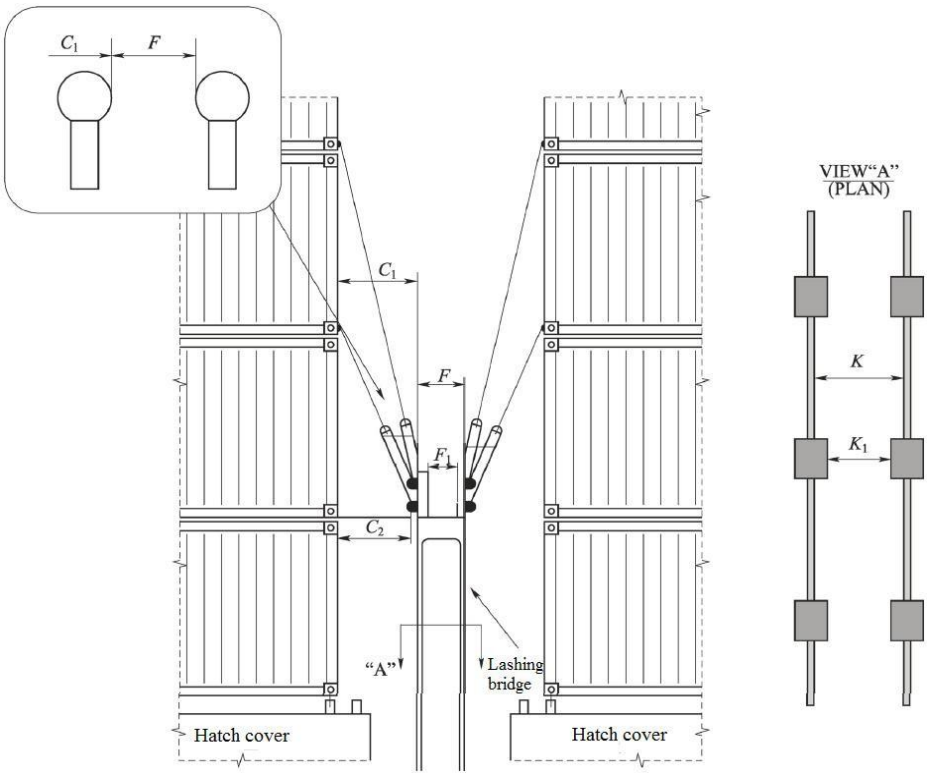

Figure 22.2.2

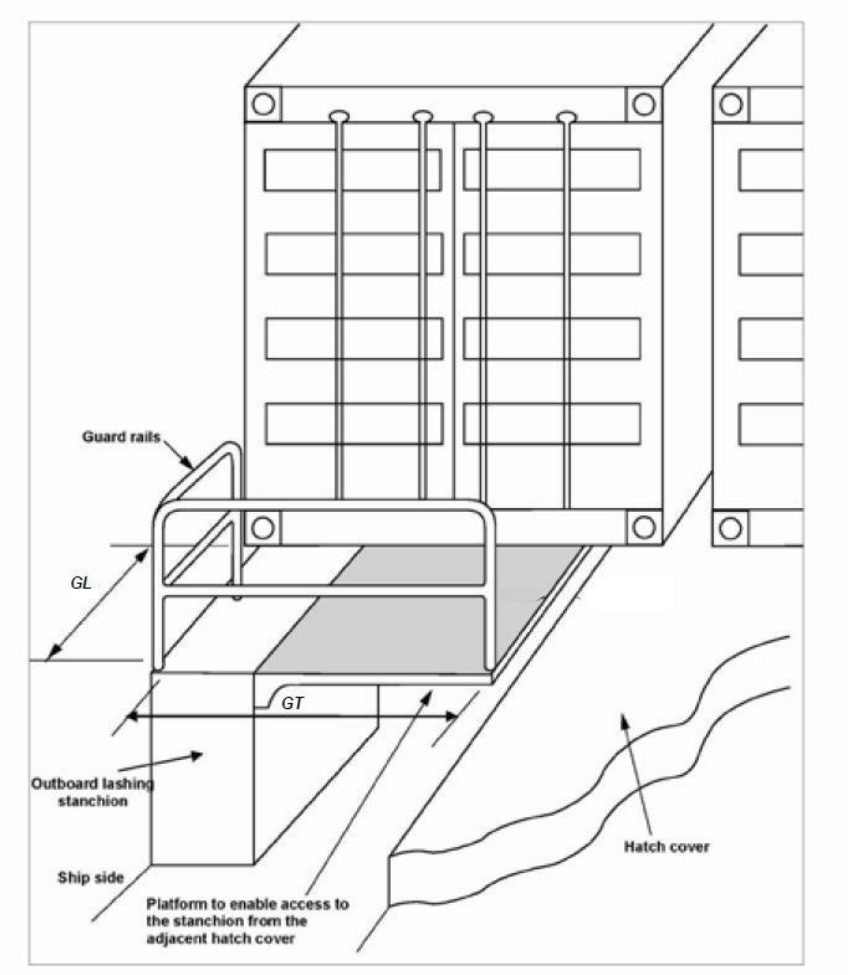

Figure 22.2.3

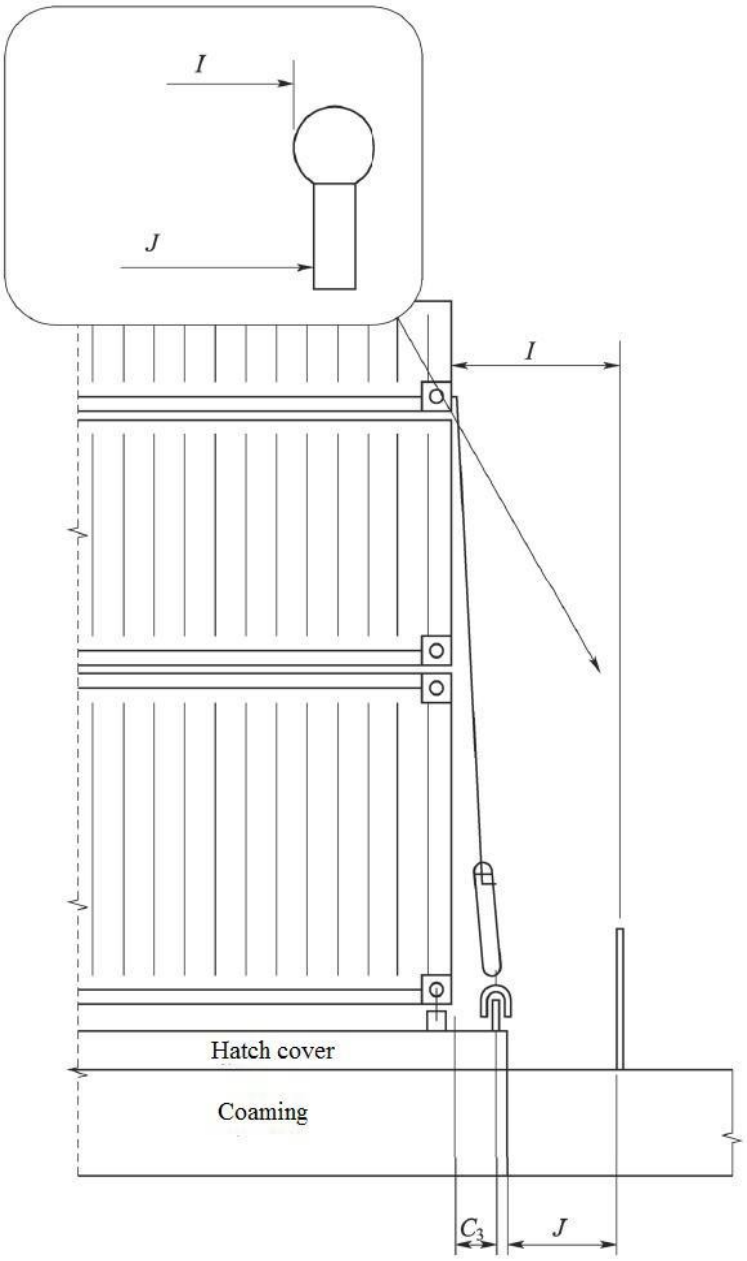

Figure 22.2.4

Container securing dimensions as shown in Figures 22.2.1 to 22.2.4 are listed in Table 22.2.1:

Table 22.2.1

Dimension	Description	Requirement (mm)
A	Width of work area between container stacks	750 minimum
B	Distance between lashing plates on deck or on hatch covers	600 minimum
C_1	Distance from lashing bridge fencing to container stack	1100 maximum
C_2	Distance from lashing plate to container stack (lashing bridge)	220 minimum
C_3	Distance from lashing plate to container stack (elsewhere)	130 minimum
F	Width of lashing bridge between top rails of fencing	750 minimum
F_1	Width of lashing bridge between storage racks, lashing cleats and any other obstruction	600 minimum
GL	Width of working platform for outboard lashing – fore/aft	750 minimum
GT	Width of working platform for outboard lashing – transverse	750 minimum
I	Width of work platform at end of hatch cover or adjacent to superstructure	750 minimum
J	Distance from edge of hatch cover to fencing	600 minimum
K	Width of lashing bridge between top rails of fencing	750 minimum
K_1	Width of lashing bridge between the pillars of the lashing bridge	600 minimum
Notes:		

B — Measured between the centres of the lashing plates. C_1 — Measured from inside of fencing. C_2, C_3 — Measured from centre of lashing plate to end of container. *F*, *K* — Measured to inside of fencing. *GL* — Measured from end of container to inside of fencing. *GT* — Measured to inside of fencing. *I* — Measured to inside of fencing. *J* — Measured to inside of fencing.

22.2.3 Fencing design

22.2.3.1 Bridges and platforms, where appropriate, are to be fenced. As a minimum, fencing design is to take into consideration:

(1) the strength and height of the rails are to be designed to prevent workers from falling;

(2) flexibility in positioning the fencing of gaps. A horizontal unfenced gap is not to be greater than 300 mm;

(3) provisions for locking and removal of fencing as operational situations change based on stowage anticipated for that area;

(4) damage to fencing and how to prevent failure due to that damage; and

(5) adequate strength of any temporary fittings. These are to be capable of being safely and securely installed.

22.2.3.2 The top rail of fencing is to be 1 m high from the base, with two intermediate rails. The opening below the lowest course of the guard rails is not to exceed 230 mm. The other courses are to be not more than 380 mm apart.

22.2.3.3 Where possible fences and handrails are to be highlighted with a contrasting colour to the background.

22.2.3.4 Athwartships cargo securing walkways are to be protected by adequate fencing if an unguarded edge exists when the hatch cover is removed.

22.2.4 Ladder and manhole design

22.2.4.1 Where a fixed ladder gives access to the outside of a lashing position, the stringers are to be connected at their extremities to the guardrails of the lashing position, irrespective of whether the ladder is sloping or vertical.

22.2.4.2 Where a fixed ladder gives access to a lashing position through an opening in the platform, the opening shall be protected with either a fixed grate with a lock back mechanism, which can be closed after access, or fencing. Grabrails are to be provided to ensure safe access through the opening.

22.2.4.3 Where a fixed ladder gives access to a lashing position from the outside of the platform, the stringers of the ladder are to be opened above the platform level to give a clear width of 700 to 750 mm to enable a person to pass through the stringers.

22.2.4.4 A fixed ladder is not to slope at an angle greater than 25° from the vertical. Where the slope of a ladder exceeds 15° from the vertical, the ladder is to be provided with suitable handrails not less than 540 mm apart, measured horizontally.

22.2.4.5 A fixed vertical ladder of a height exceeding 3 m, and any fixed vertical ladder, from which a person may fall into a hold, is to be fitted with guard hoops, which are to be constructed in accordance with paragraphs 22.2.4.6 and 22.2.4.7.

22.2.4.6 The ladder hoops are to be uniformly spaced at intervals not exceeding 900 mm and are to have a clearance of 750 mm from the rung to the back of the hoop and be connected by longitudinal strips secured to the inside of the hoops, each equally spaced round the circumference of the hoop.

22.2.4.7 The stringers are to be carried above the floor level of the platform by at least 1 m and the ends of the stringers are to be given lateral support and the top step or rung is to be level with the floor of the platform unless the steps or rungs are fitted to the ends of the stringers.

22.2.4.8 As far as practicable, access ladders and walkways, and work platforms are to be designed so that workers do not have to climb over piping or work in areas with permanent obstructions.

22.2.4.9 There are to be no unprotected openings in any part of the workplace. Access opening must be protected with handrails or access covers that can be locked back during access.

22.2.4.10 As far as practicable, manholes are not to be situated in transit areas, however, if they are, proper fencing is to protect them.

22.2.4.11 Access ladders and manholes are to be large enough for persons to safely enter and leave.

22.2.4.12 A foothold at least 150 mm deep is to be provided.

22.2.4.13 Handholds are to be provided at the top of the ladder to enable safe access to the platform to be gained.

22.2.4.14 Manhole openings that may present a fall hazard are to be highlighted in contrasting colour around the rim of the opening.
22.2.4.15 Manhole openings at different levels of the lashing bridge are not to be located directly below one another, as far as practicable.

Section 3 LASHING SYSTEMS

22.3.1 General provisions

Lashing systems, including tensioning devices, are to:
(1) conform to international standards (ISO 3874), where applicable;
(2) be compatible with the planned container stowages;
(3) be compatible with the physical ability of persons to safely hold, deploy and use such equipment;
(4) be uniform and compatible, e.g. twistlocks and lashing rod heads are not to interfere with each other;
(5) be subject to a periodic inspection and maintenance regime. Non-conforming items are to be segregated for repair or disposal; and
(6) be according to the CSM.

22.3.2 Twistlock design

22.3.2.1 Shipowners are to ensure that the number of different types of twistlocks provided for cargo securing is kept to a minimum and clear instructions are provided for their operation. The use of too many different types of twistlocks may lead to confusion as to whether the twistlocks are locked.
22.3.2.2 The design of twistlocks is to ensure the following:
(1) positive locking with easy up and down side identification;
(2) dislodging from corner fitting is not possible even when grazing a surface;
(3) access and visibility of the unlocking device is effective in operational situations;
(4) unlocked positions are easily identifiable and do not relock inadvertently due to jolting or vibration; and
(5) unlocking poles are as light as possible, of a simple design for ease of use.
22.3.2.3 Where it is not feasible to entirely eliminate working on the tops of container stows, the twistlock designs used are to minimize the need for such working, e.g. use of SATLs, fully automatic twistlocks or similar design.

22.3.3 Lashing rod design

22.3.3.1 The design of containership securing systems is to take into account the practical abilities of the workers to lift, reach, hold, control and connect the components called for in all situations anticipated in the cargo securing plan.
22.3.3.2 The maximum length of a lashing rod is to be sufficient to reach the bottom corner fitting of a container on top of two high cube containers and be used in accordance with the instructions provided by the manufacturers.
22.3.3.3 The weight of lashing rods is to be minimized as low as possible consistent with the necessary mechanical strength.
22.3.3.4 The head of the lashing rod that is inserted in the corner fitting is to be designed with a pivot/hinge or other appropriate device so that the rod does not come out of the corner fitting accidentally.
22.3.3.5 The rod's length in conjunction with the length and design of the turnbuckle is to be such that the need of extensions is eliminated when lashing high cube (9'6") containers.
22.3.3.6 Lightweight rods are to be provided where special tools are needed to lash high cube containers.

22.3.4 Turnbuckle design

22.3.4.1 Turnbuckle end fittings are to be designed to harmonize with the design of lashing rods.
22.3.4.2 Turnbuckles are to be designed to minimize the work in operating them.
22.3.4.3 Anchor points for turnbuckles are to be positioned to provide safe handling and to prevent the bending of rods.
22.3.4.4 To prevent hand injury during tightening or loosening motions, there is to be a minimum distance of 70 mm between turnbuckles.
22.3.4.5 The turnbuckle is to incorporate a locking mechanism which will ensure that the lashing does not work loose during the voyage.
22.3.4.6 The weight of turnbuckles is to be minimized as low as possible consistent with the necessary mechanical strength.

22.3.5 Storage bins and lashing equipment stowage design

22.3.5.1 Bins or stowage places for lashing materials are to be provided.

22.3.5.2 All lashing gear are to be stowed as close to its intended place of use as possible.

22.3.5.3 The stowage of securing devices is to be arranged so they can easily be retrieved from their stowage location.

22.3.5.4 Bins for faulty or damaged gear are also to be provided and appropriately marked.

22.3.5.5 Bins are to be of sufficient strength.

22.3.5.6 Bins and their carriers are to be designed to be lifted off the vessel and restowed.

Section 4 LIGHTING DESIGN

22.4.1 A lighting plan is to be developed to provide for:

22.4.1.1 the proper illumination of access ways, not less than 10 lux (1 foot candle), taking into account the shadows created by containers that may be stowed in the area to be lit, for example different length containers in or over the work area;

22.4.1.2 a separate fixed or temporary (where necessary) lighting system for each working space between the container bays, which is bright enough, not less than 50 lux (5 foot candle), for the work to be done, but minimizes glare to the deck workers;

22.4.1.3 such illumination is, where possible, to be designed as a permanent installation and adequately guarded against breakage; and

22.4.1.4 the illumination intensity is to take into consideration the distance to the uppermost reaches where cargo securing equipment is utilized.

Section 5 SPECIALIZED CONTAINER SAFETY DESIGN

22.5.1 Temperature controlled unit power outlets are to provide a safe, watertight electrical connection.

22.5.2 Temperature controlled unit power outlets are to feature a heavy duty, interlocked and circuit breaker protected electrical power outlet. This is to ensure the outlet can not be switched "live" until a plug is fully engaged and the actuator rod is pushed to the "ON" position. Pulling the actuator rod to the "OFF" position is to manually de-energize the circuit.

22.5.3 The temperature controlled unit power circuit is to de-energize automatically if the plug is accidentally withdrawn while in the "ON" position. Also, the interlock mechanism is to break the circuit while the pin and sleeve contacts are still engaged. This provides total operator safety and protection against shock hazard while eliminating arcing damage to the plug and receptacle.

22.5.4 Temperature controlled unit power outlets are to be designed to ensure that the worker is not standing directly in front of the socket when switching takes place.

22.5.5 The positioning of the temperature controlled unit feed outlets is not to be such that the flexible cabling needs to be laid out in such a way as to cause a tripping hazard.

22.5.6 Stevedores or ship's crew who are required to handle temperature controlled unit cables and/or connect and disconnect reefer units are to be given training in recognizing defective wires and plugs.

22.5.7 Means or provisions are to be provided to lay the temperature controlled unit cables in and protect them from lashing equipment falling on them during lashing operations.

22.5.8 Defective or inoperative temperature controlled unit plugs/electrical banks are to be identified and confirmed as "locked out/tagged out" by the vessel.

CHAPTER 23 ADDITIONAL REQUIREMENTS FOR SHIPS OPERATING IN LOW AIR TEMPERATURE ENVIRONMENTS

Section 1 GENERAL PROVISIONS

23.1.1 General requirements

23.1.1.1 This Chapter applies for ships intended to operate in low air temperature environments and in addition, for ships operating in areas and during periods where more severe ice and snow accretion are likely to occur.

23.1.1.2 Ships applying for ISC Anti-Cold Climate notation are to comply with the requirements of this Chapter in addition to the requirements of other Chapters of the Rules, as applicable.

23.1.1.3 Low air temperature environments may affect hull structure, function of equipment and systems, human performance and safety of the ships' operation. To remove or mitigate adverse impacts of low air temperatures and take anti-cold climate measures reasonably and effectively, the following risks, but not limited to, are to be taken into account:

(1) loss of material properties;
(2) reduced efficiency or failure of machinery/equipment;
(3) freezing of cargo;
(4) freezing of ballast water;
(5) reduced habitability;
(6) reduced human performance;
(7) frostbite;
(8) ice accretion of the ship above the waterline.

23.1.2 Definitions

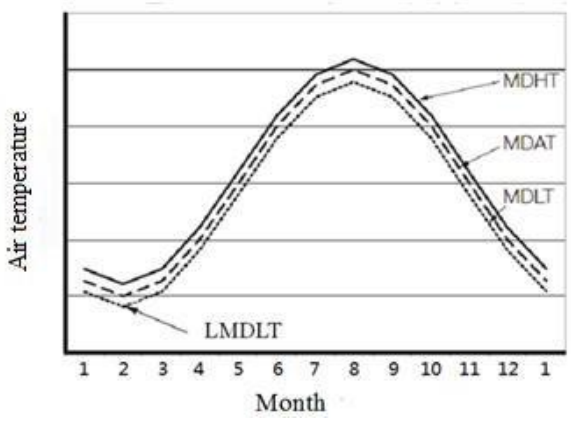
23.1.2.1 For the purpose of this Chapter:

(1) Mean Daily Low Temperature (MDLT) means the mean value of the daily low temperature for each day of the year over a minimum 10 year period. A data set acceptable to the Administration may be used if 10 years of data is not available. (Refer to Figure 23.1.2.1 for MDLT)

(2) Low air temperature environment means water areas with the lowest MDLT (LMDLT) lower than -10℃, such as the Arctic Ocean, the Antarctic Ocean, Gulf of St. Laurence, the northern Baltic Sea, Sea of Okhotsk, the Bohai Sea and the northern Huanghai Sea, etc. In general, waters of this type are covered by regional sea ice in the winter. (Refer to Figure 23.1.2.1 for LMDLT)

(3) Design Service Temperature (DST) means a temperature indicator set for the ship measuring the service performance of materials, equipment and systems in low air temperature environments in the design. The temperature is determined by the shipowner in accordance with the purpose and service condition of the ship and is in general to be set at least 10 ℃ below the LMDLT for the intended area and season of operation.

(4) Minimum Anticipated Temperature (MAT) means the lowest ambient temperature that may be anticipated in the intended navigation areas of the ship during the voyage and is in general to be taken as at least 20℃ lower than LMDLT.



(5) Positive temperature spaces mean spaces that are maintained constantly above 0 ℃ by lagging heat insulating materials or installing air conditioning systems thus making freezing unlikely.

(6) Low temperature spaces mean spaces where the ambient temperature is constantly below 0 ℃ thus making freezing likely.

(7) Anti-icing means preventing the exposed areas and facility surfaces from accumulation and freezing of ice and snow (i.e. ice and snow accretion) by means of covering, heating or other measures which are generally applied to areas such as superstructures, deck passageways, railings and handholds, cargo decks and helicopter platforms as well as equipment for navigation, mooring, life-saving and fire-fighting.

(8) De-icing means removing ice and snow accretion in the exposed areas and facility surfaces by using tools.

(9) Anti-freezing means keeping the liquid inside tanks, equipment and pipelines exposed to low air temperature environments from freezing by excitation, circulation, insulation and heating, etc.

Notes:

MDHT – Mean Daily High Temperature
MDAT – Mean Daily Average Temperature
MDLT – Mean Daily Low Temperature
LMDLT – Lowest Mean Daily Low Temperature

Figure 23.1.2.1 General Temperature Definitions

23.1.3 Class notations

23.1.3.1 The following Anti-Cold Climate notations may be assigned upon application of the shipowner subject to compliance of the ship with the provisions of this Chapter:

(1) ACC (DST): Ships that are plan approved and surveyed by ISC and found compliant with the requirements of this Chapter may be assigned with the class notation, i.e. the basic Anti-Cold Climate notation.

(2) ACC-POLAR (DST): Ships that are plan approved and surveyed by ISC and found compliant with the requirements of this Chapter and that are anticipated to operate in polar waters may be assigned with the class notation, i.e. the polar Anti-Cold Climate notation.

(3) H (DST): Ships that are plan approved and surveyed by ISC and the materials used for hull structures of which comply with the relevant requirements in Sections 2 and 10 of this Chapter may be assigned with the class notation, i.e. the hull Anti-Cold Climate notation.

(4) DE-ICE: Ships that are plan approved and surveyed by ISC and found compliant with the requirements in Section 11 of this Chapter may be assigned with the class notation, i.e. the DE-ICE notation.

23.1.4 Plans and documents

23.1.4.1 For H (DST) notation, the relevant structural plans to be submitted for approval as required by other Chapters of the Rules are to contain steel grades of the materials.

23.1.4.2 In addition to 23.1.4.1 above, for ACC (DST), ACC-POLAR (DST) notations, anti-cold climate design plans and documents as follows are to be submitted for approval:

(1) General arrangement highlighting anti-cold climate features and design service temperatures;

(2) List of anti-cold climate equipment and systems;

(3) Details of main/auxiliary engines arrangements (including anti-cold climate features such as heating arrangement);

(4) Details of materials specification/heating arrangements for exposed pipes/components;

(5) Details of anchoring lifting appliance anti-cold arrangements;

(6) Details of materials specification/heating arrangements for exposed cabling/components;

(7) Details of anti-cold climate for fire-fighting appliances;

(8) Details of anti-cold climate for life-saving appliances;

(9) Details of heating arrangements for cabins;

(10) Details of cabin and escape route arrangements;

(11) Details of anti-freezing arrangements for tanks;

(12) Inventory and locations of de-icing measures;

(13) Calculations of ice accretion stability;

(14) Details of anti-freezing arrangements for emergency towing (applicable to tankers);

(15) Anti-freezing arrangements for crew's working passageways;

(16) Structural strength calculation of the cargo maintenance system (additional ice accretion load, applicable to liquefied gas carriers);

(17) Diagram of the environmental control system (dew-point temperature control, applicable to liquefied

gas carriers);
(18) Anti-cold climate arrangements for the rescue area (applicable to offshore supply vessels);
(19) Anti-cold climate arrangements for cargo securing equipment (applicable to container ships);
(20) Anti-cold climate arrangements for the helicopter deck or hovering area.
23.1.4.3 For ACC (DST), ACC-POLAR (DST) notations, the following plans and documents are to be submitted for information:
(1) anti-cold climate design instructions;
(2) anti-cold climate operational and maintenance procedures, for example:
① continuous circulation of fluids and/or heating media;
② use of heating arrangements in low air temperature environments;
③ application of lubricants in exposed and low temperature spaces;
④ applicable locations and application procedures of antifreeze;
⑤ use of oil fuel for emergency generators and lifeboat/rescue boat engines in low air temperature environments;
⑥ applicable antifreeze and cleaning solutions for bridge windows;
⑦ draining and/or drying of pipelines prone to freezing;
⑧ characteristics and application procedures of de-icing tools.
23.1.4.4 For DE-ICE notation, refer to 23.11.3 for the requirements for submittal of plans and documents.
23.1.4.5 Anti-cold climate design diagrams and anti-cold climate operational and maintenance procedures are always to be kept on board ships.

Section 2 MATERIALS AND WELDING

23.2.1 General requirements

23.2.1.1 For ships intended to operate in low air temperature environments, the materials used for hull structures and machinery and equipment are to satisfy the normal usage demands at the design service temperature.
23.2.1.2 Material grades are to be selected based on design service temperature, material class and thickness.
23.2.1.3 Materials and welding are to comply with the relevant requirements of PART TWO of the Rules in addition to the requirements of this Section.

23.2.2 Materials of hull structural members

23.2.2.1 Steels for hull structures exposed to low air temperature environments are not to be of lower grade than those specified in Table 23.2.2.2(1) and the material grade is to be selected in accordance with Tables 23.2.2.2(2), 23.2.2.2(3) and 23.2.2.2(4).
23.2.2.2 As a special product, the steels for anchor chain cables and offshore mooring chains are to be in accordance with the requirements of Section 12, Chapter 3, PART ONE of ISC Rules for Materials and Welding, except that the use of grade 1 chain cables is not permitted. The highest temperature for the impact test is -20℃.
23.2.2.3 The materials for hatch coamings, hatch covers, foundations of cranes and windlasses are at least to be of class II. The material grade is to be selected in compliance with the requirements for material class and thickness as given in Tables 23.2.2.2(2), 23.2.2.2(3) and 23.2.2.2(4) respectively.

Material Class in Low Air Temperature Environments **Table 23.2.2.2(1)**

Structural member category	Structural member	Material class	
		Within 0.4*L* amidships	Outside 0.4*L* amidships
Secondary	Deck plating exposed to weather in general, side plating above CWL⑤, transverse bulkheads above CWL⑥	I	I
Primary	Strength deck plating① Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings Longitudinal bulkhead above CWL⑥ Top wing tank bulkhead above CWL⑥	II	I

Structural member category	Structural member	Material class	
		Within 0.4*L* amidships	Outside 0.4*L* amidships
Special	Sheer strake at strength deck; stringer plate in strength deck②; deck strake at longitudinal bulkhead ③ ; continuous longitudinal hatch coamings④	III	II

Notes: ① Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur.

② Not to be less than grade E/EH within 0.4*L* amidships in ships with length exceeding 250 m.

③ In ships with breadth exceeding 70 m at least three deck strakes are to be class III.

④ Not to be less than grade D/DH.

⑤ The Cold Waterline (CWL) is to be taken as 300 mm below the minimum design Ballast Waterline (BWL).

⑥ Applicable to platings attached to shell plating exposed to low air temperature environments. At least one strake is to be considered as the exposed plating which is to be at least 600 mm in width.

Material Grade Requirements for Class I in Low Air Temperature Environments

23.2.3 Machinery materials

23.2.3.1 Deck machinery materials are to comply with the requirements for steels for machinery structures in Section 6, Chapter 3, PART ONE of ISC Rules for Materials and Welding. The materials for lifting appliances are to be in accordance with ISC Rules for Lifting Appliances of Ships and Offshore Installations, and the materials not covered in that Rules are to comply with the requirements of 23.2.3.2 below.

23.2.3.2 The material classes of members/components of machinery installations exposed to low air temperature environments are to be in accordance with Table 23.2.3.2; the plates are to comply with the requirements of 23.2.2.1 and castings and forgings are to comply with the requirements of 23.2.3.6 and 23.2.3.7 respectively.

Material Classes for Equipment and Members/Components **Table 23.2.3.2**

Main component	Sub-component	Class
Deck machinery and equipment		
Windlass	Cable lifter, gear wheel, shaft	II
	Foundation bolt, brake system, stripper bar	II
	Casing	I
Mooring winches	Gear wheel, shaft, foundation bolt	II
	Casing	I
Winch hydraulic motors		II
Winch controls	Hydraulics	II
Bollards		III
Fairleads/bits		II
Anchor	Crown/head, shackle and shank	II
	Crown/head pin and shackle/swivel pin	I
Anchor lashing		II
Chain stopper		II
Emergency towing system①		II
Exposed weight-bearing structures and machinery components, cargo securing arrangements		II
Lifting appliances, boat davits/boat hooks		II
Others		
Ventilator, small hatch cover, manhole cover		I

Note: ① When emergency towing arrangements are used as bollards, the material is to be class III.

23.2.3.3 Charpy V-notch impact tests for materials of the piping systems (including pipes, valves and fittings) for machinery equipment and systems exposed to low air temperature environments are to be in accordance with the requirements as given in Tables 23.2.3.3(1) to 23.2.3.3(3).

23.2.3.4 The material classes specified in Tables 23.2.3.3(1) to 23.2.3.3(3) are opposite to the classes of piping in Section 1, Chapter 2, PART THREE of the Rules, i.e. for class I piping, the material class of the piping is to be class III.

23.2.3.5 In general, the Charpy V-notch impact energy of piping materials exposed to low air temperature environments is not to be less than 27 J.

Impact Testing Temperature Requirements for Class I in Low Air Temperature Environments

Table 23.2.3.3(1)

Wall thickness (mm)	Design service temperature (℃)

40<*t*≤45	-40	-40	-60	-60	-60	–
45<*t*≤50	-40	-40	-60	-60	–	–

23.2.3.6 Steel forgings and castings used for exposed machinery and system components are to be made of killed steel and to comply with the relevant requirements of Chapters 5 and 6, PART ONE of ISC Rules for Materials and Welding.

23.2.3.7 The impact testing temperature for steel forgings and castings is given in Table 23.2.3.7. For steel the yield strength of which is less than 305 N/mm^2, the minimum average impact energy is to be 27 J; for steel the yield strength of which is equal to or greater than 305 N/mm^2, the minimum average impact energy is to be 34 J.

Impact Testing Temperature Requirements for Steel Forgings and Castings in Low Air Temperature Environments **Table 23.2.3.7**

Class	Design service temperature (℃)			
	-23~-27℃	-28~-32℃	-33~-38℃	≤-39℃
Class I or II	-20	-20	-40	Specially considered
Class III	-20	-40	-40	
Note: For manufacturing and installation of non-welded members, the testing temperature may increase by 20℃, but not more than 0℃.				

23.2.4 Welding

23.2.4.1 The welding technical requirements for hull structural members and machinery structural members/components are to be referred to in Section 2, Chapter 5, PART THREE of ISC Rules for Materials and Welding.

23.2.4.2 The selection of welding consumables are to satisfy the performance requirements of the pieces to be welded. For welding of high strength quenched and tempered steel, low hydrogen welding consumables are to be used.

23.2.4.3 The finished welds are to comply with the rules requirements.

Section 3 SHIP ARRANGEMENTS

23.3.1 General requirements

23.3.1.1 Equipment and areas that require anti-icing/anti-freezing measures are as far as possible to be situated in protected locations, such as enclosed spaces, semi-enclosed spaces or covered by curtains.

23.3.1.2 For structures, equipment and pipes, the heating capacity for anti-icing and anti-freezing arrangements is to be sufficient to prevent icing or freezing in low air temperature environments, the arrangements are to be able to maintain a surface temperature of at least 3 ℃ under the minimum anticipated temperature.

23.3.1.3 In anti-icing and anti-freezing arrangements using heating, special attention is to be paid to the heat transfer from the heating cables or pipes to the equipment or structure to be heated. The spacing and fastening of heating cables or pipes are to be appropriate for efficient heating to keep the equipment or structure ice-free under the minimum anticipated temperature.

23.3.1.4 For anti-icing and de-icing arrangements applying heating by fluids in pipes, the installation is to ensure that the heating fluid maintains its heating effectiveness under the minimum anticipated temperature.

23.3.2 Accommodation

23.3.2.1 Accommodation heating systems are to be capable of maintaining a reasonable internal temperature in all spaces normally occupied when the ship is at sea. Supplementary heaters may also be used in accommodation and other manned spaces in addition to the air conditioning heating system specified in 23.6.4.12.

23.3.2.2 Heating arrangements are to be provided for the following spaces, but not limited to, containing machinery and equipment for essential or emergency services to satisfy the service demands of such spaces:

(1) navigation bridge;
(2) radio room;
(3) hospital room (including sick bay);
(4) battery room;
(5) mooring rope stores (including the bosun's store);
(6) observation/security cabins (where fitted);
(7) enclosed forecastle/sheltered deck (where fitted);
(8) under-deck passageways (where fitted);
(9) main engine and auxiliary machinery space(s) (including individually arranged main generator room);
(10) azimuth thruster space(s) (including pods);
(11) boiler room;
(12) workshop room and store(s);
(13) engine control room;
(14) switchboard room;
(15) steering gear room;

(16) bow thruster(s) room;
(17) emergency generator room;
(18) fire control station(s);
(19) fire-fighting appliances stores;
(20) stores for de-icing, anti-freezing measures (where fitted);
(21) emergency fire pump-room.
In general, fixed heating arrangements are to be used. For items (6), (7), (10) to (13) above, when the design service temperature is not lower than -25℃, portable heating arrangements may be accepted.
23.3.2.3 Accommodation requiring heating arrangements to maintain a reasonable internal temperature is to be provided with a fixed thermometer.

23.3.3 Tanks
23.3.3.1 The ship is to have an appropriate arrangement to prevent the surfaces in ballast tanks, fresh water tanks and other relevant tanks from freezing over considering the minimum anticipated temperature.
23.3.3.2 Tank arrangements are to be such that fuel oil tanks are to be maintained 10℃ above the fuel's pour point and water tanks are to be maintained not lower than 2 ℃ under the minimum anticipated temperature.
23.3.3.3 Different anti-freezing measures are to be used depending on conditions, such as continuous circulation, bubble turbulence or convection-inducing systems, etc.; where the design service temperature is below -40℃, convection-inducing measures are to be used, such as a vertical heating coil.
23.3.3.4 Level gauging arrangements of the tank is to function under the minimum anticipated temperature.
23.3.3.5 Where the ballast tank is fully below the light service waterline or lower ice waterline, whichever is lower, and where the fresh water tank is not adjacent to the shell or deck and is located in the heated area, anti-freezing measures may not be provided, unless specified otherwise.

23.3.4 Superstructures and deckhouses
23.3.4.1 For ships operating in polar waters, the bridge wings are to be enclosed and both sides are to be visible without opening the bridge doors and windows. Additional conning positions, if any, are to be enclosed.
23.3.4.2 Bridge windows are to be fitted with heating and cleaning systems and are to function under the minimum anticipated temperature. Where the water flushing system is fitted, measures are to be taken to prevent pipelines and fittings from freezing and thus becoming inoperable.
23.3.4.3 Navigation bridge doors and the adjacent deck areas are to be so arranged as to prevent ice and snow accretion.
23.3.4.4 Cargo control room sidescuttles (including window wipers) are to be heated as required and external access for cleaning is to be provided.
23.3.4.5 At least one of the Master's cabin windows is to have a heating arrangement for a view over the cargo deck where necessary.
23.3.4.6 Windows in accommodation spaces are generally to be double-glazed except for those on ships operating in low air temperature environments occasionally or for a short period.
23.3.4.7 Exterior stairs and railings not forming the escape routes are to be provided with anti-icing or de-icing protection.

23.3.5 Helicopter decks
23.3.5.1 Helicopter decks or hovering areas, if provided, are to be provided with de-icing measures.

Section 4 STABILITY

23.4.1 General requirements
23.4.1.1 Ships operating in low temperature environments① are to have sufficient stability when subject to ice accretion under the minimum anticipated temperature.
23.4.1.2 Ships operating in low temperature environments are to be:
(1) designed to minimize the accretion of ice;

① Low temperature environments mean environments where ice accretion is possible when the air temperature is below 0℃.

(2) equipped with such means for removing ice; for example, electrical and pneumatic devices, and/or special tools such as axes or wooden clubs for removing ice from bulwarks, rails and erections;
(3) monitored for ice accretion during operation and appropriate measures are to be taken to ensure that ice accretion allowance does not exceed the value specified in the Stability Manuel.

23.4.2 Intact stability

23.4.2.1 Intact stability of ships when subject to ice accretion is to comply with the relevant requirements in Section 9, Chapter 1, PART TWO of the Rules.

23.4.2.2 For ships operating in low air temperature environments, the following icing allowances are to be considered in the stability calculation:
(1) 30 kg/m^2 on exposed decks and gangways;
(2) 7.5 kg/m^2 for projected lateral area of each side of the vessel above the water plane; and
(3) the projected lateral area of discontinuous surfaces of rail, sundry booms, spars (except masts) and rigging of vessels having no sails and the projected lateral area of other small objects are to be computed by increasing the total projected area of continuous surfaces by 5% and the static moments of this area by 10%.

23.4.2.3 The Stability Manuel is to contain the information on ice accretion allowance in the stability calculation.

Section 5 WATERTIGHT AND WEATHERTIGHT INTEGRITY

23.5.1 General requirements

23.5.1.1 For ships operating in low temperature environments, all closing appliances and doors related to watertight and weathertight integrity onboard are to be operable.

23.5.2 Hatches, side doors and cargo loading doors

23.5.2.1 For ships intended to operate in low air temperature environments (except for those navigating in the cold areas occasionally or for a short period), the following requirements are also to be complied with:
(1) If the hatches or doors are hydraulically operated, measures are to be taken to prevent liquid from freezing or excessive viscosity.
(2) Watertight and weathertight doors, hatches and closing devices not in habitable environments but required for use while at sea are to be so designed as being operable by persons wearing heavy winter clothes and thick mittens.

23.5.2.2 Ramp doors and side doors are to be provided with means to remove ice accretion around hatches and doors.

23.5.3 Freeing ports, scuppers, discharges and inlets

23.5.3.1 For ships intended to operate in low air temperature environments, freeing ports, scuppers, discharges and inlets are to be kept clear.

23.5.3.2 Freeing ports are to comply with the following requirements:
(1) freeing ports are to be fitted with anti-icing protection;
(2) if a shutter is fitted on the freeing port, it is to be provided with heating sufficient for maintaining its opening ability;
(3) increasing the freeing port area by 30% is accepted as an alternative to heating.

23.5.3.3 For decks, passageways and muster areas that are required to be kept ice-free, the scuppers and discharges in such spaces are to be provided with anti-freezing protection.

Section 6 MACHINERY INSTALLATIONS

23.6.1 General requirements

23.6.1.1 All machinery, equipment and systems, including pipes and cabling, are to be located inside spaces as far as practicable to minimize exposure to low air temperature environments where ice and snow accretion are likely to occur.

23.6.1.2 Main and auxiliary machinery and exposed essential machinery equipment are to be capable of operating satisfactorily under the minimum anticipated temperature.

23.6.1.3 Each machinery and system on board ships are to be provided with the following appropriate protection methods to prevent effects of low temperatures and ice accretion:
(1) heating (for space and/or dedicated arrangements for equipment/systems);
(2) de-icing equipment;
(3) covers (where PVC covers or other water resistant materials are used, they are to be fixed firmly to prevent unintended removal in severe weather conditions);
(4) drainage;
(5) insulation;
(6) selection of materials;
(7) selection of lubricants, oils, hydraulics and greases, etc.
23.6.1.4 Where heating arrangements are provided, they are to be fitted with the following:
(1) means for ascertaining the temperature;
(2) for systems where heating arrangements could result in excessively high temperatures or pressures being generated, that may cause damage, malfunction or braking of equipment, there are to be arrangements provided for cutting off the heating;
(3) appropriate control arrangements;
(4) indication of the system(s) operation;
(5) where failure of a heating arrangement could result in a hazardous situation, an alarm is to be activated.

23.6.2 Main and auxiliary machinery
23.6.2.1 To ensure the starting capacity of ships from the dead-ship condition, due consideration is to be given to the impacts of the minimum anticipated temperature on the relevant machinery and electrical equipment.
23.6.2.2 The combustion air system of the prime mover is to be suitable for the minimum anticipated temperature.
(1) The arrangements for air supply to main propulsion, main generators and emergency generators are to ensure that the engine manufacturer's specification for air intake temperature is complied with.
(2) Turbochargers and the associated combustion air system for internal combustion engines are to be so designed as to obtain surge-free operation throughout the range of ambient air temperatures in which the ship is expected to operate.
(3) For ships operating in polar waters all year round, where the design service temperature is below -40℃, the combustion air is to be led directly from the weather to the engines having a rated power of 100 kW and over by way of ducting or other suitable means.
(4) The combustion air intakes are to be located on both sides of the ship and so arranged as to prevent the recirculation of engine exhaust gases into the combustion air intakes, ice/snow accretion and blockage of the duct.
(5) Combustion air for other internal combustion engines used as prime movers is to be provided in accordance with the manufacturer’s recommendations. The details and arrangements will be subject to special consideration of ISC.
23.6.2.3 The lubricating oil of the engine is to be maintained at the proper minimum temperature in accordance with the manufacturer’s recommendations to allow equipment start-up. The use of steam heating coils within prime mover sump tanks is not permitted.
23.6.2.4 Under the anticipated seawater temperature condition, oil-lubricated bearings are to be provided with means to heat the lubricating oil to maintain viscosity in accordance with the bearing manufacturer’s requirements; water-lubricated bearings are to be suitable for continuous operation in low temperatures.
23.6.2.5 Steering gear components are to be provided with greases or lubricating oils suitable for low temperature unless they are arranged in positive temperature spaces.
23.6.2.6 Azimuth propulsion systems as well as ship steering systems (such as pods) are to be provided with suitable provisions to prevent freezing, including heating arrangements, suitable lubricating oils, hydraulic oils and antifreeze.
23.6.2.7 Where an auxiliary boiler serves anti-cold climate arrangements simultaneously, its capacity is to satisfy the demand under the minimum anticipated temperature; for ships operating in polar waters all year round, where the design service temperature is below -40 ℃ , at least two auxiliary boilers are to be provided, either of which is to satisfy the demand of the ship.

23.6.3 Deck machinery
23.6.3.1 Exposed control panels of deck machinery are to be provided with protective covers or heating arrangements for anti-freezing protection.

23.6.3.2 Where ice accretion occurs to cranes on deck in low air temperature environments, the cranes are to be able to withstand ice accretion allowance in the stowed and operating conditions as applicable. Crane foundations and supporting structures are also to be able to support a crane with the ice accretion allowance under consideration above.
23.6.3.3 Means are to be provided for habitable working conditions in exposed crane cabs, where fitted, by providing internal space heating arrangements. Cab windows are to be provided with heating arrangements to prevent icing.
23.6.3.4 Suitable provisions for cold start at the design service temperature of exposed deck cranes are to be provided. Suitable lubricating oils and greases, circulation facilities for hydraulic oils and a flushing system for the hydraulic oil are to be provided.
23.6.3.5 The anchor windlass and exposed windlass controls are to be provided with appropriate covers or heating arrangements for anti-icing protection. Alternatively, they are to be arranged in enclosed or semi-enclosed deck areas. Anchor chains are to be capable of being de-iced manually.
23.6.3.6 The hawse pipes are to be provided with anti-freezing protection or de-icing protection by steam or hot water.
23.6.3.7 Hawse pipe wash lines are to be provided with continuous circulation or heating arrangements for anti-freezing protection of water in the pipes.
23.6.3.8 Mooring winches are to be provided with suitable covers or heating arrangements for anti-icing protection. De-icing measures are to be arranged in the vicinity of mooring winches.
23.6.3.9 The foundations of anchor windlass and mooring winches may be cast by epoxy resin, the minimum anticipated temperature is to be taken into account for selection of the epoxy resin.

23.6.4 Piping systems
23.6.4.1 Piping systems are to be so designed as to minimize exposure of crew to low air temperature environments during normal operation and routine maintenance.
23.6.4.2 The possibility of ingress of ice/snow and the adverse impacts of low air temperature and ice accretion are to be taken into account for piping systems located in exposed or low temperature spaces. Exposed piping systems are to be suitable for the minimum anticipated temperature.
(1) Hoses in low air temperature environments are to maintain their flexibility and tightness.
(2) Exposed valves are to avoid freezing of fluids on either side of the valve and to prevent the accumulation of snow and spray ice.
(3) Piping components located in exposed or low temperature spaces, such as valve control units, manifolds, vents, gasket seals, and thermal instruments such as indicators, sensors and other fittings, are to be provided with anti-icing, anti-freezing protection or other means to provide for continued functionality.
(4) Pipes in which fluids are liable to freezing are to be so arranged as to be drained effectively, otherwise means are to be provided for anti-freezing protection.
(5) Overboard discharge outlets are normally to be arranged below the waterline.
(6) Overboard discharge valves arranged in low temperature spaces or above the waterline are to be provided with low pressure steam connections for clearing purposes, unless other anti-freezing measures are provided.
(7) Due consideration is to be given to the thermal expansion and cold contraction impacts on pipes due to temperature difference for piping arrangements in exposed and low temperature spaces.
23.6.4.3 Vent piping systems and sounding pipes are to maintain functionality in low air temperature environments.
(1) For air pipes and pipe heads arranged in exposed or low temperature spaces, measures are to be taken to prevent blockage due to internal humidity freezing.
(2) Exposed air vent pipe heads are to be provided with anti-icing measures against blockage, such as heat tracing or protective cover; where protective covers are provided against icing, the covers are not to interfere with the free flow of air through the vent openings.
(3) Sounding pipes of tanks are to be provided with anti-freezing measures for ready availability.
(4) Where the tank is provided with heating arrangements, anti-freezing measures may be exempted for the vent piping system and sounding pipe upon calculation.
23.6.4.4 Ballast water piping systems are to maintain functionality in low air temperature environments.
(1) The use of gray cast iron material for piping, valves and fittings is prohibited.
(2) Where local freezing of ballast tanks is unavoidable, GRP piping and other system components in the tanks likely to be damaged by fallen ice hitting are to be suitably protected.
(3) Where sea chests are provided for ballast water piping system separately, direct steam connections to the sea chests are to be provided for de-icing purposes; alternatively, a sea bay and heating arrangements may be used.

(4) Sea inlet valves are to be provided with low pressure steam connection for clearing purposes.
(5) Overboard discharge outlets are generally not to be above the waterline; where they must be above the waterline, suitable heating arrangements are to be provided for ballast water discharge pipes.
(6) Where the design service temperature is below -40℃, suitable heating arrangements are to be provided for ballast water discharge pipes.
23.6.4.5 Fresh water piping systems in low air temperature environments are to be provided with suitable anti-freezing arrangements.
(1) Fresh water pipes are to be arranged in positive temperature spaces as far as practicable and are to be thermally insulated or heat traced when running through low temperature spaces.
(2) Exposed sections of fresh water lines are to be fitted with an isolating valve located inside a positive temperature space such that the exposed length can be drained, and in general a dry air blow connection is to be provided at the most forward end.
(3) Fresh water generation systems' inlet water temperatures are to comply with the manufacturer's requirements.
23.6.4.6 Drainage piping systems are to maintain functionality in low air temperature environments.
(1) Drainage pipes are to be arranged in positive temperature spaces as far as practicable or heat traced.
23.6.4.7 Fuel oil piping systems are to maintain functionality in low air temperature environments.
(1) In addition to adding additives to fuel oil, where necessary, fuel oil tanks for engines and boilers are to be provided with heating coils to ensure continuous supply of fuel oil in the minimum anticipated temperature.
(2) Where ships need to be filled with fuel oil in low air temperature environments, fuel oil filling stations are to be located in an area sheltered from the weather and easy for access and operation. For fuel oil filling pipes located on the deck, alternative arrangements to protect the filling pipes are to be provided such as a removable or hinged cover may be installed.
(3) Where the design service temperature is below -25℃, fuel oil filling pipes and transfer pipes arranged in exposed and low temperature spaces are to be heat traced and thermally insulated.
23.6.4.8 Seawater cooling piping systems are to ensure normal seawater supply in the anticipated environments.
(1) At least one sea chest is arranged as such to prevent the blockage of seawater inlet gratings and seawater pipe inlets by floating ice.
(2) Sea chest valves are to be provided with low pressure steam connection for clearing purposes.
(3) Where the design service temperature is below -40℃, cooling water discharge pipes are to be provided with suitable heating arrangements.
(4) As an alternative to (1), (2) and (3) above, ballast water may be circulated as cooling water for main and auxiliary engines, and relevant heat balance calculations are to be submitted.
23.6.4.9 Compressed air piping systems are to ensure supply of sufficiently dry compressed air to essential systems in low air temperature environments.
(1) Compressed air for low temperature spaces is to have a dew point not higher than the design service temperature, but at least as low as -25℃.
(2) Compressed air supplying control air to exposed facilities is to have a dew point not higher than the minimum anticipated temperature.
(3) Where the design service temperature is not lower than -25℃, heating arrangements may be used as an alternative to (1) and (2) above; where the design service temperature is lower than -25 ℃ , heating arrangements are to be provided for control air.
(4) Compressed air pipes arranged on exposed decks are to be provided with drainage valves at the lowest position.
23.6.4.10 Hydraulic piping systems are to maintain functionality in low air temperature environments.
(1) Hydraulic oil is to either be of a type that maintains an acceptable viscosity, or the hydraulic system is to have heating or circulation arrangements to keep fluids at an appropriate temperature to ensure the operability of the essential systems they serve.
(2) As far as practicable, hydraulic oil power packs are to be sited in positive temperature spaces. Where this is not practicable, the hydraulic oil and piping system are to be suitable for operation under the minimum anticipated temperature.
(3) Exposed control stand valves for hydraulic oil lines used for remote control are to be provided with heating arrangements for anti-freezing protection of the mechanism.
(4) Where the design service temperature is lower than -25 ℃ , heating arrangements are to be provided under the bottom of hydraulic oil tank in low temperature spaces; where the design service temperature is lower than -40℃, hydraulic pipes in low temperature spaces are also to be thermally insulated or heated.

23.6.4.11 Steam piping systems are to maintain functionality in low air temperature environments.
(1) Means are to be provided for anti-freezing protection of condensate in exposed steam pipes, by thermal insulation or by compressed air blow when not in use.
23.6.4.12 HVAC systems are to operate effectively under the anticipated design service temperature.
(1) Accommodation spaces are to be heated at least to 18 ℃ under the anticipated design service temperature and maintained at this temperature.
(2) The maximum fresh air ratio in accommodation spaces is to be 0.5.
(3) The relative humidity of spaces fitted with HVAC systems is to be maintained in the range between 30% and 70%.
(4) Condensate on the inner bulkheads of accommodation spaces is to be kept at a minimum and effective condensate drainage systems are to be provided.
(5) Condensate on observation windows of the navigation bridge and cargo control room are to be kept at a minimum.
(6) Closing appliances for ventilation inlets and outlets are to be suitably arranged to prevent disturbance by snow and ice accretion and to maintain the effectiveness of air circulation.

23.6.5 Electrical equipment
23.6.5.1 In addition to complying with the requirements of Section 1, Chapter 2, PART FOUR of the Rules, the capacity of the main power source is to be sufficient to supply the air-conditioning system and heating arrangements provided to keep spaces at positive temperatures.
23.6.5.2 In addition to complying with the requirements of Section 2, Chapter 2, PART FOUR of the Rules, the emergency power source is to supply the following equipment and ensure 18 h for cargo ships and 36 h for passenger ships:
(1) power to the heating arrangements in the following spaces:
① navigation bridge;
② radio room;
③ engine room centralized control room;
④ workshop;
⑤ cargo control room;
⑥ fire control room;
⑦ hospital room;
⑧ at least one public space of cargo ships (such as crew mess room and recreation room), one or several public spaces of passenger ships sufficient to hold all passengers and crew;
⑨ battery room;
⑩ emergency generator room;
⑪ emergency fire pump room;
(2) heat tracing for any piping associated with the emergency consumer;
(3) auxiliary boiler, if provided, with the control, monitoring and safety system.
23.6.5.3 Generators and electric motors installed on exposed decks and in low temperature spaces are to be provided with condensation-proof arrangements as well as lubricating oil suitable for the design service temperature if the bearings require forced lubrication or pre-lubrication.
23.6.5.4 Distribution boxes, switchboards and controllers on exposed decks and in low temperature spaces are to be provided with condensation-proof arrangements.
23.6.5.5 Electric cables on exposed decks and in low temperature spaces are to be type approved according to the design service temperature. Electric cables on exposed decks are to be protected by metallic pipes or lines or sheaths.
23.6.5.6 Where electrical equipment is used to heat battery rooms, the explosion group and temperature class of equipment is not to be lower than IIC T1.
23.6.5.7 Illumination lights and navigation lights installed on exposed decks are to be suitable for the design service temperature. Where lights mentioned above cannot generate sufficient heat to keep the light fixture ice-free, they are to be readily accessible and suitable for manual de-icing, or heating arrangements are to be provided.
23.6.5.8 Where closed circuit television systems are fitted on exposed decks, these are to be provided with heating arrangements or covers, to prevent the equipment from damages or abnormal operation due to freezing.

Section 7 FIRE FIGHTING

23.7.1 General requirements

23.7.1.1 Fire-fighting systems and appliances are to be readily available at the design service temperature.

23.7.1.2 Fire mains and fire-fighting system piping are to be provided with the following anti-freezing protection, but not limited to:

(1) located in a heated passageway; or

(2) provided with heat tracing; or

(3) arranged as a dry system.

23.7.1.3 Where piping is arranged as a dry system, it is to be drained after use. Drains are to be located at the lowest points in the system, and connection means of compressed air vent pipe are to be provided at the end of the pipe other than the end where the drains are located in order to maintain the line drying. The piping layout is to ensure that all water will drain to them without being trapped in U-bends, low points or dead-ends.

23.7.1.4 For the fire-fighting system, isolating valves are to be provided between pipelines on exposed deck and those in the heated spaces. The isolating valves in exposed locations are to be provided with anti-icing protection and located in areas where it is easily accessible.

23.7.1.5 Fire extinguishing agents (foams, powders, gases) are to be rated for operation at the design service temperature.

23.7.1.6 Hydrants are to be provided with anti-icing and anti-freezing protection. The stowage positions for fire hoses and nozzles are to be provided with anti-icing and anti-freezing protection, the hoses and nozzles are to be dried immediately after use.

23.7.1.7 Portable extinguishers located in exposed and low temperature spaces are to be rated for operation at the design service temperature. The storage facilities of the portable extinguishers are to be provided with anti-icing protection and readily accessible.

23.7.1.8 All two-way portable radiocommunication equipment are to be operable at the design service temperature.

23.7.2 Fire pumps

23.7.2.1 All fire pumps, including emergency fire pumps, are to be installed in positive temperature spaces to ensure the ship's normal operation of the fire-fighting system under the minimum anticipated temperature.

23.7.2.2 Main fire pumps, if provided with separate sea chests, are arranged as such to prevent the blockage of seawater inlet gratings and seawater pipe inlets by floating ice.

23.7.2.3 Sea chests of emergency fire pumps are to be provided with means for heating, insulation or low pressure steam connection to prevent the blockage by floating ice.

23.7.3 Fire-fighter's outfits

23.7.3.1 Fire-fighter's outfits are to be stowed in easily accessible positive temperature spaces.

23.7.4 Escape routes

23.7.4.1 Essential emergency routes, such as escape routes, muster areas, lifeboat embarkation areas, are to be provided with anti-icing protection. Where exposed decks of the ship have no anti-icing requirements, de-icing tools to remove ice and snow accretion are to be provided to ensure the safety of persons onboard. Gangways and ramps are to be provided with de-icing arrangements.

23.7.4.2 Overhead structures are to be provided with de-icing or other arrangements to prevent injuries to persons or damages to essential safety equipment/structures by fallen ice.

23.7.4.3 Escape routes are to be provided with anti-icing protection to ensure that the escape routes are ice-free or providing a minimum ice-free width of 700 mm, enabling the use of at least one railing. Railings that are important as hand-holds (stairs, escape ways) are to have anti-icing protection. Railings that function only as barriers, but are not intended as handholds, may be provided with de-icing arrangements only.

23.7.4.4 External handrails on routes, stairways and ladders, if provided with heating arrangements for anti-icing protection, are to be fitted with arrangements to cut off automatically in the event of excessively high temperatures to prevent injuries to persons when in contact.

23.7.4.5 Escape routes are to be so dimensioned as not to hinder passage for persons wearing polar clothing.

23.7.4.6 Exits forming escape routes are to be provided with anti-icing measures and door seals are to be suitable for the design service temperature.

Section 8 LIFE-SAVING APPLIANCES AND ARRANGEMENTS

23.8.1 General requirements

23.8.1.1 The performance standards of life-saving appliances and arrangements are to comply with the requirements of this Section in addition to the provisions of the International Life-Saving Appliance (LSA) Code.

23.8.1.2 Life-saving appliances and arrangements are to be fully functional at the design service temperature (DST).

23.8.1.3 For ships operating in polar waters, life-saving appliances and arrangements are to be fully operable at the design service temperature (DST) during the maximum expected rescue time.

23.8.1.4 For ships the design service temperature (DST) of which is below -30℃, the muster station is to be located inside space.

23.8.1.5 The bridge and exposed deck life-buoys are to be provided with anti-icing protection and be arranged such that it is immediately deployable by the crew.

23.8.2 Lifeboats

23.8.2.1 Lifeboats are to be of totally enclosed type. The capacity of the lifeboats is to be sized for persons dressed in heat-insulated immersion suits or anti-cold climate clothing.

23.8.2.2 Lifeboat engines are to start within 2 min at the design service temperature (DST). Two separate power sources are to be provided for the start-up of lifeboat engines. Lifeboat engine batteries are to be suitable for low temperature conditions.

23.8.2.3 The cooling system for lifeboat engines is to ensure that the engines are operable at the design service temperature (DST).

23.8.2.4 Cooling water, fuel and lubricating oils for engines are to be suitable for engine operation at the design service temperature (DST).

23.8.2.5 Heating arrangements are to be provided in way of the lifeboat doors.

23.8.2.6 Heating arrangements are to be provided for lifeboat windows at the operating position, and measures are to be taken to maintain clear field of vision.

23.8.2.7 Consideration is to be given to the capacity of drinking water containers to be suitable to allow for expansion due to freezing.

23.8.2.8 Additional rations, equaling to at least 30% of the amount specified in the LSA Code, are to be provided for ships usually operating in low air temperature environments.

23.8.2.9 The release mechanism of lifeboats is to be provided with heating or other arrangements to ensure safe release at the design service temperature (DST).

23.8.2.10 Suitable de-icing tools are to be provided in the vicinity of the stowage positions for lifeboats.

23.8.3 Rescue boats

23.8.3.1 Rescue boats provided onboard are to be rigid rescue boats.

23.8.3.2 Cooling water, fuel and lubricating oils for engines are to be suitable for engine operation at the design service temperature (DST).

23.8.4 Liferafts

23.8.4.1 Where the design service temperature (DST) is blow -30℃, the inflation of inflatable liferafts is to be completed within a period of 3 min.

23.8.4.2 Where the design service temperature (DST) is below -30 ℃ , the container and hydrostatic release mechanism for liferafts are to be provided with heating or other arrangements to ensure easy launching, inflation and release of the liferafts at the design service temperature (DST).

23.8.4.3 Where manual inflation pumps for inflatable liferafts are provided onboard, the pumps are to be stowed in positive temperature spaces in the vicinity of the inflatable liferafts.

23.8.4.4 Additional rations, equaling to at least 30% of the amount specified in the LSA Code, are to be provided for ships usually operating in low air temperature environments.

23.8.4.5 Suitable de-icing tools are to be provided in the vicinity of the stowage positions for lifeboats.

23.8.5 Launching appliances for survival craft and rescue boats

23.8.5.1 Hydraulic oil and lubricating oil for launching and embarkation appliances are to be suitable for operation at the design service temperature (DST). Greases suitable for operation in low temperatures are to be provided for davits and release hooks.
23.8.5.2 Electric motors, winches and automatic release hooks are to have moveable covers; where the design service temperature (DST) is below -40℃, heating arrangements are to be provided.
23.8.5.3 Electric motors, hydraulic units, winches, brakes and other components of launching appliance are to be operable at the design service temperature (DST). Appropriate tests are to be carried out to verify their operability.
23.8.5.4 Other members of launching appliances, such as winches, sheaves, winch brakes, etc. are to be provided with heating or other arrangements to ensure safe launching of survival craft and rescue boats at the design service temperature (DST).
23.8.5.5 The stowage positions for embarkation ladders are to be provided with covers or heating arrangements to prevent ice accretion.

23.8.6 Communication
23.8.6.1 Fixed two-way VHF radio installations onboard lifeboats are to be capable of operation at the design service temperature (DST).
23.8.6.2 For ships operating in polar waters, signal appliances fitted on all survival craft and rescue boats are to be operable at the design service temperature (DST).

Section 9 NAVIGATIONAL SAFETY

23.9.1 General requirements
23.9.1.1 Radio installations and navigational equipment installed on exposed decks are to be type tested according to the design service temperature.
23.9.1.2 Arrangements are to be made to prevent damage to antennae due to accumulation of ice and snow except for whip type antennae. Antennae may be heated or placed in heated domes, or in a place easily accessible for manual de-icing.
23.9.1.3 The movement of rotating antennae (e.g., radar, Inmarsat B and F) is not to be inhibited by snow or ice.

23.9.2 Navigational equipment
23.9.2.1 Ships operating in polar waters are to be provided with two searchlights that can rotate 360° horizontally and be remotely operated from the wheelhouse. Searchlight housing is to use heated glass or be provided with covers to prevent accumulation of ice and snow. The rotation mechanism is to be provided with anti-icing protection.
23.9.2.2 Magnetic compasses installed on exposed decks are to be provided with protective covers.

Section 10 SHIP TYPE SPECIFIC ADDITIONAL REQUIREMENTS

23.10.1 General requirements
23.10.1.1 The requirements of this Section apply respectively to different ship types, including oil tanker/chemical tanker, liquefied gas carrier, bulk carrier/ore carrier, offshore supply vessel and other special ship types.
23.10.1.2 The above-mentioned ship types are to comply with the following specific requirements in addition to the applicable requirements in Sections 1 to 9.

23.10.2 Bulk carrier/Ore carrier
23.10.2.1 Bulk carriers and ore carriers applying for Anti-Cold Climate notations are to comply with the following requirements.
23.10.2.2 Ballast tanks and piping are to comply with the following additional requirements:
(1) If fitted, piping connecting the upper wing tanks and lower wing tanks is to have anti-freezing protection. If a steam heating coil is fitted on the surface of this connecting pipe, it is to be protected so as to avoid being damaged due to cargo loading and unloading operations.

(2) For double bottom tanks and lower wing tanks that may be exposed to the design service temperature, ballast water inside such tanks is to be prevented from freezing. Water ingress alarms of cargo holds and bilge piping are to take the impacts of low temperature into account.
(3) If an air bubble system or heating coil system is provided in the lower wing tank for anti-freezing protection, no additional anti-freezing protection will be required for the upper wing tank and connecting pipe.
23.10.2.3 Where cargo loading and unloading operations will be carried out in low air temperature environments for long duration, the low-temperature performance of materials of inner bottom plating of double bottom tanks and sloping bottom plating of lower wing tanks is to be considered in the design.

23.10.3 Oil tanker/Chemical tanker
23.10.3.1 Oil tankers and chemical tankers applying for Anti-Cold Climate notations are to comply with the following requirements.
23.10.3.2 In addition to the provisions of 23.3.2.2, compartments requiring additional heating arrangements are to include cargo control rooms, cargo pump rooms, oil discharge monitoring equipment rooms (where fitted) as well as compressor rooms, motor rooms and cargo transfer observation stations that may be fitted. For cargo control rooms and cargo transfer observation stations, where the design service temperature is not lower than -25℃, portable heating arrangements may be accepted.
23.10.3.3 The emergency towing arrangements are to be provided with either anti-icing or de-icing protection. The pre-rigged emergency towing arrangement is to have suitable cover or heating arrangements for anti-icing protection, or be located in an enclosed or semi-enclosed deck area to be readily available.
23.10.3.4 Piping systems arranged on exposed decks are to comply with the following additional requirements:
(1) For exposed cargo piping and piping supports installed on the main deck, including vent piping, the design loads are to include the expected ice/snow accretion allowance.
(2) The supports for cargo piping systems on exposed deck are to be so arranged that free expansion and contraction of the pipes during cargo operations cannot be blocked by ice/snow accretion.
(3) Means are to be provided for anti-freezing protection of cargo fluids within exposed pipes, particularly for small bore pipes such as cargo drain and pressure gauge lines. When the design service temperature is below -25℃, the cargo and stripping lines on exposed deck are to be provided with suitable heat tracing and thermal insulation.
(4) Exposed inert gas systems and relevant equipment are to comply with the following requirements:
① the inert gas system scrubber is to be located in a compartment not affected by the weather. The cooling water system for inert gas scrubber is to be provided with suitable means of anti-freezing protection;
② means for the deck water seal are to be provided to ensure the added fluid to be free from freezing. Proper application of antifreeze or provision of heating arrangements may be used;
③ the exposed water supply and discharge lines to the deck water seal are to be provided with heating arrangements or thermal insulation with continuous circulation;
④ the non-return valve for the deck water seal is to be provided with suitable drainage and a set of control handles for testing;
⑤ the pressure/vacuum breakers are to be suitable for the minimum anticipated temperature. Proper application of antifreeze or provision of heating arrangements may be used;
⑥ drainage lines are to be thermally insulated;
⑦ equipment requiring de-icing maintenance are to be grouped together as far as practicable and readily accessible.
(5) Pressure/vacuum valves are to be provided with suitable anti-icing protection and de-icing measures so as to keep the valves readily operable.
(6) De-icing arrangements with steam or hot water are to be provided in areas designated for control of cargo loading and unloading (including gangways), with a fixed pipeline on the deck and connection valves for hoses.
23.10.3.5 The safe access to bow gangway is to either be provided with anti-icing protection, or it is to be made of a grating with raised non-skid points that will give safe footing in the presence of minor sea spray icing.
23.10.3.6 Monitoring systems are to comply with the following requirements:
(1) Heat tracing systems are to be provided with the temperature monitoring function so that any system failure or temperature exceeding limits will result in an alarm at the manned control station.

(2) The following instruments and equipment, when exposed to the low air temperature environments, are to be provided with heat tracing systems:

① level indicators for cargo tanks;

② overflow control;

③ pressure gauges;

④ temperature-indicating devices;

⑤ instrumentation for gas detection systems.

23.10.4 Liquefied gas carrier (LPG/LNG)

23.10.4.1 LPG and LNG carriers applying for Anti-Cold Climate notations are to comply with the following requirements.

23.10.4.2 For cargo containment system or any cover for the containment system exposed outside the hull, the requirements of 4.3.4 in Chapter 4, PART THREE of ISC Rules for Construction and Equipment of Ships Carrying Liquefied Gases in Bulk are to be complied with, taking into account the following ice and snow loads on the system or the cover in low air temperature environments:

(1) static load of ice and snow;

(2) dynamic load from sliding or dropped ice.

23.10.4.3 In addition to the provisions of 23.3.2.2, compartments requiring additional heating arrangements are to include cargo control rooms, cargo pump rooms, nitrogen storage rooms as well as compressor rooms, motor rooms and cargo transfer observation stations that may be fitted. For cargo control rooms and cargo transfer observation stations, where the design service temperature is not lower than -25℃, portable heating arrangements may be accepted.

23.10.4.4 The emergency towing arrangements are to be provided with either anti-icing or de-icing protection. The pre-rigged emergency towing arrangement is to have suitable cover or heating arrangements for anti-icing protection, or be located in an enclosed or semi-enclosed deck area to be readily available.

23.10.4.5 Exposed cargo related systems are to function properly in low air temperature environments and under ice/snow accretion conditions:

(1) For exposed cargo piping and piping supports installed on the main deck, including vent piping, the design loads are to include the expected ice/snow accretion allowance.

(2) The supports for cargo piping systems on exposed deck are to be so arranged that free expansion and contraction of the pipes during cargo operations cannot be blocked by ice/snow accretion.

(3) Where LNG carriers utilize cargo boil-off as fuel for propulsion power, particularly operating in the "gas only mode", the normal rate of boil-off (NBOR) is to take into account the minimum anticipated temperature, and the provisions for forced boil-off are to be adequate.

(4) Exposed safety relief valves and other valves are to be arranged in such a way as to provide their local and remote activation under all circumstances. De-icing and heat tracing arrangements are to be provided for the valves. Valve actuators with local position indicators are to be of the enclosed type.

(5) Emergency shutdown (ESD) valves are to be provided with anti-icing protection.

(6) All piping and pressure/vacuum protection systems (including valves) are to be provided with heat tracing arrangements so as to keep them readily operable.

(7) The maximum temperature of heating media within the cargo area is to be controlled within safe and controllable limits, taking into account the auto ignition temperature of the cargoes being carried.

(8) Equipment used for the environmental control of the cargo spaces, inter-barrier spaces and other spaces are to be designed to maintain a dew point below the lesser of the design service temperature or -30℃.

(9) Spaces required to be ventilated before entering are to be equipped with suitable means of pre-heating the ventilation systems to provide for their proper functioning at the design service temperature.

(10) If the cargo manifold and cargo vapor areas and associated valves are enclosed from the weather, the enclosures are to be arranged in such a way as to provide for sufficient ventilation of the space during cargo loading and unloading. Where mechanical ventilation is provided, the number of air changes is to be at least 30 per hour based on the gross volume of the space. In addition, gas detectors are to be provided.

(11) The vent mast head is to be designed to prevent blockage by ice accretion. Drip pans for the purpose of collecting moisture in the vent mast are to be provided. Drip pans with associated drain pipes inside the vent mast head and foot are to be provided with heat tracing.

(12) A steam-operated vapor heater for the purpose of preventing vapor descending to the deck is to be installed in the vapor line before the vent riser used for controlled venting.

(13) Insulation of the boil-off gas piping is required in way of areas exposed or subject to the design service temperature.

(14) The air intakes and exhaust louvres for cargo control rooms, cargo pump rooms, compressor rooms and motor rooms (where fitted) are to be provided with anti-icing protection by de-icing measures or heating arrangements.
(15) De-icing arrangements with steam or hot water are to be provided in areas designated for control of cargo loading and unloading (including gangways), with a fixed pipeline on the deck and connection valves for hoses.
(16) The piping system providing water curtain for the cargo loading and unloading area is to be provided with anti-freezing arrangements. Seawater for the water curtain may be preheated to avoid excessive ice accretion at the side shell plating.
23.10.4.6 A water spray system installed on exposed deck is to be equipped with heating arrangements for anti-freezing protection, and to be dried immediately after use.
23.10.4.7 Dry chemical powder systems are to be so arranged as to prevent clogging of the nozzles, and being capable of releasing the medium at the design service temperature.
23.10.4.8 The safe access to bow gangway is to either be provided with anti-icing protection, or it is to be made of a grating with raised non-skid points that will give safe footing in the presence of minor sea spray icing.
23.10.4.9 Monitoring systems are to comply with the following requirements:
(1) Heat tracing systems are to be provided with the temperature monitoring function so that any system failure or temperature exceeding limits will result in an alarm at the manned control station.
(2) The following instruments and equipment, when exposed to the low air temperature environments, are to be provided with heat tracing systems:

① level indicators for cargo tanks;
② overflow control;
③ pressure gauges;
④ temperature-indicating devices;
⑤ instrumentation for gas detection systems.

23.10.5 Offshore supply vessel

23.10.5.1 Offshore supply vessels applying for Anti-Cold Climate notations are to comply with the following requirements.
23.10.5.2 Piping systems arranged on exposed decks are to comply with the following additional requirements:
(1) Drilling muds and other specialized bulk cargoes carried by offshore support vessels may be particularly susceptible to freezing and may flow less freely in low air temperature environments. This fact is to be taken into account in the design. Valves and control stations are to be suitably located so as to be protected from cold and ice/snow accretion, as practicable.
(2) Where the transfer of fuel, drilling muds and other specialized bulk cargoes to drill ships at sea is anticipated, all equipment associated with the transfer such as, hoses, valves, fittings, etc. are to be suitable for operation under the minimum anticipated temperature.
23.10.5.3 For vessels with a rescue zone, suitable arrangements are to be provided for anti-icing protection:
(1) on a cross-deck area between the rescue zones port and starboard;
(2) the railings and handrails in the rescue zone; and
(3) routes to the accommodation/treatment areas.

23.10.6 Other ship types

23.10.6.1 Other ship types applying for Anti-Cold Climate notations are to comply with the following requirements.
23.10.6.2 For container ships, the exposed cargo securing arrangements are to be prevented from freezing, the material of which are to be suitable for the design service temperature, and are to be provided with grease suitable for use in low air temperature environments and with de-icing measures.
23.10.6.3 For container ships, where five layers or more of containers are stowed on exposed deck, the stowage positions for portable fire-extinguishing monitors are to be provided with anti-icing and anti-freezing protection, and the monitors are to be dried immediately after use.
23.10.6.4 For standby ships/rescue ships, the rescue facilities, if provided, are to be provided with anti-icing protection.

23.10.6.5 For standby ships/rescue ships, helicopter decks or hovering areas, if provided, are to be provided with de-icing measures, to ensure normal operation of the deck/area at the design environmental conditions for a period of one hour.
23.10.6.6 External fire-extinguishing appliances of fire-fighting ships are to be provided with anti-icing and anti-freezing protection.

Section 11 ANTI-ICING AND DE-ICING MEASURES

23.11.1 Application

23.11.1.1 This Section applies for ships operating occasionally in low air temperature environments and also for ships operating in areas and during periods where more severe ice and snow accretion are likely to occur but not in low air temperature environments.
23.11.1.2 The anti-icing and/or de-icing measures complying with this Section are to be taken by the above-mentioned ships.

23.11.2 Class notation

23.11.2.1 Ships complying with the provisions of this Section are to be assigned with the following notation:
(1) winterization de-icing notation: DE-ICE.

23.11.3 Plans and documents

23.11.3.1 The following plans and documents are to be submitted for approval:
(1) Arrangement of anti-icing and de-icing equipment, indicating heating capacity;
(2) Single line diagram of heating cables, if provided;
(3) Piping diagram of steam or heating fluids, if provided;
(4) Stability calculations in which ice accretion is considered;
(5) Anti-icing and de-icing procedures manual.
Items (4) and (5) above are always to be kept on board ships.

23.11.4 Main methods for anti-icing/de-icing

23.11.4.1 Main methods for anti-icing are:
(1) heating by steam, hot fluids or heating cables;
(2) using permanent or removable protective covers.
23.11.4.2 Main methods for de-icing are:
(1) flushing by hot water or steam;
(2) de-icing by mechanical means manually;
(3) using hot air or chemical substances.

23.11.5 Technical requirements

23.11.5.1 The anti-icing and de-icing arrangements of ships are to comply with the requirements given in Table 23.11.5.1.

Anti-icing and De-icing Arrangements **Table 23.11.5.1**

Area or equipment	Anti-icing and de-icing requirements	Reference No.
Ship arrangements		
Tanks	The ship is to have an appropriate arrangement to prevent the surface of ballast tanks, fresh water tanks and other relevant tanks from freezing over considering the minimum anticipated temperature.	23.3.3.1
Superstructures and decks		
Bridge windows	Bridge windows are to be fitted with heating and cleaning systems and are to function under the minimum anticipated temperature. Where the water flushing system is fitted, measures are to be taken to prevent pipelines and fittings from freezing and thus becoming inoperable.	23.3.4.2
Bridge doors	Navigation bridge doors and the adjacent deck areas are to be so arranged as to prevent ice and snow accretion.	23.3.4.3
Master's cabin windows	At least one of the Master's cabin windows is to have a heating arrangement for a view over the cargo deck where necessary.	23.3.4.5
Exterior stairs and railings	Exterior stairs and railings not forming the escape routes are to be provided with anti-icing or de-icing protection.	23.3.4.7

Area or equipment	Anti-icing and de-icing requirements	Reference No.
Helicopter decks or hovering areas	Helicopter decks or hovering areas, if provided, are to be provided with de-icing measures.	23.3.5.1
Stability		
Means for removing ice	Equipped with such means for removing ice; for example, electrical and pneumatic devices, and/or special tools such as axes or wooden clubs for removing ice from bulwarks, rails and erections.	23.4.1.2(2)
Ice accretion monitoring	Monitored for ice accretion during operation and appropriate measures are to be taken to ensure that ice accretion allowance does not exceed the value specified in the Stability Manuel.	23.4.1.2(3)
Watertight and weathertight integrity		
Ramp doors and side doors	Ramp doors and side doors are to be provided with means to remove ice accretion around hatches and doors.	23.5.2.2
Freeing ports	Freeing ports are to be fitted with anti-icing protection.	23.5.3.2(1)
Scuppers and discharges	For decks, passageways and muster areas that are required to be kept ice-free, the scuppers and discharges in such spaces are to be provided with anti-freezing protection.	23.5.3.3
Main and auxiliary machinery		
Combustion air intakes	The combustion air intakes are to be located on both sides of the ship and so arranged as to prevent the recirculation of engine exhaust gases into the combustion air intakes, ice/snow accretion and blockage of the duct.	23.6.2.2(4)
Piping		
Exposed valves	Exposed valves are to prevent the accumulation of snow and spray ice.	23.6.4.2(2)
Piping components located in exposed or low temperature spaces	Piping components located in exposed or low temperature spaces, such as valve control units, manifolds, vents, gasket seals, and thermal instruments such as indicators, sensors and other fittings, are to be provided with anti-icing, anti-freezing protection or other means to provide for continued functionality.	23.6.4.2(3)
Exposed air vent pipe heads	Exposed air vent pipe heads are to be provided with anti-icing measures against blockage, such as electric heat tracing or protective cover; where protective covers are provided against icing, the covers are not to interfere with the free flow of air through the vent openings.	23.6.4.3(2)
Sea chests	At least one sea chest is arranged as such to prevent the blockage of seawater inlet gratings and seawater pipe inlets by floating ice.	23.6.4.8(1)
Exposed control stand valves	Exposed control stand valves for hydraulic oil lines used for remote control are to be provided with heating arrangements for anti-freezing protection of the mechanism.	23.6.4.10(3)
Electrical installations		
Generators and electric motors installed on exposed decks and in low temperature spaces	Generators and electric motors installed on exposed decks and in low temperature spaces are to be provided with condensation-proof arrangements.	23.6.5.3
Distribution boxes, switchboards and controllers on exposed decks and in low temperature spaces	Distribution boxes, switchboards and controllers on exposed decks and in low temperature spaces are to be provided with condensation-proof arrangements.	23.6.5.4
Illumination lights and navigation lights installed on exposed decks	If illumination lights and navigation lights installed on exposed decks cannot generate sufficient heat to keep the light fixture ice-free, they are to be readily accessible and suitable for manual de-icing, or heating arrangements are to be provided.	23.6.5.7
Deck machinery		
Exposed control panels of deck machinery	Exposed control panels of deck machinery are to be provided with protective covers or heating arrangements for anti-freezing protection.	23.6.3.1
Cab windows of cranes	Cab windows are to be provided with heating arrangements to prevent icing.	23.6.3.3
Anchor windlass and its control	The anchor windlass and exposed windlass controls are to be provided with appropriate covers or heating arrangements for anti-icing protection. Alternatively, they are to be arranged in enclosed or semi-enclosed deck areas.	23.6.3.5
Anchor chains	Anchor chains are to be capable of being de-iced manually.	23.6.3.5
Hawse pipes	The hawse pipes are to be provided anti-icing protection or de-icing protection by steam or hot water.	23.6.3.6

Area or equipment	Anti-icing and de-icing requirements	Reference No.
Hawse pipe wash lines	Hawse pipe wash lines are to be provided with continuous circulation or heating arrangements for anti-freezing protection of water in the pipes.	23.6.3.7
Mooring winches	Mooring winches are to be provided with suitable covers or heating arrangements for anti-icing protection. De-icing measures are to be arranged in the vicinity of mooring winches.	23.6.3.8
Fire fighting		
Isolating valves	The isolating valves in exposed locations are to be provided with anti-icing protection and located in areas where it is easily accessible.	23.7.1.4
Hydrants	Hydrants are to be provided with anti-icing and anti-freezing protection. The stowage positions for fire hoses and nozzles are to be provided with anti-icing and anti-freezing protection, the hoses and nozzles are to be dried immediately after use.	23.7.1.6
Portable extinguishers	The storage facilities for portable extinguishers are to be provided with anti-icing protection and readily accessible.	23.7.1.7
Sea chests of emergency fire pumps	Sea chests of emergency fire pumps are to be provided with means for heating, insulation or low pressure steam connection to prevent the blockage by floating ice.	23.7.2.3
Emergency routes	Essential emergency routes, such as escape routes, muster areas, lifeboat embarkation areas, are to be provided with anti-icing protection. Where exposed decks of the ship have no anti-icing requirements, de-icing tools to remove ice and snow accretion are to be provided to ensure the safety of persons onboard. Gangways and ramps are to be provided with de-icing arrangements.	23.7.4.1
Overhead structures	Overhead structures are to be provided with de-icing or other arrangements to prevent injuries to persons or damages to essential safety equipment/structures by fallen ice.	23.7.4.2
Escape routes	Escape routes are to be provided with anti-icing protection to ensure that the escape routes are ice-free or providing a minimum ice-free width of 700 mm, enabling the use of at least one railing. Railings that are important as hand-holds (stairs, escape ways) are to have anti-icing protection. Railings that function only as barriers, but are not intended as handholds, may be provided with de-icing arrangements only.	23.7.4.3
Exits forming escape routes	Exits forming escape routes are to be provided with anti-icing and de-icing measures.	23.7.4.6
Life-saving appliances		
Life-buoys	The bridge and exposed deck life-buoys are to be provided anti-icing protection and be arranged such that it is immediately deployable by the crew.	23.8.1.5
Release mechanism of lifeboats	The release mechanism of lifeboats is to be provided with heating or other arrangements to ensure safe release.	23.8.2.9
Vicinity of lifeboats	Suitable de-icing tools are to be provided in the vicinity of the stowage positions for lifeboats.	23.8.2.10
Launching appliances of survival craft and rescue boats	Electric motors, winches and automatic release hooks of survival craft and rescue boats are to have moveable covers.	23.8.5.2
Launching appliances of survival craft and rescue boats	Other members of launching appliances, such as winches, sheaves, winch brakes, etc. are to be provided with heating or other arrangements to ensure safe launching of survival craft and rescue boats.	23.8.5.4
Embarkation ladders	The stowage positions for embarkation ladders are to be provided with covers or heating arrangements to prevent ice accretion.	23.8.5.5
Navigational equipment		
Antennae	Arrangements are to be made to prevent damage to antennae due to accumulation of ice and snow except for whip type antennae. Antennae may be heated or placed in heated domes, or in a place easily accessible for manual de-icing.	23.9.1.2
Searchlight housing	Searchlight housing is to use heated glass or be provided with covers to prevent accumulation of ice and snow. The rotation mechanism is to be provided with anti-icing protection.	23.9.2.1
Magnetic compasses	Magnetic compasses installed on exposed decks are to be provided with protective covers.	23.9.2.2

23.11.5.2 Anti-icing and de-icing arrangements specific to ship types are also to comply with the requirements given in Table 23.11.5.2.

Anti-icing and De-icing Arrangements Specific to Ship Types **Table 23.11.5.2**

Area or equipment	Anti-icing and de-icing requirements	Reference No.
Oil tanker/Chemical tanker		
Emergency towing arrangements	The emergency towing arrangements are to be arranged with either anti-icing or de-icing protection. The pre-rigged emergency towing arrangement is to have suitable cover or heating arrangements for anti-icing protection, or be located in an enclosed or semi-enclosed deck area to be readily available.	23.10.3.3
Cargo piping	① For exposed cargo piping and piping supports installed on the main deck, including vent piping, the design loads are to include the expected ice/snow accretion allowance. ② The supports for cargo piping systems on exposed deck are to be so arranged that free expansion and contraction of the pipes during cargo operations cannot be blocked by ice/snow accretion.	23.10.3.4(1) 23.10.3.4(2)
Inert gas systems and related equipment	① Means for the deck water seal are to be provided to ensure the added fluid to be free from freezing. Proper application of antifreeze or provision of heating arrangements may be used. ② The pressure/vacuum breakers are to be suitable for the minimum anticipated temperature. Proper application of antifreeze or provision of heating arrangements may be used. ③ Equipment requiring de-icing maintenance are to be grouped together as far as practicable and readily accessible.	23.10.3.4(4)② 23.10.3.4(4)⑤ 23.10.3.4(4)⑦
Pressure/vacuum valves	Pressure/vacuum valves are to be provided with suitable anti-icing protection and de-icing measures so as to keep the valves readily operable.	23.10.3.4(5)
Areas designated for control of cargo loading and unloading	De-icing arrangements with steam or hot water are to be provided in areas designated for control of cargo loading and unloading (including gangways), with a fixed pipeline on the deck and connection valves for hoses.	23.10.3.4(6)
Safe access	The safe access to bow gangway is to either be provided with anti-icing protection, or it is to be made of a grating with raised non-skid points that will give safe footing in the presence of minor sea spray icing.	23.10.3.5
Liquefied gas carriers		
Cargo containment system or any cover for the containment system	For cargo containment system or any cover for the containment system exposed outside the hull, special consideration is to be given to ice and snow loads on the system or the cover.	23.10.4.2
Emergency towing arrangements	The emergency towing arrangements are to be provided with either anti-icing or de-icing protection. The pre-rigged emergency towing arrangement is to have suitable cover or heating arrangements for anti-icing protection, or be located in an enclosed or semi-enclosed deck area to be readily available.	23.10.4.4
Cargo piping	① For exposed cargo piping and piping supports installed on the main deck, including vent piping, the design loads are to include the expected ice/snow accretion allowance. ② The supports for cargo piping systems on exposed deck are to be so arranged that free expansion and contraction of the pipes during cargo operations cannot be blocked by ice/snow accretion.	23.10.4.5(1) 23.10.4.5(2)
Safety relief valves and other valves	Exposed cargo related safety relief valves and other valves are to be provided with de-icing and heat tracing arrangements.	23.10.4.5(4)
Emergency shutdown valves	Emergency shutdown (ESD) valves are to be provided with anti-icing protection.	23.10.4.5(5)
Vent masts	The vent mast head is to be designed to prevent blockage by ice accretion.	23.10.4.5(11)
Air intakes and exhaust louvres	The air intakes and exhaust louvres for cargo control rooms, cargo pump rooms, compressor rooms and motor rooms (where fitted) are to be provided with anti-icing protection by de-icing measures.	23.10.4.5(14)
Areas designated for control of cargo loading and unloading	De-icing arrangements with steam or hot water are to be provided in areas designated for control of cargo loading and unloading (including gangways), with a fixed pipeline on the deck and connection valves for hoses.	23.10.4.5(15)
Water spray systems	A water spray system installed on exposed deck is to be equipped with heating arrangements for anti-freezing protection, and to be dried immediately after use.	23.10.4.6
Safe access	The safe access to bow gangway is to either be provided with anti-icing protection, or it is to be made of a grating with raised non-skid points that will give safe footing in the presence of minor sea spray icing.	23.10.4.8
Offshore supply vessels		

Area or equipment	Anti-icing and de-icing requirements	Reference No.
Piping for drilling muds and other specialized bulk cargoes	The valves and control stations of piping for drilling muds and other specialized bulk cargoes are to be suitably located so as to be protected from cold and ice/snow accretion, as practicable.	23.10.5.2(1)
Rescue zones	For vessels with a rescue zone, suitable arrangements are to be provided for anti-freezing protection: (1) on a cross-deck area between the rescue zones port and starboard; (2) the railings and handrails in the rescue zone; and (3) routes to the accommodation/treatment areas.	23.10.5.3
Container ships		
Cargo securing arrangements of container ships	For container ships, the exposed cargo securing arrangements are to be prevented from freezing, and are to be provided with grease suitable for use in low air temperature environments and with de-icing measures.	23.10.6.2
Portable fire-extinguishing monitors of container ships	For container ships, where five layers or more of containers are stowed on exposed deck, the stowage positions for portable fire-extinguishing monitors are to be provided with anti-icing and anti-freezing protection, and the monitors are to be dried immediately after use.	23.10.6.3
Standby ships and rescue ships		
Rescue facilities	For standby ships and rescue ships, the rescue facilities, if provided, are to be provided with anti-icing protection.	23.10.6.4
Helicopter decks or hovering areas	For standby ships and rescue ships, helicopter decks or hovering areas, if provided, are to be provided with de-icing measures, to ensure normal operation of the deck/area at the design environmental conditions for a period of one hour.	23.10.6.5
Fire-fighting ships		
External fire-extinguishing appliances of fire-fighting ships	External fire-extinguishing appliances of fire-fighting ships are to be provided with anti-icing and anti-freezing protection.	23.10.6.6

Section 12 SURVEY REQUIREMENTS FOR ANTI-COLD CLIMATE NOTATIONS

23.12.1 General requirements

23.12.1.1 This Section applies to plan approval and survey of ships to be assigned with Anti-Cold Climate notations in accordance with the requirements of this Chapter, to verify anti-cold climate measures are suitable for ship's operation in anticipated low air temperature environments.

23.12.1.2 In plan approval, installation and testing according to the requirements of this Section, the requirements of the flag State Administration and/or the Administration of the ship's intended operational areas, and of the relevant international conventions are to be taken into account for anti-cold climate measures; if applicable, it is to be ensured that they are not contradictory to the statutory requirements and to be confirmed that anti-cold climate measures will not impair or weaken the normal operation of the relevant equipment and systems.

23.12.1.3 For equipment, systems and components exposed to low air temperature environments, the design service temperature is to be specified. All relevant purchase orders and plans are to indicate the temperature to ensure it complies with the appropriate approval and the requirements of the impact strength test at low temperature. Such equipment, systems and components are to be confirmed that there is the evidence of the design service temperature performance, which may include the marine product certificate issued by ISC, or statement of the manufacturer, or statement of experience at similar ambient temperature.

23.12.1.4 If the design service temperature of structural materials of the ship (DST_1) is lower than the design service temperature of equipment and system anti-cold climate measures (DST_2), H(DST_1) notation may be assigned individually. In this case, the polar service temperature (PST) of the polar ships is to be taken as DST_2.

23.12.2 Initial survey

23.12.2.1 In the process of plan approval, a design evaluation of anti-cold climate measures is to be carried out based on plans and documents submitted according to 23.1.4 of this Chapter, to confirm their

compliance with the rules requirements and their adequacy and suitability being verified, but not to confirm technical details of the specific anti-cold climate measures.

23.12.2.2 The hull and machinery arrangements are to be surveyed to confirm their compliance with the rules requirements and approved plans. The installation and testing of structures, equipment, systems and outfittings according to the agreed plan are to be conducted to the satisfaction of the Surveyor, of which the start-up and operation are to be verified, but their performance at the design service temperature are not necessarily confirmed.

23.12.3 Survey after construction

23.12.3.1 Survey to maintain class notations is to be carried out within 3 months before or after the anniversary date of assigning the Anti-Cold Climate notations except for the H(DST) notation.

23.12.3.2 During an annual survey, the Surveyor is to confirm that the arrangements and equipment comply with the rules and to verify as far as practicable the functions of the installed equipment and related controls and alarm systems according to the anti-cold climate measures listed in 23.1.4.2 and/or 23.11.3. The survey is to include but not limited to the following applicable items:

(1) Hull:

① anti-freezing arrangements for tanks;

② anti-icing/de-icing arrangements for passageways and openings;

③ heating arrangements for essential spaces;

④ heating and cleaning systems for bridge windows;

⑤ anti-cold climate measures for life-saving appliances and fire-fighting systems.

(2) Machinery, equipment and systems:

① For all ships:

a. pre -heating and introduction of combustion air for internal combustion engines and other prime movers;

b. anti-cold climate measures for deck machinery;

c. de-icing and anti-freezing arrangements for exposed piping;

d. anti-cold climate measures for navigational equipment;

e. emergency heating system for specified spaces, and tests are to be carried out where necessary.

② For bulk carriers and ore carriers:

a. anti-freezing arrangements connecting the upper and lower wing tanks.

③ For oil tankers and chemical tankers:

a. anti-freezing arrangements for the related equipment of the inert gas system, if fitted;

b. inspecting heat-tracing of additional fire-fighting and safety systems;

④ For liquefied gas carriers:

a. ventilation and gas detectors of enclosed cargo areas, if fitted;

b. inspecting heat-tracing of additional fire-fighting and safety systems provided according to ISC Rules for Construction and Equipment of Ships Carrying Liquefied Gas in Bulk.

⑤ For offshore supply vessels:

a. for vessels with a rescue zone, anti-icing arrangements of the following positions are to be inspected:

(a) on a cross-deck area between the rescue zones port and starboard;

(b) the railings and handrails in the rescue zone; and

(c) routes to the accommodation/treatment areas.

23.12.4 Products inspection

23.12.4.1 Products for ships assigned with the Anti-Cold Climate notations are to specify the conditions for use in the relevant plans, purchase documents, survey notices or applications, including installation positions, minimum ambient temperature, anti-cold climate measures, etc.

23.12.4.2 Exposed equipment and systems are to consider the low temperature impacts in the following aspects, as appropriate, to verify their functionality at the design service temperature:

(1) materials and welding of structures and components, including low temperature resistant brittle materials and low temperature welding procedures;

(2) seal materials, with low temperature resistant performance;

(3) lubricating medium, using grease with low temperature performance;

(4) warm-keeping measures, including heat tracing (power), cover;

(5) de-icing methods, including limitations and requirements of de-icing methods;

(6) moving components, low temperature impacts;

(7) working medium, using hydraulic oil with low temperature performance;
(8) drives: hydraulic motor, electric motor, hydraulic pump, etc. involving the measures above;
(9) control box: low temperature impacts.

23.12.4.3 Where necessary, the marine product certificate is to indicate the design service temperature.

CHAPTER 24 ADDITIONAL REQUIREMENTS FOR STAND-BY SHIPS AND RESCUE SHIPS

Section 1 GENERAL PROVISIONS

24.1.1 Application

24.1.1.1 Unless expressly provided otherwise, this Chapter applies to stand-by ships and rescue ships.

24.1.1.2 Stand-by ships and rescue ships are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules as well as the relevant provisions of ISC Rules for Materials and Welding and of the flag State Administration, if any.

24.1.2 Notation

24.1.2.1 Stand-by ships complying with the provisions of this Chapter may be assigned the notation: Stand-by Ship.

24.1.2.2 Rescue ships complying with the provisions of this Chapter may be assigned the notation: Rescue Ship.

24.1.3 Definitions

24.1.3.1 Stand-by ship means ships providing safety stand-by and conventional rescue for offshore installations or ships in operation, capable of receiving personnel evacuated from offshore engineering installations and offshore structures or from other ships on account of an emergency, or of rescuing personnel from sea.

24.1.3.2 Rescue ship means ships engaged in rescue operations at sea for ships and crew in distress.

24.1.3.3 Survivors mean personnel evacuated from offshore engineering installations and offshore structures or from other ships on account of an emergency, or rescued from sea.

24.1.4 Plans and documents

24.1.4.1 In addition to those required in the relevant PARTs and Chapters of the Rules, the following plans and documents are to be submitted to ISC for approval. For special structures and arrangements, the scope of plans and documents to be submitted for approval may be expanded if deemed necessary by ISC:

(1) Arrangement of safety and rescue equipment;

(2) System diagram and arrangement of searchlights;

(3) System diagram of aviation frequency two-way VHF radiotelephone apparatus.

24.1.4.2 The following plans and documents are to be submitted to ISC site surveyors:

(1) Operation manual, in working language, available onboard for the crew. The operation manual is to include:

① safety stand-by and rescue information and training details provided by the ship owner or operator;

② maintenance and operation of safety and rescue equipment, including the arrangement and information on the use of radio apparatus onboard provided as required;

③ safety and rescue procedures, to guide the evacuation of personnel from offshore engineering installations and offshore structures or from other ships, or the rescue of personnel from sea;

④ operation details of safety and rescue;

⑤ dynamic capability analysis (ship's mooring, heading keeping capability, speed, etc., under the specified sea conditions).

Section 2 CONSTRUCTION AND ARRANGEMENT

24.2.1 Superstructures and deckhouses

24.2.1.1 The structure is to comply with the relevant requirements of Chapter 11, PART TWO of the Rules.

24.2.1.2 Windows are to comply with the relevant requirements of Chapter 11, PART TWO of the Rules.

24.2.1.3 Navigation bridge

(1) The navigation bridge is to be so arranged that there is an unobstructed view all around. Clear view at the navigation bridge is to be ensured during safe rescue operations.

(2) Windows are to be installed from the outside except for those on the aft bulkhead.

24.2.2 Rescue zone

24.2.2.1 A rescue zone with a length of not less than 5 m is to be established and extended as far as possible on each side of the ship.

24.2.2.2 The rescue zone is to be located well clear of the propellers and as close to midships as practicable, with a clear deck area portside to starboard to permit the boarding of survivors and to carry on rescue operations.

24.2.2.3 Handrails in the rescue zone are to be provided with doors or chains which are readily openable, or removable stanchions are to be used. Bulwarks in the rescue zone are to be provided with doors, openings or other means of embarkation. Such means of embarkation are to be arranged to facilitate the hanging and use of boarding nets.

24.2.2.4 The rescue zone is to be provided with boarding nets fitted with lifelines.

24.2.2.5 The rescue zone is to be free of hull fittings and projections and overboard discharges which would impede rescue operations.

24.2.2.6 The rescue zone is to be provided with lighting required by 24.4.5.

24.2.2.7 The rescue zone is to be marked so as to be readily identified from seaward.

Section 3 ACCOMMODATION SPACES FOR SURVIVORS

24.3.1 Provision requirements for the spaces

24.3.1.1 General requirements

(1) Spaces provided for shelter of the survivors are to be enclosed from the weather and provided with heating, lighting and ventilation facilities.

(2) In emergency, the survivors may be lodged in the accommodation spaces other than the following spaces: sanitary area, galley, the master's cabin, radio room, navigation bridge and main passages that are to be kept unblocked.

(3) The dimension of the shelter spaces for the survivors is to be indicated on the general arrangement plan.

24.3.1.2 The area of the shelters is to be determined as 0.75 m^2 for every assigned survivors, including free spaces and floors for movable furniture, fixed seating and fixed beds; other fixed furniture, toilets and bathrooms are not to be included.

24.3.1.3 Sanitary facilities

(1) Dedicated sanitary facilities are to be provided for the survivors. One set of fixtures comprising a toilet, a washing basin and shower, is to be provided for every 50 survivors.

(2) Fresh water tanks and potable water tanks of sufficient quantity are to be provided for the survivors onboard.

24.3.1.4 Treatment area

(1) The treatment area is to be readily accessible for the survivors from the rescue zone and is to be effectively isolated from the crew's accommodation area.

(2) Given the situation when the survivors are transferred to the helicopter winching area, the arrangement of the treatment area is to make transfer passage easily accessible and unobstructed.

(3) Corridors and doors leading to the rescue zone are to be sufficient in width to allow the passage of stretchers transferring survivors.

Section 4 RESCUE AND SAFETY EQUIPMENT

24.4.1 Rescue boats

24.4.1.1 A rescue boat is to be provided on a stand-by ship.

24.4.1.2 A readily available fast rescue boat is to be provided on a rescue ship.

(1) The rescue boat and its launching appliances are to comply with the requirements of Chapters V and VI of the International Life-saving Appliance (LSA) Code.

(2) Where davits for rescue boats have to rely on electricity for operation, they are to be power supplied by emergency switchboard.

24.4.2 Rescue nets

24.4.2.1 Rescue nets are not to be less than 5 m in width with the center of gravity at bottom.

24.4.2.2 The length of the rescue nets is to extend at least 1 m below the waterline at lightest draught.

24.4.3 Searchlights

24.4.3.1 Two searchlights capable of rotating 360° horizontally are to be provided. The searchlights are remotely controllable at the navigation bridge.

24.4.3.2 The searchlights are to provide at least 50 lux illumination at a distance of 250 m.

24.4.4 Water spray fire extinguishing systems

24.4.4.1 The water spray fire extinguishing system is to be provided on a rescue ship to protect the rescue operation area on the open deck against the heat and fire in the boundary of the rescue zone.

24.4.4.2 The nozzles of the water spray fire extinguishing system are to be arranged to give an even distribution of waterspray over the whole rescue operation area on the open deck.

24.4.4.3 The water spray fire extinguishing system is to ensure even distribution of water spray in the rescue operation area.

24.4.4.4 The water spray fire extinguishing system is to have a capacity of at least 5 *l*/min per m^2 of the protected area which is internally insulated to A-60 class and at least 10 *l*/min per m^2 of other protected areas.

24.4.4.5 The pumping capacity is to be sufficient to supply simultaneously at the required pressure the sections which serve the maximum area of the rescue zone. Where the main fire pumps are used for this purpose, they are to be capable of operating this system, the water monitors and the hose stations simultaneously at the required pressure. A connection with a shut-off valve is to be fitted between the piping system for the water monitors and the supply line for the water spray fire extinguishing system.

24.4.4.6 Means are to be taken to ensure that necessary visibility from the navigation bridge and the remote-control station can be maintained during the water spray operations.

24.4.5 Deck illumination

24.4.5.1 Main lighting and emergency lighting are to be provided in the following areas:

(1) rescue boat stowage locations, launching appliances, reception and rescue areas;

(2) to provide floodlighting of the sea in way of the rescue zone and rescue boat launch and recovery area;

(3) the helicopter winching deck area and access routes leading to and from the reception area.

24.4.6 Treatment facilities

24.4.6.1 Treatment facilities, including stretchers, blankets or coverings, bandages and dressing, splints, thermal insulation blankets and insulation materials, etc. are to be provided.

24.4.6.2 The treatment facilities are to be readily available.

24.4.6.3 The treatment facilities are to be appropriately wrapped, labeled, stored and marked.

24.4.7 Towing

24.4.7.1 Means to tow rescue boats, lifeboats or liferafts are to be provided.

24.4.8 Other life-saving appliances

24.4.8.1 The relevant life-saving appliances are to be provided according to Table 24.4.8.1.

Other Life-Saving Appliances **Table 24.4.8.1**

Appliance	Quantity
Fall protection equipment (e.g. safety harness and safety line with hook)	3
Throw lines	4
Diver ladders	2
Lifejackets	Assigned number of survivors
Long handle hooks	2
Lifebuoys with self-igniting lights and ropes (not less than 30 m in length)	4

24.4.9 Helicopter winching deck area

24.4.9.1 Helicopter winching deck area is to be provided. The area is to be unobstructed and well-illuminated.

Section 5 NAVIGATION AND COMMUNICATION EQUIPMENT

24. 5.1 Navigation equipment

24.5.1.1 Regardless of its dimension, shipborne navigation equipment required to be provided for cargo ships of 500 gross tonnage and above according to the Administration is to be provided.

24.5.2 Radiocommunications

24.5.2.1 One two-way VHF radiotelephone using aviation frequency (121.5 MHz and 123.1 MHz) is to be provided, in addition to the radio equipment required by the Administration.

CHAPTER 25 ADDITIONAL REQUIREMENTS FOR DIVING SUPPORT VESSELS

Section 1 GENERAL PROVISIONS

25.1.1 Application

25.1.1.1 This Chapter applies to vessels supporting diving operations or unmanned remotely operated vehicles operations.

25.1.1.2 Diving support vessels are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules as well as the relevant provisions of ISC Rules for Materials and Welding and of the flag State Administration, if any.

25.1.2 Notations

25.1.2.1 The following notations may be assigned to vessels complying with the requirements of this Chapter[①]:

Diving Support Vessel[②] is assigned to vessels permanently supporting diving system and complying with the relevant requirements of this Chapter.

DSV-Air is assigned to vessels supporting conventional air diving systems and complying with the relevant requirements of this Chapter.

DSV-Sat is assigned to vessels supporting saturation diving systems and complying with the relevant requirements of this Chapter.

Types of Diving **Table 25.1.2.1**

	Type of diving	
Parameter	DSV-Air	DSV-Sat
Designed diving depth	≤58 MSW	≤457 MSW
Diving duration	≤8 hours	No restriction
Breathing air medium	compressed air	Heliox or equivalent
MSW = Metres Sea Water		

25.1.2.2 Vessels complying with the requirements of Section 6 of this Chapter may be assigned the notation ROVS.

25.1.3 Definitions

25.1.3.1 Diving support vessels are mother vessels supporting diving operations or submersible system operations.

25.1.4 Plans and documents

25.1.4.1 In addition to those required in the relevant PARTs and Chapters of the Rules, the following plans and documents are to be submitted to ISC for approval. For special structures and arrangements, the scope of plans and documents to be submitted for approval may be expanded if deemed necessary by ISC:

(1) Arrangement of the diving system;

(2) Details of hull supporting structure for submersible and its handling system;

(3) Electrical loading evaluation of diving system operation conditions during the operation of the diving system;

(4) Power system diagram and electrical equipment arrangement of the diving system;

(5) Piping schematics for the diving support vessel's piping systems supplying diving systems;

(6) Arrangement and details of communication systems between the diving support vessel and diving systems.

25.1.4.2 The following plans and documents are to be submitted to ISC for information:

(1) Design details of foundation for submersible and its handling system;

(2) Calculations of supporting structure for submersible and its handling system.

---

① DSV-Air, DSV-Sat may be assigned together with the notation Diving Support Vessel or separately as special performance notations.

② The DSV-Sat notation must be obtained for granting the Diving Support Vessel notation

25.1.4.3 The following plans and documents are to be submitted to ISC site surveyors:
(1) Operation manual.

Section 2 SEA KEEPING OF VESSEL'S POSITION

25.2.1 General requirements

25.2.1.1 During the operation of the diving system, the diving support vessel is to be capable of withstanding wind and wave in order to maintain its position at sea.

25.2.1.2 The means to maintain position may be a mooring system with anchors or a dynamic positioning system.

25.2.2 Dynamic positioning systems

25.2.2.1 Where the diving support vessel uses the dynamic positioning system to maintain its position, such dynamic positioning system is to comply with the relevant provisions for DP-2 or DP-3 in Chapter 11 of this PART.

Section 3 ARRANGEMENT OF DIVING SYSTEMS

25.3.1 Installation location of diving systems

25.3.1.1 The diving system is to be installed in the non-hazardous area of the diving support vessel (IEC 60079-1). Special consideration is to be given as appropriate if the system is installed in the hazardous area.

25.3.1.2 Diving systems and breathing gas storage facilities are not to be installed in machinery spaces, except for equipment not used for operating the diving system.

25.3.1.3 Diving systems are not to be installed in the vicinity of exhausts/ventilation outlets from machinery spaces and galleys.

25.3.1.4 The diving system is to be located so that the diving operations are not affected by propellers, thrusters or anchors of the diving support vessel.

25.3.1.5 The diving system is to be so arranged that diving operations are conducted as far away as practicable from the vessel's overboard discharge outlets/suction inlets.

25.3.1.6 Where an impressed current cathodic protection system is fitted, the system is to be switched off during the diving operations.

25.3.1.7 Where pressure vessels serving divers are fitted, such as the deck pressurized tank, it is recommended that the pressure vessels are arranged longitudinally along the diving support vessel so as to reduce the impact of rolling on divers.

25.3.1.8 Diving systems are to be installed in spaces or locations that are adequately ventilated and provided with suitable lighting on the diving support vessel.

25.3.1.9 Where any part of the diving system is located on the open deck, reasonable protection is to be provided so as to prevent damages caused by wave, ice or other activities onboard.

25.3.1.10 In order to minimize deflections and to obtain satisfactory transfer of heavy loads through the deck foundations, it is recommended that diving systems be installed in-line with the supporting deck structure.

25.3.2 Storage room for breathing gas cylinders of the diving system

25.3.2.1 Breathing gas cylinders for diving systems are to be stored on the open deck or in well ventilated enclosed spaces, and away from flammable substances and sources of ignition.

25.3.2.2 Where breathing gas cylinders are stored on the open deck area, weathertight shelters against wave and heat radiation and effective protection against mechanical damages are to be provided for the cylinders.

25.3.2.3 The boundaries between the enclosed spaces storing breathing gas cylinders and other enclosed spaces are to be gastight. The doors of the enclosed spaces are to open outward.

25.3.2.4 The storage area or space for breathing gas cylinders is to be provided with appropriate draining arrangements.

25.3.2.5 The outlets of relief valves or bursting discs are to be piped-outside the enclosed spaces to the open deck and away from sources of ignition.

25.3.2.6 The enclosed spaces storing breathing gas cylinders are to be provided with an independent ventilation system, the outlets of which are in safe areas. The ventilation capacity of the forced ventilation

system is to be such as to provide for at least eight air changes per hour, based on the gross volume of the enclosed spaces.
25.3.2.7 The air of the ventilation system is to be drawn from safe areas.
25.3.2.8 The fans of the ventilation system are to be of non-sparking construction.
25.3.2.9 Breathing gas mixtures containing more than 25% oxygen by volume are to be treated and handled as pure oxygen.
25.3.2.10 Pure oxygen breathing gas cylinders are to be stored on the open deck, but not to be stored in the spaces or areas below the deck.
25.3.2.11 When breathing gas mixtures containing less than 25% oxygen by volume are stored in enclosed spaces, the following requirements are to be complied with:
(1) at least two oxygen analyzers fitted with audible and visual alarms are to be provided, one of which is used to monitor the upper levels of the enclosed spaces and the other of which is used to monitor the lower levels of the enclosed spaces;
(2) the enclosed spaces for storage of the breathing gas cylinders are to be kept clean, i.e. free of grease or other debris.
25.3.2.12 Where the diving support vessel is also used for fire-fighting operations, means are to be provided to protect the oxygen cylinders from heat that may radiate from the fire that is being extinguished.

25.3.3 Diving system control station

25.3.3.1 Where the diving support vessel is permanently provided with the diving system, the diving system control station is to comply with the requirements of this Chapter.
25.3.3.2 The diving system control station is to be securely fastened at a location close to and in sight of the diving location.
25.3.3.3 The position of the diving system control station is to allow the operations control personnel an overview of the diving system, including all activities related to the submersible operations.
25.3.3.4 The diving system control station is not to be located in the hazardous area.
25.3.3.5 When selecting the location of the diving system control station, ship's motion or support structure vibrations are to be considered.
25.3.3.6 A direct two-way direct communication systems are to be provided between the diving system control station and the following spaces or persons as applicable:
(1) diver in the water;
(2) diving bell;
(3) each chamber of the deck decompression chambers;
(4) operating space of the handling system and the emergency control station;
(5) dynamic positioning control station;
(6) navigation bridge.
25.3.3.7 Emergency communication means are to be provided between the control station of a diving system and divers in its deck decompression chamber and diving bell.
25.3.3.8 Where more than one control station are provided onboard for the diving system, direct communication is to be provided between these stations.

25.3.4 Power supply and illumination of the diving system

25.3.4.1 Electrical installations essential to safe completion of the diving operations are to be supplied from the main and emergency power sources.
25.3.4.2 The main power source of the diving support vessel may be used to supply normal power to diving systems, provided that the main power source of the vessel has sufficient capacity simultaneously supply the vessel's electrical loads as well as the electrical loads of the diving systems. The main power source of the diving system can also be supplied by the dedicated self-contained power source.
25.3.4.3 In the event of failure of the main source of electrical power to the diving system, an independent emergency source of electrical power is to be available for the safe termination of the diving operation. The emergency power source can be dedicated self-contained power source (provided by the vessel or fitted on the submersible), or the emergency power source mentioned in 25.3.4.4.
25.3.4.4 The emergency generator of the diving support vessel can be used as the emergency power source mentioned in 25.3.4.3, provided that the emergency power generator has sufficient capacity to supply the emergency electrical loading of the diving support vessel and of the diving system simultaneously.
25.3.4.5 The power supply extent and duration of the emergency power source of the diving system are to comply with 10.2.1.9 and 10.2.1.10, Chapter 10 of ISC Rules for the Construction and Classification of Diving Systems and Submersibles.

25.3.4.6 The emergency power source of the diving system is to be installed outside the engine room of the diving support vessel and be as far apart as practicable from the main power generator.
25.3.4.7 Appropriate illumination is to be provided at the interface between the diving system and the diving support vessel. The critical handling area of the diving system is to be provided with illumination supplied by the main and emergency power source.

Section 4 STRUCTURAL REQUIREMENTS

25.4.1 Deck foundations, fastening arrangements and hull supporting structures
25.4.1.1 Deck foundations and fastening arrangements are to permit relative movement of manned pressure vessels and large gas storage cylinders due to internal pressure variations that may cause them to expand/contract.
25.4.1.2 For manned pressure vessels and large gas storage cylinders installed on the diving support vessel, the relevant requirements for the installation of independent tanks (independent pressure vessels) onboard may be referred to.
25.4.1.3 For the submersible and its handling system, the strength of the supporting structure is to be checked. For the calculation and modelling methods, the relevant requirements of Chapter 1, PART TWO of the Rules may be referred to, where: inertia force of the foundation and fastening arrangements of the submersible may be calculated according to Section 5, Chapter 1, PART TWO of the Rules; ② the design load of the handling system of the submersible is to comply with the requirements of Appendix B of ISC Rules for the Construction and Classification of Diving Systems and Submersibles.
25.4.1.4 The calculation stress of the hull supporting structure of the submersible is not to be greater than the permissible value in Table 3.7.4.12, Chapter 3, PART TWO of the Rules. The calculation stress of the hull supporting structure under the foundation of the handling system of the submersible is to satisfy the requirements in 3.10.7, Chapter 3 of ISC Rules for the Construction and Classification of Diving Systems and Submersibles.

25.4.2 Moon pools
25.4.2.1 Moon pools, where provided for diving operations are to meet the following requirements:
(1) Openings are to be a suitable distance from the deck edge, from cargo hatch covers, from superstructure breaks and from other area of structure discontinuity.
(2) The side structure of moon pools are to be designed for impact loads from diving equipment that may be guided through the moon pools.
(3) The plating thickness of the moon pool side structures is not to be inferior to the requirements for shell plating in Section 3, Chapter 2, PART TWO of the Rules.
(4) The corner radius of the moon pool opening is to comply with the requirements of 2.4.4, PART TWO of the Rules.
(5) Free edges of the moon pool opening are to be suitably rounded in order to protect diving system umbilicals from sharp edges.
(6) Means of protection are to be provided around the moon pool opening, such as guardrails, to prevent personnel from falling into the moon pool.

Section 5 FIRE-FIGHTING

25.5.1 Structural protection
25.5.1.1 Diving systems installed in enclosed spaces
(1) Enclosed spaces on diving support vessels housing diving systems are to be separated from adjacent spaces by means of A-60 class bulkheads or decks. All doors between these enclosed spaces and adjacent enclosed spaces are to be of the self-closing type. The enclosed spaces of the diving system are not to be connected to the machinery spaces of category A.
(2) Pipes and cables passing through the bulkheads and decks of the enclosed spaces are to be of A-60 class mechanical penetrations or electrical penetrations.
(3) The enclosed spaces of the diving system are to be provided with independent forced ventilation. The outlets of the ventilation system are to be in the safe areas. The ventilation capacity of the forced ventilation system is to be such as to provide for at least eight air changes per hour, based on the gross volume of the enclosed spaces.

25.5.1.2 Diving systems installed on the open deck

(1) The diving system may be installed on the open deck or similar structures directly adjacent to the machinery spaces of category A.

(2) Where the diving system is installed in areas directly adjacent to the machinery spaces of category A, the bulkheads and decks are to be of A-60 class division.

25.5.2 Fire-extinguishing systems and means of cooling

25.5.2.1 Diving systems installed in enclosed spaces

(1) Fixed fire extinguishing systems installed in enclosed spaces are to be:

① fixed pressure water spray fire-extinguishing systems suitable for machinery spaces of category A according to the requirements of the FSS Code; or

② fixed gas fire-extinguishing systems suitable for machinery spaces of category A according to the requirements of the FSS Code; or

③ equivalent fire-extinguishing systems deemed by the Administration to provide an equivalent level of protection.

(2) Portable fire extinguishers of sufficient number are to be provided in the enclosed spaces storing the diving system, one of which is to be placed near the access to the enclosed spaces. Spare charges are to be provided for 100% of the first ten extinguishers and 50% of the remaining fire extinguishers in the enclosed spaces.

(3) Where fixed gas fire-extinguishing systems are used, the selection of the fire-extinguishing medium is to be such that when the medium is applied in its entirety in the enclosed spaces, the concentration[③] of the toxic gas will not impair human body.

25.5.2.2 Diving systems installed on the open deck

(1) Decks or similar hull structure areas storing diving systems are to be provided with appropriate fire-extinguishing systems.

(2) Fire hoses on the diving support vessel connecting to the fire mains are to be protected as appropriate.

25.5.2.3 Means of cooling

(1) For windows, observation windows or other windows fitted on the manned pressure vessels in the enclosed spaces, means of cooling are to be provided.

(2) Enclosed spaces storing breathing gas cylinders or pressure vessels are to be provided with manually-actuated water spray systems so as to cool the breathing gas cylinders or pressure vessels in case of fire. The application rate on the projected horizontal area is at least $10L/m^2$ per minute. Water mist fire-extinguishing systems may be provided in the enclosed spaces as an alternative, the application rate of which is at least $5L/m^2$ per minute.

25.5.3 Fire detection and alarm systems of the diving system

25.5.3.1 The control panel of the fire detection and alarm system of the diving support vessel is to be installed in the dynamic positioning control station or mooring control station, and repeaters are to be provided in the diving control station and engine room centralized control room.

25.5.3.2 When diving systems are installed in enclosed spaces, the following requirements are to be complied with:

(1) automatic fire detection and alarm systems complying with the FSS Code are to be provided in the enclosed spaces;

(2) the loop or group of the fire detection and alarm systems of the enclosed spaces is to be independent of those of other spaces.

25.5.3.3 When diving systems are installed on the open deck, the following requirements are to be complied with:

(1) the open deck and similar structures of the diving support vessel is to be provided with suitable automatic fire detection and alarm systems;

(2) visual and audible monitoring systems continuously monitored by personnel at the control station may substitute the automatic fire detection and alarm systems on the open deck of the diving support vessel.

25.5.4 Piping systems

25.5.4.1 Piping systems carrying breathing gases under high pressure are not to be arranged inside accommodation spaces, engine rooms or similar compartments.

---

③ The concentration of fire-extinguishing medium is to be lower than the No Observed Adverse Effect Level (NOAEL) as defined in amendments to MSC/Circ.848 (MSC.1/Circ.1267).

25.5.4.2 Piping systems carrying breathing gases are to run as far as practicable apart from electrical cable conduits.
25.5.4.3 Piping systems containing flammable fluids are not to run through enclosed spaces or open deck areas housing breathing gas cylinders.

Section 6 UNMANNED REMOTELY OPERATED VEHICLE SUPPORT

25.6.1 General requirements

25.6.1.1 An unmanned underwater vehicle which can only be operated with remote controls. Such vehicles are divided into, according to the pattern of control, tethered ones operated through umbilical and non-tethered ones operated through sound wave.
25.6.1.2 Unmanned remotely operated vehicles and their relevant supporting systems (the handling system, control station, etc.), if complying with the requirements of this Section, may be assigned the notation ROVS upon request of the ship owner and ship operator.

25.6.2 Handling systems

25.6.2.1 Handling systems of unmanned remotely operated vehicles are to comply with the relevant requirements of ISC Rules for the Construction and Classification of Diving Systems and Submersibles.
25.6.2.2 Handling systems of unmanned remotely operated vehicles are to be so arranged as to minimize the possibility of any interference with propellers, thrusters or anchors of the support vessel.
25.6.2.3 Safe storage location with fastening arrangements is to be provided for remotely operated vehicle being securely stowed on the support vessel while they are not in operation.
25.6.2.4 The relevant hull structure strengthening of the unmanned remotely operated vehicle as well as the hull structure strengthening beneath the handling system foundation are to comply with the requirements of 25.4.1 of this Chapter.

25.6.3 Control stations

25.6.3.1 The control station for the unmanned remotely operated vehicle is to be securely fastened at a location close to and in sight of the launch and recovery location.
25.6.3.2 The control station for the unmanned remotely operated vehicle is to provide direct communication to the following positions:
(1) the vessel's control station;
(2) the control station of any other underwater vehicle;
(3) the control station for subsea equipment on the offshore engineering support vessel, such as the control station for oil well accident handling.

Section 7 SURVEY, INSPECTION AND TESTING

25.7.1 General requirements

25.7.1.1 The installation of the diving system and/or ROV system on the diving support vessel is to be to the satisfaction of the attending surveyor.
25.7.1.2 The diving system and/or ROV system on the diving support vessel is to be approved by ISC or other IACS members.
25.7.1.3 Upon installation, the diving system and/or ROV system and their support vessel interfaces as well as the interfaces between the diving systems and/or ROV systems installed on the support vessel are to be functionally tested to the satisfaction of the attending surveyor.

CHAPTER 26 ADDITIONAL REQUIREMENTS FOR INSTALLATION OF BALLAST WATER MANAGEMENT SYSTEMS

Section 1 GENERAL PROVISIONS

26.1.1 Application

26.1.1.1 Unless provided otherwise, this Chapter applies to :

(1) existing ships where an application for approval of BWMS is made on or after 1 July 2022;

(2) a ballast water management system which is installed in ships contracted for construction on or after 1 July 2022.

26.1.1.2 In addition to the requirements contained in International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 (hereinafter referred to as the BWM Convention), the requirements of this Chapter for the installation of ballast water management systems above are to be complied with.

26.1.1.3 Ballast Water Management System is also to meet the additional requirements for fire safety measures as specified in appendix 1 to this Chapter.

26.1.2 Definitions

26.1.2.1 For the purpose of this Chapter:

(1) Ballast water management system (hereinafter referred to as 'BWMS') means any system which processes ballast water such that it meets or exceeds the ballast water performance standard in regulation D-2 of the BWM Convention. The BWMS includes ballast water equipment, all associated piping arrangements as specified by the manufacturer, control and monitoring equipment and sampling facilities. The categorization of BWMS technologies is given in Table 26.1.2.1 of this Chapter. Applicability of the requirements for each BWMS technology is in accordance with Table 26.1.2.2 of this Chapter.

(2) Cargo area of tankers is defined in:

① for tankers to which regulation 1.6.1 of SOLAS Chapter II-2 as amended by IMO resolutions up to MSC.421(98) (hereinafter the same) applies, regulation 3.6 of SOLAS Chapter II-2;

② for chemical tankers, Paragraph 1.3.6 of the IBC Code as amended by IMO resolutions up to MSC.460(101);

③ for gas carriers, Paragraph 1.2.7 of the IGC Code as amended by IMO resolutions up to MSC.441(99); and

④ for offshore support vessels, Paragraph 1.3.1 of the IMO Resolution A.673(16) as amended by Resolution MSC.236(82) or Paragraph 1.2.7 of the IMO Resolution A.1122(30), as applicable.

(3) Dangerous gas means any gas which may develop an atmosphere being hazardous to the crew and/or the ship due to flammability, explosivity, toxicity, asphyxiation,corrosivity or reactivity and for which due consideration of the hazards is required, e.g. hydrogen (H_2), hydrocarbon gas, oxygen (O2), carbon dioxide (CO2), carbon monoxide (CO), ozone (O_3), chlorine (Cl_2) and chlorine dioxide (ClO_2), etc.

(4) Hazardous area is defined in IEC 60092-502 and means an area in which an explosive gas atmosphere is or may be expected to be present, in quantities such as to require special precautions for the construction, installation and use of electrical apparatus. When a gas atmosphere is present, the following hazards may also be present: toxicity, asphyxiation, corrosivity and reactivity.

(5) Dangerous liquid means any liquid that is identified as hazardous in the Material Safety Data Sheet or other documentation relating to this liquid.

(6) Non-hazardous area means an area which is not a hazardous area as defined in above (4).

Categorization of BWMS technologies **Table 26.1.2.1**

BWMS's Technology category*		1	2	3a	3b	3c	4	5	6	7a	7b	8
Characteristics		In-line UV or UV + Advanced Oxidation Technology (AOT) or UV + TiO or UV + Plasma	In-line Flocculation	In-line membrane separation and de-oxygenation (injection of N from a N Generator)	In-line de-oxygenation (injection of Inert Gas from Inert Gas Generator)	In-tank de-oxygenation with Inert Gas Generator	In-line full flow electrolysis	In-line side stream electrolysis (2)	In-line (stored) chemical injection	In-line side-stream ozone injection without gas/liquid separation tank and without Discharge treatment tank	In-line side-stream ozone injection with gas/liquid separation tank and Discharge water treatment tank	In-tank pasteurization and de-oxygenation with N2 generator
Des-infection when ballasting	Making use of active substance		x			In-tank technology: No treatment when ballasting or de-ballasting	x	x	x	x	x	In-tank technology: No treatment when ballasting or de-ballasting
	Full flow of ballast water is passing through the BWMS	x	x	x	x		x				x	
	Only a small part of ballast water is passing through the BWMS to generate the active substance							x				
After-treatment when deballasting	Full flow of ballast water is passing through the BWMS	x									x	
	Injection of neutralizer						x	x	x	x	x	
	Not required by the Type Approval Certificate issued by the Administration		x	x								
Examples of dangerous gas as defined in 26.1.2.1(3)			(1)	O_2 N_2	CO_2 CO		H_2 Cl_2	H_2 Cl_2	(1)	O_2 O_3 N_2		O_2 N_2

Note:
(1) To be investigated on a case by case basis based on the result of the IMO (GESAMP) MEPC report for Basic and Final approval in accordance with the G9 Guideline.
(2) In-line side stream electrolysis may also be applied in-tank in circulation mode (no treatment when ballasting or de-ballasting)

Footnote: *Taking into consideration future developments of BWMS technologies, some additional technologies may be considered in this Table 1 by identifying their characteristics in the same manner as for the above BWMS categories 1, 2, 3a, 3b, 3c, 4, 5, 6, 7a, 7b and 8.

Applicability of the requirements for each BWMS technology **Table 26.1.2.2**

BWMS's Technology category*→	1	2	3a	3b	3c	4	5	6	7a	7b	8
Requirements of this Chapter ↓	In-line UV or UV + Advanced Oxidation Technology (AOT) or UV + TiO or UV + Plasma	In-line Flocculation	In-line membrane separation and de-oxygenation (injection of N from a N Generator)	In-line de-oxygenation (injection of Inert Gas from Inert Gas Generator)	In-tank de-oxygenation with Inert Gas Generator	In-line full flow electrolysis	In-line side stream electrolysis (2)	In-line (stored) chemical injection	In-line side-stream ozone injection without gas/liquid separation tank and without Discharge treatment tank	In-line side-stream ozone injection with gas/liquid separation tank and Discharge water treatment tank	In-tank pasteurization and de-oxygenation with N2 generator
26.1.1and 26.1.2	x	x	x	x	x	x	x	x	x	x	x

26.2.3.4						x	x	x	x	x	

Section 2 INSTALLATION

26.2.1 General requirements

26.2.1.1 All valves, piping fittings and flanges are to comply with the relevant requirements of Chapter 2, PART THREE of the Rules. In addition, special consideration can be given to the material used for this service with the agreement of ISC.

26.2.1.2 The BWMS is to be provided with by-pass or override arrangement to effectively isolate it from any essential ship system to which it is connected. For new installation or retrofit to existing ships, under normal operating conditions of ballasting and de-ballasting given in the Ballast Water Management Plan (BWMP) the adequacy of the generating plant capacity installed on the vessel is to be demonstrated by an electrical load analysis.

For retrofit installation to exiting ships, a revised electrical load analysis with preferential trips of non-essential services can be accepted.

26.2.1.3 The BWMS is to be operated in accordance with the requirements specified in the type approval certificate (TAC) issued by the flag Administration or a recognized organization authorized by it. BWMS is to be operated within its Treatment Rated Capacity (TRC) as per the TAC. This may require limiting of ship's ballast pump flowrates.

The arrangement of the bypasses or overrides of the BWMS is to be consistent with the approved Operation Maintenance and Safety Manual by the Flag Administration's Type Approval.

In case the maximum capacity of the ballast pump(s) exceeds the maximum treatment rated Capacity (TRC) of the BWMS specified in the TAC issued by the Flag Administration, there is to be a limitation on the BWMP giving a maximum allowable flow rate for operating the ballast pump(s) that is not to exceed the maximum TRC of the BWMS.

26.2.1.4 BWMS should be subject to design review by ISC to verify the compliance of the BWMS's manufacturer package with ISC Rules.

Manufacturers of the BWMS may apply for this design review at the type approval process.

In general, monitoring functions of BWMS belongs to system category I under the application of 2.6.3 of Chapter 2, PART SEVEN of the Rules. However, in case a by-pass valve is integrated in the valve remote control system, the by-pass valve belongs to the system category II Ballast transfer remote control system.

The BWMS's components are required to be inspected and certified by ISC at the manufactory including pressure vessels, piping class I or II, filters, switchboards, etc.

26.2.1.5 Where a vacuum or overpressure may occur in the ballast piping or in the ballast tanks due to the height difference or injection of inert gas or nitrogen (N_2), a suitable protection device is to be provided, e.g. P/V valves, P/V breakers, breather valves or pressure safety relief valve or high/low pressure alarms.

The pressure and vacuum settings of the protection device should not exceed the design pressure of the ballast piping (BWMS categories 3a and 3b) or ballast tank (BWMS categories 3a, 3b and 3c), as relevant.

For BWMS categories 3a, 3b and 3c, the inert gas or nitrogen product enriched air from the inert gas system and from the protection devices installed on the ballast tanks (i.e. P/V valves, P/V breakers or P/V breather valves) are to be discharged to a safe location[①②] on the open deck.

Safe location needs to address the specific types of discharges separately.

Signboards or similar warnings at the discharge areas are to be provided.

① inert gas or nitrogen product enriched air from:

a in-line (categories 3a and 3b) and in-tank (categories 3c and 8) de-oxygenation BWMS: the protection devices installed on the ballast tanks, nitrogen or inert gas generators, nitrogen buffer tank (if any); or

b in-line ozone injection BWMS (categories 7a and 7b): the oxygen generator;

safe locations on the open deck are:

a not within 3 m of areas traversed by personnel; and

b not within 6 m of air intakes for machinery (engines and boilers) and all ventilation inlets/outlets.

② oxygen-enriched air from:

a in-line and in-tank de-oxygenation BWMS (categories 3a and 8): the nitrogen generator; or

b in-line ozone injection BWMS (categories 7a and 7b): the protection devices or vents from oxygen generator, compressed oxygen vessel, the ozone generator and ozone destructor devices;

safe locations on the open deck are:

a outside of hazardous area;

b not within 3 m of any source of ignition and from deck machinery, which may include anchor windlass and chain locker

openings, and equipment which may constitute an ignition hazard;

c not within 3 m of areas traversed by personnel; and

When the concerned ballast tanks are hazardous areas, an extension of hazardous area is to be considered at the outlet of the protection devices: with reference to IEC 60092-502 §4.2.2.9 the areas on open deck, or semi-enclosed spaces on open deck, within 1.5 m of their outlets are to be categorized hazardous zone 1 and with reference to IEC 60092- 502 §4.2.3.1, an additional 1.5 m surrounding the 1.5 m hazardous zone 1 is to be categorized hazardous zone 2. Any source of ignition such as anchor windlass or opening into chain locker should be located outside the hazardous areas.

Where products covered by IEC 60092-502 are stored on-board or generated during operation of the BWMS, the requirements of this standard are to be followed in order to:

① Define hazardous areas and acceptable electrical equipment, and

② Design ventilation systems.

26.2.1.6 Electric and electronic components are not to be installed in a hazardous area unless they are of certified safe type for use in the area. Cable penetrations of decks and bulkheads are to be sealed when a pressure difference between the areas is to be maintained.

26.2.1.7 Inert gas systems installed for de-oxygenation BWMS (categories 3a, 3b, 3c and 8) are to be designed in accordance with the following requirements:

(1) FSS Code Ch 15 requirements

① 2.1.2, 2.1.3;

② 2.2.1.3, 2.2.1.4, 2.2.2.1, 2.2.2.2, 2.2.2.3, 2.2.2.6, 2.2.4.1, 2.2.4.2, 2.2.4.3, 2.2.4.4, 2.2.4.5 except 2.2.4.5.1.3 and 2.2.4.5.3;

③ 2.3.1.1.2, 2.3.1.2, 2.3.1.4.2, 2.3.1.5, 2.3.1.6, 2.3.2 except 2.3.2.2.1;

④ 2.4.1.3, 2.4.1.4 and 2.4.2;

⑤ For inert gas systems installed for in-tank de-oxygenation BWMS (category 8): 2.2.3.1, 2.2.3.2 except 2.2.3.2.6, 2.2.3.2.7 and 2.2.3.2.10.

In general, when applying FSS Code Ch.15 requirements to inert-gas based BWMS, the following modifications are to be considered:

① The terms "cargo tank" and "cargo piping" are to be replaced by "ballast water tank" or "ballast water piping" as relevant.

② The term "cargo control room" is to be replaced by "BWMS control station" as relevant.

③ Requirements for slop tanks on combination carriers are to be disregarded.

④ When applying FSS Code / 15.2.2.4.5.1.1, the acceptable oxygen content is to be specified by the manufacturer, 5% oxygen content need not necessarily be applied.

(2) 4.1.1.2, 4.2.2.1, 4.2.2.3, 4.2.2.7, 4.2.2.8, 4.2.3.4, 4.2.3.5 and 4.2.3.6 of Chapter 4, PART SIX of the Rules. In applying 4.2.3.6, the terms “cargo tanks” and “cargo piping” are to be understood as “ballast tanks” and “ballast piping” respectively. For de-oxygenation BWMS (categories 3a, 3b, 3c and 8), the requirements in (1) prevail.

26.2.1.8 When cavitation is the BWMS treatment process (for example by use of pressure vacuum reactor working in combination with a vertical ballast water drop line) or part of the BWMS treatment process (for example by use of “smart pipe” or “special pipe” in BWMS category 7b or by use of “venturi pipe” in BWMS technology 3b) or by use other means, the design and the wall thickness or grade of materials or inside coating or surface treatment of the part of the piping where the cavitation is taking place is to be specifically considered.

26.2.1.9 When it is required to have an automatic shutdown of the BWMS for safety reasons, this must be initiated by a safety system independent of the BWM control system.

26.2.2 Additional requirements for tankers

26.2.2.1 Hazardous area classification is to be in accordance with IEC 60092-502 with due consideration of IACS UI SC274.

(1) BWMS using ozone generators (categories 7a and 7b) and de-oxygenation BWMS using inert gas generator by treated flue gas from main or auxiliary boilers or gas from an oil or gas-fired gas generator (categories 3b and 3c) are to be located outside the cargo area in accordance with FSS Code Ch 15 §2.3.1.1.2.

Note: this requirement does not apply to inert gas generators for which FSS Code Ch 15/2.4.1 and 4.2.2 and 4.2.3 of Chapter 4, PART SIX of the Rules apply.

(2) In-line full flow electrolysis BWMS (category 4), in-line side-stream electrolysis BWMS (category 5) and in-line injection BWMS using chemical which is stored onboard (category 6) can be located inside the hazardous areas with due consideration of the requirement of 26.2.1.6 but are not to be located inside the

d not within 6 m of air intakes for machinery (engines and boilers) and all ventilation inlets.

cargo pump room unless it is demonstrated by the BWMS manufacturer that the additional hazards that could be expected from dangerous liquids and dangerous gases stored or evolved from the BWMS (for example H_2 generation):

① do not lead to an upgrade of the hazardous area categorization of the cargo pump room,

② are not reactive with the cargo vapours expected to be present in the cargo pump room,

③ are not reactive with the fire-extinguishing medium provided inside the cargo pump room,

④ are not impacting the performance of the existing fire-fighting systems provided inside the cargo pump room, and

⑤ are not introducing additional hazards inside the cargo pump room such as toxicity hazards that would not have been prior addressed by suitable counter measures.

Notes:

① In-line full flow electrolysis BWMS (category 4) could be accepted in cargo compressor rooms of liquefied gas carriers and inside cargo pump rooms of oil tankers or chemical tankers if that cargo pump room is located above the cargo tank deck.

② For submerged cargo pumps, the room containing the hydraulic power unit or electric motors is not to be considered as the "cargo pump room".

③ Ballast pump rooms and other pump rooms not containing the cargo pumps are not to be considered as the "cargo pump room".

26.2.2.2 In general, two independent BWMS should be required i.e. one for ballast tanks located within the cargo area and the other one for ballast tanks located outside cargo area. Specific arrangements where only one single In-line BWMS (categories 1, 2, 3a, 3b, 5, 6, 7a and 7b) could be accepted are given in appendix 2.

Note: When the Fore Peak Tank is ballasted with the piping system serving the other ballast tanks within the cargo area in accordance with 3.4.14 of Chapter 3, PART SIX of the Rules, the ballast water of the Fore Peak tank is to be processed by the BWMS processing the ballast water of the other ballast tanks within the cargo area.

26.2.2.3 Isolation between ballast piping serving the ballast tanks inside and outside of the cargo area is to be in accordance with the following requirements:

(1) Means of appropriate isolation are as follows: Interconnection in between the ballast piping serving the ballast tanks located within the cargo area and the ballast piping serving the ballast tanks located outside the cargo area may be accepted if appropriate isolation arrangement is provided in accordance with appendix 2 is applied.

Notes:

① The means of appropriate isolation is necessary for the interconnection specified above regardless of the diameter of the piping.

② As indicated in appendix 2, the means of appropriate isolation is necessary for the interconnection specified in said Paragraph in the case of the active substance piping such as N2 gas piping, inert gas piping, neutralizer piping, fresh water piping for filter cleaning, compressed air piping for remaining water purge and sea water piping for adjusting the salinity etc. At the discretion of the Classification Society and for active substance piping and neutralizer piping (both not exceeding 50.8 mm) only, alternative isolation arrangements, provided preferably on the open deck, offering enhanced safety and gastightness may be considered for penetration of the bulkhead separating the non-hazardous machinery space from a hazardous area (such as the cargo pump room) at as high an elevation in the machinery space as possible, preferably, just below the main deck. The arrangements are to provide suitable protection measures in addressing the pollution hazards and safety concerns due to the potential migration of hydrocarbon or flammable or toxic liquids or vapours from the hazardous areas.

③ The means of appropriate isolation described above for the interconnection specified in said Paragraph need not be applied to the sampling lines described in Paragraph 26.2.2.4.

① two non-return valves with positive means of closing in series with a spool piece (also mentioned "means of dis-connection" in appendix 2), as indicated in Figure 26.2.2.3(1):

Note: As an alternative to positive means of closure, an additional valve having such means of closure may be provided between the non-return valve and the spool piece.

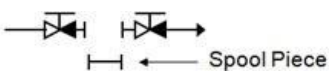

Figure 26.2.2.3(1)
Two Non-return Valves with Positive Means of Closing in Series with a Spool Piece

or:

② two non-return valves with positive means of closing in series with a liquid seal at least 1.5 m in depth, as indicated in Figure 26.2.2.3(2):

Note a: As an alternative to positive means of closure, an additional valve having such means of closure may be provided between the non-return valve and the liquid seal.
Note b: For ships operating in cold weather conditions, freeze protection should be provided in the water seal. A portable heating system can be accepted for this purpose.

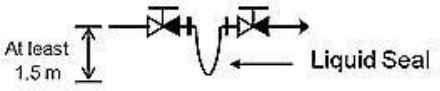

Figure 26.2.2.3(2)
Two Non-return Valves with Positive Means of Closing in Series with a Liquid Seal At Least 1.5 m in Depth

or:

③ automatic double block and bleed valves and a non-return valve with positive means of closing, as indicated in Figure 26.2.2.3(3):

Note: As an alternative to positive means of closure, an additional valve having such means of closure may be provided after the non-return valve.

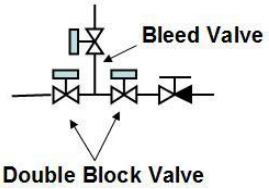

Figure 26.2.2.3(3)
Automatic Double Block and Bleed Valves and a Non-return Valve with Positive Means of Closing

(2) The above-mentioned means of appropriate isolation is to be provided on the open deck in the cargo area.
Note: When the Fore Peak Tank is ballasted with the piping system serving the other ballast tanks within the cargo area in accordance with 3.4.14 of Chapter 3, PART SIX of the Rules, the means of appropriate isolation described in Paragraphs (1) and (2) is not required in between the Fore Peak Tank and the common ballast water piping serving the other ballast water tanks within the cargo area.

26.2.2.4 Sampling lines which are connected to the ballast water piping system serving the tanks in the cargo area and provided for the purpose of the following:

① for any BWMS: ballast water sampling required by the G2 Guideline of the BWM Convention, or

② for BWMS technologies categories 4, 5, 6, 7a and 7b: total residual oxidant (TRO) analysis in closed loop system;

are not to be led into a non-hazardous enclosed space outside the cargo area.
However, the sampling lines may lead into a non-hazardous enclosed space outside the cargo area provided the following requirements are fulfilled:

(1) The sampling facility (for BWMS monitoring/control) is to be located within a gas tight enclosure (hereinafter, referred to as a 'cabinet'), and the following ① through ④) are to be complied.

① In the cabinet, a stop valve is to be installed on each sampling line.

② Gas detection equipment is to be installed in the cabinet and the valves specified in ① above are be automatically closed upon activation of the gas detection equipment.

③ Audible and visual alarm signals are to be activated both locally and at the BWMS control station when the concentration of explosive gases reaches a pre-set value, which is not to be higher than 30% of the lower flammable limit (LFL). Upon an activation of the alarm, all electrical power to the cabinet is to be automatically disconnected.

Note: when the electrical equipment is of a certified safety type, the automatic disconnection of power supply is not required.

④ The cabinet is to be vented to a safe location in non-hazardous area on open deck and the vent is to be fitted with a flame arrester.

(2) The standard internal diameter of sampling pipes is to be the minimum necessary in order to achieve the functional requirements of the sampling system.

(3) The cabinet is to be installed as close as possible to the bulkhead facing the cargo area, and the sampling lines located outside the cargo area are to be routed on their shortest ways.

(4) Stop valves are to be located in the non-hazardous enclosed space outside the cargo area, in both the suction and return lines close to the penetrations through the bulkhead facing the cargo area. A warning plate stating "Keep valve closed when not performing measurements" is to be posted near the valves.

Furthermore, in order to prevent backflow, a water seal or equivalent arrangement is to be installed on the hazardous area side of the return pipe.
(5) A stop valve is to be installed on the cargo area for each sampling line (i.e. both the suction and return lines).
(6) The samples which are extracted from the ballast water piping system serving the tanks within the cargo area are not to be discharged to a tank located outside the cargo area and not to discharge to a piping line supplying the spaces located outside the cargo area.

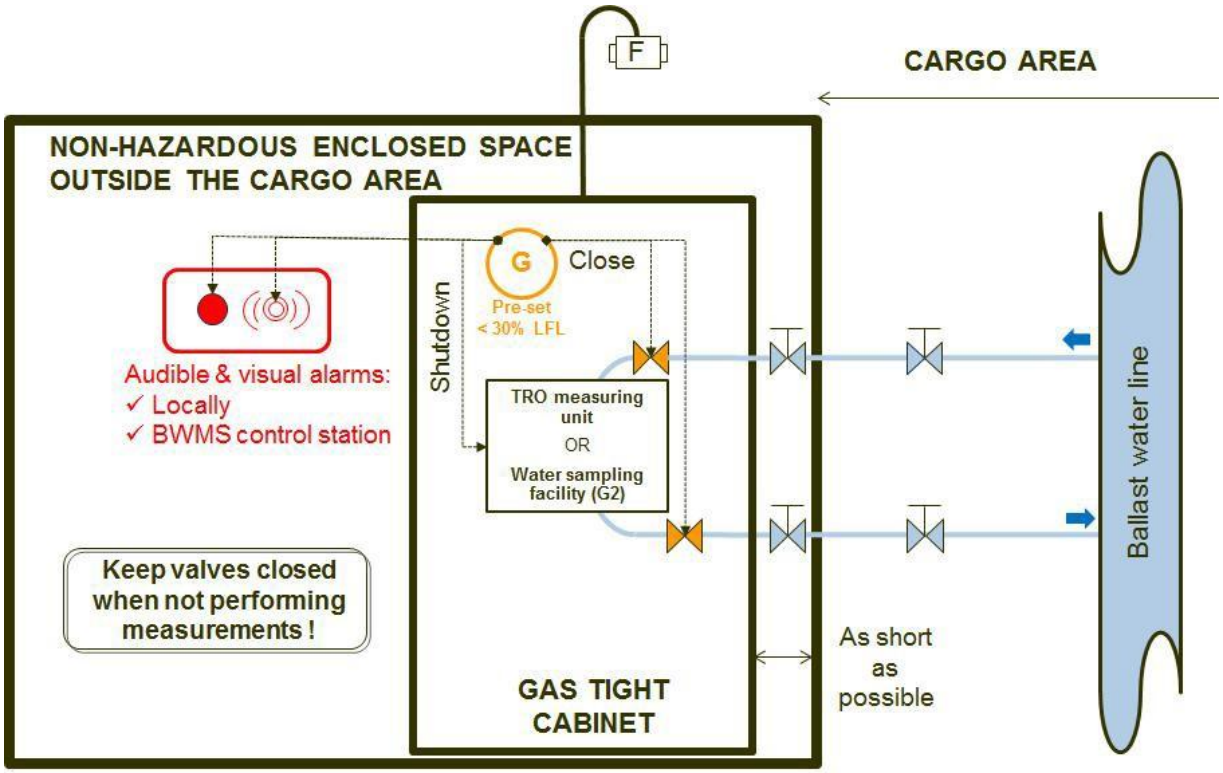

Figure 26.2.2.4 Arrangement of sampling lines led to outside the cargo area

26.2.3 Special requirements for BWMS categories 2, 3a, 3b, 3c, 4, 5, 6, 7a, 7b and 8 generating dangerous gas or dealing with dangerous liquids

26.2.3.1 Where the operating principle of the BWMS involves the generation of a dangerous gas, the following requirements are to be satisfied:
(1) Gas detection equipment is to be fitted in the spaces where dangerous gas could be present, and an audible and visual alarm is to be activated both locally and at the BWMS control station in the event of leakage.
The gas detectors should be located as close as possible to the BWMS components where the dangerous gas may accumulate.
For flammable gases and explosive atmosphere including but not limited to H_2, the construction, testing and performance of the gas detection devices is to be in accordance with IEC 60079-29-1, IEC 60079-29-2, IEC 60079-29-3 and/or IEC 60079-29-4, as applicable.
Where other hazards are considered like toxicity, asphyxiation, corrosive and reactivity hazards, a recognized standard acceptable to ISC is to be selected with due consideration of the specific gases to be detected and due consideration of the performance of the detection device with regards to the specific atmosphere where it is used.
(2) In spaces where inert gas generator systems are fitted (BWMS categories 3b and 3c) or nitrogen generators are fitted (BWMS categories 3a and 8), at least two oxygen sensors are to be positioned at appropriate locations (as required by Paragraph 2.2.4.5.4 of Chapter 15 of the FSS Code as amended by IMO resolutions up to MSC.410(97)) to alarm when the oxygen level falls below 19%. The alarms are to be both audible and visual and are to be activated:
① inside the space;

② at the entry into the space; and

③ inside the BWMS control station.

For BWMS categories 7a and 7b, at least two oxygen sensors are to be positioned at appropriate locations in the following spaces:

① spaces where ozone generators are fitted, or

② spaces where ozone destructors are fitted, or

③ spaces where ozone piping is routed;

to alarm when the oxygen level raises above 23 %. The alarms are to be both audible and visual and are to be activated at the following locations:

① inside the space; and

② at the entry into the space; and

③ inside the BWMS control station.

Automatic shut-down of the BWMS is to be arranged when the oxygen level raises above 25%. Audible and visual alarms independent from those specified in the preceding paragraph are to be activated prior to this shut-down.

(3) For BWMS categories 7a and 7b, at least one ozone sensor is to be provided at the vicinity of the discharge outlet to the open deck from the ozone destructors addressed in 26.2.3.2(3) to alarm when the ozone concentration level raises above 0.1 ppm. The alarms are to be both audible and visual and are to be activated in the BWMS control room. In addition, at least two ozone sensors are to be positioned at appropriate location in the following spaces:

① spaces where ozone generators are fitted, or

② spaces where ozone destructors are fitted, or

③ spaces where ozone piping is routed

to alarm when the ozone concentration level raises above 0.1 ppm. The alarms are to be both audible and visual and are to be activated at the following locations:

① inside the space;

② at the entry into the space; and

③ inside the BWMS control station.

Automatic shut-down of the BWMS is to be arranged when the ozone concentration measured from one of the two sensors inside the space raises above 0.2 ppm.

(4) Inside double walled spaces or pipe ducts constructed for the purpose of 26.2.3.2 (1) Note ①, sensors are to be provided for the detection of H_2 leakages (BWMS categories 4, 5 and 6 when relevant) or O_2 leakages (BWMS categories 7a and 7b) or O_3 leakages (BWMS categories 7a and 7b). The sensors are to activate an alarm at the high level settings and automatic shut-down of the BWMS at the high-high level settings described in above (1) and (3).

Note: As an alternative to the sensor for the gas detection, monitored under-pressurization inside the double walled spaces or pipe ducts could be provided with an automatic alarm and shut-down of the BWMS in case of loss of the under-pressurization. The monitoring can be achieved either by monitoring the pressure inside the double walled spaces or pipe ducts or by monitoring the exhaust fan.

(5) For in-line full flow electrolysis BWMS (category 4), in-line side-stream electrolysis BWMS (category 5) and in-line injection BWMS using chemical which is stored onboard (category 6): the hydrogen de-gas arrangement (when provided) is to be provided with redundant ventilation fans and redundant monitoring of the ventilation system.

In addition the ventilation fan shall be certified explosion proof and have spark arrestor to avoid ignition sources to enter the ventilation systems whereas remaining H_2 gas may be present in dangerous concentrations.

Audible and visual alarms and automatic shut-down of the BWMS are to be arranged for respectively high and high-high levels of H_2 concentration. The open end of the hydrogen by-product enriched gas relieving device is to be led to a safe location[①] on open deck.

(6) The open end of inert gas or nitrogen gas enriched air (BWMS categories 3a, 3b, 3c and 8) or oxygen-enriched air (BWMS categories 3a, 7a, 7b and 8) are to be led to a safe location[①②] on open deck.

26.2.3.2 Where the piping is conveying active substances, by-products or neutralizers that are containing dangerous gas or dangerous liquids as defined respectively in 26.1.2.1(3) and (5), the following requirements are to be satisfied:

---

① For safe location, refer to requirements of paragraph 26.2.3.2(3).

①② For safe location, refer to requirements of paragraph 26.2.1.5.

Notes:

① This requirement is applicable to the injection lines conveying the dangerous gas or dangerous liquids but not applicable to the ballast water lines where the dangerous gas or dangerous liquids are diluted.

② The IMO reports issued during the basic and final approval procedures of the BWMS that make use of active substances (G9 Guideline) could be used for assessing the hazards that could be expected from the media conveyed by the BWMS piping.

(1) Irrespective of design pressure and temperature, the piping is to be either of Class I (without special safeguard) or Class II (with special safeguard) as required by Table 2.1.5.1 of Chapter 2, PART THREE of the Rules. The selected materials, the testing of the material, the welding, the non-destructive tests of the welding, the type of connections, the hydrostatic tests and the pressure tests after assembly on-board are to be as required in Chapter 2, PART THREE of the Rules. Mechanical joints, where allowed, are to be selected in accordance with Table 2.5.3.1(3) of Chapter 2, PART THREE of the Rules.

Notes:

① For piping class II with special safeguards conveying dangerous gas like hydrogen (H_2), oxygen (O_2) or ozone (O_3), the special safeguards are to be either double walled pipes or pipe duct.

② For piping class II with special safeguards conveying dangerous liquids, other special safeguards could be considered like shielding, screening, etc.

③ Plastic pipes may be accepted after due assessment of the dangerous gas or dangerous liquids conveyed inside. When plastic pipes are accepted, the requirements of Appendix 1to Chapter 2, PART THREE of the Rules apply.

(2) The length of pipe and the number of connections are to be minimised.

(3) Inside double walled space or pipe ducts constructed as the special safeguard for the purpose of 26.2.3.2(1) Note ① are to be equipped with mechanical exhaust ventilation leading to a safe location[①②] on open deck.

(4) The routing of the piping system is to be kept away from any source of heating, ignition and any other source that could react hazardously with the dangerous gas or liquid conveyed inside. The pipes are to be suitably supported and protected from mechanical damage.

(5) Pipes carrying acids are to be arranged so as to avoid any projection on crew in case of a leakage.

(6) H_2 by-product enriched air vent pipes (BWMS categories 4, 5 and 6) or O_2 enriched air vent pipes (BWMS categories 3a, 7a, 7b and 8) or O_3 piping (BWMS categories 7a and 7b) are not to be routed through accommodation spaces, services spaces and control stations.

(7) O_2 enriched air vent pipes (BWMS categories 3a, 7a, 7b and 8) are not to be routed through hazardous areas unless it is arranged inside double walled pipes or pipe ducts constructed as the special safeguard for the purpose of 26.2.3.2(1) Note ① and provided with suitable gas detection as described in 26.2.3.1(4) and mechanical exhaust ventilation as described in 26.2.3.2(3).

(8) The routing of H_2 by-product enriched air vent pipes (BWMS categories 4, 5 and 6) or O_2 enriched air vent pipes (BWMS categories 3a, 7a, 7b and 8) is to be as short and as straight as possible. When necessary, horizontal portions may be arranged with a minimum slope in accordance with the manufacturer's recommendation.

26.2.3.3 For BWMS using chemical substances or dangerous gas which are stored on-board for either:

① storage or preparation of the active substances (BWMS categories 2 and 6), or

---

① hydrogen by-product enriched gas from:

- in-line full flow electrolysis BWMS (category 4), in-line side-stream electrolysis BWMS (category 5) and in-line injection BWMS using chemical which is stored onboard (category 6): the hydrogen de-gas arrangement (when provided);

safe locations on the open deck are:

- not within 5 m of any source of ignition and from deck machinery, which may include anchor windlass and chain locker openings, and equipment which may constitute an ignition hazard;
- not within 3 m of areas traversed by personnel; and
- not within 5 m of air intakes from non-hazardous enclosed spaces.

The areas on open deck, or semi-enclosed spaces on open deck, within 3 m of the outlets are to be categorized hazardous zone 1 plus an additional 1,5 m surrounding the 3 m hazardous zone 1 is to be categorized hazardous zone 2.

Electrical apparatus located in the above hazardous areas zone 1 and zone 2 is to be suitable for at least IIC T1.

② For in-line ozone injection BWMS (categories 7a and 7b), vent outlet from O_3 destructor device (ODS) can be considered as oxygen-enriched air provided that:

- the ODS are duplicated; and
- the manufacturer justified that the quantity of consumable (activated carbon) used by the ODS is sufficient for the considered life cycle of the BWMS; and - ozone detection is arranged in the vicinity of the discharge outlet from the vent outlet of the ODS to alarm the crew in case the ODS is not working.

If one of the above 3 conditions is not fulfilled, the safe location from ODS on open deck are:

- outside of hazardous area;
- not within 3 m of any source of ignition;
- not within 6 m of areas traversed by personnel; and
- not within 6 m of air intakes for machinery (engines and boilers) and all ventilation inlets.

② storage or preparation of the neutralizers (BWMS categories 4, 5, 6, 7a and 7b), or

③ recycling the wastes produced by the BWMS (BWMS category 2),

procedures are to be in accordance with the Material Safety Data Sheet and BWM.2/Circ.20 "Guidance to ensure safe handling and storage of chemicals and preparations used to treat ballast water and the development of safety procedures for risks to the ship and crew resulting from the treatment process", and the following measures are to be taken as appropriate:

(1) The materials, inside coating used for the chemical storage tanks, piping and fittings are to be resistant to such chemicals substances.

(2) Chemical substances (even if they are not defined as dangerous liquid in the sense of 26.1.2.1(4)) and gas storage tanks are to be designed, constructed, tested, inspected, certified and maintained in accordance with:

① for independent tanks permanently fixed onboard containing dangerous liquids (e.g. sulfuric acid H_2SO_4) or dangerous gas (e.g. oxygen O_2): Chapter 6, PART THREE of the Rules as applicable to pressure vessels;

② for independent tanks permanently fixed onboard not containing dangerous liquid (e.g. sodium sulphite, sodium biosulphite or sodium thiosulfphate neutralizers) and not containing dangerous gas (eg. nitrogen N_2): Chapter 6, PART THREE of the Rules as applicable to pressure vessels or other industry standard recognized by ISC.

(3) When the chemical substances are stored inside integral tanks, the ship's shell plating is not to form any boundary of the tank.

(4) Dangerous liquids and dangerous gas storage tank air pipes are to be led to a safe location[1&2] on open deck.

(5) An operation manual containing chemical injection procedures, alarm systems, measures in case of emergency, etc. is to be kept onboard.

(6) Dangerous liquid storage tanks and their associated components like pumps and filters, are to be provided with spill trays or secondary containment system of sufficient volume to contain potential leakages from tank openings, gauge glasses, pumps, filters and piping fittings.

Further to the safety and/or pollution assessment of the concerned chemical substances, consideration should be provided for segregation of the drains from such spill trays (or secondary containment system) or piping systems from engine room bilge system or from cargo pump room bilge system, as applicable. When necessary, arrangement should be provided within the spill trays (or within the secondary containment system) for the detection of dangerous liquid or dangerous gas as defined respectively in 26.1.2.1(3) and (5).

Note: The IMO reports issued during the basic and final approval procedures of the BWMS that make use of active substances (G9 Guideline) could be used for this assessment.

26.2.3.4 A risk assessment is to be conducted in a generic manner during the design review mentioned in 26.2.1.4 and submitted to ISC for approval for the following BWMS categories:

- BWMS category 4: in all cases;
- BWMS category 5: in all cases;
- BWMS category 6: when one of the MSDS indicates that the chemical substance stored on-board is either flammable, toxic, corrosive or reactive;
- BWMS category 7a and 7b: in all cases.

Note: The IMO reports issued during the basic and final approval procedures of the BWMS that make use of active substances (G9 Guideline) could be used as a reference for this assessment.

(1) The recommended risk assessment techniques for BWMS and other guidances are listed below but not limited to:

- FMEA, FMECA, HAZID, HAZOP, etc.
- ISO 31010 – Risk Assessment Techniques
- IACS Recommendation Rec. 146
- Rules of the Classification Society for risk assessment techniques

(2) The risk assessment should ensure that the package supplied by the BWMS's manufacturer is intrinsically safe and/or provides mitigation measures to the hazards created by the BWMS which have been identified during the design review mentioned in 26.2.1.4 but that need to be implemented during the installation on-board.

Appendix 1 ADDITIONAL FIRE SAFETY MEASURES RELATED TO THE INSTALLATION OF BALLAST WATER MANAGEMENT SYSTEMS

Section 1 GENERAL REQUIREMENTS①

1.1 Application

1.1.1 This Appendix details fire safety measures, in addition to that required by SOLAS II-2, related to the installation of Ballast Water Management Systems onboard any ship. This section is to be read in conjunction with Chapter 26, PART EIGHT of the Rules.

1.1.2 The requirements of this Appendix apply for BWMS technologies as listed in Table 26.1.2.1. BWMS with alternative technologies are to be specially considered.

1.2 Definitions

1.2.1 Airlock

An airlock is a space enclosed by gastight steel bulkheads with two gastight doors spaced not more than 2.5 m apart. The doors are to be self-closing without any holding back arrangements. Air locks are to have mechanical ventilation and are not to be used for other purposes. An audible and visual alarm system to give a warning on both sides of the air lock is to be provided to indicate if more than one door is moved from the closed position. The air lock space is to be monitored for dangerous gas as defined in 26.1.2.1(3) of Chapter 26, PART EIGHT of the Rules.

1.2.2 Ballast Water Management System (BWMS)

Ballast Water Management System means any system defined in paragraph 26.1.2.1 of Chapter 26, PART EIGHT of the Rules.

---

① This Section is to be uniformly implemented for:

i) existing ships, where the application for approval for the [installation] plans of BWMS is dated on or after 1 July 2022; or

ii) BWMS installed on the new ships contracted for construction on or after 1 July 2022.

1.2.3 Ballast Water Management Room (BWMR)
A Ballast Water Management Room is any space containing equipment belonging to the Ballast Water Management System. A space containing remote controls for the BWMS or a space dedicated to the storage of liquid or solid chemicals for BWMS need not be considered as a BWMR for the purposes of this Section.
1.2.4 BWMS storing, introducing or generating chemicals.
In general, BWMS storing, introducing or generating chemicals refer to:
(1) In-line flocculation (cat.2 as per Table 26.1.2.1),
(2) Chemical injection (cat.6 as per Table 26.1.2.1) and
(3) BWM technologies using neutralizers injection (cat.4, 5, 6 and 7 as per Table 26.1.2.1)
BWMS that do not store, introduce or generate toxic or flammable chemicals may be specially considered as detailed in Table 1.1.2.1 below.

Requirements that may be reduced for BWMS storing, introducing or generating chemicals depending on the chemicals

Table 1.1.2.1

Requirement	Conditions to be met before reducing the requirement
2.3.4	The stored chemicals are neither toxic nor flammable
3.1.1	The BWMS does not use any flammable or toxic chemical substances
3.3.1	No dangerous gas as defined in 26.1.2.1(3) will be generated by the BWMS
6.1.1	No toxic chemical is stored and no toxic gas will be generated by the BWMS
7.1.1 7.1.3 7.1.6	No toxic chemical is used or will be generated by the BWMS

The IMO reports issued during the basic and final approval procedures of the BWMS that make use of active substances (G9 Guidelines) and "safety hazard'' as listed in Ch.17 of IMO IBC code are to be considered for this purpose.
Note: Chemicals include additives for BWMS.

Section 2 FIRE CATEGORIZATION

2.1 General
2.1.1 BWMR shall be classified as follows for the purpose of applying the requirements of SOLAS Chapter II-2:
(1) BWMR containing oil-fired inert gas generators (i.e. BWMS cat.3b and 3c as per Table 1.1.2.1) is to be treated as machinery spaces of category A;
(2) Other BWMR shall be considered as other machinery spaces and shall be categorized, depending on the ship type (10) or (11) according to SOLAS II-2/9.2.2.3 or (7) according to SOLAS II-2/9.2.2.4, II-2/9.2.3 and II-2/9.2.4.

2.2 BWMS located in the cargo area of tankers
2.2.1 Notwithstanding the above, where a BWMS is located in the cargo area of a tanker as allowed by Chapter 26, PART EIGHT of the Rules, the BWMR shall be categorized as (8), a cargo pump-room, according to SOLAS II-2/9.2.4.2.2 for determining the extent of fire protection to be provided.
Note: The cargo area of a tanker is defined in para 26.1.2.1(2) of Chapter 26, PART EIGHT of the Rules.

2.3 Storage of chemicals
2.3.1 Spaces where the storage of liquid or solid chemicals for BWMS is intended shall be categorized as store-rooms for the purpose of applying the requirements of SOLAS Chapter II-2, i.e.:
(1) On passenger ships carrying more than 36 passengers:
① "Other spaces in which flammable liquids are stowed" as defined in SOLAS II-2/9.2.2.3.2.2(14), if flammable products are stored;
② "Store-rooms, workshops, pantries, etc." as defined in SOLAS II-2/9.2.2.3.2.2(13) otherwise.
(2) On other ships:
① "Cargo pump-rooms" as defined in SOLAS II-2/9.2.4.2.2.2(8) if located in the cargo area of a tanker;

② “Service spaces (low risk)” as defined in SOLAS II-2/9.2.2.4.2.2(5), SOLAS II-2/9.2.3.3.2.2(5) or II-2/9.2.4.2.2.2(5) if the surface area is less than 4m2 and if no flammable products are stored;

③ “Service spaces (high risk)” as defined in SOLAS II-2/9.2.2.4.2.2(9), SOLAS II-2/9.2.3.3.2.2(9) or II-2/9.2.4.2.2.2(9) otherwise.

Note: It is understood that only chemical injection (cat.6 as per Table 26.1.2.1), in-line flocculation (cat.2 as per Table 26.1.2.1) and technologies using neutralizer injection (cat.4, 5, 6 and 7 as per Table 26.1.2.1) will require chemical or additive storage.

2.3.2 Where the storage of chemicals is foreseen in the same room as the ballast water management machinery, this room shall be considered both as a store-room and as a machinery space in line with 2.1.

2.3.3 When the chemical substances are stored inside integral tanks, the ship's shell plating shall not form any boundary of the tank.

2.3.4 Tanks containing chemicals shall be segregated from accommodation, service spaces, control stations, machinery spaces not related to the BWMS and from drinking water and stores for human consumption by means of a cofferdam, void space, cargo pump-room, empty tank, oil fuel storage tank, BWMR or other similar space. On-deck stowage of permanently attached deck tanks or installation of independent tanks in otherwise empty hold spaces should be considered as satisfying this provision.

Section 3 BWMR LOCATION AND BOUNDARIES

3.1 BWMS using chemical substances

3.1.1 For BWMS storing, introducing or generating chemicals, the BWMR and chemical substance storage rooms are not to be located in the accommodation area. Any ventilation exhaust or other openings from these rooms are to be located not less than 3m from entrances, air inlets and openings to accommodation spaces. This requirement need not apply in case the BWMS is located in the engine room.

3.2 Ozone-based BWMS

3.2.1 Ozone-based BWMS – i.e. cat.7a and 7b - shall be located in dedicated compartment, separated from any other space by gastight boundaries. Access to the BWMR from any other enclosed space is to be through airlock only, except if the only access to that space is from the open deck.

Access to the ozone based BWMR may be provided through the engine room only provided:

(1) Access from the engine room to the BWMR is through airlock and,

(2) An alarm repeater is provided in the BWMR, which will repeat any alarm activated in the engine room.

3.2.2 A sign shall be affixed on the door providing personnel with a warning that ozone may be present and with the necessary instructions to be followed before entering the room.

3.3 General

3.3.1 BWMR containing equipment for BWMS of the following types shall be equipped with tested gastight and self-closing doors without any holding back arrangements:

(1) BWMS storing, introducing or generating chemical substances

(2) De-oxygenation based on inert gas generator

(3) Electrolysis

(4) Ozone injection

Doors leading to the open deck need however not to be self-closing.

Section 4 FIRE FIGHTING

4.1 Fixed fire-extinguishing system

4.1.1 Where fitted, fixed fire extinguishing systems shall comply with the relevant provisions of the Fire Safety Systems Code.

4.1.2 Ozone-based BWMS

BWMR containing equipment related to ozone-based BWMS shall be provided with a fixed fire extinguishing system suitable for category A machinery spaces and capable of manual release.

4.1.3 Where a fixed fire-extinguishing system is provided in the BWMR, it should be compatible with the BWMS and the chemical products that are used, produced or stored in the BWMR. Specific attention shall be paid to potential chemical reactions between the fire extinguishing medium and chemical products used for water treatment. Especially, water-based fire-extinguishing systems should be avoided in case of sulfuric acid storage.

4.1.4 Foam fixed fire-extinguishing system

For all kinds of BWMS, in case a foam fire extinguishing system is installed in the BWMR, its efficiency shall not be impaired by chemicals used by the BWMS where relevant.

4.1.5 Where a fixed fire-extinguishing system is installed in the BWMR, automatic shutdown of the BWMS upon release of the fixed fire extinguishing system shall be arranged. Any need for cooldown necessary for safe shutdown to be considered in the shutdown sequence.

4.1.6 Where BWMS that includes air or O_2 storage is located in a room covered by a fixed gas fire-extinguishing system, air or O_2 storage shall be taken into account for the gas capacity calculation, unless the discharge pipe from safety valves for air or O_2 storage are led directly to outside the room.

4.2 Portable fire-fighting equipment

4.2.1 There shall be at least one portable fire extinguisher that complies with the provisions of the Fire Safety Systems Code and suitable for electrical fires in the BWMR containing UV type BWMS.

Section 5 FIRE PREVENTION

5.1 Equipment protection

5.1.1 Overcurrent or overvoltage protection is to be installed to protect UV type BWMS.

5.1.2 Electrolysis reactors are to be provided with at least with two independent means of monitoring operation. The monitoring system shall initiate audible and visual alarms and automatic shutdown of the BWMS in the event that an anomaly is detected. Requirements for shutdown arrangement are clarified in 26.2.1.9 of Chapter 26, PART EIGHT of the Rules.

Note: If a pressure relief valve is also provided, the vent of this valve is to be led to a safe location on the open deck, as clarified in Chapter 26, PART EIGHT of the Rules. The valve should be positioned to optimally remove gas from the electrolysis reactor.

5.2 Fire detection

5.2.1 A fixed fire detection and fire alarm system complying with the provisions of the Fire Safety Systems Code shall be installed in spaces containing an inert gas generator or an ozone generator.

5.2.2 A section of fire detectors which covers a control station, a service space or an accommodation space is not to include a BWMR containing equipment related to ozone based BWMS.

Section 6 VENTILATION

6.1 Ventilation arrangement

6.1.1 The ventilation systems for BWMR containing BWMS of the following types shall be independent of the ventilation systems serving any other spaces:

(1) BWMS storing, introducing or generating chemical substances;

(2) De-oxygenation, including pasteurization and de-oxygenation (cat.3 and cat.8 as per Table 26.1.2.1);

(3) Electrolysis;

(4) Ozone injection.

6.1.2 The ventilation exhaust for BWMR containing a nitrogen generator shall be located in the lower part of the room in order to efficiently evacuate dangerous gases – as defined in 26.1.2.1(3) of Chapter 26, PART EIGHT of the Rules - heavier than air.

6.1.3 The ventilation exhaust for BWMR containing electrolysis systems shall be located so as to be able to efficiently evacuate dangerous gases – as defined in 26.1.2.1(3) of Chapter 26, PART EIGHT of the Rules - that could be generated during the electrolysis process. Due regard is to be paid to the expected quantity and density of such gases when designing the ventilation exhaust.

6.1.4 The following requirements apply to ventilation ducts serving BWMR for ozone-based BWMS:

(1) The part of the ducts located outside of the BWMR shall be made of steel having a thickness of at least 3 mm for ducts with a free cross-sectional area of less than 0.075 m^2, at least 4 mm for ducts with a free cross-sectional area of between 0.075 m^2 and 0.45 m^2, and at least 5 mm for ducts with a free cross-sectional area of over 0.45 m^2; and

(2) The ducts shall be suitably supported and stiffened;

(3) The outside openings of the ducts shall be fitted with protective screens of not more than 13 mm square mesh.

6.1.5 The ventilation system for BWMR containing ozone-based BWMS or ventilation system for hydrogen de gas arrangement as required by 26.2.3.1(5) of Chapter 26, PART EIGHT of the Rules shall be interlocked with the BWMS such that:
(1) In case of loss of ventilation (primary and secondary), a visual and audible alarm shall be triggered both inside and outside the BWMR and at a place where a responsible member of the crew is on duty. If the ventilation is not restored after a pre-set time, the BWMS shall then be automatically shut down. Any need for cooldown necessary for safe shutdown is to be considered in the shutdown sequence.
(2) It shall not be possible to start the BWMS without the ventilation running.
6.1.6 For ventilation systems serving BWMR and containing or conveying a dangerous gas, relevant requirements in 26.2.3.1 of Chapter 26, PART EIGHT of the Rules are to be satisfied.

6.2 Ventilation rate

6.2.1 An adequate power ventilation system shall be provided in enclosed BWMR.
6.2.2 The ventilation capacity shall be at least 30 air changes per hour where explosive or toxic gases may be generated during operation of the BWMS. The IMO reports issued during the basic and final approval procedures of the BWMS that make use of active substances (G9 Guidelines) and "safety hazard'' as listed in Ch.17 of IBC code are to be used as references for identifying those cases.
6.2.3 The ventilation capacity may be reduced as follows:

(1) Flocculation-type BWMS	6 air changes per hour
(2) De-oxygenation, incl. pasteurization and de-oxygenation (cat.3 and cat.8 as per Table 26.1.2.1)	6 air changes per hour
(3) Full flow electrolysis	6 air changes per hour
(4) Side-stream electrolysis	20 air changes per hour
(5) Ozone injection	20 air changes per hour
(6) Chemical injection	6 air changes per hour

Note: More stringent ventilation capacity requirements may arise from other regulations e.g. IBC Code requirements for spaces located in the cargo area.

Section 7 PERSONAL EQUIPMENT

7.1 General Requirement

7.1.1 Suitable protection equipment shall be available onboard for the protection of the crew members who are engaged in the servicing, maintenance and repair of BWMS storing, introducing or generating chemicals, as recommended by the product manufacturers. The protection equipment shall consist of large aprons, special gloves with long sleeves, suitable footwear, coveralls of chemical-resistant materials, and tight fitting goggles or face shields or both. The protective clothing and equipment shall cover all skin so that no part of the body is unprotected. This protection equipment is to be provided separately without taking into account equipment required by other mandatory requirements.
7.1.2 Work clothes and protective equipment shall be kept in easily accessible places and in special lockers. Such equipment shall not be kept within accommodation spaces, with the exception of new, unused equipment and equipment which has not been used since undergoing a thorough cleaning process. Notwithstanding the above, storage rooms for such equipment within accommodation spaces if adequately segregated from living spaces such as cabins, passageways, dining rooms, bathrooms, etc.
7.1.3 When a BWMS storing, introducing or generating chemicals is installed on board, suitably marked decontamination showers and an eyewash are to be available in a convenient location in close proximately to the BWMS and the chemical store room(s).
7.1.4 An emergency escape breathing apparatus (EEBD) is to be provided in the BWMR. This emergency escape breathing apparatus may be one of the EEBDs provided in accordance with the requirements of SOLAS II-2/13.
An EEBD need not be required for BWMS of cat.1 as per Table 26.1.2.1.
7.1.5 A personal ozone detector, calibrated as per the manufacturer's specifications, shall be provided for each person engaged in the servicing, maintenance and repair of BWMS utilizing ozone.
7.1.6 A two-way portable radiotelephone apparatus dedicated for the BWMS service, maintenance and repair shall be provided, in addition to those required by SOLAS for firefighting purposes. This two-way radiotelephone apparatus is to be properly identified in order to avoid mix-up with the apparatus intended for fire-fighting operations. Where the BWMS may release explosive gases, this two-way radiotelephone apparatus is to be of a certified safe type suitable for use in zone 1 hazardous areas, as defined in IEC

Publication 60079.Where the BWMS stores, utilizes or introduces chemicals, the apparatus is to undergo deep cleaning or de-contamination after use.
A two-way portable radiotelephone apparatus need not be required for BWMS of cat.1 as per Table 26.1.2.1.

Appendix 2 INSTALLATION OF ONE SINGLE BWMS ON TANKERS

BWMS's Technologies Categorization **Table 1.1**

BWMS's Technology category* →		1	2	3a	3b	4	5	6	7a	7b
Characteristics↓		In-line UV or UV + Advanced Oxidation Technology (AOT) or UV + TiO2 or UV + Plasma	In-line Flocculation	In-line membrane separation and deoxygenation (injection of N2 from a N2 Generator)	In-line de-oxygenation (injection of Inert Gas from Inert Gas Generator)	In-line full flow electrolysis	In-line side stream electrolysis (2)	In-line (stored) chemical injection	In-line side-stream ozone injection without gas/liquid separation tank and without Discharge treatment tank	In-line side-stream ozone injection with gas/liquid separation tank and Discharge water treatment tank
Des-infection when ballasting	Making use of active substance		x			x	x	x	x	x
	Full flow of ballast water is passing through the BWMS	x	x	x	x	x				x
	Only a small part of ballast water is passing through the BWMS to generate the active substance						x			
After-treatment when deballasting	Full flow of ballast water is passing through the BWMS	x								x
	Injection of neutralizer					x	x	x	x	x
	Not required by the Type Approval Certificate issued by the Administration		x	x

In-tank Pasteurization + de-oxygenation with N2 Generator

CHAPTER 27 BOW LOADING SYSTEMS

Section 1 GENERAL PROVISIONS

27.1.1 Application

27.1.1.1 This Chapter applies to oil tankers provided with bow loading systems.

27.1.1.2 Oil tankers provided with bow loading systems are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules

27.1.2 Notation

27.1.2.1 Oil tankers complying with the provisions of Sections 1 to 8 of this Chapter may be assigned the notation: Bow Loading System.

27.1.2.2 Oil tankers complying with the provisions of Section 9 of this Chapter may be assigned the notation: Bow Loading System*.

27.1.3 Definition

27.1.3.1 For the purpose of this Chapter:

(1) Bow loading control station means a control station performing all operations concerning positioning of the ship, operation and monitoring of bow loading safety systems, and monitoring of mooring and loading parameters.

27.1.4 Plans and documents

27.1.4.1 The following plans and documents are to be submitted for approval. If they have been included in plans and documents required for ship's classification, re-submission may be omitted:

(1) general arrangement of bow loading systems, including bow loading control stations;

(2) mooring arrangement of bow loading system areas;

(3) lower hull supporting structure of mooring equipment of bow loading systems;

(4) cargo lines of bow loading systems;

(5) bow loading hydraulic oil systems;

(6) foam fire-extinguishing piping and equipment capacity calculations of bow loading system areas;

(7) water-spraying fire-extinguishing piping and equipment capacity calculations of bow loading system areas;

(8) ventilation piping arrangement of bow loading system areas;

(9) arrangement of the ship showing dangerous zones and spaces of bow loading system areas;

(10) arrangement of electrical equipment in hazardous areas of bow loading system areas;

(11) fire-resisting divisions of bow loading system areas;

(12) fire control plans of bow loading system areas;

(13) schematic diagram of control and monitoring systems of bow loading systems;

(14) schematic diagram of communication systems related to the bow loading control station.

27.1.4.2 The following plans and documents are to be submitted for information:

(1) operation manual of bow loading systems.

27.1.4.3 For special structures and arrangement, expansion of the submission scope of plans and documents may be required if deemed necessary by ISC.

Section 2 ARRANGEMENT

27.2.1 Arrangement of bow loading systems

27.2.1.1 Cargo lines used for bow loading are to be arranged outside accommodation spaces, service spaces, machinery spaces and control stations, and they are to be clearly identified.

27.2.1.2 The bow loading system is to be so arranged as not to interfere with the operation and use of life-saving appliances and embarkation stations at bow. The stowage position of life-saving appliances and embarkation stations are to have a distance of not less than 10 m from the coupling.

27.2.1.3 Enclosed spaces containing the working area of bow loading coupler are to be provided with mechanical ventilation system capable of giving at least 30 air changes per hour.

27.2.1.4 For oil tankers provided with emergency towing arrangements at bow, the bow loading system is

to be so designed as not to interfere with the operation and use of emergency towing arrangements.
27.2.1.5 The working area of bow loading coupler is to be provided with sufficient lighting that ensures good working environment.

27.2.2 Bow loading control station
27.2.2.1 For ships provided with bow loading systems, a control station for bow loading is to be arranged within the bow area or on the navigation bridge.
27.2.2.2 Where the bow loading control station is arranged within the bow area, positive pressure mechanical ventilation is to be provided.
27.2.2.3 Where the bow loading control station is arranged within the bow area, at least one lifejacket and one immersion suit are to be provided for each person on watch.

27.2.3 Classification of hazardous areas and electrical equipment in hazardous areas
27.2.3.1 For oil tankers provided with bow loading systems, classification of hazardous areas and electrical equipment in hazardous areas are, in addition to additional requirements for oil tankers in Section 16, Chapter 2, PART FOUR of the Rules, to comply with the provisions of this Section.
27.2.3.2 Where the cargo hose joint is arranged outside the cargo tank area, for the purpose of electrical equipment or ignition devices, areas within 3 m from the manifold are to be considered as hazardous area zone 1, with corresponding requirements to electrical equipment and wiring.
27.2.3.3 Spaces housing the loading pipe (fitted with detachable joint) and bow loading coupling are to be considered as hazardous area zone 1, with corresponding requirements to electrical equipment and wiring.
27.2.3.4 Entrances, air inlets and openings to service and machinery spaces and control stations are not to face the bow loading coupling, and are to be located at least 10 m from the bow loading coupling. Direct access from the hazardous bow loading coupler room to non-hazardous spaces in the forecastle area is acceptable provided protected from gas ingress as follows:
An air lock in accordance with IEC60092-502 is provided between the bow loading coupler room and an intermediate space. The air lock will be considered as a hazardous zone 2. The intermediate space complies with the requirements to an air lock in IEC60092-502. The intermediate space will be considered as a non-hazardous space.
27.2.3.5 Spaces considered as non-hazardous are not to have any connections with hazardous spaces or areas, and are to be ventilated in accordance with IEC60092-502.

Section 3 EQUIPMENT AND OUTFITS

27.3.1 Mooring equipment and its supporting structures
27.3.1.1 The ship is to be provided with suitable mooring equipment that can be used in conjunction with the ship's manoeuvring system to ensure that the ship is moored during bow loading. The mooring equipment is to be arranged to prevent the mooring load from being transferred to the oil pipeline used for loading.
27.3.1.2 Mooring equipment and its arrangement are to meet Oil Companies International Marine Forum (OCIMF) mooring equipment guidelines
27.3.1.3 The arrangement plan of mooring equipment is to indicate the safe working load of equipment.
27.3.1.4 The design load of the hull supporting structure of the mooring equipment is to be 2 times the safe working load of the equipment, and the calculated stress is not to exceed the minimum yield limit of the material used.

Section 4 PIPING SYSTEMS

27.4.1 General provisions
27.4.1.1 Materials, design and manufacture and testing of piping systems, valves and fittings of bow loading systems are to comply with applicable requirements of Chapter 2 of PART THREE of the Rules.
27.4.1.2 For ships to which this Chapter is applicable, requirements for bow loading in Chapter 5 of PART THREE of the Rules are replaced by requirements of this Chapter.

27.4.2 Cargo lines
27.4.2.1 Cargo lines used for the bow loading system which are outside the cargo area are to have welded

connections. Flanged connections may be used in way of the coupler. If necessary, expansion joints of flanged connection may be permitted when compensation is needed for lines subject to expansion and contraction.
27.4.2.2 Lines of the bow loading system and lines within the cargo area are to be effectively segregated in the cargo area by the following methods or equivalent means:
(1) a spool piece and blanking the line ends; or
(2) a valve and blanking the line ends; or
(3) two valves which can be secured in the closed position and provided that the efficiency of the segregation can be checked.
27.4.2.3 The bow loading coupling is to be fitted with a shut-off valve and a blank flange. The blank flange may be omitted when a patent hose coupling is fitted. A spill tray or coaming arrangement is to be provided in way of the bow loading coupling. Means for draining the spill tray to the cargo tank or slop tank are to be provided.
27.4.2.4 The cargo line is to be arranged to drain cargoes in the line to the cargo tank or slop tank by itself or by means of a draining device, where necessary by connection to a stripping device.
27.4.2.5 Spray shields are to be provided in way of valves or joints with potential leakage of the loading manifold of bow loading system except where the loading manifold is located outboard.
27.4.2.6 Means of inerting, purging and gas freeing for relevant lines of bow loading piping system are to be arranged, and the connected vent pipes are to be located in the cargo area. The relevant joints to the lines are to be fitted with shut-off valves and blank flanges.

Section 5 CONTROL AND MONITORING

27.5.1 General requirements

27.5.1.1 The control and monitoring of electrical installations are, in addition to the applicable requirements of the Rules, to comply with the provisions of this Section.
27.5.1.2 For instrumentation, equipment and automation, including computer based control and monitoring, the requirements of Chapter 2, PART SEVEN of the Rules are to be complied with.
27.5.1.3 From the control station for bow loading, all operations concerning positioning of the ship, operation and monitoring of bow loading safety systems, and monitoring of mooring and loading parameters are to be performed. The station is in general arranged on the navigation bridge and may also be arranged within the bow area Where the bow loading control station is arranged on the navigation bridge, it is to have concentrated arrangement and control and monitoring functions above. The bow area may also be provided with local operation which a necessary operation function of the bow loading system. Where the bow loading control station is only arranged within the bow area, all functions of the station are to be met.
27.5.1.4 Oil tankers applying for the notation DP are to satisfy the applicable requirements of Chapter 11 of this PART.

27.5.2 Instrumentation, equipment and automation

27.5.2.1 Ship manoeuvring instrumentation or equipment is to cover:
(1) thruster(s) control;
(2) main engine(s) emergency stop, or disengagement of clutch, if fitted;
(3) steering gear control, if fitted;
(4) radar;
(5) log.
27.5.2.2 Bow mooring instrumentation or equipment is to cover:
(1) mooring line traction control;
(2) chain stopper control;
(3) data logger system for recording of mooring and load parameters.
The mooring system is to be provided with a tension meter continuously indicating the tension during the bow loading operation. This requirement may be waived if the vessel has in operation an approved dynamic positioning system.
27.5.2.3 The bow loading system is to cover:
(1) indicator for loading connector coupling position;
(2) cargo valve position indicators;
(3) cargo tank level indicators and high level alarm (which may be omitted if the bow loading control station is located on the navigation bridge and such indicators are provided in other areas of the bridge);
(4) a system for automatic transfer of signals from the control and safety system, to enable automatic

termination of cargo supply from the offshore terminal;
(5) cargo pressure monitoring in the bow loading line in way of the bow loading coupling with high and low pressure alarms.
27.5.2.4 An emergency disconnection system is to be provided, which is to be activated from the control station.
- tripping the main crude oil transfer pumps;
- closing the connector and loading hose end coupler valves;
- start of the water sprinkler system;
- opening of the bow loading coupling claws;
- opening of the chain stopper.
In addition to the above automatic disconnection systems, a manually-operated backup emergency disconnection system is to be provided. Such a system may be based on accumulators providing hydraulic pressure.

27.5.3 Communication
27.5.3.1 Means of communication between the ship's cargo oil control station and bow loading control station and the offshore loading terminal are to be provided and certified safe for hazardous areas, if necessary.
27.5.3.2 Means of emergency communication between the bow loading control station and the offshore terminal are to be arranged.
27.5.3.3 Both primary and secondary methods are to be provided to ensure that continuous communication can be maintained between the bow loading control station and the offshore terminal in the event of any equipment failure or other problems arising during the operations.

Section 6 FIRE SAFETY

27.6.1 Fire protection, fire detection and fire extinction
27.6.1.1 Where the bow loading control station is arranged within the bow compartment, a protected escape route is to be provided and protected by a self-closing A-class door with the control station. The exit of the escape route is to be 10 m away from the coupling and not to face the joint of coupling.
27.6.1.2 Where the bow loading control station is arranged within the bow compartment, A-60 insulation protection is to be provided for boundaries adjacent to the space containing the coupling, including doors, windows and side scuttles.
27.6.1.3 At least one fire hydrant with associated fire hose and nozzle is to be provided in the working area of bow loading coupler.
27.6.1.4 The compartment containing the working area of bow loading coupler is to be provided with fixed combustible gas system and fire detection and alarm system. The alarm of the above systems is to be provided locally and in the bow loading control station.
27.6.1.5 The bow area is to be additionally provided with at least one additional foam monitor and one additional foam applicator complying with 2.2.2, Chapter 14 of the FSS Code, which are to be capable of effectively protecting the cargo lines and loading areas at bow.
27.6.1.6 Where the coupling and cargo lines are arranged in the compartment, a fixed foam fire-extinguishing system complying with the following requirements or other equivalent fire-extinguishing system is to be provided:
(1) foam sprinkler system. The system is to be capable of operating continuously for at least 30 minutes at a rate of not less than 6 L/m2 to protect the compartment; or
(2) fixed high-expansion foam system. The system is to be arranged to meet the requirements of the foam fire extinguishing system for the cargo pump room in Chapter 6 of the FSS Code.
The control of the fixed foam fire-extinguishing system required by this paragraph is to be located in an easily operable position outside the protected space.
27.6.1.7 The bow area is to be provided with a water spraying system with a spraying intensity not less than $5L/m^2$ per minute. The system is to cover potential spark generating equipment and location, e.g. mooring related equipment and coupling etc. The water spraying system is to be capable of being started within and outside the working area of bow loading coupler, and in addition, its control is to meet starting requirements in case of emergency disconnection.

Section 7 OPERATION MANUAL

27.7.1 Operation manual

27.7.1.1 An operation manual is to be provided on board, generally containing the bow loading operation procedure and safety measures that need to be taken during operation.

27.7.1.2 The operation manual is in general to give information regarding the following:

(1) Arrangement and equipment

① tank arrangement;

② arrangement and explanation of mooring equipment;

③ cargo loading and transfer system;

④ control station;

⑤ communication equipment;

⑥ other relevant equipment.

(2) Operation procedures

① communication procedure;

② mooring procedure;

③ connection and disconnection of cargo hose coupling;

④ transfer/distribution/storage of oil cargo;

⑤ oil spillage alarm of tanks.

(3) Safety measures

① emergency disconnection system;

② emergency communication system;

③ ventilation system;

④ fire safety system;

⑤ emergency escape routes.

(4) Cleaning and gas-freeing.

Section 8 TESTING AND SURVEY

27.8.1 Inspection and testing of products

27.8.1.1 Equipment forming the bow loading system is to be furnished with ISC certificates in accordance with the requirements of Chapter 3, PART ONE of the Rules.

27.8.1.2 Equipment forming the bow loading system is to be inspected and tested in accordance with approved plans and relevant standards.

27.8.2 Ship survey

27.8.2.1 For newbuildings and ships in service, the first survey after onboard installation is to comply with the provisions of 27.8.2.2 of this Chapter. The survey after construction is to comply with the provisions of 27.8.2.3 and 27.8.2.4 of this Chapter.

27.8.2.2 Initial classification survey

(1) checking the product certificate of equipment forming the bow loading system;

(2) checking the arrangement and installation of equipment forming the bow loading system comply with approved plans;

(3) After completion of installation, related equipment and systems of the bow loading system are subject to the following examination and testing:

① visual examination;

② examining and testing the function of instrument, automation and communication equipment in the bow loading control station (including the bow area and navigation bridge);

③ examining and testing the function of emergency disconnection system;

④ examining and testing the function of water spraying system;

⑤ interlock functional testing of mooring equipment and the bow loading system;

⑥ calibration testing of mooring line tension sensor;

⑦ functional test of the interconnection effect between the bow loading coupling and the connecting hose joint or equivalent device.

27.8.2.3 Annual survey

(1) The bow loading system is subject to the following examination:

① visual examination;

② examining and testing the function of instrument, automation and communication equipment in the bow loading control station (including the bow area and navigation bridge);

③ examining and testing the function of emergency disconnection system;

④ examining and testing the function of water spraying system.

27.8.2.4 The requirements for intermediate and special surveys are the same as those for annual survey.

Section 9 REQUIREMENTS FOR BOW LOADING SYSTEM*

27.9.1 General requirements

27.9.1.1 Oil tanks applying for Bow Loading System* may be exempted from the requirements of 27.5.2.3(4) of this Chapter, but are to comply with other requirements of this Chapter and the provisions of this Section.

27.9.2 System requirements

27.9.2.1 Reliable control and safety signal transmission are to be achieved between the bow loading system control station and offshore terminal. The offshore terminal is responsible for safe control of cargo oil supply.

27.9.2.2 The communication system required by 27.5.3 of this Chapter is to be capable of sending emergency signal in case of communication failure during the operation and timely terminate the operation.

27.9.2.3 The emergency disconnection system required by 27.5.2.4 of this Chapter can disconnect the main crude oil transfer pumps of the offshore terminal by means of 27.5.3 and 27.9.2.2 of this Chapter.

CHAPTER 28 ADDITIONAL REQUIREMENTS FOR CABLE LAYERS

Section 1 GENERAL PROVISIONS

28.1.1 Application

28.1.1.1 This Chapter applies to ships provided with cable laying machinery and other special equipment.

28.1.1.2 Cable layers are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules as well as the relevant provisions of ISC Rules for Materials and Welding and of the flag State Administration, if any.

28.1.2 Notation

28.1.2.1 Ships complying with the provisions of this Chapter may be assigned the notation: Cable Layer.

28.1.3 Definition

28.1.3.1 Cable layers mean ships provided with cable laying machinery and other special equipment, engaged in under-sea cable laying for offshore wind plants, interconnection of power supply among islands and under-sea cable servicing.

28.1.4 Plans and documents

28.1.4.1 In addition to those required in the relevant PARTs and Chapters of the Rules, the following plans and documents are to be submitted to ISC for approval:

(1) Diagram for structural strengthening of cable laying equipment;

(2) Diagram for structural strengthening of positioning and towing equipment for cable laying operation;

28.1.4.2 The following plans and documents are to be submitted to ISC for information:

(1) Installation and arrangement of cable laying equipment;

(2) Strength calculations for structural strengthened cable laying equipment;

(3) Strength calculations for holds in cable capstan areas;

(4) Arrangement of positioning and towing equipment for cable laying operation;

(5) Strength calculations for structural strengthened positioning and towing equipment for cable laying operation.

For special structures and arrangement, expansion of the submission scope of plans and documents may be required if deemed necessary by ISC.

Section 2 HULL STRUCTURE AND ARRANGEMENT

28.2.1 Hull structure

28.2.1.1 Hull structural strength is normally to comply with the requirements of main class rules, with consideration of the necessary reinforcement of the support structure of the equipment used in cable laying operation. For special hull structures, hull structural strength will be specially considered.

28.2.2 Cable capstan

28.2.2.1 Structural strength of holds in cable capstan areas is to be checked by means of direct assessment. For the checking methods, reference may be made to the Appendix “Method of Checking Transverse Strength of Pontoon Barges” of Chapter 12 of PART TWO of the Rules. During the check, the maximum bearing load of cable capstan is taken as the deck load in the cable laying area, which is applied on the deck according to the actual force forms.

28.2.3 Cable laying equipment

28.2.3.1 Strength of the strengthened structures of the cable laying equipment, and of the positioning and towing equipment during cable laying operation is to be checked in accordance of Sections 6 and 7 of Chapter 3 of PART TWO of the Rules.

28.2.4 Hold arrangement

28.2.4.1 The bunker cannot be directly positioned under the working deck, unless a void hold, storage hold or ballast tank is arranged between the working deck and the bunker. The working deck is to be distant from the engine room air inlet and outlet as far as possible. The obstacles in way of the hold vents are to be minimized.

CHAPTER 29 ADDITIONAL REQUIREMENTS FOR PIPE LAYERS

Section 1 GENERAL PROVISIONS

29.1.1 Application

29.1.1.1 This Chapter applies to ships provided with special equipment for laying pipes.

29.1.1.2 Pipe layers are, in addition to the provisions of this Chapter, to comply with the relevant requirements of other PARTs and Chapters of the Rules as well as the relevant provisions of ISC Rules for Materials and Welding and of the flag State Administration, if any.

29.1.2 Notation

29.1.2.1 Ships complying with the provisions of this Chapter may be assigned the notation: Pipe Layer.

29.1.3 Definition

29.1.3.1 Pipe layers mean ships provided with special equipment for laying pipes under sea.

29.1.4 Plans and documents

29.1.4.1 In addition to the plans and documents required in the relevant PARTs and Chapters of the Rules, the documents in relation to the pipe laying equipment (e.g. tensioners, A/R winches and stingers) are to be submitted to ISC for approval. For special structures and arrangement, expansion of the submission scope of plans and documents may be required if deemed necessary by ISC.

Section 2 HULL STRUCTURE AND ARRANGEMENT

29.2.1 Hull structure

29.2.1.1 Hull structural strength is normally to comply with the requirements of main class rules, with consideration of the necessary reinforcement of the support structure of the equipment used in pipe laying operation. For special hull structures, hull structural strength will be specially considered.

29.2.2 Bunker

29.2.2.1 The bunker cannot be directly positioned under the working deck, unless a void hold or ballast tank is arranged between the working deck and the bunker.

29.2.3 Hold arrangement

29.2.3.1 The working deck is to be distant from the engine room air inlet and outlet as far as possible. The obstacles in way of the hold vents are to be minimized.

Section 3 EQUIPMENT

29.3.1 General provisions

29.3.1.1 Pipe layers are to be capable of anchor mooring positioning or dynamic positioning.

29.3.2 Wheel house

29.3.2.1 A pipe layer is to be provided with a wheel house with good vision, and communication by means of hardwired connection between the wheel house and the remote control station is to be provided.

CHAPTER 30 ADDITIONAL PROVISIONS ON THE FUNCTIONALITY OF RO-RO PASSENGER SHIPS

Section 1 GENERAL PROVISIONS

30.1.1 Application

30.1.1.1 This Chapter applies to ro-ro passenger ships applying for the notation specified in 30.1.2.

30.1.2 Notation

30.1.2.1 Upon application, ro-ro passenger ships complying with the relevant requirements of this Chapter may be assigned the notation: PVSED (Passenger and Vehicle Separated Embarkation and Disembarkation).

30.1.3 Definition

30.1.3.1 Variable lane, means an arrangement in which both big vehicle lane and small vehicle lane are marked in the same area, and the use of big vehicle lane or small vehicle lane is decided according to the vehicle condition of each voyage.

30.1.4 Plans and documents

30.1.4.1 In addition to those required in relevant Parts and Chapters of the Rules, the following plans and documents are to be submitted:

(1) Passenger and Vehicle Embarkation and Disembarkation Arrangement (approved);

Section 2 PASSENGER AND VEHICLE EMBARKATION AND DISEMBARKATION ARRANGEMENT

30.2.1 Passenger and vehicle separated embarkation and disembarkation arrangement

30.2.1.1 The ship is to be provided with embarkation and disembarkation access and entrance and exit dedicated to passengers.

30.2.1.2 The ship is to be provided with ramps for embarkation and disembarkation of vehicles.

30.2.1.3 Ro-ro spaces or special category spaces is to be provided with access for drivers to go directly to passenger spaces, and clear width of access is not to be less than 700 mm, in which the inclination angle of stairway is not to be greater than 50°. If the access is used as an escape route, it is also to meet the relevant requirements of the Administration of the flag State.

30.2.1.4 If passengers can only embark on and disembark from the ship through the vehicle ramp due to the limited terminal facilities, clear width of the passenger access is not to be less than 900 mm, and means of isolation that are not easy to be surmounted are to be provided on both sides of the access. Dedicated personnel are to guide passengers and vehicles and maintain order during embarkation and disembarkation. This measure is to be included in the safety management documents on board.

30.2.2 Vehicle deck

30.2.2.1 Upper and lower vehicle decks are to be connected by fixed or movable ramps.

30.2.2.2 Where terminal facilities are provided with multi-tier vehicle and/or passenger separated access, on-board vehicle and/or passenger decks are also to be provided with docking facilities with corresponding access of the terminal(if applicable).

30.2.3 Lane arrangement

30.2.3.1 Dedicated lanes in ro-ro spaces or special category spaces are to be clearly marked.

30.2.3.2 The arrangement of variable lanes is acceptable.

30.2.3.3 Where big vehicle and small vehicle dedicated lanes are arranged in vehicle decks or some areas, such lanes are to be clearly marked with different colors and lines.

30.2.4 Lane width

30.2.4.1 Width of small vehicle lanes is not to be less than 2.4 m, and width of big vehicle lanes is not to be less than 3 m.

CHAPTER 31 NOTATIONS FOR OTHER EQUIPMENT

Section 1 GENERAL PROVISIONS

31.1.1 General requirements

31.1.1.1 The provisions of this Chapter are voluntary and optional, which apply to ships with various special equipment.

Section 2 NOTATION FOR VIDEO MONITORING SYSTEM

31.2.1 Notation

31.2.1.1 Upon application, a ship provided with equipment complying with the requirements of this Section may be assigned the following notation: VDMS (video monitoring system).

31.2.2 Definitions

31.2.2.1 For the purpose of this Section, the following definitions apply:

(1) Video detection means a kind of detection method to perceive the object by photoelectric imaging technology (from near-infrared to the limit of visible spectrum) and to form video picture signals.

(2) Video monitoring means to monitor the object by adopting with video method and to record object information.

(3) Video transport means or from one equipment to another one directly or through modulation demodulation by adopting with the wire or wireless transmission medium.

(4) Video switcher means the video controller, which is the core device of the operation and controlling of the video system and generally is able to complete the video switching and the controlling of cradle head and lens, etc.

(5) Front-end device means all kinds of equipment distributed on the detection site. In this system, it usually refers to the video camera as well as its relevant matching devices (such as lens, cradle head, decoding driver, shield, etc.).

(6) Video motion alarm means a means of alarm that uses video detection technology to detect changes in scene images and sends out alarm information once the set threshold is reached.

(7) Video signal loss alarm means a system function, i.e. when the video switcher monitors the video signal from the front end, once the peak value of the video signal is less than the set value, the system will consider the video signal loss and provide alarm information.

31.2.3 Plans and documents

31.2.3.1 The following plans are to be submitted for approval:

(1) Electrical system diagram of video monitoring system;

(2) Electrical equipment arrangement plan of video monitoring system.

31.2.4 General requirements

31.2.4.1 Ship video monitoring system is generally composed of four main parts, i.e. front-end device, transport device, control and record display device.

31.2.4.2 The front-end device can be divided into separate combined camera or integrated camera.

31.2.4.3 Control and record display device can be separated or integrated.

31.2.5 Video detection front-end device

31.2.5.1 Video detection front-end device is to be able to clearly and effectively detect and identify pictures of important locations, covering areas such as navigation bridge, engine room, public spaces, corridors and stairways (passenger ship), special category and ro-ro spaces, fire control stations, etc.

31.2.5.2 Video detection front-end device is to be able to adapt to the lighting conditions of the site. When the illumination of the site cannot meet the requirements for clear detection, the equipment is to be provided with night vision function or auxiliary lighting equipment.

31.2.5.3 The enclosure protection grade and certified safe type (if applicable) of the video detection front-end device is to be appropriate to the space where it is installed.

31.2.6 Video monitoring system

31.2.6.1 The video monitoring system is to have automatic storage function, not causing loss of stored data in case of power off or shutdown.

31.2.6.2 The video monitoring system for ro-ro spaces is to monitor the front-end video signal and give a video motion alarm.

31.2.6.3 The video monitoring system is to give a video signal loss alarm at the display terminals, and this alarm is auditory and visual.

31.2.6.4 The video monitoring system is to be able to store monitoring records for at least 30 days.

31.2.6.5 The video monitoring system is to have ports for networking and remote operation and invocation.

Section 3 NOTATION FOR NIGHT VISION EQUIPMENT

31.3.1 Notation

31.3.1.1 Upon application, a ship provided with equipment complying with the requirements of this Section may be assigned the following notation: NVE (night vision equipment).

31.3.2 Definition

31.3.2.1 For the purpose of this Section:

(1) Night vision equipment means any technical means enabling the position and aspect of objects above the water surface relative to the ship to be detected at night.

31.3.3 Plans and documents

31.3.3.1 The following plans and documents are to be submitted for approval:

(1) Electrical system diagram of night vision equipment;

(2) Electrical equipment arrangement plan of night vision equipment.

31.3.4 General requirements

31.3.4.1 Night vision equipment① facilitates the detection at night of hazards to navigation above the water surface, thus providing essential information to the navigator for collision avoidance and safe navigation.

31.3.5 Technical requirements

31.3.5.1 Night vision equipment is to be capable of detecting objects within a certain distance from the ship, and of displaying the information pictorially in real time, to assist in collision avoidance and safe navigation.

31.3.5.2 Night vision equipment is to be operational in less than 15 min after the equipment has been switched on, and is to be capable of continuous operation from after sunset until before sunrise.

31.3.5.3 The controls of night vision equipment are to be installed in the work area for navigating and manoeuvring, within easy reach of the navigator. For any failure of the night vision equipment, a visual indication is to be provided on the navigation bridge.

31.3.5.4 The operational controls of night vision equipment are to be clearly identifiable in the dark. If illumination is used, the brightness is to be adjustable.

Section 4 NOTATION FOR FOG NAVIGATION ENHANCED SENSING

31.4.1 Notation

31.4.1.1 Upon application, a ship provided with equipment complying with the requirements of this Section may be assigned the following notation: EFN-M (fog navigation enhanced sensing system - manual identification) and EFN-A (fog navigation enhanced sensing system - intelligent identification).

31.4.2 Definitions

---

① Refer to Annex of resolution MSC.94(72) Recommendation on Performance Standards for Night Vision Equipment for High Speed Craft (HSC).

31.4.2.1 For the purpose of this Section:
(1) Typical target identification means the cognition of target characteristics of ships, buoys, shorelines, islands, reefs, etc. Target characteristics are to at least include target position, speed, heading, category, encounter distance, encounter time, movement trend, etc.
(2) Visual fog penetration means the use of optical fog penetration, software fog penetration, thermal imaging and other technologies to detect and identify typical targets in the navigation environment. These targets are visually displayed on the display unit, and the navigator or intelligent system can effectively identify typical targets.
(3) Image identification function means identification using computer programs or algorithms based on the image or thermal imaging of typical targets, by means of of machine learning and other artificial intelligence technologies.
(4) Data fusion function means the automatic fusion of visual fog penetration data and traditional navigation sensing data through computer programs or algorithms for comprehensive identification of typical targets, such as radar echo of collision-avoiding targets, automatic identification instrument, and superposition of image data.
(5) Cradle head means the supporting equipment installed with fog penetration sensor to provide stability function and ensure the stability of target detection during ship navigation.
(6) Fog penetration sensor means the camera or heat source probe with fog penetration function.
(7) Control and data processing unit means the control, data collection, storage and processing of visual fog penetration equipment based on computer technology, which can access the data of traditional navigation sensing equipment, realize image identification and data fusion, continuously detect the operational state of the equipment, and provide man-machine operation interface.
(8) Fault alarm means the alarm information given when the performance of fog navigation enhanced sensing system is significantly reduced or fails.
(9) Traditional navigation sensing equipment means the detection equipment for navigation environment and collision-avoiding targets provided according to the requirements of the existing conventions and rules, such as radar, electronic chart display and information system, automatic identification instrument, etc.
(10) Intelligent identification means identification of the fused data of typical targets by use of artificial intelligence technology or automation technology.
(11) Visibility means the maximum horizontal distance a person with normal vision can see the outline of a target clearly in prevailing weather conditions.

31.4.3 Plans and documents

31.4.3.1 The following plans and documents are to be submitted for approval:
(1) Electrical system diagram of fog navigation enhanced sensing system;
(2) Electrical equipment arrangement plan of fog navigation enhanced sensing system.

31.4.4 General requirements

31.4.4.1 Fog navigation enhanced sensing system is based on optical fog penetration, software fog penetration, thermal imaging, image identification and other technologies. By filtering the impact of haze and fog, smoke and soot, rain and snow on vision, it identifies collision-avoiding targets and reduces collision risk.
31.4.4.2 Fog navigation enhanced sensing system can effectively make up for the defect of navigator's vision in the fog condition, i.e. not being able to effectively find collision-avoiding targets at a long distance.
31.4.4.3 Visual fog penetration equipment is composed of fog penetration sensor, control and data processing unit and display unit.
31.4.4.4 Fog navigation enhanced sensing system is composed of traditional navigation sensing equipment and visual fog penetration equipment, realizing one of the following two functions.
(1) The navigator integrates the data of two types of equipment to manually identify typical targets, i.e., EFN-M;
(2) On the basis of (1), the system can carry out image identification and display for typical targets, and carry out intelligent identification for fusion data of typical targets, i.e., EFN-A.

31.4.5 Technical requirements

31.4.5.1 The fog navigation enhanced sensing system is to have video fog penetration function as a minimum, and the following advanced functions may also be provided:
(1) image identification function;
(2) data fusion function.

31.4.5.2 Video fog penetration can be realized by one or more fog penetration technologies such as optical fog penetration, software fog penetration and thermal imaging.
31.4.5.3 The application environment of fog navigation enhanced sensing system is haze and fog, smoke and soot, rain and snow as well as other typical marine environment.
31.4.5.4 The camera of video fog penetration is to have optical zoom function.
31.4.5.5 The effective distance of the fog navigation enhanced sensing system is to be not less than 1 nautical mile, including at night.
31.4.5.6 The fog penetration sensor can rotate at least 180°in the horizontal direction and is to be adjustable; the maximum horizontal rotation speed is above 20°/S and adjustable; the detection range in the vertical direction is to be at least +60~-60° and adjustable; the maximum vertical rotation speed is above 20°/S and adjustable. The fog navigation enhanced sensing system shall be able to operate normally in the visibility of 0.28 nautical mile to 0.55 nautical miles, and the operating distance shall be greater than 1 nautical mile, including the dark environment.
31.4.5.7 Video fog penetration camera is to have not less than 2 million pixels. The resolution of the thermal sensor is not to be less than 320×240.
31.4.5.8 On the basis of visual fog penetration, the image identification function can in general automatically identify typical targets such as ships, buoys, shorelines, islands and reefs.
31.4.5.9 The data fusion function needs to fuse the following data, and achieve the artificial identification by navigator or intelligent identification by system of typical targets:
(1) automatic identification instrument data;
(2) electronic chart data;
(3) information of other ships, such as position, heading, speed and encounter distance;
(4) information of other obstacles, such as position, relative direction, relative speed;
(5) navigation radar data;
(6) data of visual fog penetration equipment.
31.4.5.10 The fog navigation enhanced sensing system is to meet the following design principles of bridge equipment:
(1) assisting bridge staff and pilots to perform navigation tasks;
(2) promoting effective and safe management of bridge resources;
(3) enabling bridge staff and pilots to conveniently and continuously obtain important information;
(4) indicating the working state of fog navigation enhanced sensing system;
(5) enabling bridge staff and pilots to process information and make decisions quickly, continuously and effectively;
(6) preventing or minimizing unnecessary work in the bridge that may lead to fatigue of staff and pilots, decreased vigilance and other factors, such as distractive affairs;
(7) identifying and reducing the risk of human error to the maximum extent through monitoring and alarm system, so that bridge staff and pilots can take corresponding actions in a timely manner;
(8) effective maintenance, such as maintenance manual, maintenance plan, etc.
31.4.5.11 The fog navigation enhanced sensing system is to have the functions of self-inspection and alarm, and can provide continuous monitoring during normal operation of the equipment.
When the equipment performance is significantly reduced or failure is detected, the system is to be able to send prompt alarm and fault information.
31.4.5.12 The fog navigation enhanced sensing system shall have an interface connected to the ship voyage recorder.

CHAPTER 32 TRANSVERSE PROPULSION ARRANGEMENT

Section 1 GENERAL PROVISIONS

32.1.1 Application

32.1.1.1 This Chapter applies to ships provided with transverse propulsion arrangement and applying for the T-Propulsion notation.

32.1.1.2 Certification requirements and inspections of products with regard to transverse propulsion arrangement are to comply with relevant provisions of Chapter 3, PART ONE of the Rules.

32.1.2 Notation

32.1.2.1 Ships provided with transverse propulsion arrangement complying with the provisions of this Chapter may be assigned the notation: T-Propulsion.

32.1.3 Definition

32.1.3.1 Transverse propulsion arrangement is a special propelling unit fitted in the transverse duct below the waterline at the ship's bow or stern.

32.1.4 Plans and documents

32.1.4.1 The following plans and documents are to be submitted for approval or information:

(1) arrangement plan of transverse propulsion arrangement (for information);

(2) plan of piping system of hydraulic system (where fitted);

(3) plan of piping system of lubricating oil (where fitted);

(4) plan of electrical system of transverse propulsion arrangement;

(5) list of control, monitoring and alarm.

Section 2 TRANSVERSE PROPULSION ARRANGEMENT

32.2.1 General requirements

32.2.1.1 Transverse propulsion arrangement is to have sufficient transverse thrust to satisfy the working requirements of navigation at low speed and docking and leaving wharf.

32.2.1.2 Material and test of transverse propulsion arrangement and its components are to comply with the relevant requirements of ISC Rules for Materials and Welding.

32.2.1.3 Diesel engines driving transverse propulsion arrangement are to comply with the relevant requirements in Chapter 9, PART THREE of the Rules.

32.2.1.4 Motor and distribution system of driving transverse propulsion arrangement are to comply with the relevant requirements in PART FOUR of the Rules.

32.2.1.5 The design of shafting together with its parts and propeller is to comply with the relevant requirements of Chapter 11, PART THREE of the Rules.

32.2.1.6 The thickness of tunnel of transverse propulsion arrangement is not to be less than the adjacent part of the hull.

32.2.1.7 The shaft sealing box is to be installed to prevent water so as to protect steel shafts from sea water.

32.2.1.8 For installed corrosion prevention of cylinders, means of cathodic protection or corrosion prevention materials are to be provided.

32.2.2 Hydraulic transmission piping system (where fitted)

32.2.2.1 After being assembled as a set, the pipe lines and pressure elements of hydraulic transmission system and control system for controllable pitch propellers are to be subject to tightness test to a pressure of 1.25 times the design pressure. There is to be no leakage in way of permanent sealing and pipe joints.

32.2.2.2 Materials, piping systems and arrangement of hydraulic transmission piping system are to comply with applicable requirements of Section 7, Chapter 4, PART THREE of the Rules.

32.2.3 Lubricating oil piping system (where fitted)

32.2.3.1 Lubricating oil system and tank arrangement are to comply with applicable requirements of

Chapters 3 and 4, PART THREE of the Rules.

Section 3 CONTROL, MONITORING AND ALARM

32.3.1 General requirements

32.3.1.1 Control, monitoring and alarm of the transverse propulsion arrangement are, in addition to requirements of this Chapter, to comply with relevant requirements of PART SEVEN of the Rules.

32.3.1.2 It is to be possible to stop the transverse propulsion arrangement from the bridge by means of a system independent of the remote control system.

32.3.1.3 The transverse propulsion arrangement is to be provided with indications, individual or groupwise alarms specified in Table 32.3.1.3.

Alarm and monitoring **Table 32.3.1.3**

Item	Indication	Alarm
Overload of prime mover and servo unit		X
Power failure of remote control system		X
Power failure of alarm system		X
Level in lubrication oil tank (if fitted)		Low
Lubrication oil pressure (if forced lubrication oil system)		Low
Level in hydraulic daily service tank (where applicable)		Low
Pressure in hydraulic system		Low
Running and stop of prime mover	X	
Propeller pitch for controllable pitch propeller plants	Propeller pitch	
Direction of rotation for fixed propeller plants;	Direction of rotation	
r.p.m. for fixed propeller plants	r.p.m.	

32.3.1.4 Where the ship applies for the dynamic positioning notation at the same time, the transverse propulsion arrangement is to be provided with alarms and indications complying with Chapter 11, PART EIGHT of the Rules in the dynamic positioning control station.

CHAPTER 33 SHIP COMMUNICATION NETWORKS SATISFYING SPECIFIC NEEDS

Section 1 GENERAL PROVISIONS

33.1.1 General requirements

33.1.1.1 The provisions of this Chapter apply to ships of which the communication networks satisfy specific needs.

33.1.1.2 The specific needs mentioned in this Chapter refer to communication needs such as passenger using Internet and remote survey.

33.1.1.3 The ship communication networks mentioned in this Chapter refer to the communication networks which realize the specific needs in 33.1.1.2 through ship communication network equipment, based on hosting modes of communication networks such as satellite broadband communication network and 4G or 5G cellular communication network.

33.2.1.4 The applicant is to be responsible for whether the operator of the ship communication network services meets the requirements of relevant laws and regulations.

33.2.1.5 The applicant is to ensure that the management and operation of the ship communication network meet the requirements of relevant laws and regulations, such as real-name registration for network users.

33.1.2 Class notations

33.1.2.1 Upon its application, a ship the ship communication network of which has undergone plan approval and survey by ISC and satisfied the relevant requirements of this Chapter, may be assigned class notations as follows:

Specific Communication Network (Px, Rx)

where the letters P and R in the parentheses stand for the specific needs of the ship communication network, which may be assigned according to the actual function of the ship and are defined as follows:

P - network provided for passengers to satisfy the daily communication needs of passengers to use the Internet.

R - network provided for crew to satisfy the communication needs for ship remote survey.

x - additional notations for hosting modes of ship communication networks. Each small letter indicates one hosting mode. The ship communication network satisfying one specific need may be realized by one or more hosting modes, which may be assigned one or more additional notations where:

s - ship communication network realized by satellite broadband communication network.

c - ship communication network realized by 4G or 5G cellular communication network.

If the ship realizes the needs for daily use of the Internet by passengers and ship remote survey in accordance with the requirements of this Chapter, based on satellite broadband communication network and 4G or 5G cellular communication network respectively, it may be assigned Specific Communication Network (Ps, Pc, Rs, Rc).

Section 2 TECHNICAL REQUIREMENTS

33.2.1 Hosting modes

33.2.1.1 The hosting modes of ship communication networks may be satellite broadband communication network, 4G or 5G cellular communication network, etc.

33.2.2 Network bandwidth

33.2.2.1 The communication network bandwidth is to satisfy the actual needs through the estimation of communication traffic and network capacity load test.

33.2.2.2 For ships applying for class notation "Ps", the theoretical bandwidth of the communication network is not to be less than 2 Mbps for upstream rate and 4 Mbps for downstream rate, which is to be confirmed by relevant supporting documents provided by the ship communication network service provider. The measured bandwidth is not to be less than 1 Mbps for upstream momentary rate and 2 Mbps for downstream momentary rate. For ships applying for class notation "Pc", the measured bandwidth is not to be less than 5 Mbps for upstream momentary rate and 25 Mbps for downstream momentary rate.

33.2.2.3 For ships applying for class notation "Rs", the theoretical bandwidth of communication network is not to be less than 2 Mbps for upstream rate and 2 Mbps for downstream rate, which is to be confirmed by relevant supporting documents provided by the ship communication network service provider. The measured bandwidth is not to be less than 1 Mbps for upstream momentary rate and 1 Mbps for downstream momentary rate. For ships applying for class notation "Rc", the measured bandwidth is not to be less than 4 Mbps for upstream momentary rate and 4 Mbps for downstream momentary rate.

33.2.3 Equipment arrangements

33.2.3.1 Local area network (LAN) is to be arranged to realize the network coverage of relevant spaces.

33.2.3.2 For ships applying for class notation “P”, the network is to be arranged by fixed LAN devices. The network is to cover the living areas of passengers, including primary accommodation spaces as a minimum, such as public spaces, corridors, cabins, cinemas, game and hobby rooms.

33.2.3.3 For ships applying for class notation “R”, the network may be arranged by fixed LAN devices and/or portable network relay equipment which are readily deployed. The network is to cover the survey areas of remote survey including spaces falling in the scope of annual survey as a minimum, such as engine room, steering gear room, other machinery spaces, accommodation spaces, service spaces, control station, forecastle and cargo area (where applicable).

33.2.4 Equipment requirements

33.2.4.1 The ship communication network is to be isolated from the networks related to the normal operation and safety of the ship, such as navigation equipment network, machinery control system network, alarm system network, etc.

33.2.4.2 Ship communication network equipment, which generally contains receiving unit, signal amplification unit, hub, switch, network bridge, router, gateway, network access point, modem, portable network equipment (including customer terminal equipment (CPE), network relay equipment), etc., is to meet the relevant requirements of Sections 2 and 3, Chapter 1, PART FOUR of the Rules.

33.2.4.3 The cables provided for the ship communication network equipment are to meet the relevant requirements of Section 12, Chapter 2, PART FOUR of the Rules.

33.2.4.4 The ship communication network equipment may be powered by main source of electrical power. For ships applying for class notation "R", there is to be a standby power to supply the network for not less than 0.5 hours (for portable equipment, not less than 4 hours), such as UPS or accumulator batteries, etc.

33.2.4.5 Manufacture’s supporting documents of the ship communication network equipment are to be provided for check. System and equipment installed in places with explosion risk are to be explosion-proof, or corresponding measures are to be taken to avoid explosion risks during use at least.

33.2.4.6 The construction, operation, maintenance and security assessment of the ship communication network system and equipment may be implemented with reference to the relevant requirements in ISC Guidelines for Requirement and Security Assessment of Ship Cyber System.

33.2.4.7 The procedures for daily inspection and maintenance of the ship communication network equipment are to be implemented onboard, including inspection for equipment working status and power supply status, connection identifier for cables, network connectivity, etc., and the results are to be recorded.

Section 3 PLANS AND DOCUMENTS

33.3.1 Plans and documents

33.3.1.1 The following plans and documents are to be submitted to ISC for approval:

(1) Arrangement of ship communication network equipment;

(2) Power supply plan of ship communication network equipment.

33.3.1.2 The following plans and documents are to be submitted to ISC for information:

(1) Topology diagram of ship communication network system;

(2) Estimation of communication traffic for ship communication network;

(3) Specification of cables for ship communication network equipment;

(4) Specification of working conditions for ship communication network equipment;

(5) List of ship communication network equipment, including brand, model, quantity and function description as a minimum;

(6) Operation manual of ship communication network equipment.

33.3.1.3 The following plans and documents are to be submitted to ISC surveyor for approval and/or confirmation:

(1) Test program including test procedures, acceptance criteria and records of test results;

(2) Procedures for daily inspection and maintenance of ship communication network equipment.

Section 4 SURVEY AND TESTS

33.4.1 Initial surveys

33.4.1.1 The surveyor is to confirm the actual installation layout of the ship communication network equipment onboard according to the reviewed plans and documents, and confirm the function and working status of the communication network equipment according to the approved test program. Where necessary, the surveyor is to review the relevant documents provided by the service provider required in 33.2.2.

33.4.1.2 The test for ship communication network is to be carried out under the witness of the surveyor according to the test program, including:

(1) The connectivity test of system and equipment;

(2) The network coverage test: for the network coverage spaces indicated in the plan referred to in 33.3.1.1 (1), at least one representative network access point is to be selected for each space for test;

(3) Communication network capacity load test, bandwidth test, network transmission delay test and network stability test, which are to be carried out simultaneously with the test referred to in 33.4.1.2 (2);

(4) The functional tests of the communication network, such as real-time video communication, document transmission, etc., which are to be carried out simultaneously with the test referred to 33.4.1.2 (2).

33.4.2 Annual surveys

33.4.2.1 After assigned with the class notation specified in this Chapter, as the condition of maintenance of the notation, the following survey is to be carried out during the subsequent class periodical survey:

(1) Relevant plans and documents are to be kept onboard, and no unconfirmed changes by ISC have been made;

(2) The system and equipment are in normal working condition, and no unconfirmed changes by ISC which affect the realization of specific needs specified in this Chapter have been made;

(3) Records for relevant daily inspection and maintenance are checked;

(4) If necessary, some or all tests may be carried out according to 33.4.1.

33.4.3 Intermediate surveys

(1) The requirements for intermediate surveys are the same as those for annual surveys.

33.4.4 Special surveys

(1) The requirements for special surveys are the same as those for annual surveys.

33.4.5 Occasional surveys

33.4.5.1 In case of any change, fault or damage to the approved plans and documents, systems and equipment, which affect the realization of specific needs of the communication network specified in this Chapter, ISC is to be notified in time for occasional surveys to maintain the validity of the class notation.

33.4.6 Maintenance, cancellation and withdrawal of the class notation

33.4.6.1 The ship is to meet the requirements of this Chapter to maintain the validity of the class notation. Otherwise, ISC will cancel the relevant class notation as appropriate.

33.4.6.2 The ship company can apply for cancellation of the relevant class notation specified in this Chapter in written form.

CHAPTER 34 EVALUATION OF COLLISION RESISTANCE CAPABILITY OF SHIPS

Section 1 GENERAL PROVISIONS

34.1.1 General requirements

34.1.1.1 This Chapter applies to ships applying for the class notation related to evaluation of collision resistance capability on a voluntary basis.

34.1.1.2 Ships applying for evaluation of collision resistance capability generally are subject to, but not limited to the following three critical situations:

(1) Structural damage to cargo tanks with subsequent leakage of, e.g., oil, chemicals, etc.;

(2) Structural damage leading to water ingress into dry cargo holds during carriage of particularly valuable or dangerous cargo;

(3) Structural damage to fuel oil tanks with subsequent leakage of fuel oil.

34.1.1.3 Evaluation of collision resistance capability of ships is intended to calculate the deformation energy absorbed by the hull structure and critical striking speed of striking ships of different magnitude that the hull structure can bear when the ship structure is struck by another ship and the hull structure shell plate (inner hull plate for a double hull ship) is in the critical damaged state, and to give the displacement – critical striking speed curve of the struck ship, so as to guide the operation of the ship.

34.1.1.4 The simplified method or FE method may be used for evaluation of collision resistance capability. For the FE method, the general FE analysis procedure may be used. If non-general procedures are used, the explanatory documents on the reliability of the calculation procedures are to be provided by the unit applying for the notation.

34.1.2 Definitions

34.1.2.1 The **critical damaged state** refers to the state when the maximum plastic deformation of the hull structure shell plate (inner hull plate for a double hull ship) of the struck ship occurs without rupture.

34.1.2.2 The **initial striking speed** V_0, in knots, refers to the speed of the striking ship when striking occurs.

34.1.2.3 The **critical striking speed** V_{cr}, in knots, refers to the maximum striking speed that the struck ship can bear in the critical situation. If the speed of the striking ship exceeds this value, the expected critical state will occur.

34.1.2.4 The **critical deformation energy** E_{cr}, in MJ, refers to the plastic deformation energy absorbed by the hull structure when large plastic deformation occurs in the hull structure shell plate (inner hull plate for a double hull ship) of the struck ship without rupture in case of a collision. When that amount of energy is exceeded, the expected critical state will occur.

34.1.3 Class notation

34.1.3.1 Ships that have undergone evaluation of collision resistance capability according to the requirements of this Chapter may be assigned with the notation “COLL”.

34.1.4 Plans and documents

34.1.4.1 The following plans and documents are to be submitted for approval in addition to the plans and documents required by relevant chapters and PARTS of the Rules:

(1) Critical striking speed curve.

34.1.4.2 The following plans and documents are to be submitted for information:

(1) Strength analysis report, including structural collision deformation energy analysis and critical speed analysis.

(2) List of critical situations in which the ship is involved.

34.1.5 Document retention

34.1.5.1 The shipowner is to keep the plans and documents required by 34.1.4.1 onboard the ship and make them accessible to the operator in case of a collision.

Section 2 EVALUATION METHODS

34.2.1 Evaluation conditions

34.2.1.1 The bow of the striking ship meets the side of the struck ship at 90°, and the struck ship has no speed and remains upright.

34.2.1.2 The impact area is to be taken as the side structure between the two transverse bulkheads of the cargo hold area within 0.4*L* amidships.

34.2.1.3 The location of collision is to be the most dangerous collision point selected according to the relative draft of the striking ship and the struck ship.

34.2.1.4 The most dangerous bulbous bow form is to be selected according to the ship type and displacement, and the structure is assumed to be rigid.

34.2.2 Critical deformation energy of the side structure

34.2.2.1 The Minorsky method or a validated analytical method may be accepted to calculate critical deformation energy of the side structure. Assuming that the structural response is quasi-static and the material is ideal elastic plastic, the structural plastic deformation energy is calculated when the side structure in the impact area of the struck ship is damaged to the critical state.

34.2.2.2 When the FE method is adopted, the dynamic response of the structure is to be calculated. The bow of the striking ship ramming into the struck ship at the initial striking velocity V_0, and the kinetic energy loss of the striking ship is all transformed into the kinetic energy of the struck ship and the plastic deformation energy absorbed by the structure, until the critical damaged state of the side structure is reached. For the impact on the attached water mass of the ship, the total mass of the striking ship is to be 1.1 times its own displacement, and the total mass of the struck ship is to be 2 times its own displacement.

34.2.3 Critical striking speed of the ship

34.2.3.1 The critical striking speed V_{cr} of the ship is to be calculated according to the following formula:

$$V_{cr} = 19.41\left\{\frac{10E_{cr}}{\Delta}\left(1 + 1.815\frac{\Delta}{\Delta_0}\right)\right\}^{0.5} \quad \text{kn}$$

where: Δ——displacement of the striking ship, in t;

Δ_0——displacement of the struck ship, in t;

E_{cr}——critical deformation energy of the struck ship, in MJ, see 34.2.2 of this Chapter.

Section 3 EVALUATION CRITERIA

34.3.1 Evaluation criteria collision resistance capability

34.3.1.1 Ships of approximately equal displacement and with design draughts approximately identical to that of the struck ship to be examined are to be assumed as striking ships. The critical striking speed, V_{cr}, of the ship is not to be less than 7 kn.

Section 4 CRITICAL STRIKING SPEED CURVE

34.4.1 Critical striking speed curve

34.4.1.1 According to the analysis results of collision of ships with different levels of displacement, the relationship curve between the critical striking speed and the displacement of the striking ship is drawn to provide guidance for navigation operation.

34.4.1.2 The range of the struck ship displacement required to draw the critical striking speed curve is to include but not be limited to 0.5~1.5 times the striking ship displacement.

CHAPTER 35 SYSTEM AND EQUIPMENT READY

Section 1 GENERAL PROVISIONS

35.1.1 General requirements

35.1.1.1 This Chapter applies to system and/or equipment ready for which technical requirements are specified for existing class notations[①].

35.1.1.2 For ships assigned relevant ready class notations in accordance with the requirements of this Chapter, corresponding class notations may be assigned upon completion of onboard installation/modification of system and/or equipment and subject to satisfactory survey by ISC, and ready class notations are withdrawn.

Section 2 READY CLASS NOTATIONS

35.2.1 Form of identification

35.2.1.1 Ready (X-i) is used as the form of identification of ready class notations, where "X" indicates class notation for system and/or equipment corresponding to the ready class notation; "i" indicates different ready levels corresponding to X. i=1 for completion of principled design, i=2 for completion of detailed design.

35.2.1.2 With regard to multiple systems and/or equipment ready, they may be filled in the parentheses after Ready. Different class notations are separated by commas (,), e.g. "video monitoring system ready level 1" and "shore connection system ready level 2" may be expressed as Ready (VDMS-1, AMPS-2).

Section 3 TECHNICAL REQUIREMENTS AND PLANS AND INFORMATION

35.3.1 Principled design ready

35.3.1.1 Technical requirements

(1) Comprehensive consideration is to be given to the space for the installation, arrangement and repair of the systems and/or equipment required on the ship, as well as the possible impact on the ship's arrangement, equipment, power load, structural strength, stability, tonnage and deadweight etc.

35.3.1.2 Plans and information

(1) The following plans and information are to be submitted for review as a minimum:

① instructions of the ready plan;

② ready-related principled design plans and information.

35.3.2 Detailed design ready

35.3.2.1 Technical requirements

(1) Based on 35.3.1.1 above, the ship also needs to satisfy applicable provisions of class notations corresponding to the system and/or equipment.

35.3.2.2 Plans and information

(1) The following plans and information are to be submitted for review as a minimum:

① instructions of the ready plan;

② instructions of the ready system and/or equipment;

③ ready-related detailed design plans and information;

④ applicable plans and information of the class notation corresponding to the system and/or equipment.

---

① "Existing class notations" mean those class notations in Table G etc. of Appendix 1 List of Class Notations, Chapter 2, PART ONE of the Rules, excluding existing ready class notations (e.g. EGC Ready (X)).

CHAPTER 36 ONBOARD CARBON CAPTURE SYSTEM

Section 1 GENERAL PROVISIONS

36.1.1 General requirements

36.1.1.1 This Chapter applies to ships applying for the Onboard Carbon Capture System notation, for the purpose of providing standards for the design, survey and operational safety of ships provided with OISC so as to minimize the harm to ships, crew members and the environment caused by OISC.

36.1.1.2 Ships provided with the onboard carbon capture system are, in addition to the provisions of this Chapter, to satisfy applicable requirements of others parts and chapters of the rules and relevant requirements of ISC Guidelines for Onboard Carbon Capture Systems.

36.1.2 Class notation

36.1.2.1 Ships complying with the provisions of this Chapter are assigned the onboard carbon capture system notation upon satisfactory survey:

OISC (Onboard Carbon Capture System)

36.1.2.2 For OISC ready ships, the ready notation and requirements are to satisfy relevant requirements of ISC Guidelines for Onboard Carbon Capture Systems.

36.1.3 Plans and information

36.1.3.1 The following plans and information are to be submitted for approval as a minimum:

(1) relevant piping system plan of onboard carbon capture system;

(2) power load calculations;

(3) electrical system plan of onboard carbon capture system.

36.1.3.2 The following plans and information are to be submitted for information as a minimum:

(1) technical description and installation plan of onboard carbon capture system, including:

① system design parameters;

② system carbon dioxide capture capacity calculation;

③ list of system equipment;

④ system arrangement plan.

(2) operation and maintenance manual of onboard carbon capture system;

(3) carbon dioxide absorber safety data sheet;

(4) risk assessment report of onboard carbon capture system.

36.1.3.3 The scope of plans and information submitted for approval may be expanded when deemed necessary by ISC.

Section 2 DESIGN AND ARRANGEMENT

36.2.1 System design

36.2.1.1 The onboard carbon capture system is to be able to adapt to the environmental and working conditions of the ship's operation.

36.2.1.2 The carbon dioxide capture capacity of the onboard carbon capture system is to meet the expected design objectives, and the capacity of carbon dioxide storage tank is to meet the expected design volume.

36.2.1.3 The strength and tightness design of the onboard carbon capture system is to meet the set conditions and the possible low temperature condition in case of leakage of carbon dioxide.

36.2.1.4 The onboard carbon capture system is to be provided with necessary redundant safety protection measures and capable of preventing and dealing with accidents.

36.2.1.5 The onboard carbon capture system is to be provided with monitoring, alarm and control systems.

36.2.1.6 The design of onboard carbon capture system is to facilitate shipboard operation and maintenance.

36.2.1.7 The energy supply (e.g. electricity, steam etc.) on board is to satisfy the expected operating requirements of the onboard carbon capture system.

36.2.1.8 The onboard carbon capture system is to minimize the potential risk to ships, essential equipment, personnel and the environment. Chemical substances in storage and use are to ensure that they will not cause harm to personnel and the environment.

36.2.2 Arrangement and safety requirements

36.2.2.1 Shipboard installation, arrangement and operation of onboard carbon capture system are to meet the following requirements:

(1) mechanical and high temperature protection is to be considered;

(2) life-saving appliances, muster station and means of escape are not to be affected;

(3) the impact of the change of ship tonnage on the applicable standards after the addition of the system;

(4) navigation bridge visibility is to comply with SOLAS regulation V/22 and the relevant provisions of the flag State;

(5) the normal operation of the ship's essential equipment (e.g. as main engines, generators and boilers, etc.) is not affected.

36.2.2.2 After the onboard carbon capture system is installed, the ship’s structural strength is to satisfy the requirements for longitudinal and local strength of the rules.

36.2.2.3 The effect of windage area, lightship center of gravity, heel and trim on ship stability is to be considered for ships provided with onboard carbon capture system.

36.2.2.4 The mechanical properties, chemical composition, manufacturing and testing of materials used in the equipment and pipelines of onboard carbon capture system are to comply with the relevant provisions of ISC Rules for Materials and Welding, and corrosion prevention measures are be considered (if necessary). Materials (including coatings) used in equipment, pipelines and components in contact with seawater is not to cause any harm to marine organisms.

36.2.2.5 Detectors are to be fitted where carbon dioxide leakage or accumulation is likely to occur. When the detector operates, audible and visual alarm signals are to be given on the bridge and in the onboard carbon capture system control station.

36.2.2.6 The installation and operation of the onboard carbon capture system is to minimize the impact on the fuel combustion device.

36.2.2.7 During the operation and maintenance of the onboard carbon capture system, all operations that may pose risks to personnel are to be provided with appropriate protective equipment on board.

Section 3 SURVEYS

36.3.1 General requirements

36.3.1.1 Equipment and components of the onboard carbon capture system are to satisfy the applicable requirements of Chapter 3, PART ONE of the rules.

36.3.1.2 Equipment constituting the onboard carbon capture system is to be subject to surveys and tests in accordance with approved plans and relevant standards.

36.3.2 Surveys during construction

36.3.2.1 Surveys and functional testing are to be carried out to devices, equipment, systems, components and installation of relevant pipelines of the onboard carbon capture system.

36.3.2.2 Sea trials are to be carried out to the system in accordance with the requirements of the sea trial programme

36.3.3 Surveys after construction

36.3.3.1 Ships provided with the onboard carbon capture system are to be subject to annual surveys, intermediate surveys and special surveys.

CHAPTER 37 ADDITIONAL REQUIREMENTS FOR CARRYING DRY CARGO IN BULK

Section 1 GENERAL PROVISIONS

37.1.1 General requirements

37.1.1.1 Ships which are intended to carry dry cargo in bulk, with a configuration different from that defined in 8.1.1.1, Chapter 8, PART TWO of the rules, are assigned the notation: SOLAS XII where the requirements of this Chapter are satisfied.

37.1.2 Additional requirements for SOLAS XII bulk cargo carriage

37.1.2.1 Ships applying for the SOLAS XII notation are, in addition to satisfying the applicable requirements SOLAS Chapter XII, to satisfy applicable requirements of Chapter 8, PART TWO of the rules based on specific configuration.

Chapter 1 RULE GENERAL PRINCIPLES

Section 1 APPLICATION

1 SCOPE OF APPLICATION

1.1 General

1.1.1

These Rules apply to the following ships:

a) Bulk carriers and double hull oil tankers and;
b) Being self-propelled ships with unrestricted navigation, and;
c) Contracted for construction on or after 1st July 2015.

ISC 1.1.1a Oil tankers and bulk carriers having a length of 150m and above and contracted for construction on and after 1 July 2016 are to comply with applicable ISC Guidelines for Construction Monitoring of Hull Structures(2014) and to be assigned the class notation CM.

Note1: Unrestricted navigation means that the ship is not subject to any geographical restrictions (i.e. any oceans, any seasons) except that limited by the ship's capability for operation in ice.

Note2: The 'contracted for construction' means the date on which the contract to build the ship is signed between the prospective owner and the builder. For further details regarding the date of 'contracted for construction', refer to IACS Procedural Requirement (PR) No. 29.

1.1.2

These Rules apply to ships constructed of welded steel structures and composed of stiffened plate panels. The ship's structure is to be longitudinally or transversely framed with full transverse bulkheads and intermediate web frames.

The typical arrangements of ships covered by the rules assume that the structural arrangements include:

- Double bottom, the depth of which is to be in accordance with applicable statutory requirements.
- Engine room located aft of the cargo tank/hold region.

1.1.3

Ships for which these Rules are not applicable are to comply with the relevant Rules of the Society.

ISC 1.1.3a Unless provided otherwise, "the Society" in this PART means "ISC".

1.2 Scope of application for bulk carriers

1.2.1

These Rules apply to the hull structures of single side skin and double side skin bulk carriers having a freeboard length L_{LL} of 90 m or above.

Bulk carriers are ships which are constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo hold region and intended primarily to carry dry cargoes in bulk. Typical arrangements of bulk carriers are shown in Figure 1.

Hybrid bulk carriers, where at least one cargo hold is constructed with hopper tank and topside tank, see typical arrangements in Figure 1, and other cargo holds are constructed without hopper tank and/or topside tanks, see examples of a transverse section in Figure 2, are to comply with the strength criteria defined in these Rules.

These Rules are not applicable to the following ship types:

- Ore carriers.
- Combination carrier.
- Woodchip carrier.
- Cement, fly ash and sugar carriers provided that loading and unloading is not carried out by grabs heavier than 10 tons, power shovels and other means which may damage cargo hold structure.
- Ships with inner bottom construction adapted for self-unloading.

1.3 Scope of application for oil tankers

a) *Length and structural arrangement application*

These Rules apply to the hull structures of double hull oil tankers having a freeboard length L_{LL} of 150 m or above. Oil tanker is defined as a ship which has to comply with Annex I of MARPOL73/78.

The typical arrangements of oil tankers covered by the rules are shown in Figure 3 and assume that the structural arrangements include:

- Double side structure with breadth in accordance with statutory requirements.
- Side longitudinal, centreline longitudinal or transverse bulkheads of plane, corrugated or double skin construction.
- Single deck structure.

The cross sections shown in Figure 3 are typical examples only and other variations of cross tie and web frame arrangements are also covered.

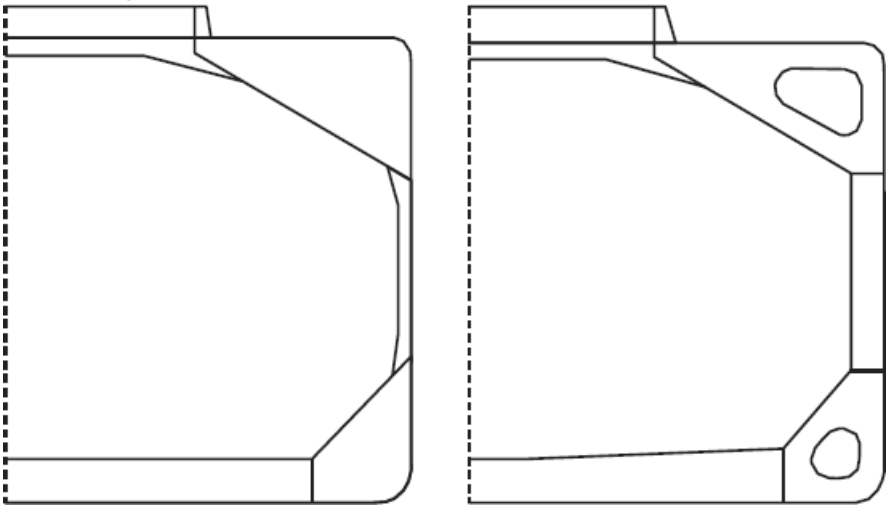

Figure 1 Typical arrangements of bulk carriers

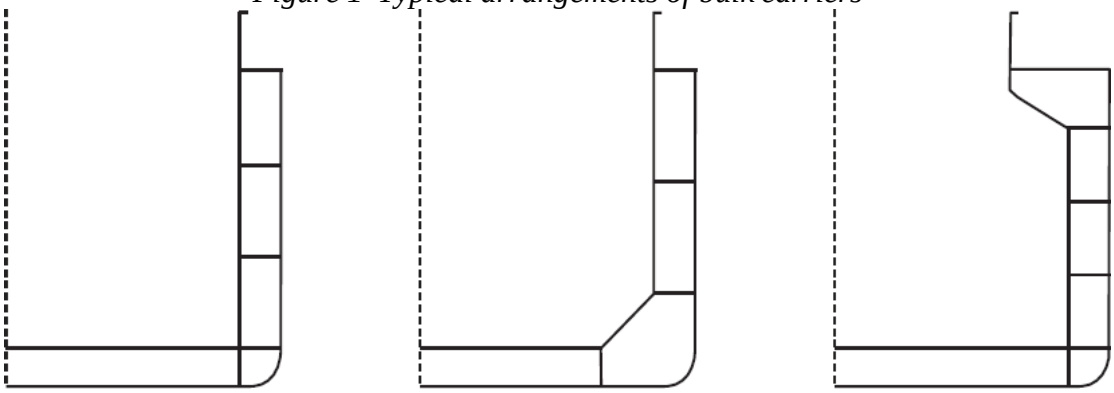

Figure 2 Examples of transverse sections of cargo hold without hopper tank and/or topside tank

b) **Cargo temperature application**

The Rules are based on the following design temperatures for the cargo:

a) maximum temperature: 80°C
b) minimum temperature: 0°C.

2 *RULE APPLICATION*

2.1 Rule description

a) *Rule structure*

The rules contain 2 parts:

- Part 1: General hull requirements.
- Part 2: Ship types.

The parts are structured in chapters giving instructions for detail application and requirements which are applied in order to satisfy the rule objectives.

b) *Numbering*

The system of numbering is given in Table 1.

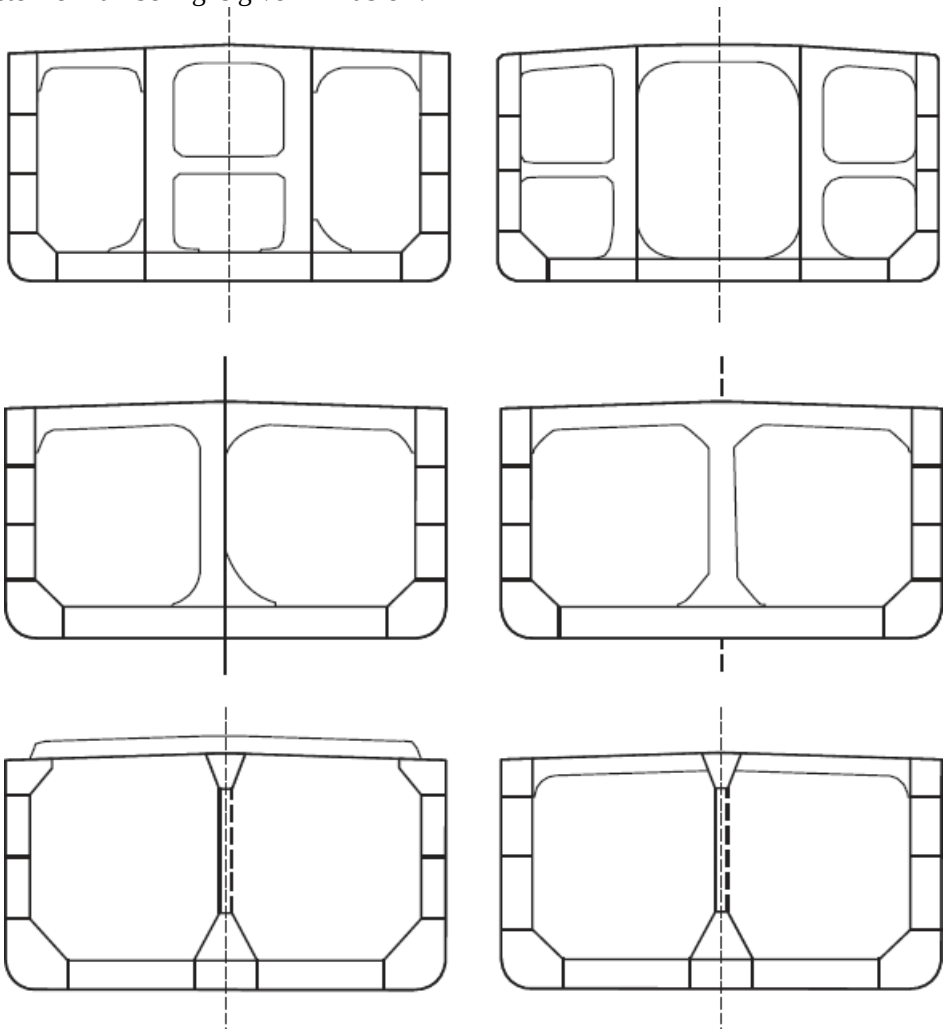

Figure 3 Typical arrangements of double hull oil tankers

Rule numbering and abbreviations **Table 1**

Order	Levels	Example	Abbreviations
1	Part	Part 1 – General Hull Requirements	Pt 1
2	Chapter	Chapter 1 – Rule General Principle	Ch 1
3	Section	Section 1 – Application	Sec 1
4	Article	1. Scope of Application	[1]
5	Sub-article	1.1 General	[1.1]
6	Requirements	1.1.1 These Rules apply to...	[1.1.1]

2.2 Rule Requirements

a) *Part 1*

Part 1 of the Rules provides requirements common to all ship types as follow:

- Chapter 1: Rule General Principles.
- Chapter 2: General Arrangement Design.
- Chapter 3: Structural Design Principles.
- Chapter 4: Loads.
- Chapter 5: Hull Girder Strength.
- Chapter 6: Hull Local Scantling.
- Chapter 7: Direct Strength Analysis.
- Chapter 8: Buckling.
- Chapter 9: Fatigue.
- Chapter 10: Other Structure.
- Chapter 11: Superstructure, Deckhouses and Hull Outfitting.
- Chapter 12: Construction.
- Chapter 13: Ship in Operation - Renewal Criteria.

The provisions of the Ch 1, 2, 3, 4, 5, 6, 8, 12, 13 and Ch 10, Sec 4 are applicable all over the ships length.

The Ch 7, 9, 10 and 11 define their own scope of application.

b) *Part 2*

Part 2 of the Rules provides requirements coming in addition to those of Part 1 specific for ship types and is divided as follow:

- Chapter 1: Bulk Carriers.
- Chapter 2: Oil Tankers.

c) *Application of the Rules*

The ship arrangement and scantlings are to comply with the relevant parts and chapters of the Rules as it is given in Figure 4.

d) *General criteria*

The ship arrangement, the proposed details and the offered scantling in net or gross, as the case may, are to comply with the requirements and the minimum scantling given in the Rules.

2.3 Structural requirements

a) *Materials and welding*

The Rules applies to welded hull structures made of steel having characteristics complying with requirements in Ch 3, Sec 1. The Rules applies also to welded steel ships in which parts of the hull, such as superstructures or small hatch covers, are built in material other than steel, complying with requirements in Ch 3, Sec 1.

Ships whose hull materials are different than those given in the first paragraph are to be individually considered by the Society, on the basis of the principles and criteria adopted in the present rules.

2.4 Ship parts

a) *General*

For the purpose of application of the present rules, the ship is considered as divided into the following five parts:

- Fore part.
- Cargo hold region.
- Machinery space.
- Aft part.
- Superstructures and deckhouses.

b) *Fore part*

The fore part is that part of the ship located forward of the collision bulkhead, i.e.:

- The fore peak structures.

- The stem.

c) *Cargo hold region*

The cargo hold region is the part of the ship that contains cargo holds, cargo tanks, and slop tanks. It includes the full breadth and depth of the ship, the collision bulkhead and the transverse bulkhead at its aft end. The cargo hold region does not include the pump room, if any.

d) *Machinery space*

The machinery space is the part of the ship between the aft peak bulkhead and the transverse bulkhead at the aft end of the cargo hold region and includes the pump room, if any.

e) *Aft part*

The aft part includes the structures located aft of the aft peak bulkhead.

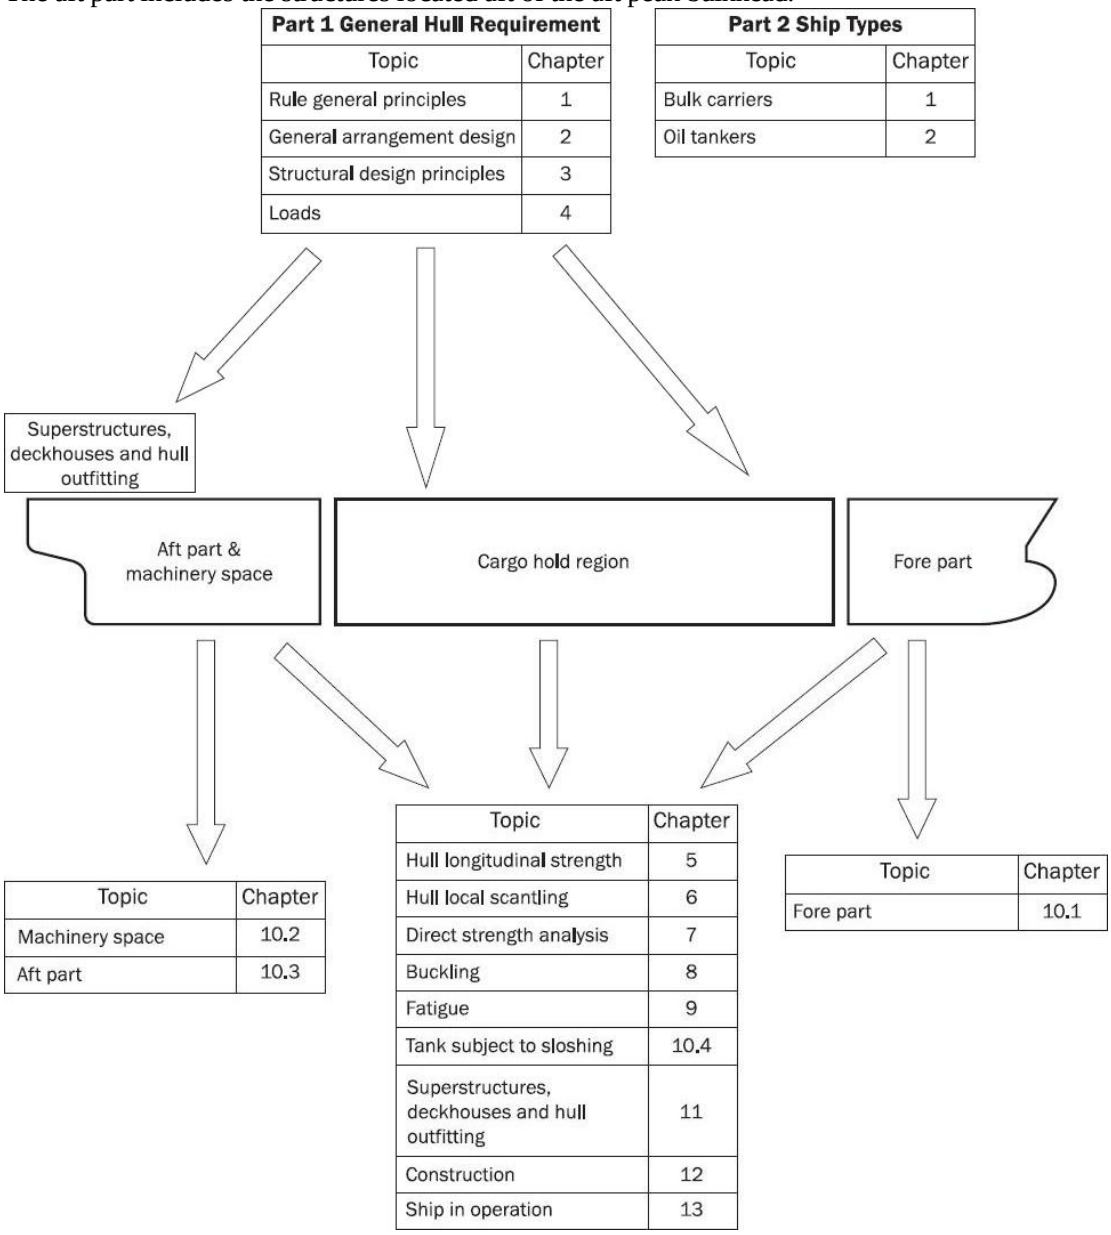

Figure 4 Application of Rules

f) **Superstructures and deckhouses**

A superstructure is a decked structure on the freeboard deck extending from side to side of the ship or with the side plating not being inboard of the shell plating more than 0.04 *B*.

A deckhouse is a decked structure on the freeboard or superstructure deck which does not comply

with the definition of a superstructure.

2.5 Limits of application to lifting appliances

a) **Definition**

The fixed parts of lifting appliances, considered as an integral part of the hull, are the structures permanently connected by welding to the ship's hull (for instance, crane pedestals, masts, king posts, derrick heel seatings, etc, excluding cranes, derrick booms, ropes, rigging accessories, and, generally, any removable parts), only for that part directly interacting with the hull structure.

b) *Rule application for lifting appliances*

The fixed parts of lifting appliances and their connections to the ship's structure may be covered by the Society's rules for lifting appliances, and/or by the certification (especially the issuance of the Register of ship's lifting appliances and cargo handling gear) of lifting appliances when required.

ISC 2.5.2a The supporting structures of lifting appliances are to comply with the requirements of 4, Section 4, Chapter 11 of this PART.

c) *Structures supporting fixed lifting appliances*

The design of the structure supporting fixed lifting appliances and the structure that might be called to support a mobile appliance is to be designed taking into account the additional loads that may be imposed on them by the operation of the appliance and environmental conditions as declared by the builder or its sub-contractors.

2.6 Novel designs

2.6.1

Ships with novel features or unusual hull design are to comply with Ch 1, Sec 3, [6.2].

3 CLASS NOTATIONS

3.1 Class notation CSR

a) **Application**

In addition to the class notations granted by the Society and to the service features and additional class notations defined hereafter, ships fully complying with these Rules are assigned the notation CSR.

3.2 Class notation for bulk carriers

a) **Additional service features BC-A, BC-B and BC-C**

The following requirements apply to ships, as defined in [1.2.1], having a freeboard length L_{LL} of 150 m or above. Bulk carriers are to be assigned one of the following additional service features:

a) BC-A: For bulk carriers designed to carry dry bulk cargoes of cargo density 1.0 t/m^3 and above with specified holds empty at maximum draught in addition to BC-B conditions.
b) BC-B: For bulk carriers designed to carry dry bulk cargoes of cargo density of 1.0 t/m^3 and above with all cargo holds loaded in addition to BC-C conditions.
c) BC-C: For bulk carriers designed to carry dry bulk cargoes of cargo density less than 1.0 t/m^3.

The following additional service features are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design in the following cases:

- {Maximum cargo density in t/m3} for additional service features BC-A and BC-B if the maximum cargo density is less than 3.0 t/m3, see also Ch 4, Sec 8, [4.1].
- {No MP} for all additional service features when the ship has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in Ch 4, Sec 8, [4.2.2].
- {Holds a, b, … may be empty} for additional service feature BC-A, see also Ch 4, Sec 8, [4.1].
- {Block loading} for additional service feature BC-A, when the ship is intended to

operate in alternate block load condition, see also Ch 4, Sec 8, [4.2.3] ,item d.

b) *Additional class notation GRAB [X]*

The additional class notation GRAB [X] is mandatory for ships having one of the additional service features BC- A or BC-B, according to [3.2.1]. For these ships, the requirements for the GRAB [X] notation given in Pt 2, Ch 1, Sec 6 are to comply with for an unladen grab weight X taken not less than:

- 35 t for ships with $L \geq 250$ m,
- 30 t for ships with 200 m $\leq L < 250$ m,
- 20 t otherwse.

For all other ships, the additional class notation GRAB [X] is voluntary.

4 *APPLICATION OF THE RULES OF THE SOCIETY*

4.1 Structural parts not covered by these Rules

4.1.1.

Designer should take care that parts of the structure that these Rules do not cover comply with the relevant requirements of the Society's Rule.

Section 2 RULE PRINCIPLES

1 GENERAL

1.1 Rule objectives

1.1.1

The objectives of the Rules are to establish the classification minimum requirements to mitigate the risks of major hull structural failure in order to help improve the safety of life, environment and property and to contribute to the durability of the hull structure for the ship's design life.

1.1.2

The sub-sections contain:

- The general assumptions pertaining to the design, construction and operation of the ship and give information on the assumed roles of the Society, builders, designers and owners.
- The design basis which specifies the premises on which the Rules are based in terms of design parameters and assumptions about the ship operation.
- The design principles which define the fundamental principles used for the structural requirements in the Rules with respect to loads and structural capacity.
- The rule design methods which describe how the design principles are applied and the criteria are used in view of [1.1.1].

2 *GENERAL ASSUMPTIONS*

2.1 International and national regulations

2.1.1

Ships are to be designed, constructed and operated in compliance with the regulatory framework prescribed by the International Maritime Organisation (IMO) and implemented by National Administrations or the Society on their behalf. The builder is to give due consideration to the influence on the structural design and arrangement from the relevant requirements of the International Labour Organization (ILO) implemented by National Administrations or the Society on their behalf.

2.1.2

The Rules are based on the assumption that the applicable statutory requirements are complied with.

2.2 *Application and implementation of the Rules 2.2.1*

The Society develops and publishes the rules for classification of ships, containing minimum requirements for the hull structure and essential engineering systems. The Society verifies compliance with the classification requirements and the applicable international regulations when authorised by a National Administration during design, construction and operation of the ship.

2.2.2

These Rules address the hull structural aspects of classification and do not include requirements related to the verification of compliance with the Rules during construction and operation. In order to achieve the safety level targeted by the Rules, a number of aspects related to design, construction and operation of the ship are assumed to be adhered to by the parties involved in the application and implementation of the Rules. A summary of these assumptions are given in the following:

a) General aspects:
   - Relevant information and documentation involved in the design, construction and operation is communicated between the builder, the designer, the Society and the owner as agreed between builder and owner. Design documentation according to Rule requirements is provided.
   - Quality systems are applied to the design, construction, operation and maintenance activities by owners and other relevant parties to ensure the compliance with the

requirements of the Rules.

b) Design aspects:
   - The owner specifies the intended use of the ship, and the ship is designed according to operational requirements as well as the structural requirements given in the Rules.
   - The builder identifies and documents the operational limits for the ship so that the ship can be safely and efficiently operated within these limits.
   - Verification of the design is performed by the builder to check compliance with provisions contained in the Rules in addition to national and international regulations.
   - The design is performed by appropriately qualified, competent and experienced personnel.
   - The Society performs a technical appraisal of the design plans and related documents for a ship to verify compliance with the appropriate classification Rules.
   - For spaces where lighting and ventilation are to be fitted, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of International Conventions such as SOLAS and MLC2006 Regulation 3.1 - Accommodation and recreational facilities, and Society's rules if any. Human element considerations, including enhanced safety and productivity, may be considered using Recommendation No. 132 or other ergonomic standards accepted by the Society.
   - For continually manned spaces where noise is to be minimised, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of SOLAS Ch II-1, Reg.3-12 and "The Code on Noise Levels Onboard Ships" adopted at MSC.337(91).
   - For continually manned spaces where vibration is to be minimised, the builder is to give consideration to the influence on the structural design and arrangement from the relevant requirements of relevant statutory requirements such as MLC 2006 Regulation 3.1 - Accommodation and recreational facilities. Human element considerations, including enhanced safety and productivity, may be considered using Recommendation No. 132 or other ergonomic standards accepted by the Society.

c) Construction aspects:
   - The builder provides adequate supervision and quality control during the construction.
   - Construction is carried out by qualified and experienced personnel.
   - Workmanship, including alignment and tolerances, is in accordance with acceptable shipbuilding standards.
   - The Society performs surveys to verify that the construction and quality control are in accordance with the classification features of approved plans and procedures.

d) Operational aspects:
   - Personnel involved in operations are aware of, and comply with, the operational limitations of the ship.
   - Operations personnel receive sufficient training such that the ship is properly handled so that the loads and resulting stresses imposed on the structure are minimised.
   - The ship is maintained in adequate condition and in accordance with the Society survey scheme and international and national regulations and requirements.
   - The Society performs surveys to verify that the ship is maintained in class in accordance with the Society survey scheme.

ISC 2.2.2a The applicable requirements in ISC Guidelines on Application of Marine Ergonomics may be applied as an ergonomic standard in [2.2.2] b).

3 *DESIGN BASIS*

3.1 General

3.1.1

This sub-section specifies the design parameters and the assumptions about the ship operation that are used as the basis of the design principles of the Rules.

3.1.2
Ships are to be designed to withstand, in the intact condition, the environmental conditions as defined in [5.3.2] and [5.3.3] anticipated during the design life, for the appropriate loading conditions. Structural strength is to be determined against buckling and yielding. Ultimate strength calculations have to include ultimate hull girder capacity and ultimate strength of plates and stiffeners.

3.1.3 *Residual strength*
Ships having a freeboard length L_{LL} of 150 m or above are to be designed to have sufficient reserve strength to withstand the loads in damaged conditions, e.g. collision, grounding or flooded scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour as specified in Ch 5, Sec 3.

3.1.4 *Finite element analysis*
The scantling of the structural members within the cargo hold region of ships having a freeboard length L_{LL} of 150 m or above is to be assessed according to the requirements specified in Pt 1, Ch 7.

3.1.5 *Fatigue life*
Ships having a freeboard length L_{LL} of 150 m or above are to be assessed according to the design fatigue life for structural details specified in Pt 1, Ch 9.

3.1.6
The Rules are applicable for ships in compliance with the specified design basis. Special consideration is given to deviations from this design basis.

ISC 3.1.6a This PART applies to ships complying with the design basis specified in this Section. For ships which are not designed on this basis, equivalence or substitution is to be granted in accordance with the requirements in ISC Appendix D of PART 9-1.

3.1.7
The design basis used for the design of each ship, as communicated by the builder to the owner, is to be documented and submitted to the Society as part of the design review and approval. All changes of the design basis are to be formally advised to the Society and the owner for approval.

3.2 *Hull form*
limit 3.2.1
The Rules assume the following hull form with respect to environmental loading:

- $L < 500$ m
- $C_B > 0.6$
- $L/B > 5$
- $B/D < 2.5$

For ships over 350 m in length, special consideration is to be made for the wave loads by the Society.

ISC 3.2.1a For ships not complying with the conditions of 3.2.1, the dynamic hull girder loads, ship motions, ship accelerations and sea water dynamic pressures are to be calculated in accordance with the following requirements:
1) Where the ship length L is greater than 350 m,
a) Vertical wave bending moments, vertical wave shear forces, horizontal wave bending moments and torsional moments of hull girder are to be calculated respectively in accordance with the requirements of the following chapters and sections, the greater of which is used for strength assessment and fatigue assessment:

- *ISC Appendix A of PART 9-1;*
- *Section 4, Chapter 4 of PART 9-1 (CB is to be taken not less than 0.6 during*

calculation);

b) Ship motions, ship accelerations and sea water dynamic pressures are to be calculated respectively in accordance with the requirements of the following chapters and sections and used for strength assessment and fatigue assessment:

- *ISC Appendix A of PART 9-1;*
- *Chapter 4 of PART 9-1.*

2) Where the ship length L is not greater than 350 m, for ships not complying with conditions of other hull form limit in 3.2.1,

a) Vertical wave bending moments and vertical wave shear forces of hull girders are to be calculated according to Section 4, Chapter 4 of PART 9-1 (C_B is to be taken not less than 0.6 during calculation) and used for strength assessment and fatigue assessment;

b) Horizontal wave bending moments and torsional moments of hull girder are to be calculated respectively in accordance with the requirements of the following chapters and sections, the greater of which is used for strength assessment and fatigue assessment:

- *ISC Appendix A of PART 9-1;*
- *Section 4, Chapter 4 of PART 9-1 (C_B is to be taken not less than 0.6 during calculation);*

c) Ship motions, ship accelerations and sea water dynamic pressures are to be calculated respectively in accordance with the requirements of the following chapters and sections and used for strength assessment and fatigue assessment:

- *ISC Appendix A of PART 9-1;*
- *Chapter 4 of PART 9-1.*

3.3 *Design life*

3.3.1

A design life of 25 years is assumed for selecting ship design parameters. The specified design life is the nominal period that the ship is assumed to be exposed to operating conditions.

3.4 *Environmental conditions*

3.4.1 North Atlantic wave environment

The rule requirements are based on a ship trading in the North Atlantic wave environment for its entire design life.

3.4.2 *Wind and current*

The effects of wind and current with regard to the strength of the structure are not considered.

3.4.3 *Ice*

The effects of ice and ice accretion are not taken into account by the Rules.

3.4.4 *Design temperatures*

The Rules assume that the structural assessment of hull strength members is valid for the following design temperatures:

- Lowest mean daily average temperature in air is -10°C.
- Lowest mean daily average temperature in seawater is 0°C.

Ships intended to operate in areas with lower mean daily average temperature, e.g. regular service during winter seasons to Arctic or Antarctic waters are subject to the requirements as specified by the Society.

In the above, the following definitions apply:

Mean: Statistical mean over observation period (at least 20 years).

Daily Average: Average during one day and night.

Lowest: Lowest during year.

For seasonally restricted service the lowest value within the period of operation applies.

ISC 3.4.4a For ships operating for long periods in areas with lower mean daily average temperature, the steels used for hull structures exposed to low temperature are to comply with the requirements of ISC 2.4.1a to ISC 2.4.1e, Section 1, Chapter 3 of this PART.

3.4.5 *Thermal loads*
The effects of thermal loads and residual stresses are not taken into account in the Rules.

3.5 *Operating conditions*
3.5.1
The Rules specify minimum loading conditions that are to be assessed for compliance.
Specification of loading conditions other than those required by the Rules is the responsibility of the owner. These other loading conditions are to be documented and also be assessed for compliance.

3.5.2
The Rules assume the following:

- The ballast cargo hold of bulk carriers is not to be partly filled in seagoing operations.
- Ballasting and deballasting operations in the ballast cargo hold of bulk carriers are not to be performed when the weather is not fair.

3.6 *Operating draughts*
3.6.1
The design operating draughts are to be specified by the builder/designer subject to acceptance by the owner and are to be used to derive the appropriate structural scantlings. All operational loading conditions in the loading manual are to comply with the specified design operating draughts. The following design operating draughts are as a minimum to be considered:

3.6.1 Scantling draught for the assessment of structure.

3.6.2 Minimum ballast draught at midship for assessment of structure.

3.6.3 Minimum heavy ballast draught at midship for assessment of bulk carrier structure.

3.6.4 Minimum forward draughts for the assessment of bottom structure forward subjected to slamming loads, $T_{F\text{-}e}$ and $T_{F\text{-}f}$, with and without ballast tanks in way filled.
$T_{F\text{-}e}$ and $T_{F\text{-}f}$ are defined in Ch 4, Sec 5, [3.2.1]

- For oil tankers: maximum draughts amidships for both conditions:
  - with all cargo tanks abreast empty.
  - with centre cargo tank empty and wing cargo tanks full.
  - with centre cargo tank full and wing cargo tanks empty.
- For bulk carriers carrying steel coils: maximum draught amidships for steel coil loading conditions.

3.7 *Internal environment*
3.7.1 Oil cargo density for strength assessment
A density of 1.025t/m^3, or a higher value if specified by the designer, is to be used for oil cargoes for the strength assessment of all relevant tank structures.

3.7.2 *Oil cargo density for fatigue assessment*
For the fatigue assessment of cargo tank structures, the mean density is to be taken as 0.9t/m^3, or a higher value if specified by the designer.

3.7.3 *Dry cargo density*
The density for dry bulk cargo is to be taken according to the specifications in Ch 4, Sec 6, [2.3].

3.7.4 *Water ballast density*
A density of 1.025t/m^3 is to be used for water ballast.

3.8 *Structural construction and inspection 3.8.1*
The structural requirements included in the Rules are developed with the assumption that construction and repair follow acceptable shipbuilding and repair standards and tolerances. The Society may require that additional attention is paid to critical areas of the structure by the builder during construction and by the owner for repair after the ship's delivery.

3.8.2
As an objective, ships are to be built in accordance with controlled quality production standards using approved materials as necessary.

3.8.3
The Rules define the renewal criteria for the individual structural items. The structural requirements included are developed on the assumption that the structure is subject to appropriate monitoring by the owner once the ship is in operation and to periodical survey in accordance with Society rules and regulations.

3.8.4
Tank strength and tightness testing are to be carried out as a part of the verification scheme according to the Rules and /or documents of the individual Society which incorporate IACS UR S14.

3.8.5
Specifications for material manufacturing, assembling, joining and welding procedures, steel surface preparation and coating are to be included in the ship construction quality procedures. It is assumed that the owner has approved these builder specifications.

3.9 *Maximum service speed 3.9.1*
The maximum service speed is to be specified in the design specification. Although the hull structure verification criteria takes into account the service speed this does not relieve the responsibilities of the owner and personnel to properly handle the ship, see item (d) in [2.2.2].

3.10 *Owner's extras*
3.10.1
Owner's specification of requirements above the general classification or statutory requirements may affect the structural design. Owner's extras may include requirements for:

- Vibration analysis.
- Maximum percentage of high strength steel.
- Additional scantlings above that required by the Rules.
- Additional design margin on the loads specified by the Rules, etc.
- Improved fatigue resistance, in the form of a specified increase in design fatigue life or equivalent. Owner's extras are not specified by these Rules. Owner's extras, if any, that may affect the structural design are to be clearly specified in the design documentation.

4 DESIGN PRINCIPLES
4.1 Overall principles
4.1.1 Introduction
This sub-section defines the underlying design principles of the Rules in terms of loads, structural capacity models and assessment criteria and also construction and in-service aspects.

4.1.2 *General*
The Rules are based on the following overall principles:

- The safety of the structure can be assessed by addressing the potential structural failure mode(s) when the ship is subjected to operational loads and environmental loads/conditions.
- The design complies with the design basis, see Ch 1, Sec 3.
- The structural requirements are based on consistent design load sets which cover the appropriate operating modes of a bulk carrier or oil tanker.

The ship's structure is designed such that:

- It has a degree of redundancy. The ship's structure should work in a hierarchical manner and, in principle, failure of structural elements lower down in the hierarchy do not result in immediate consequential failure of elements higher up in the hierarchy.
- It has sufficient reserve strength to withstand the wave and internal loads in damaged

conditions that are reasonably foreseeable e.g. collision, grounding or flooding scenarios. Residual strength calculations are to take into account the ultimate reserve capacity of the hull girder, considering permanent deformation and post-buckling behaviour.

- The incidence of in-service cracking is minimised, particularly in locations which affect the structural integrity or containment integrity, affect the performance of structural or other systems or are difficult to inspect and repair.
- It has adequate structural redundancy to survive in the event that the structure is accidentally damaged by a minor impact leading to flooding of any compartment.

4.1.3 *Limit state design principles*

The rules are based on the principles of limit state design.

Limit state design is a systematic approach where each structural element is evaluated with respect to possible failure modes related to the design scenarios identified. For each retained failure mode, one or more limit states may be relevant. By consideration of all relevant limit states, the limit load for the structural element is found as the minimum limit load resulting from all the relevant limit states.

The limit states defined in Ch 3, Sec 5 are divided into the four categories: Serviceability Limit State (SLS), Ultimate Limit State (ULS), Fatigue Limit State (FLS) and Accidental Limit State (ALS).

The Rules include requirements to cover the relevant limit states for the various parts of the structure.

4.2 *Loads*

4.2.1 Design load scenarios

The structural assessment of the structure is based on the design load scenarios encountered by the ship. Refer to Ch 4, Sec 7.

The design load scenarios are based on static and dynamic loads as given below:

- Static design load scenario (S):
  Covers application of relevant static loads and typically covers load scenarios in harbour, sheltered water, or tank testing.
- Static plus Dynamic design load scenario (S+D):
  Covers application of relevant static loads and simultaneously occurring dynamic load components and typically cover load scenarios for seagoing operations.
- Impact design load scenario (I):
  Covers application of impact loads such as bottom slamming and bow impact encountered during seagoing operations.
- Sloshing design load scenario (SL):
  Covers application of sloshing loads encountered during seagoing operations.
- Fatigue design load scenario (F):
  Covers application of relevant dynamic loads.
- Accidental design load scenario (A):
  Covers application of some loads not occurring during normal operations.

4.3 *Structural capacity assessment*

4.3.1 General

The basic principle in structural design is to apply the defined design loads, identify plausible failure modes and employ appropriate capacity models to verify the required structural scantlings.

4.3.2 *Capacity models for ULS, SLS and ALS*

The strength assessment method is to be capable of analysing the failure mode in question to the required degree of accuracy.

The structural capacity assessment methods are in either a prescriptive format or require the use of more advanced calculations such as finite element analysis methods.

The formulae used to determine stresses, deformations and capacity are deemed appropriate for the selected capacity assessment method and the type and magnitude of the design load set.

4.3.3 *Capacity models for FLS*

The fatigue assessment method provides Rule requirements to assess structural details against fatigue failure.

The fatigue capacity model is based on a linear cumulative damage summation (Palmgren-Miner's rule) in combination with a design S-N curve, a reference stress range and an assumed long-term stress distribution curve.

The fatigue capacity assessment models are in either a prescriptive format or require the use of more advanced calculations, such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads.

4.3.4 *Net scantling approach*

The objective of the net scantling approach is to:

- Provide a relationship between the thickness used for strength calculations during the newbuilding stage and the minimum thickness accepted during the operational phase.
- Enable the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

The net scantling approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the overall average corrosion of larger areas, such as primary supporting members and the hull girder. Both the local and global corrosion are used as a basis for the newbuilding review and are to be assessed during operation of the ship.

No credit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

The application of the net thickness approach to assess the structural capacity is specified in Ch 3, Sec 2.

4.3.5 *Intact structure*

All strength calculations for ULS, SLS and FLS are based on the assumption that the structure is intact. The residual strength of the ship in a structurally damaged condition is assessed for ALS.

5 RULE DESIGN METHODS

5.1 General

5.1.1 Design methods

Scantling requirements are specified to cover the relevant limit states (ULS, SLS, FLS and ALS) as necessary for various structural parts.

The criteria for the assessment of the scantlings are based on one of the following design methods:

- Working Stress Design (WSD) method, also known as the permissible or allowable stress method.
- Partial Safety Factor (PSF) method, also known as Load and Resistance Factor Design (LRFD).

For both WSD and PSF, two design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined loads, A and B.

- The WSD method has the following composition:

  $W_{stat} \leq \eta_1 R$ for condition A.

  $W_{stat} + W_{dyn} \leq \eta_2 R$ for condition B.

  where:

  W_{stat}: Simultaneously occurring static loads (or load effects in terms of stresses).

  W_{dyn}: Simultaneously occurring dynamic loads. The dynamic loads are typically a combination of local and global load components.

  R : Characteristic structural capacity (e.g. specified minimum yield stress or buckling capacity).

  i : Permissible utilisation factor (resistance factor). The utilisation factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure.

- The PSF method has the following composition:

$$\gamma_{stat-1} W_{stat} + \gamma_{dyn-1} W_{dyn} \leq \frac{R}{\gamma_R} \text{ for condition A.}$$

$$\gamma_{stat-2} W_{stat} + \gamma_{dyn-2} W_{dyn} \leq \frac{R}{\gamma_R} \text{ for condition B.}$$

where:

γ_{stat-i} : Partial safety factor that accounts for the uncertainties related to static loads.

γ_{dyn-i} : Partial safety factor that accounts for the uncertainties related to dynamic loads.

γ_R : Partial safety factor that accounts for the uncertainties related to structural capacity.

The acceptance criteria for both the WSD method and PSF method are calibrated for the various requirements such that consistent and acceptable safety levels for all combinations of static and dynamic load effects are derived.

5.2 *Minimum requirements*

5.2.1

Minimum requirements specify the minimum scantling requirements which are to be applied irrespective of all other requirements, hence thickness below the minimum is not allowed.

The minimum requirements are usually in one of the following forms:

- Minimum thickness, which is independent of the specified minimum yield stress.
- Minimum stiffness and proportion, which are based on buckling failure modes.

5.3 *Load-capacity based requirements*

5.3.1 General

In general, the Working Stress Design (WSD) method is applied in the requirements, except for the hull girder ultimate strength criteria where the Partial Safety Factor (PSF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

The identified load scenarios are addressed by the Rules in terms of design loads, design format and acceptance criteria set, as given in Table 2. The table is schematic and only intended to give an overview.

Load based prescriptive requirements provide scantling requirements for all plating, local support members, most primary supporting members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment.

In general, these requirements explicitly control one particular failure mode and hence several requirements may be applied to assess one particular structural member.

5.3.2 *Design loads for SLS, ULS and ALS*

The structural assessment of compartment boundaries, e.g. bulkheads, is based on loading condition deemed relevant for the type of ship and the operation the ship is intended for.

To provide consistency of approach, standardised Rule values for parameters, such as GM, R_{roll}, T_{sc} and C_B are applied to calculate the Rule load values.

The probability level of the dynamic global, local and impact loads (see Table 1) is 10-8 and is derived using the long-term statistical approach.

The probability level of the sloshing loads (see Table 1) is 10^{-4}.

The design load scenarios for structural verification apply the applicable simultaneously acting local and global load components. The relevant design load scenarios are given in Ch 4, Sec 7.

The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the dynamic load values given in Ch 4. The dynamic load combination factors that define the dynamic load cases are given in Ch 4, Sec 2.

Design load conditions for the hull girder ultimate strength are given in Ch 5, Sec 2.

5.3.3 *Design loads for FLS*

For the fatigue requirements given in Ch 9, the load assessment is based on the expected load history and an average approach is applied. The expected load history for the design life is characterised by the 10^{-2} probability level of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding

stresses.

The considered wave induced loads include:

- Hull girder loads (i.e. vertical and horizontal bending moments).
- Dynamic wave pressures.
- Dynamic pressure from cargo.

The load values are based on Rule parameters corresponding to the loading conditions, e.g. *GM*, C_B, and the applicable draughts at amidships.

The simultaneously occurring dynamic loads are accounted for by combining the stresses due to the various dynamic load components. The stress combination procedure is given in Ch 9.

Load scenarios and corresponding rule requirements *Table 1*

Operation	Load type	Design load scenario	Acceptance criteria
Seagoing operations			
Transit	Static and dynamic loads in heavy weather	S + D	AC-SD
	Impact loads in heavy weather	Impact (I)	AC-I
	Internal sloshing loads	Sloshing (SL)	AC-S
	Cyclic wave loads	Fatigue (F)	-
BWE by flow through or sequential methods	Static and dynamic loads in heavy weather	S + D	AC-SD
Harbour and sheltered operations			
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	S	AC-S
Tank testing	Typical maximum loads during tank testing operations	S	AC-S
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	S	AC-S
Accidental condition			
Flooded conditions	Typically maximum loads on internal watertight subdivision structure in accidental flooded conditions	A	AC-SD AC-S

Acceptance criteria - prescriptive requirements **Table 2**

Acceptance criteria	Plate panels and local support members (1)		Primary supporting members(1)		Hull girder members	
	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC-S AC-SD	Permissible stress: Ch 6, Sec 4 Ch 6, Sec 5	Control of stiffness and proportions: Ch 8, Sec 2	Permissible stress: Ch 6, Sec 6 Pt 2, Ch 1, Sec 4 Pt 2, Ch 2, Sec 3	Control of stiffness and proportions: Ch 8, Sec 1 Ch 8, Sec 2 Pillar buckling	Permissible stress: Ch 5, Sec 1	Allowable buckling utilisation factor: Ch 8, Sec 1, [3]

Acceptance criteria	Plate panels and local support members (1)		Primary supporting members(1)		Hull girder members	
	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC-I	Plastic criteria: Ch 10, Sec 1, [3]	Control of stiffness and proportions: Ch 8, Sec 2 Ch 10, Sec 1, [3]	Plastic criteria: Ch 10, Sec 1, [3]	Control of stiffness and proportions: Ch 8, Sec 2 Ch 10, Sec 1, [3]	N/A	N/A
(1) Refer to Ch 10 for Other structures and to Ch 11 for Superstructure, deckhouses and hull outfitting						

Acceptance criteria - FE analysis *Table 3*

Acceptance criteria	Cargo hold analysis		Fine mesh analysis
	Yield	Buckling	Yield
AC-S AC-SD	Permissible stress: Ch 7, Sec 2, [5]	Allowable buckling utilisation factor: Ch 8, Sec 1, [3]	Permissible Von Mises stress: Ch 7, Sec 3, [6] Screening criteria: Ch 7, Sec 3, [3.3]

5.3.4 Structural response analysis

In general, the following approaches are applied for determination of the structural response to the applied design load combinations.

a) Beam theory:
   - Used for prescriptive requirements.

b) FE analysis:
   - Coarse mesh for cargo hold model.
   - Fine mesh for local models.
   - Very fine mesh for fatigue assessment.

5.4 *Acceptance criteria*

5.4.1 General

The acceptance criteria are categorised into three acceptance criteria sets. These are explained below and shown in Table 2 and Table 3. The specific acceptance criteria set that is applied in the rule requirements is dependent on the probability level of the characteristic combined load.

The acceptance criteria set AC-S is applied for the static design load combinations, and for the sloshing design loads. The allowable stress for such loads is lower than that for an extreme load to take into account effects of:

- Repeated yield.
- Allowance for some dynamics.
- Margins for some selected limited operational mistakes.

The acceptance criteria set AC-SD is applied for the S+D design load combinations where considered loads are extreme loads with a low probability of occurrence.

The acceptance criteria set AC-I is typically applied for impact loads, such as bottom slamming and bow impact loads.

5.4.2 *Acceptance criteria*

The specific acceptance criteria applied in the working stress design requirements are given in the detailed

Rule requirements in Pt 1, Ch 5 to Ch 8, Ch 10, Ch 11 and Pt 2, Ch 1 and Ch 2.

To provide a general informational summary overview of the acceptance criteria, refer to Table 2 and Table 3 below for the different design load scenarios covered by these Rules for the yield and buckling failure modes. For the yield criteria the permissible stress is proportional to the specified minimum yield stress of the material. For the buckling failure mode, the acceptance criteria are based on the control of stiffness and proportions as well as on the buckling utilisation factor.

5.5 *Design verification*

5.5.1 Design verification – hull girder ultimate strength

The requirements for the ultimate strength of the hull girder are based on a Partial Safety Factor (PSF) method. A safety factor is assigned to each of the basic variables, the still water bending moment, wave bending moment and ultimate capacity. The safety factors were determined using a structural reliability assessment approach, the long-term load history distribution of the wave bending moment was derived using ship motion analysis techniques suitable for determining extreme wave bending moments.

The purpose of the hull girder ultimate strength verification is to demonstrate that one of the most critical failure modes of a ship is controlled.

5.5.2 *Design verification – global finite element analysis*

The global finite element analysis is used to verify the scantlings given by the load-capacity based prescriptive requirements to better consider the complex interactions between the ship's structural components, complex local structural geometry, change in thicknesses and member section properties as well as the complex load regime with sufficient accuracy.

A linear elastic three dimensional finite element analysis of the cargo region (a FE model length of three holds is required) is carried out to assess and verify the structural response of the proposed hull girder and primary supporting members and assist in specifying the scantling requirements for the primary supporting members. The purpose with the finite element analysis is to verify that the stresses and buckling capability of the primary supporting members are within acceptable limits for the applied design loads.

5.5.3 *Design verification – fatigue assessment*

The fatigue assessment is required to verify that the fatigue life of critical structural details is adequate. A simplified fatigue requirement is applied to details such as end connections of longitudinal stiffeners using stress concentration factors (SCF) to account the actual detail geometry. A fatigue assessment procedure using finite element analysis for determining the actual hot spot stress of the geometric detail is applied to selected details. In both cases, the fatigue assessment method is based on the Palmgren-Miner linear damage model.

5.5.4 *Relationship between prescriptive scantling requirements and FE analysis*

The scantlings defined by the prescriptive requirements are not to be reduced by any form of alternative calculations such as FE analysis, unless explicitly stated.

Section 3 VERIFICATION OF COMPLIANCE

1 GENERAL

1.1 Newbuilding

1.1.1

For newbuildings, the plans and documents submitted for approval, as indicated in [2], are to comply with applicable requirements in these Rules, taking account of the relevant criteria, such as additional service features and classification notations assigned to the ship or the ship length.

1.1.2

When a ship is surveyed by the Society during construction, the Society:

- Approves the plans and documentation submitted as required by the Rules.
- Proceeds with the appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works.
- Carries out surveys or obtains appropriate evidence to satisfy itself that the scantlings and construction meet the Rule requirements in relation to the approved drawings.
- Attends tests and trials provided for in the Rules.
- Assigns the classification character of the Society's notation.

1.1.3

The Society defines in specific Rules which materials and equipment used for the construction of ships built under survey are, as a rule, subject to appraisal of their design and to inspection at works, and according to which particulars.

ISC 1.1.3a The appraisal of the design of materials and equipment used in the construction of the ship and their inspection at works are to comply with the relevant requirements of Chapter 3, PART ONE of the Rules.

1.1.4

As part of his/her interventions during ship's construction, the surveyor:

- Conducts an overall examination of the parts of the ship covered by the Rules.
- Examines the construction methods and procedures when required by the Rules.
- Checks selected items covered by the Rule requirements.
- Attends tests and trials where applicable and deemed necessary.

1.1.5

Through all stages of ship construction, it is the builder's responsibility to promptly inform the Society of modifications or departures from approved plans. The builder is to ensure that any deviations from the requirements of the Rules or approved plans are, in any case, accepted by the Society.

1.2 *Ships in service 1.2.1*

For ships in service, the requirements in Ch 13 are to be complied with.

2 DOCUMENTS TO BE SUBMITTED

2.1 Documentation and data requirements

2.1.1 Loading information

Loading information containing sufficient information to enable the master of the ship to maintain the ship within the stipulated operational limitations is to be provided on board the ship. The loading information is to include an approved loading manual and loading instrument complying with the requirements given in Ch 1, Sec 5.

2.1.2 *Calculation data and results*

Where calculations have been carried out in accordance with the procedures given in the Rules, one copy of the following is to be submitted for information as applicable:

a) Reference to the calculation procedure and technical program used.
b) A description of the structural modelling.
c) A summary of the analysed parameter including properties and boundary conditions for direct analysis, when applicable.
d) Details of the loading conditions and the means of applying loads for direct analysis, when applicable.
e) A comprehensive summary of calculation results.
f) Sample calculations where appropriate.

The responsibility for error free specification and input of program data and the subsequent correct transposal of output resides with the designer.

Reference is made to Ch 7, Sec 1, [4.1] for required reporting of finite element analysis.

2.2 *Submission of plans and supporting calculations*

2.2.1 Plans and supporting calculations are to be submitted for approval

For the application of these Rules, the plans and supporting calculations to be submitted to the Society for approval are listed in Table 1.

Plans are to be submitted electronically or physically. When physically submitted plans are to be submitted in triplicate, with one copy necessary for supporting documents and calculations. In addition, the Society may request the submission of information, other plans and documents deemed necessary for the review of the design.

Structural plans are to show scantling, details of connection of the various parts and are to specify the design materials including, in general, their grades, manufacturing processes, welding procedures and heat treatments, and are to include information related to the renewal thickness as specified in Ch 13.

For welding requirements, see Ch 12, Sec 2 and Ch 12, Sec 3.

In case there are deviations from the design basis, then these are to be documented and submitted to the Society.

Plans and supporting calculation to be submitted for approval *Table 1*

Plan or supporting calculation	Containing also information on
Midship section Transverse sections Shell expansion Decks and profiles Double bottom Pillar arrangements Framing plan Deep tank and ballast tank bulkheads, Wash bulkheads Standard construction details	Class characteristics Ship's main dimensions Minimum ballast draught Frame spacing Maximum service speed Density of cargoes Design loads on decks and double bottom Steel grades Corrosion protection Openings in decks and shell and relevant compensations Boundaries of flat areas in bottom and sides Details of structural reinforcements and/or discontinuities Bilge keel with details of connections to hull structures Welding
Watertight subdivision bulkheads Watertight tunnels	Openings and their closing appliances, if any
Fore part structure	-
Aft part structure	-
Machinery space structures Foundations of propulsion machinery and boilers	Type, power and RPM of propulsion machinery Mass and centre of gravity of machinery and boilers
Superstructures and deckhouses Machinery space casing	Extension and mechanical properties of the aluminium alloy used (where applicable)
Hatch covers and hatch coamings	Design loads on hatch covers Sealing and securing arrangements, type and position of locking bolts Distance of hatch covers from the summer load waterline and from the fore end

Plan or supporting calculation	Containing also information on
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures	-
Bulwarks and freeing ports	Arrangement and dimensions of bulwarks and freeing ports on the freeboard deck and superstructure deck
Windows and side scuttles, arrangements and details	-
Scuppers and sanitary discharges	-
Mooring and towing arrangement	-
Supporting structure and foundations for shipboard fittings associated with mooring and towing operations	Design loads and directions of load actions, rated pull and holding load for mooring winches Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for mooring winches Material specifications and welding
Supporting structure and foundations for windlasses and chain stoppers	Design loads and directions of load actions Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for windlasses Material specifications and welding
Stern frame or sternpost, sterntube Propeller shaft boss and brackets (1)	-
Plan of watertight doors and scheme of relevant closing devices	Closing devices Electrical diagrams of power control and position indication circuits
Plan of weathertight or outer doors and hatchways	-
Supporting structure for lifting appliances	Design loads (forces and moments) SWL and self weight of lifting appliances Maximum sea state in offshore operation, if any Connections to the hull structures
Supporting structure for life saving appliances	Design loads (forces and moments) SWL and self weight of lifting appliances Connections to the hull structure
Sea chests, stabiliser recesses, etc	-
Plan of access to and escape from spaces	-
Plan of ventilation including ventilators and tank vents	Use of spaces and location and height of air vent outlets of various compartments
Plan of tank testing	Testing procedures for the various compartments Height of pipes for testing
Equipment number calculation	Geometrical elements for calculation List of equipment Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes
Anchoring arrangement	-

Plan or supporting calculation	Containing also information on
Hawse pipes	-
Loading manual and/or trim and stability booklet	-
(1) Where other steering or propulsion systems are adopted (e.g. steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted.	

2.2.2 *Plans to be submitted for information*

In addition to those in [2.2.1], the following plans are to be submitted to the Society for information:

a) General arrangement.
b) Capacity plan, indicating the volume and position of the centre of gravity of all compartments and tanks.
c) Lines plan, when deemed necessary by the Society.
d) Hydrostatic curves.
e) Lightweight distribution.
f) Docking plan.
g) Arrangement of lifting appliances.
h) Plan of manholes.

2.2.3 *Plans and instruments to be supplied onboard the ship*

As a minimum, the following plans and instrument are to be supplied onboard:

a) One copy of the following plans indicating the newbuilding and renewal thickness for each structural item is to be supplied onboard the ship: plans of midship sections, construction profiles, shell expansion, transverse bulkheads, aft and fore part structures, machinery space structures
One copy of the following plans indicating the newbuilding thickness for each structural item is to be supplied onboard the ship: plans of superstructures deckhouses and casing
b) One copy of the final approved loading manual, see [2.1.1].
c) One copy of the final approved loading instrument, see [2.1.1].
d) Welding.
e) Details of the extent and location of higher tensile steel together with details of the specification and mechanical properties, and any recommendations for welding, working and treatment of these steels.
f) Details and information on use of special materials, such as an aluminium alloy, used in the hull construction.
g) Towing and mooring arrangements plan.
h) Structural access manual.
i) Structural details for which post weld treatment methods are applied, showing the description of the details and their locations.

Other plans or instrument may be required by the Society.

ISC 2.2.3a For other plans and documents available on board which are to be submitted, see Appendix 1, Chapter 4, PART ONE of the Rules.

3 SCOPE OF APPROVAL

3.1 General

3.1.1

The attention of owners, designers and builders is directed to the regulations of international, national, canal, and other authorities dealing with those requirements which may affect structural aspects, in addition to or in excess of the classification requirements.

3.1.2

The documentation, plans and data requirements specified in [2] are to be submitted. The Society is to review such documentation to verify compliance with the requirements.

3.1.3
An appropriate term to indicate that the plans, reports or documents have been reviewed for compliance with these Rules is to be used according to the procedures of the Society.

ISC 3.1.3a Relevant procedures are to comply with the requirements of Section 5 Submission and Examination of Plans, Chapter 2, PART ONE of the Rules.

3.2 *Requirements of international and national regulations*

3.2.1 Responsibility

It is the responsibility of the designer to ensure that the design complies with the national and international regulations applicable to the ship.
The Society is not responsible for assessing compliance with international and national regulations as part of the general classification process. However, the Society may enter into an agreement with the flag administration of the ship under which they are explicitly instructed to review and approve a ship design for compliance with specified regulations.

4 *WORKMANSHIP*

4.1 Requirements to be complied with by the manufacturer

4.1.1
The manufacturing plant is to be provided with suitable equipment and facilities to enable proper handling of the materials, manufacturing processes and structural components. The manufacturing plant is to have at its disposal sufficiently qualified personnel. The Society is to be advised of the names and areas of responsibility of the supervisory and control personnel in charge of the project.

4.2 *Quality control*

4.2.1
As far as required and expedient, the manufacturer's personnel has to examine all structural components both during manufacture and on completion, to verify that they are complete, that the dimensions are correct and that workmanship is satisfactory and meets the standard of good shipbuilding practice.
Upon inspection and corrections by the manufacturing plant, the structural components are to be shown to the surveyor of the Society for inspection, in suitable sections, normally unpainted condition and enabling proper access for inspection.
The Surveyor may reject components that have not been adequately checked by the plant and may demand their re-submission upon successful completion of such checks and corrections by the plant.

5 *STRUCTURAL DETAILS*

5.1 Details in manufacturing documents

5.1.1
Significant details concerning quality and functional ability of the component concerned are to be entered in the manufacturing documents (e.g. workshop drawing). This includes not only scantlings but, where relevant, such items as surface conditions (e.g. finishing of flame cut edges and weld seams), and special methods of manufacture involved as well as inspection and acceptance requirements and where relevant permissible tolerances. When a standard is used (works or national standard), it is to be submitted to the Society. For weld joint details, see Ch 12, Sec 2.
If, due to missing or insufficient details in the manufacturing documents, the quality or functional ability of the component is doubtful, the Society may require appropriate improvements to be submitted by the manufacturer. This includes the provision of supplementary or additional parts (for example, reinforcements) even if these were not required at the time of plan approval.

6 EQUIVALENCE PROCEDURES

6.1 Rule applications

6.1.1
These Rules apply to ships of normal form, proportions, speed and structural arrangements. Relevant design parameters defining the assumptions made are given in Ch 1, Sec 2, [3].

6.1.2
Special consideration is to be given to the application of the Rules incorporating design parameters which are outside the design basis as specified in Ch 1, Sec 2, [3], for example, increased fatigue life.

ISC 6.1.2a The procedure for assessing the alternative methods used in hull structural design should be followed in accordance with the requirements in ISC Appendix D of PART 9-1.

6.2 *Novel designs*

6.2.1
Ships of novel design, i.e. those of unusual form, proportions, speed and structural arrangements outside those specified in Ch 1, Sec 2, [3.2], are specially considered according to the contents of [6.2.2] to [6.2.4].

6.2.2
Information is to be submitted to the Society to demonstrate that the structural safety of the novel design is at least equivalent to that intended by the Rules.

6.2.3
In such cases, the Society is to be contacted at an early stage in the design process to establish the applicability of the Rules and additional information required for submission.

6.2.4
Dependent on the nature of the deviation, a systematic review may be required to document equivalence with the Rules.

6.3 *Alternative calculation methods 6.3.1*

Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantling and arrangements are of at least equivalent strength to those derived using the Rules.

Section 4 SYMBOLS AND DEFINITIONS

1 PRIMARY SYMBOLS AND UNITS

1.1 General

1.1.1

Unless otherwise specified, the general symbols and their units used in these Rules are those defined in Table 1.

Primary symbols *Table 1*

Symbol	Meaning	Units
A	Area	m^2
	Sectional area of stiffeners and primary members	cm^2
C	Coefficient	-
F	Force and concentrated loads	kN
I	Hull girder inertia	m^4
	Inertia of stiffeners and primary members	cm^4
M	Bending moment	kNm
M	Mass	t
P	Pressure	kN/m^2
Q	Shear force	kN
T	Draught of ship, see [3.1.5]	m
Z	Hull girder section modulus	m^3
	Section modulus of stiffeners and primary supporting members	cm^3
a_i	Acceleration for the effect 'i'	m/s^2
b	Width of attached plating	mm
	Width of face plate of stiffeners and primary supporting members	mm
g	Gravity acceleration, taken equal to 9.81 m/s2	m/s^2
h	Height	m
	Web height of stiffeners and primary supporting members	mm
l	Length/span of stiffeners and primary supporting members	m
n	Number of items	-
r	Radius	mm
	Radius of curvature of plating or bilge radius	mm
t	Thickness	mm
x	*X* coordinate along longitudinal axis, see [3.6]	m
y	*Y* coordinate along transverse axis, see [3.6]	m
z	*Z* coordinate along vertical axis, see [3.6]	m
η	Permissible utilisation factor (usage factor)	-
γ	Safety factor	-
δ	Deflection/displacement	mm
θ	Angle	deg
ρ	Density of seawater, taken equal to 1.025 t/m3	t/m^3

Symbol	Meaning	Units
σ	Normal stress	N/mm^2
τ	Shear stress	N/mm^2

2 *SYMBOLS*

2.1 Ship's main data

2.1.1

Unless otherwise specified, symbols regarding ship's main data and their units used in these Rules are those defined in Table 2.

Ship's main data **Table 2**

Symbol	Meaning	Units
L	Rule length	m
L_{LL}	Freeboard length	m
L_{PP}	Length between perpendiculars	m
L_0	Rule length, L, but not to be taken less than 110 m	m
L_1	Rule length, L, but need not be taken greater than 250 m	m
L_2	Rule length, L, but need not be taken greater than 300 m	m
B	Moulded breadth of ship	m
D	Moulded depth of ship	m
T	Moulded draught	m
T_{SC}	Scantling draught	m
T_{BAL}	Ballast draught (minimum midship)	m
T_{BAL-H}	Heavy ballast draught at midship	m
T_{BAL-E}	Emergency ballast draught or gale ballast draught at midship	m
T_{LC}	Midship draught at considered loading condition	m
T_{F-f}, T_{F-e}	Minimum draught at forward perpendicular for bottom slamming, with respectively all ballast tanks full or with any tank empty in bottom slamming area	m
Δ	Moulded displacement at draught T_{SC}	t
C_B	Block coefficient at draught T_{SC}	-
V	Maximum service speed	knot
x, y, z	X,Y,Z coordinates of the calculation point with respect to the reference coordinate system	m

2.2 Materials

2.2.1

Unless otherwise specified, symbols regarding materials and their units used in these Rules are those defined in Table 3.

Materials *Table 3*

Symbol	Meaning	Units
E	Young's modulus, see Ch 3, Sec 1, [2]	N/mm^2
G	Shear modulus, $G = \frac{E}{2(1+\nu)}$	N/mm^2

Symbol	Meaning	Units
R_{eH}	Specified minimum yield stress, see Ch 3, Sec 1, [2]	N/mm^2
τ_{eH}	Specified shear yield stress, $\tau_{eH} = \frac{R_{eH}}{\sqrt{3}}$	N/mm^2
ν	Poisson's ratio, see Ch 3, Sec 1, [2]	-
k	Material factor, see Ch 3, Sec 1, [2]	-
R_m	Specified minimum tensile strength, see Ch 3, Sec 1, [2]	N/mm^2
R_Y	Nominal yield stress, taken equal to 235/k	N/mm^2

2.3 *Loads*

2.3.1

Unless otherwise specified, symbols regarding loads and their units used in these Rules are those defined in Table 4.

Loads *Table 4*

Symbol	Meaning	Units
C_w	Wave coefficient	-
T_θ	Roll period	s
θ	Roll angle	deg
T_φ	Pitch period	s
φ	Pitch angle	deg
a_o	Common acceleration parameter	-
a_z	Vertical acceleration	m/s^2
a_y	Transverse acceleration	m/s^2
a_x	Longitudinal acceleration	m/s^2
f_p	Probability factor	-
k_r	Roll amplitude of gyration	m
GM	Metacentric height	m
λ	Wave length	m
S	Static load case	-
S+D	Dynamic load case	-
P_{ex}	Total sea pressure, see Ch 4, Sec 5, [1.1]	kN/m^2
P_{in}	Total internal pressure due to liquid, see Ch 4, Sec 6, [1], or due to dry bulk cargo, see Ch 4, Sec 6, [2.4.1]	kN/m^2
P_s	Static sea pressure	kN/m^2
P_{ls}	Static tank pressure	kN/m^2
P_w	Dynamic wave pressure	kN/m^2
P_{ld}	Dynamic tank pressure	kN/m^2
P_D	Green sea deck pressure	kN/m^2
$P_{slh\text{-}j}$	Sloshing pressure, j=direction	kN/m^2
P_{dl}	Total pressure due to distributed load on deck or platform, see Ch 4, Sec 5, [2.3] or Ch 4, Sec 6, [5.2]	kN/m^2

Symbol	Meaning	Units
P_{SL}	Bottom slamming pressure	kN/m^2
P_{FB}	Bow impact pressure	kN/m^2
P_{fs}	Static pressure in flooded conditions	kN/m^2
P_{fd}	Dynamic pressure in flooded conditions	kN/m^2
P_{ST}	Tank testing pressure (static)	kN/m^2
F_U	Total force due to concentrated load on deck or platform, see Ch 4, Sec 5, [2.3] or Ch 4, Sec 6, [5.3]	kN
$M_{sw\text{-}j}$	Vertical still water bending moment, $j = h, s, p$ (hog, sag, harbour)	kNm
Q_{sw}	Vertical still water shear force	kN
$M_{wv\text{-}j}$	Vertical wave bending moment, $j = h, s$ (hog, sag)	kNm
Q_{wv}	Vertical wave shear force	kN
M_{wt}	Torsional wave moment	kNm
M_{wh}	Horizontal wave bending moment	kNm

2.4 *Scantlings*

2.4.1

Unless otherwise specified, symbols regarding scantlings and their units used in these Rules are those defined in Table 5.

Scantlings *Table 5*

Symbol	Meaning	Units
$I_{y\text{-}n50}$	Net vertical moment of inertia of hull girder	m^4
$I_{z\text{-}n50}$	Net horizontal moment of inertia of hull girder	m^4
$Z_{D\text{-}n50}$, $Z_{B\text{-}n50}$	Net vertical hull girder section moduli, at deck and bottom respectively	m^3
z_n	Vertical distance from BL to horizontal neutral axis	m
a	Length of EPP, as defined in Ch 3, Sec 7, [2.1.1]	mm
b	Breadth of EPP, as defined in Ch 3, Sec 7, [2.1.1]	mm
s	Stiffener spacing (see Ch 3, Sec 7, [1.2.1])	mm
S	Primary supporting member spacing (see Ch 3, Sec 7, [1.2.2])	m
l	Span of stiffeners or primary supporting member (see Ch 3, Sec 7, [1])	m
l_b	Bracket arm length	m
t	Net thickness with full corrosion reduction	mm
t_{n50}	Net thickness with half corrosion reduction	mm
t_c	Corrosion addition	mm
t_{gr}	Gross thickness	mm
t_{as_built}	As built thickness	mm
t_{gr_off}	Gross thickness offered	mm
t_{gr_req}	Gross thickness required	mm
t_{off}	Net thickness offered	mm
t_{req}	Net thickness required	mm
t_{vol_add}	Thickness for voluntary addition	mm
t_{res}	Reserve thickness	mm

Symbol	Meaning	Units
t_{c1}, t_{c2}	Corrosion addition on each side of structural member	mm
h_w	Web height of stiffener or primary supporting member	mm
t_w	Web thickness of stiffener or primary supporting member	mm
b_f	Face plate width stiffener or primary supporting member	mm
h_{stf}	Height of stiffener	mm
t_f	Face plate/flange thickness of stiffener or primary supporting member	mm
t_p	Thickness of the plating attached to a stiffener or a primary supporting member	mm
b_{eff}	Effective breadth of attached plating, in bending, for yield and fatigue	mm
A_{eff} or $A_{eff\text{-}n50}$	Net sectional area of stiffeners or primary supporting members, with attached plating (of width *s*)	cm^2
A_{shr} or $A_{shr\text{-}n50}$	Net shear sectional area of stiffeners or primary supporting members	cm^2
I_p	Net polar moment of inertia of stiffener about its connection to plating	cm^4
I	Net moment of inertia of the stiffener, with attached shell plating, about its neutral axis parallel to the plating	cm^4
Z or Z_{n50}	Net section modulus of a stiffener or primary supporting member with attached plating (of breadth b_{eff})	cm^3

3 DEFINITIONS

3.1 Principal Particulars

3.1.1 *L*, Rule length

The Rule length *L* is the distance, in m, measured on the waterline at the scantling draught *TSC* from the forward side of the stem to the centre of the rudder stock. *L* is to be not less than 96% and need not exceed 97% of the extreme length on the waterline at the scantling draught T_{SC}.

In ships without rudder stock (e.g. ships fitted with azimuth thrusters), the Rule length *L* is to be taken equal to 97% of the extreme length on the waterline at the scantling draught T_{SC}.

In ships with unusual stem or stern arrangements, the Rule length is considered on a case-by-case basis.

ISC 3.1.1a For ships with unusual stem or stern arrangements, the Rule length L is 97% of the distance, in m, measured on the waterline at the scantling draught T_{SC} from the forward side of the stem to the after side of the stern frame.

3.1.2 *L_{LL}, freeboard length*

The freeboard length L_{LL}, in m, is to be taken as 96% of the total length on a waterline at 85% of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that be greater.

For ships without a rudder stock, the length L_{LL} is to be taken as 96% of the waterline at 85% of the least moulded depth.

Where the stem contour is concave above the waterline at 85% of the least moulded depth, both the forward end of the extreme length and the forward side of the stem are to be taken at the vertical projection to that waterline of the aftermost point of the stem contour (above that waterline), see Figure 1.

3.1.3 *Moulded breadth*

The moulded breadth *B* is the greatest moulded breadth, in m, measured amidships at the scantling draught, T_{SC}.

3.1.4 *Moulded depth*

D, the moulded depth, is the vertical distance, in m, amidships, from the moulded baseline to the

moulded deck line of the uppermost continuous deck measured at deck at side. On ships with a rounded gunwale, *D* is to be measured to the continuation of the moulded deck line.

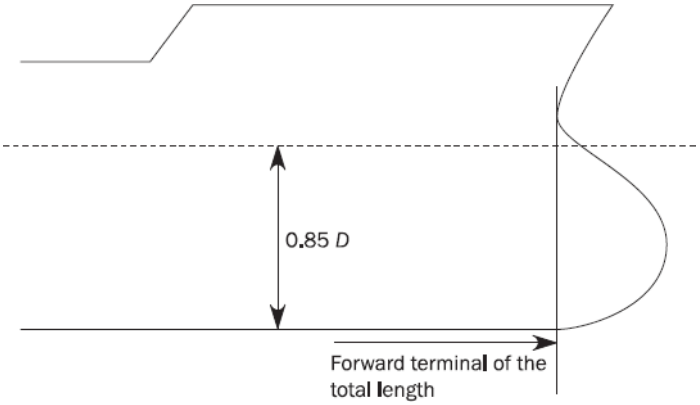

Figure 1 Concave stem contour

3.1.5 Draughts

T, the draught in m, is the summer load line draught for the ship in operation, measured from the moulded baseline at midship. Note this may be less than the maximum permissible summer load waterline draught.

T_{SC} is the scantling draught, in m, at which the strength requirements for the scantlings of the ship are met and represents the full load condition. The scantling draught T_{SC} is to be not less than that corresponding to the assigned freeboard. The draught of ships to which timber freeboards are assigned corresponds to the loading condition of timber, and the requirements of the Society are to be applied to this draught.

T_{BAL} is the minimum design normal ballast draught amidships, in m, at which the strength requirements for the scantlings of the ship are met. This normal ballast draught is the minimum draught of ballast conditions including ballast water exchange operation. If any, for any ballast conditions in the loading manual including both departure and arrival conditions.

$T_{BAL\text{-}H}$ is the minimum design heavy ballast draught, in m, at which the strength requirements for the scantlings of the ship are met. This heavy ballast draught is to be considered for ships having heavy ballast condition.

3.1.6 *Moulded displacement*

Moulded displacement, in t, corresponds to the underwater volume of the ship, at a draught, in seawater with a density of 1.025 t/m^3.

3.1.7 *Maximum service speed*

V, the maximum ahead service speed, in knots, means the greatest speed which the ship is designed to maintain in service at her deepest seagoing draught at the maximum propeller RPM and corresponding engine MCR (Maximum Continuous Rating).

3.1.8 *Block coefficient*

C_B, the block coefficient at the draught, T_{SC} is defined in the following equation:

$$C_B = \frac{\Delta}{1.025LBT_{SC}}$$

where:

Δ: Moulded displacement of the ship at draught T_{SC}.

3.1.9 *Lightweight*

The lightweight is the ship displacement, in t, complete in all respects, but without cargo, consumable stores, crew and their effects, and without any liquids on board except that machinery and piping fluids, such as lubricants and hydraulics, are at operating levels.

3.1.10 *Deadweight*

The deadweight DWT is the difference, in t, between the displacement, at the summer draught in

seawater of density $\rho = 1.025$ t/m^3, and the lightweight.

3.1.11 *Fore end*
The fore end (FE) of the rule length *L*, see Figure 2, is the perpendicular to the scantling draught waterline at the forward side of the stem.

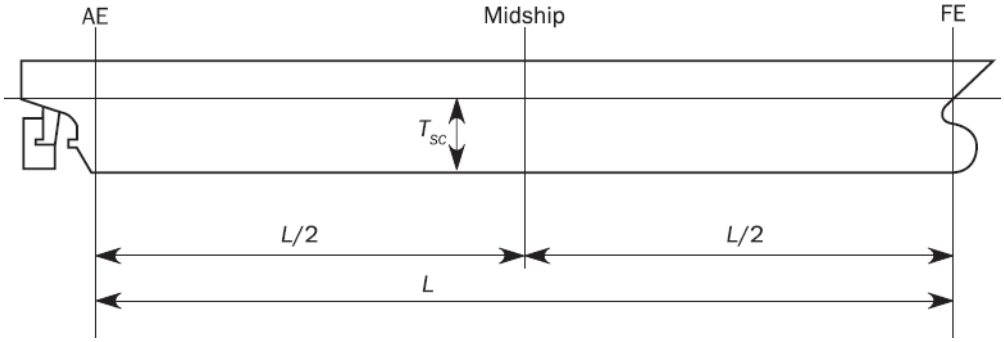

Figure 2 Ends and midship

3.1.12 Aft end
The aft end (AE) of the rule length *L*, see Figure 2, is the perpendicular to the scantling draught waterline at a distance *L* aft of the fore end.

3.1.13 *Midship*
The midship is the perpendicular to the scantling draught waterline at a distance 0.5 *L* aft of the fore end.

3.1.14 *Midship part*
The midship part of a ship is the part extending 0.4 *L* amidships, unless otherwise specified.

3.1.15 *Forward freeboard perpendicular*
The forward freeboard perpendicular, FP_{LL}, is to be taken at the forward end of the length L_{LL} and is to coincide with the foreside of the stem on the waterline on which the length L_{LL} is measured.

3.1.16 *After freeboard perpendicular*
The after freeboard perpendicular, AP_{LL}, is to be taken at the aft end of the length L_{LL}.

3.2 *Position 1 and Position 2*
3.2.1 Position 1
Position 1 includes:
- Exposed freeboard and raised quarter decks.
- Exposed superstructure decks situated forward of 0.25 L_{LL} from FP_{LL}.

3.2.2 *Position 2*
Position 2 includes:
- Exposed superstructure decks situated aft of 0.25 L_{LL} from FP_{LL} and located at least one standard height of superstructure above the freeboard deck.
- Exposed superstructure decks situated forward of 0.25 L_{LL} from FP_{LL} and located at least two standard heights of superstructure above the freeboard deck.

3.3 *Standard height of superstructure*
3.3.1
The standard height of superstructure is defined in Table 6.

Standard height of superstructure *Table 6*

Freeboard length L_{LL}, in m	Standard height h_S, in m	
	Raised quarter deck	All other superstructures
$90 < L_{LL} \leq 125$	$0.3 + 0.012\ L_{LL}$	$1.05 + 0.01\ L_{LL}$

Freeboard length L_{LL}, in m	Standard height h_S, in m	
	Raised quarter deck	All other superstructures
L_{LL} > 125	1.80	2.30

3.3.2
A tier is defined as a measure of the extent of a deckhouse. A deckhouse tier consists of a deck and external bulkheads. In general, the first tier is the tier situated on the freeboard deck.

3.4 *Type A and Type B freeboard ships*

3.4.1 Type A ship

Type A ship is one which:

- Is designed to carry only liquid cargoes in bulk.
- Has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material.
- Has low permeability of loaded cargo compartments.

Type A ship is to be assigned a freeboard following the requirements specified in the ICLL.

3.4.2 *Type B ship*

All ships which do not come within the provisions regarding Type A ships stated in [3.4.1] are to be considered as Type B ships.
Type B ship is to be assigned a freeboard following the requirements specified in ICLL.

3.4.3 *Type B-60 ship*

Type B-60 ship is any Type B ship of over 100 m in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 60% of the difference between the 'B' and 'A' tabular values for the appropriate ship lengths.

3.4.4 *Type B-100 ship*

Type B-100 ship is any Type B ship of over 100 m in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 100% of the difference between the 'B' and 'A' tabular values for the appropriate ship lengths.

3.5 *Operation definition*

3.5.1 Multiport

Multiport corresponds to short voyage with loading and unloading in multiple ports.

3.5.2 *Sheltered water*

Sheltered waters are generally calm stretches of water when the wind force does not exceed 6 Beaufort scale, i.e. harbours, estuaries, roadsteads, bays, lagoons.

3.6 *Reference coordinate system*

3.6.1

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system, see Figure 3:
Origin : At the intersection among the longitudinal plane of symmetry of ship, the aft end of *L* and the baseline.
X axis : Longitudinal axis, positive forwards.
Y axis : Transverse axis, positive towards portside.
Z axi : Vertical axis, positive upwards.

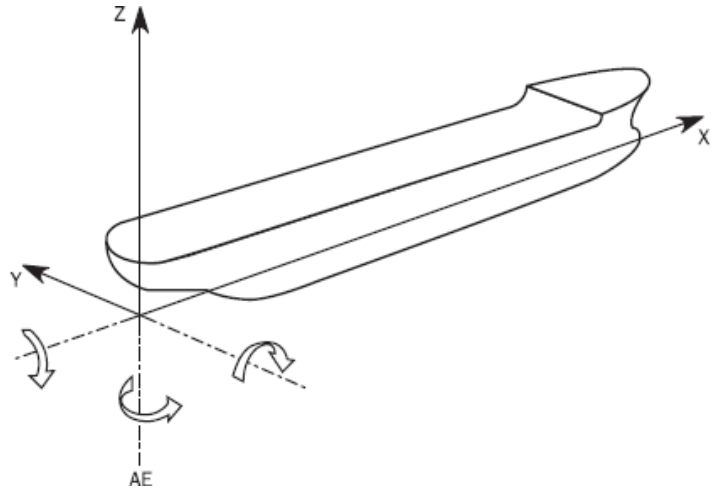

Figure 3 Reference coordinate system

3.7 Naming convention

3.7.1 Structural nomenclature

Figure 4 to Figure 8 show the common structural nomenclature used within these Rules.

3.8 Glossary

3.8.1 Definitions of term

Definition of terms *Table 7*

Terms	Definition
Accommodation deck	A deck used primarily for the accommodation of the crew.
Accommodation ladder	A portable set of steps on a ship's side for people boarding from small boats or from a pier.
Aft peak	The area aft of the aft peak bulkhead.
Aft peak bulkhead	The first main transverse watertight bulkhead forward of the stern.
Aft peak tank	The compartment in the narrow part of the stern aft of the aft peak bulkhead.
Anchor	A device which is attached to anchor chain at one end and lowered into the sea bed to hold a ship in position; it is designed to grip the bottom when it is dragged by the ship trying to float away under the influence of wind and current, usually made of heavy casting or casting.
Ballast tank	A compartment used for the storage of water ballast.
Bay	The area between adjacent transverse frames or transverse bulkheads.
Bilge hopper tank	The tank used for ballast or for stability when carrying certain cargoes in bulk carriers.
Bilge keel	A piece of plate set perpendicular to a ship's shell along the bilges to reduce the rolling motion.
Bilge plating	The bilge plating is the curved plating between the bottom shell and side shell. It is to be taken as follows: Within the cylindrical part of the ship: From the start of the curvature at the lower turn of bilge on the bottom to the end of the curvature at the upper turn of the bilge, Outside the cylindrical part of the ship: From the start of the curvature at the lower turn of the bilge on the bottom to the lesser of: ● A point on the side shell located 0.2*D* above the baseline/local centreline elevation. ● The end of the curvature at the upper turn of the bilge.
Bilge strake	The lower strake of bilge plating.
Boss	The boss of the propeller is the central part to which propeller blades are attached and through which the shaft end passes.
Bottom shell	The shell envelope plating forming the predominantly flat bottom portion of the shell envelope including the keel plate.
Bow	The structural arrangement and form of the forward end of the ship.
Bower anchor	An anchor carried at the bow of the ship.
Bracket	An extra structural component used to increase the strength of a joint between two structural members.
Bracket toe	The narrow end of a tapered bracket.
Breakwater	Inclined and stiffened plate structure on a weather deck to break and deflect the flow of water coming over the bow.
Breast hook	A triangular plate bracket joining port and starboard side structural members at the stem.
Bridge	An elevated superstructure having a clear view forward and at each side, and from which a ship is steered.
Buckling panel	Elementary plate panel considered for the buckling analysis.
Builder	The party contracted by the owner to build a ship in compliance with the specifications including Rules.
Bulb profile	A stiffener utilising an increase in steel mass on the outer end of the web instead of a separate flange.

Terms	Definition
Bulkhead	A structural partition wall sub-dividing the interior of the ship into compartments.
Bulkhead deck	The uppermost continuous deck to which transverse watertight bulkheads and shell are carried.
Bulkhead stool	The lower or upper base of a corrugated bulkhead.
Bulkhead structure	The transverse or longitudinal bulkhead plating with stiffeners and girders.
Bulwark	The vertical plating immediately above the upper edge of the ship's side surrounding the exposed deck(s).
Bunker	A compartment for the storage of fuel oil used by the ship's machinery.
Cable	A rope or chain attached to the anchor.
Camber	The upward rise of the weather deck from both sides towards the centreline of the ship.
Cargo hold region	See Ch 1, Sec 1, [2.4.3].
Cargo hold	Generic term for spaces intended to carry cargo, liquid or dry bulk.
Cargo tank	Tank carrying cargoes
Cargo tank bulkhead	A boundary bulkhead separating cargo tanks.
Carlings	A stiffening member used to supplement the regular stiffening arrangement.
Casing	The covering or bulkhead around or about any space for protection.
Cellular construction	A structural arrangement where there are two closely spaced boundaries and internal diaphragm plates arranged in such a manner to create small compartments.
Centreline girder	A longitudinal member located on the centreline of the ship.
Chain	Connected metal rings or links used for holding anchor, fastening timber cargoes, etc.
Chain locker	A compartment usually at the forward end of a ship which is used to store the anchor chain.
Chain pipe	A section of pipe through which the anchor chain enters or leaves the chain locker.
Chain stopper	A device for securing the chain cable when riding at anchor as well as securing the anchor in the housed position in the hawse pipe, thereby relieving the strain on the windlass.
Coaming	The vertical boundary structure of a hatch or skylight.
Cofferdams	See Ch 2, Sec 3, [1].
Collar plate	A patch used to, partly or completely, close a hole cut for a longitudinal stiffener passing through a transverse web.
Collision bulkhead	The foremost main transverse watertight bulkhead.
Companionway	A weathertight entrance leading from a ship's deck to spaces below.
Compartment	An internal space bounded by bulkheads or plating.
Continually manned space	A space in which the continuous or prolonged presence of seafarers is necessary for normal operational periods. This includes spaces routinely occupied for a period of 20 minutes or more during normal operational periods.
Corrugated bulkhead	A bulkhead including corrugations and usually fitted with lower and upper stools.
Corrugation	Plating arranged in a corrugated fashion, shedder and gusset plates excluded.
Cross deck	The area between cargo hatches.

Terms	Definition
Cross ties	Large transverse structural members joining longitudinal bulkheads or joining a longitudinal bulkhead with double side structures and used to support them against hydrostatic and hydrodynamic loads.
Deck	A horizontal structure element that defines the upper or lower boundary of a compartment.
Deckhouse	See Ch 1, Sec 1, [2.4.6].
Deck structure	The deck plating with stiffeners, girders and supporting pillars.
Deck transverse	Transverse PSM at the deck.
Deep tank	Any tank which extends between two decks or the shell/inner bottom and the deck above or higher.
Designer	A party who creates documentation submitted to the Society necessary for approval or for information. The designer can be the builder or a party contracted by the builder or owner to create this documentation.
Discharges	Any piping leading through the ship's sides for conveying bilge water, circulating water, drains etc.
Docking bracket	A bracket located in the double bottom to locally strengthen the bottom structure for the purposes of docking.
Double bottom structure	The shell plating with stiffeners below the top of the inner bottom and other elements below and including the inner bottom plating.
Doubler	Small piece of plate which is attached to a larger area of plate that requires strengthening in that location. Usually at the attachment point of a stiffener.
Double skin member	Double skin member is defined as a structural member where the idealised beam comprises webs, with top and bottom flanges formed by attached plating.
Duct keel	A keel built of plates in box form. It is used to house ballast and other piping leading forward which otherwise would have to run through the cargo tanks and/or ballast tanks.
Enclosed superstructure	The superstructure with bulkheads forward and/or aft fitted with weather tight doors and closing appliances.
Engine room bulkhead	A transverse bulkhead either directly forward or aft of the engine room.
EPP	Elementary plate panel, the smallest plate element surrounded by structural members, such as stiffeners, PSM, bulkheads, etc.
Face plate	The section of a stiffening member attached to the plate via a web and is usually parallel to the plated surface.
Flange	The section of a stiffening member, typically attached to the web, but is sometimes formed by bending the web over. It is usually parallel to the plated surface.
Flat bar	A stiffener comprised only of a web.
Floor	A bottom transverse member.
Forecastle	A short superstructure situated at the bow.
Fore peak	The area of the ship forward of the collision bulkhead.
Fore peak deck	A short raised deck extending aft from the bow of the ship.
Freeboard deck	Generally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all exposed openings.
Freeing port	An opening in the bulwarks to allow water shipped on deck to run freely overboard.

Terms	Definition
Gangway	The raised walkway between superstructure, such as between the forecastle and bridge, or between the bridge and poop.
Girder	A collective term for primary supporting structural members.
Gudgeon	A block with a hole in the centre to receive the pintle of a rudder; located on the stern post, it supports and allows the rudder to swing.
Gunwale	The upper edge of the ship's sides.
Gusset	A plate, usually fitted to distribute forces at a strength connection between two structural members.
Hatch cover	A cover fitted over a hatchway to prevent the ingress of water into the ship's hold.
Hatchways	Openings, generally rectangular, in a ship's deck affording access into the compartment below.
Hawse pipe	Steel pipe through which the hawser or cable of anchor passes, located in the ship's bow on either side of the stem, also known as spurling pipe.
Hawser	Large steel wire or fibre rope used for towing or mooring.
Hopper plating	Plating running the length of a compartment sloping between the inner bottom and vertical portion of inner hull longitudinal bulkhead.
HP	Bulb profile in accordance with the Holland profile standard.
IACS	International Association of Classification Societies
ICLL	IMO International Convention on Load Lines, 1966, as amended.
IMO	International Maritime Organisation
Independent tank	A self supporting tank.
Inner hull	The innermost plating forming a second layer to the hull of the ship.
Intercostal	Non-continuous member between stiffeners or PSM.
JIS	Japanese industrial standard.
Keel	The main structural member or backbone of a ship running longitudinally along the centreline of the bottom. Usually a flat plate stiffened by a vertical plate on its centreline inside the shell.
Keel line	Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships.
Knuckle	A discontinuity in a structural member.
Lightening hole	A hole cut in a structural member to reduce its weight.
Limber hole	A small drain hole cut in a frame or plate to prevent water or oil from collecting.
Local support members	Local stiffening members which only influence the structural integrity of a single panel, e.g. deck beams.
Longitudinal centreline bulkhead	A longitudinal bulkhead located on the centreline of the ship.
Longitudinal hull girder structural members	Structural members that contribute to the longitudinal strength of the hull girder, including: deck, side, bottom, inner bottom, inner hull longitudinal bulkheads including upper sloped plating where fitted, hopper, bilge plate, longitudinal bulkheads, double bottom girders and horizontal girders in wing ballast tanks.
Longitudinal hull girder shear structural members	Structural members that contribute to strength against hull girder vertical shear loads, including: side, inner hull longitudinal bulkheads, hopper, longitudinal bulkheads and double bottom girders.
Manhole	A round or oval hole cut in decks, tanks, etc, for the purpose of providing access.

Terms	Definition
Margin plate	The outboard strake of the inner bottom and when turned down at the bilge the margin plate (or girder) forms the outer boundary of the double bottom.
MARPOL	IMO International Convention for the Prevention of Pollution from Ships, 1973 and Protocol of 1978, as amended.
Mid-hold	Middle hold(s) of the three cargo hold length FE model as defined in Pt 1, Ch 7, Sec 2, [1.2.2]
Normally unmanned space	A space not normally manned (without the continuous or prolonged presence of seafarers) during normal operational periods. This includes spaces routinely occupied for a period of less than 20 minutes during normal operational periods.
Notch	A discontinuity in a structural member caused by welding.
Oil fuel tank	A tank used for the storage of fuel oil.
Outer shell	Same as shell envelope.
Owner	The party that has assumed all duties and responsibilities for registration and operation of the ship and who on assuming such responsibilities has agreed to take over all the duties and responsibilities on delivery of the ship from the builder with valid certificates prepared for the owner.
Pillar	A vertical support placed between decks where the deck is unsupported by the shell or bulkhead.
Pipe tunnel	The void space running in the midships fore and aft lines between the inner bottom and shell plating forming a protective space for bilge, ballast and other lines extending from the engine room to the tanks.
Plate panel	Unstiffened plate surrounded and supported by structural members, such as stiffeners, PSM, bulkheads, etc. See also EPP.
Plating	Sheet of steel supported by stiffeners, primary supporting members or bulkheads.
Poop	The space below an enclosed superstructure at the extreme aft end of a ship.
Poop deck	The first deck above the shelter deck at the aft end of a ship.
Primary supporting members PSM	Members of the beam, girder or stringer type which provide the overall structural integrity of the hull envelope and tank boundaries, e.g. double bottom floors and girders, transverse side structure, deck transverses, bulkhead stringers and vertical webs on longitudinal bulkheads.
Propeller post	The forward post of stern frame, which is bored for propeller shaft.
Rudder post	After post of stern frame to which the rudder is hung (also called stern post).
Scallop	A hole cut into a stiffening member to allow continuous welding of a plate seam.
Scarfing bracket	A bracket used between two offset structural items.
Scantlings	The physical dimensions of a structural item.
Scupper	Any opening for carrying off water from a deck, either directly or through piping.
Scuttle	A small opening in a deck or elsewhere, usually fitted with a cover or lid or a door for access to a compartment.
Shedder plates	Slanted plates that are fitted to minimize pocketing of residual cargo in way of corrugated bulkheads.
Sheer strake	The top strake of a ship's side shell plating.
Shelf plate	A horizontal plate located on the top of a bulkhead stool.
Shell envelope plating	The shell plating forming the effective hull girder exclusive of the strength deck plating.

Terms	Definition
Side frame	A vertical member attached to the side shell in bulk carriers.
Side shell	The shell envelope plating forming the side portion of the shell envelope above the bilge plating.
Single skin member	A structural member where the idealised beam comprises a web, with a top flange formed by attached plating and a bottom flange formed by a face plate.
Skylight	A deck opening fitted with or without a glass port light and serving as a ventilator for engine room, quarters, etc.
Slop tank	A tank in an oil tanker which is used to collect the oil and water mixtures from cargo tanks after tank washing.
SOLAS	IMO International Convention for the Safety of Life at Sea, 1974 as amended.
Spaces	Separate compartments including tanks.
Stay	Bulwark and hatch coaming brackets.
Stem	The piece of bar or plating at which a ship's outside plating terminates at the forward end.
Stern	The after end of the vessel.
Stern frame	The heavy strength members attached to the after end of a hull to form the ship's stern. It includes rudder post, propeller post, and aperture for the propeller.
Stern tube	A tube through which the shaft passes to the propeller; and acts as an after bearing for the shafting. It may be water or oil lubricated.
Stiffener	A collective term for secondary supporting structural members.
Stool	A structure supporting tank bulkheads.
Strake	A course, or row, of shell, deck, bulkhead, or other plating.
Strength deck	The uppermost continuous deck.
Stringer	Horizontal girders linking vertical web frames.
Stringer plate	The outside strake of deck plating.
Superstructure	See Ch 1, Sec 1, [2.4.6].
SWL	Safe working load
Tank	Generic term for spaces intended to carry liquid, such as, seawater, fresh water, oil, liquid cargoes, FO, DO, etc.
Tank top	The horizontal plating forming the bottom of a cargo tank.
Towing pennant	A long rope which is used to effect the tow of a ship.
Topside tank	The tank that normally stretches along the length of the ship's side and occupies the upper corners of the cargo hold in bulk carriers.
Transom	The structural arrangement and form of the aft end of the ship.
Transverse ring	All transverse material appearing in a cross section of the ship's hull, in way of a double bottom floor, vertical web and deck transverse girder.
Transverse web frame	The primary transverse girders which join the ships longitudinal structure.
Tripping bracket	A bracket used to strengthen a structural member under compression against torsional forces.
Trunk	A decked structure similar to a deckhouse, but not provided with a lower deck.
'Tween deck	An abbreviation of between decks, placed between the upper deck and the tank top in the cargo tanks.
Ullage	The quantity represented by the unoccupied space in a tank.
Void	An enclosed empty space in a ship.

Terms	Definition
Wash bulkhead	A perforated or partial bulkhead in a tank.
Watertight	Watertight means capable of preventing the passage of water through the structure under a head of water for which the surrounding structure is designed.
Weather deck	A deck or section of deck exposed to the elements which has means of closing weathertight, all hatches and openings.
Weathertight	Weathertight means that in any sea conditions water will not penetrate into the ship.
Web	The section of a stiffening member attached perpendicular to the plated surface.
Web frame	Transverse PSM including deck transverse.
Wind and water strakes	The strakes of a ship's side shell plating between the ballast and the deepest load waterline.
Windlass	A winch for lifting and lowering the anchor chain.
Wing tank	The space bounded by the inner hull longitudinal bulkhead and side shell.

Section 5 LOADING MANUAL AND LOADING INSTRUMENTS

1 GENERAL REQUIREMENTS

1.1 Application

1.1.1

This Section contains minimum requirements for loading guidance information.

1.1.2

An approved loading manual and an approved loading instrument are to be supplied onboard.

1.1.3

A ship may in actual operation be loaded differently from the loading conditions specified in the loading manual, provided limitations for longitudinal and local strength as defined in the loading manual and loading instrument onboard and applicable stability requirements are not exceeded.

1.1.4

The requirements concerning the loading manual are given in [2] and those concerning the loading instruments in [3].

1.2 *Annual and class renewal survey 1.2.1*

At each annual and class renewal survey, it is to be checked that the approved loading manual is available onboard.

1.2.2

The loading instrument is to be checked for accuracy at regular intervals by the ship's master by applying test loading conditions.

1.2.3

At each class renewal survey this checking is to be done in the presence of the surveyor.

2 LOADING MANUALS

2.1 General requirements

2.1.1 Definition

The approved loading manual is to be based on the final data of the ship.

A loading manual is a document which describes:

- The loading conditions on which the design of the ship has been based for seagoing and harbour/sheltered water, including permissible limits of still water bending moment and shear force. The conditions specified in the ballast water exchanging procedure and dry docking procedure are to be included in the loading manual,
- The results of the calculations of still water bending moments, shear forces and where applicable limitations due to lateral loads,
- The allowable local loading for the structure (e.g. hatch covers, decks, double bottom, etc), where applicable,
- The relevant operational limitations.

2.1.2 *Condition of approval*

The approved loading manual is to be based on the final data of the ship.

Modifications resulting in changes to the main data of the ship (e.g. lightship weight, buoyancy distribution, tank volumes or usage, etc), require the loading manual to be updated and re-approved, and subsequently the loading computer system to be updated and re-approved. However, new loading guidance and an updated loading manual need not be resubmitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.

The loading manual is to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

2.1.3 *Loading conditions*

The loading manual is to include the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions as appropriate, upon which the approval of the hull scantlings is based, as defined in Ch 4, Sec 8.

The loading conditions common to both oil tankers and bulk carriers are listed in Ch 4, Sec 8, [2].

2.1.4 *Operational limitations*

The loading manual is to describe relevant operational limitations:

- Scantling draught,
- Design minimum ballast draught at midships,
- Design slamming ballast draught forward with forward double bottom ballast tanks filled,
- Design slamming ballast draught forward with any of the forward double bottom ballast tanks empty,
- Maximum allowable cargo density,
- Maximum cargo density in any loading condition in the Loading Manual,
- Maximum service speed,
- Envelope results and permissible limits of still water bending moments and shear forces.

The loading manual must indicate that bulk carriers cannot be operated in seagoing conditions with ballast cargo holds partially filled.

2.2 *Requirements specific to oil tankers 2.2.1*

The loading manual is to contain the loading conditions described in Ch 4, Sec 8, [3]. This requirement applies in addition to [2.1].

2.3 *Requirements specific to bulk carriers 2.3.1*

The loading manual is to contain the loading conditions described in Ch 4, Sec 8, [4]. This requirement applies in addition to [2.1].

2.3.2

The loading manual is to describe:

- Envelope results and permissible limits of still water bending moments and shear forces in the flooded conditions according to Ch 4, Sec 4,
- The cargo hold(s) or combination of cargo holds that might be empty at full draught. If no cargo hold is allowed to be empty at full draught, this is to be clearly stated in the loading manual,
- Maximum allowable and minimum required mass of cargo and double bottom contents of each hold as a function of the draught at mid-hold position as defined in Ch 4, Sec 8, [4.3],
- Maximum allowable and minimum required mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds. This mean draught may be calculated by averaging the draught of the two mid-hold positions as defined in Ch 4, Sec 8, [4.3],
- Maximum allowable tank top loading together with specification of the nature of the cargo for cargoes other than bulk cargoes,
- Maximum allowable load on deck and hatch covers. If the ship is not approved to carry load on deck or hatch covers, this is to be clearly stated in the loading manual,
- Maximum rate of ballast change together with the advice that a load plan is to be agreed with the terminal on the basis of the achievable rates of change of ballast.

2.3.3

The additional following loading conditions, subdivided into departure and arrival conditions as appropriate, are to be included in the loading manual:

- Homogeneous light and heavy cargo loading conditions at maximum draught,
- Alternate light and heavy cargo loading conditions at maximum draught, where

applicable,

- Ballast conditions. For ships having ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper and double bottom tanks are empty,
- Short voyage conditions, i.e. the ship is loaded to maximum draught but with a limited amount of bunkers, where appropriate,
- Multiple port loading/unloading conditions,
- Deck cargo conditions, where applicable,
- Typical sequences for change of ballast at sea, where applicable,
- Typical loading sequences where the ship is loaded from commencement of cargo loading to reaching full deadweight capacity, for homogeneous conditions, relevant part load conditions and alternate conditions where applicable. Typical unloading sequences for these conditions are also to be included. The typical loading/unloading sequences are also to be developed to not exceed applicable strength limitations. The typical loading sequences are also to be developed paying due attention to loading rate and the deballasting capability. Figure 1 contains, as guidance only, an example of a Loading Sequence Summary Form.

3 LOADING INSTRUMENT

3.1 General requirements

3.1.1 Definition

A loading computer system is a system, which is either analog or digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, relevant operational limitations, such as the still water bending moments, shear forces, and lateral loads, where applicable, in any load or ballast condition do not exceed the specified permissible values.

The loading instrument is ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.

An approved loading instrument can not replace an approved loading manual.

3.1.2 *Conditions of approval of loading instruments*

The loading instrument is subject to approval based on the Rules of the individual Society. The approval is to include:

- Verification of type approval, if any,
- Verification that the final data of the ship has been used,
- Acceptance of number and position of read-out points,
- Acceptance of relevant limits for all read-out points,
- Checking of proper installation and operation of the instrument onboard, in accordance with agreed test conditions, and that a copy of the operation manual is available.

Modifications resulting in changes to the main data of the ship (e.g. lightship weight, buoyancy distribution, tank volumes or usage, etc), require the loading manual to be updated and re-approved, and subsequently the loading instrument to be updated and re-approved. However, new loading guidance and an updated loading instrument need not be resubmitted provided that the resulting draughts, still water bending moments and shear forces do not differ from the originally approved data by more than 2%.

An operational manual is always to be provided for the loading instrument. The operation manual and the instrument output are to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

The operation of the loading instrument is to be verified upon installation. It is to be checked that the agreed test conditions and the operation manual for the instrument is available onboard.

ISC 3.1.2a The loading instruments are to comply with the requirements of Appendix 1, Chapter 2, PART TWO of ISC Rules for Classification of Sea-going Steel Ships.

3.2 *Requirements specific to bulk carriers*

3.2.1 General

For BC-A, BC-B and BC-C ships, the loading instrument is to ascertain as applicable:

- The mass of cargo and double bottom contents in way of each hold as a function of the

draught at mid- hold position,

- The mass of cargo and double bottom contents of any two adjacent holds as a function of the mean draught in way of these holds,
- That the still water bending moment and shear forces in the hold flooded conditions do not exceed the specified permissible values.

3.2.2 *Condition of approval*

For BC-A, BC-B and BC-C ships, the approval is to include, as applicable:

- Acceptance of hull girder bending moment limits for all read-out points,
- Acceptance of hull girder shear force limits for all read-out points,
- Acceptance of limits for the mass of cargo and double bottom contents of each hold as a function of draught,
- Acceptance of limits for the mass of cargo and double bottom contents in any two adjacent holds as a function of draught.

4 LOADING SPECIFIC TO BULK CARRIERS

4.1 Guidance for loading/unloading sequences

4.1.1 Scope of application

The requirements given in [4] are applicable to bulk carriers having a freeboard length L_{LL} of 150 m or above.

4.1.2

The typical loading/unloading sequences are to be developed paying due attention to the loading/unloading rate, the ballasting/deballasting capacity and the applicable strength limitations.

4.1.3

Typical loading and unloading sequences are to be prepared and submitted for approval by the builder.

4.1.4

The typical loading sequences as relevant are to include:

- Alternate light and heavy cargo load condition,
- Homogeneous light and heavy cargo load condition,
- Short voyage condition where the ship is loaded to maximum draught but with limited bunkers,
- Multiple port loading/unloading condition,
- Deck cargo condition,
- Block loading.

4.1.5

The loading/unloading sequences may be port specific or typical.

4.1.6

The sequence is to be built up step by step from commencement of cargo loading to reach full deadweight capacity. Each time the loading equipment changes position to a new hold defines a step. Each step is to be documented and submitted to the Society. In addition to longitudinal strength, the local strength of each hold is to be considered.

4.1.7

For each loading condition, a summary of all steps is to be included. This summary is to highlight the essential information for each step, such as:

- How much cargo is filled in each hold during the different steps,
- How much ballast is discharged from each ballast tank during the different steps,
- The maximum still water bending moment and shear force at the end of each step,
- The ship’s trim and draught at the end of each step.

Figure 1 Loading Sequence Summary Form

Chapter 2 GENERAL ARRANGEMENT DESIGN

Section 1 GENERAL

1 GENERAL

1.1 General

1.1.1

This chapter covers the general structural arrangement requirements for the ship.

1.1.2

Arrangements for continually manned spaces are to include consideration of ventilation, lighting, noise and whole-body vibration in accordance with industry standards accepted by the Society. See also Sec 4, [1.1.1] to [1.1.3].

ISC 1.1.2a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

1.1.3

Arrangements for normally unmanned spaces are to include consideration of lighting and ventilation for periodic inspections, survey and maintenance in accordance with industry standards accepted by the Society. See also Sec 4,[1.1.1] to [1.1.5].

ISC 1.1.3a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

Section 2 SUBDIVISION ARRANGEMENT

1 WATERTIGHT BULKHEAD

ARRANGEMENT

1.1 Number and disposition of watertight bulkheads

1.1.1

All ships are to have at least the following transverse watertight bulkheads:

a) One collision bulkhead.
b) One aft peak bulkhead.
c) One bulkhead forward of the machinery space, and one bulkhead at the aft end of the machinery space which may be the aft peak bulkhead.

1.1.2

In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

1.1.3

In addition to the requirements of [1.1.1] and [1.1.2], the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the requirements of national regulations.

1.1.4

For bulk carriers with freeboard length L_{LL} less than 150 m not required to comply with subdivision requirements, bulkheads not less in number than indicated in Table 1 are to be fitted.

Number of bulkheads for bulk carriers with freeboard length L_{LL} less than 150 m Table 1

Freeboard length in m	Number of bulkheads for ships with aft machinery(1)
$90 \leq L_{LL} < 105$	4
$105 \leq L_{LL} < 120$	5
$120 \leq L_{LL} < 145$	6
$145 \leq L_{LL} < 150$	7
(1) Aft peak bulkhead and aft machinery bulkhead are the same.	

1.1.5

The bulkheads in the cargo hold region are to be spaced at uniform intervals as far as practicable.

2 *COLLISION BULKHEAD*

2.1 Extent and position of collision bulkhead

2.1.1

A collision bulkhead is to be fitted on all ships and is to extend to the freeboard deck. It is to be located between 0.05 L_{LL} or 10 m, whichever is less, and except as may be permitted by the Administration, 0.08 L_{LL} or 0.05 L_{LL}+3 m, whichever is the greater, aft of the reference point, where the reference point is as defined in [2.1.2].

2.1.2

For ships without bulbous bows the reference point is to be taken where the forward end of L_{LL} coincides with the forward side of stem, on the waterline which L_{LL} is measured. For ships with bulbous bows, it is to be measured from the forward end of L_{LL} a distance x forward; where x is to be taken as the lesser of the following:

a) Half the distance, from FP_{LL} to the extreme forward end of the bulb extension.
b) 0.015 L_{LL}.
c) 3.0 m.

2.2 Arrangement of collision bulkhead

2.2.1

In general, the collision bulkhead is to be in one plane; however, the bulkhead may have steps or recesses provided that they are within the limits prescribed in [2.1.1] and [2.1.2].

2.2.2
Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck. Where the collision bulkhead is extended above the freeboard deck, the number of openings in the extension is to be kept to a minimum compatible with the design and proper working of the ship. Reference is made to Ch1, Sec 2, [2.1].

3 AFT PEAK BULKHEAD

3.1 General

3.1.1
An aft peak bulkhead, enclosing the stern tube and rudder trunk in a watertight compartment, is to be provided. Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical, alternative arrangements are specially considered.

ISC 3.1.1a Where the shafting arrangements make enclosure of the stern tube in a watertight compartment impractical, equivalence or substitution is to be granted in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules and effective means are to be provided to ensure the watertightness of the stern tube.

3.1.2
The aft peak bulkhead may be stepped below the freeboard deck, provided that the degree of safety of the ship as regards subdivision is not thereby diminished.

3.1.3
The aft peak bulkhead location on ships powered and/or controlled by equipment that do not require the fitting of a stern tube and/or rudder trunk are also subject to special consideration.

ISC 3.1.3a The location of the aft peak bulkhead on ships powered and/or controlled by equipment that does not require the fitting of a stern tube and/or rudder trunk is to be in accordance with paragraph 2.2.5, Section2, Chapter2, PART ONE of the Rules and if the relevant requirements of paragraph 1.1 of this Section are complied with, may be specially considered.

3.1.4
Provided that the aft peak bulkhead extends above the deepest load line, termination of the afterpeak bulkhead on a watertight deck lower than the freeboard deck can be accepted. In order to provide such a watertight deck a tight sealing of the rudder stock shall be fitted I n way of this deck or above.

Section 3 COMPARTMENT ARRANGEMENT

1 COFFERDAMS

1.1 Definition

1.1.1

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be kept gas-tight and is to be properly ventilated, provided with drainage arrangement, and of sufficient size to allow proper inspection, maintenance and safe evacuation.

1.2 *Arrangement of cofferdams 1.2.1*

Cofferdams are to be provided between compartments intended for liquid hydrocarbons (including fuel oil, lubricating oil) and those intended for fresh water (water for propelling machinery and boilers) as well as tanks intended for the carriage of liquid foam for fire extinguishing.

1.2.2

Furthermore, tanks carrying fresh water for human consumption are to be separated from other tanks containing substances hazardous to human health by cofferdams or other means as approved by the Society.

Note 1: Normally, tanks for fresh water and water ballast are considered non-hazardous.

1.2.3

Where a corner to corner situation occurs, tanks are not considered to be adjacent.

1.2.4

The cofferdams specified in [1.2.1] may be waived when deemed impracticable or unreasonable by the Society in relation to the characteristics and dimensions of the spaces containing such tanks, provided that:

- the thickness of common boundary plates of adjacent tanks is increased, with respect to the thickness obtained according to Ch6, Sec4, by 2 mm in the case of tanks carrying fresh water or boiler feed water, and by 1 mm in all other cases,
- the sum of the throats of the weld fillets at the edges of these plates is not less than the thickness of the plates themselves,
- the structural test is carried out with a test pressure increased by 1 m with respect to Ch1, Sec2, [3.8.4].

2 DOUBLE BOTTOM

2.1 General

2.1.1

A double bottom need not be fitted in way of watertight tanks, including dry tanks of moderate size provided the safety of the ship is not impaired in the event of bottom or side damage as regulated in SOLAS II-1, Reg 9.

ISC 2.1.1a For bulk carriers, a double bottom may not be fitted in way of watertight tanks (including dry tanks) of moderate size, provided the safety of the ship is not impaired in the event of bottom or side damage.

2.2 *Extent of double bottom 2.2.1*

For bulk carriers, a double bottom is to be fitted extending from the collision bulkhead to the aft peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

For oil tankers, a double bottom is to be fitted to protect the cargo hold region and pump rooms. However the double bottom below pump rooms may be omitted provided that it is in compliance

with MARPOL, Annex I, Ch 4, Reg 22.

2.2.2
Where double bottom is required to be fitted, the inner bottom is to be continued out to the ship side in such a manner as to protect the bottom to the turn of the bilge in areas where hopper or double side spaces are not provided.

2.3 *Height of double bottom 2.3.1*
Unless otherwise specified, the height of the double bottom is not to be less than the lesser of:

- For oil tankers: *B*/15 or 2 m, however not less than 1.0 m measured at right angles to the shell plating at any cross section.
- For bulk carriers: *B*/20 or 2 m, however not less than 0.76 m measured vertically from the plane parallel with keel line to inner bottom.

2.4 *Small wells in double bottom tank 2.4.1*
Small wells constructed in the double bottom are not to extend in depth more than necessary. A well extending to the outer bottom, may, however, be permitted at the after end of the shaft tunnel of the ship. Other wells may be permitted by the Society if it is satisfied that the arrangements give protection equivalent to that afforded by a double bottom that complies with [2.1].

ISC 2.4.1a Small wells constructed in the double bottom in connection with drainage arrangements of holds, etc., are not to extend downward more than necessary. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel. Other wells (e.g., for lubricating oil under main engines) may be permitted if satisfied that the arrangements give protection equivalent to that afforded by a double bottom complying with requirements. In no case is the vertical distance from the bottom of such a well to a plane coinciding with the keel line to be less than 500 mm.

3 DOUBLE SIDE
3.1 Double side width
3.1.1 Oil tankers
The minimum double side width, W_{ds}, in m, is to be taken as the lesser of:

$$W_{ds} = 0.5 + \frac{DWT}{20000} \text{ but less not than } 1.0$$

$$W_{ds} = 2.0$$

3.1.2 *Bulk carriers*
Double side skin means a configuration where each ship side is constructed by the side shell and a longitudinal bulkhead connecting the double bottom and the deck. Hopper side tanks and topside tanks may, where fitted, be integral parts of the double side skin configuration.
The minimum double side width, W_{ds}, is not to be less than 1 m measured perpendicular to the side shell.

3.2 *Minimum clearance inside the double side*
3.2.1 Definition
The minimum clearance is defined as the shortest distance measured between assumed lines connecting the inner surfaces of the stiffeners on the inner and outer hulls.

3.2.2 *Minimum clearance dimensions*
The minimum clearance between the inner surfaces of the stiffeners inside the double side is not to be less than:

- 600 mm when the inner and/or the outer hulls are transversely framed,
- 800 mm when the inner and the outer hulls are longitudinally framed.

Outside the parallel part of the cargo hold, the clearance may be reduced but is not to be less than 600 mm.

4 *BALLAST TANKS*

4.1 Capacity and disposition of ballast tanks

4.1.1

All ships are to have ballast tanks of sufficient capacity that the ship may operate safely on ballast voyage. The capacity of ballast is to be at least such that, in any ballast condition at any part of the voyage, including the conditions consisting of lightweight plus ballast only, the ship's draught and trim can meet the requirements defined in:

- For oil tankers, Ch4, Sec 8, [3.1].
- In addition, for oil tankers, the moulded draught amidships, T_{mid}, excluding any hogging or sagging correction, is not to be less than:
  $T_{mid} = 2.0 + 0.02L_{LL}$, in m
- For bulk carriers, Ch4, Sec8, [4.1].

Section 4 ACCESS AND ESCAPE ARRANGEMENT

1 ENCLOSED SPACES

1.1 General

1.1.1 Special considerations

Human element considerations, including enhanced safety and productivity, may be considered using Recommendation No. 132 or other ergonomic standards accepted by the Society.

Where spaces have special considerations or requirements for access; e.g. security restrictions for the CO2 room to prevent unintentional release, these are to be considered in conjunction with the requirements of this section, and any conflicts should be raised as soon as possible for consideration by the Society.

ISC 1.1.1a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

1.1.2 *Enclosed spaces*

All enclosed spaces are to be accessible with appropriate access arrangements for easy inspection, survey and maintenance i.e. access is to allow unobstructed passage to items for inspection for personnel wearing the appropriate clothing, including personal protective equipment, and using all necessary tools and test equipment.

Provision is also to be made for appropriate arrangements to facilitate emergency egress of inspection personnel or ships' crew in accordance with industry standards accepted by the Society, notwithstanding the requirements set out in SOLAS or other relevant regulatory instruments.

ISC 1.1.2a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

1.1.3 *Spaces not explicitly covered by SOLAS*

For spaces which are not explicitly covered by SOLAS, ChII-1, Reg 3-6, the builder is to provide appropriate accesses arrangements for easy inspection, survey and maintenance in accordance with industry standards accepted by the Society. See also [1.1.5].

Provision is also to be made for appropriate arrangements to facilitate emergency egress of inspection personnel or ships' crew in accordance with industry standards accepted by the Society. Special measures for inspection and maintenance are to be put in place for small closed spaces for which the design causes impracticality for the access.

ISC 1.1.3a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

1.1.4 *Ventilation of normally unmanned spaces*

Unless otherwise specifically detailed in these Rules, normally unmanned spaces are to be capable of being ventilated through natural or forced ventilation. Such ventilation could be achieved through the inclusion of mushroom ventilators, gooseneck ventilators, ventilators with weather proof covers etc. Exchange air may be provided through permanent or temporary mechanical ventilation and air trunk systems or a suitable air exchange path through tank openings and ventilators.

1.1.5 *Permanent means of access to normally unmanned spaces*

Unless otherwise specifically detailed in these Rules, permanent means of access to normally unmanned spaces is to be provided in accordance with SOLAS, Ch II-1, Reg. 3-6.

For enclosed spaces, which are not explicitly covered by SOLAS, Ch II-1, Reg. 3-6, the requirements of the Convention and associated Resolutions should be applied as far as practicable. The size of openings providing access to or emergency egress from spaces not entered during operation, entered for maintenance or entered for regular inspections shall, in general, not be less than 600mm x 400mm if oval or in accordance with industry standards accepted by the Society if

circular.

ISC 1.1.5a The applicable requirements given in ISC Guidelines on Application of Marine Ergonomics may be applied.

2 CARGO AREA AND FORWARD SPACES

2.1 General

2.1.1 Means of access

Each space is to be provided with means of access as regulated in SOLAS, ChII-1, Reg 3-6. This requirement applies to:

- Oil tankers.
- Bulk carriers having a length of 150 m or above, irrespective of their gross tonnage.

2.1.2

All tanks are to be accessible for easy inspection.

Chapter 3 STRUCTURAL DESIGN PRINCIPLES

Section 1 MATERIAL

1 GENERAL

1.1 Standard of material 1.1.1

Materials used during construction are to comply with the Rules for Materials of the Society.

ISC 1.1.1a Materials used for hull structures are to comply with the relevant provisions of PART ONE of ISC Rules for Materials and Welding.

1.1.2

Other materials than those covered under [1.1.1] may be accepted, provided their specification (e.g. manufacture, chemical composition, mechanical properties, welding) is submitted to the Society for approval.

1.2 *Testing of materials 1.2.1*

Materials are to be tested in compliance with the applicable requirements of Rules for Materials of the Society.

ISC 1.2.1a Materials are to be tested in compliance with the applicable requirements of Chapter 1, PART ONE of ISC Rules for Materials and Welding.

1.3 *Manufacturing process*

1.3.1

The requirements of this section presume that welding and other cold or hot manufacturing processes are carried out in compliance with current sound working practice defined in the Rules and/or documents of the individual Society which incorporate IACS UR W and the applicable requirements of Rules for Materials of the Society.

In particular:

- Parent material and welding processes are to be within the limits stated for the specified type of material for which they are intended.
- Specific preheating may be required before welding.
- Welding or other cold or hot manufacturing processes may need to be followed by an adequate heat treatment.

ISC 1.3.1a Welding and other cold or hot manufacturing processes of this Section are to comply with the applicable requirements of Section 1, Chapter 5, PART THREE of ISC Rules for Materials and Welding.

2 HULL STRUCTURAL STEEL

2.1 General

2.1.1 Young's modulus and Poisson's ratio

The Young's modulus for Carbon steel materials is equal to 206,000 N/mm^2 and the Poisson's ratio equal to 0.3.

2.1.2 *Steel material grades and mechanical properties*

Steel having a specified minimum yield stress of 235N/mm^2 is regarded as normal strength hull structural steel and is denoted by 'MS' for mild steel. Steel having a higher specified minimum yield stress is regarded as higher strength hull structural steel and is denoted 'HT' for high tensile steel.

Material grades of hull structural steels are referred to as follows:

a) A, B, D and E denote normal strength steel grades.
b) AH, DH and EH denote higher strength steel grades.

Table1 gives the mechanical characteristics of steels generally used in the construction of ships.

2.1.3

Higher strength steels other than those indicated in Table 1 are considered by the Society on a case-by-case basis.

ISC 2.1.3a For higher tensile steels other than those indicated in Table 1, the chemical composition, deoxidation method, condition of supply and mechanical properties of the steels are to be submitted to ISC for approval.

Mechanical properties of hull steels *Table1*

Steel grades for plates with t_{as_built} 100 mm	R_{eH}, specified minimum yield stress, in N/mm^2	R_m, specified tensile strength, in N/mm^2
A-B-D-E	235	400 - 520
AH32-DH32-EH32-FH32	315	440 - 570
AH36-DH36-EH36-FH36	355	490 - 630
AH40-DH40-EH40-FH40	390	510 - 660

2.1.4 High tensile steel

When steels with a specified minimum yield stress R_{eH} other than 235 N/mm^2 are used, hull girder strength and hull scantlings are to be determined by taking into account the material factor, k defined in [2.2].

2.1.5 *Onboard documents*

It is required to keep onboard a plan indicating the steel types and grades adopted for the hull structures. Where steels other than those indicated in Table 1 are used, their mechanical and chemical properties, as well as any workmanship requirements or recommendations, are to be available onboard together with the above plan.

2.2 *Material factor, k*

2.2.1

Unless otherwise specified, the material factor, k of normal and higher strength steel for hull girder strength and scantling purposes is to be taken as defined in Table 2, as a function of the specified minimum yield stress R_{eH}.

For intermediate values of R_{eH}, k is obtained by linear interpolation.

Steels with a specified minimum yield stress R_{eH}, greater than 390 N/mm^2 are considered by the Society on a case-by-case basis.

Material factor, *k* **Table2**

R_{eH}, specified minimum yield stress, in N/mm^2	k
235	1.00
315	0.78
355	0.72
390	0.68

2.3 *Steel grades*

2.3.1

Materials in the various strength members are not to be of lower grade than those corresponding to the material classes and grades specified in Table 3 to Table 7. General requirements are given in Table 3, while additional minimum requirements for ships with length exceeding 150m and 250m, single side bulk carriers with length exceeding 150 m, are given in Table 4 to Table 6. The

material grade requirements for hull members of each class depending on the thickness are defined in Table 7.

Material classes and grades *Table3*

	Structural member category	Material class/grade
Secondary	A1. Longitudinal bulkhead strakes, other than those belonging to the Primary category A2. Deck plating exposed to weather, other than that belonging to the Primary or Special category A3. Side plating	- Class I within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
Primary	B1. Bottom plating, including keel plate B2. Strength deck plating, excluding that belonging to the Special category B3. Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings B4. Uppermost strake in longitudinal bulkhead B5. Vertical strake (hatch side girder) and uppermost sloped strake in topside tank	- Class II within 0.4 *L* amidships - Grade A/AH outside 0.4 *L* amidships
Special	C1. Sheer strake at strength deck (1) C2. Stringer plate in strength deck (1) C3. Deck strake at longitudinal bulkhead, excluding deck plating in way of inner-skin bulkhead of double-hull ships (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
	C4. Strength deck plating at outboard corners of cargo hatch openings for ships with hatch opening configurations similar to those of container carriers	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships - Min. Class III within cargo hold region
	C5. Strength deck plating at corners of cargo hatch openings	- Class III within 0.6 *L* amidships - Class II within rest of cargo hold region
	C6. Bilge strake of ships with double bottom over the full breadth and with length less than 150 m	- Class II within 0.6 *L* amidships - Class I outside 0.6 *L* amidships
	C7. Bilge strake in other ships (1)	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships
	C8. Longitudinal hatch coamings of length greater than 0.15 *L* including coaming top plate and flange C9. End brackets and deckhouse transition of longitudinal cargo hatch coamings	- Class III within 0.4 *L* amidships - Class II outside 0.4 *L* amidships - Class I outside 0.6 *L* amidships - Not to be less than Grade D/DH

(1) Single strakes required to be of class III within 0.4*L* amidships are to have breadths not less than 800+5*L*, in mm, need not be greater than 1800 mm, unless limited by the geometry of the ship's design.

Minimum material grades for ships with length exceeding 150 m **Table4**

Structural member category	Material grade
Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0.4 *L* amidships
Continuous longitudinal plating of strength members above strength deck	Grade B/AH within 0.4 *L* amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo hold region

Minimum material grades for ships with length exceeding 250 m Table 5

Structural member category(1)	Material grade
Sheer strake at strength deck	Grade E/EH within 0.4 *L* amidships
Stringer plate in strength deck	Grade E/EH within 0.4 *L* amidships
Bilge strake	Grade D/DH within 0.4 *L* amidships

(1) Single strakes required to be of Grade D/DH or Grade E/EH as shown in the above table and within 0.4*L* amidships are to have breadths not less than 800+5*L* (mm), need not be greater than 1800 (mm), unless limited by the geometry of the ship's design.

Minimum material grades for single side skin bulk carriers with length exceeding 150 m Table 6

Structural member category	Material grade
Lower bracket of ordinary side frame (1), (2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125 above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (2)	Grade D/DH

(1) The term 'lower bracket' means webs of lower brackets and webs of the lower part of side frames up to the point of 0.125 above the intersection of side shell and bilge hopper sloping plate or inner bottom plate.

(2) The span of the side frame, *l*, is defined as the distance between the supporting structures (see Pt 2, Ch1, Sec 2, Figure 2).

Material grade requirements for classes I, II and III Table7

Class	I		II		III	
As-built thickness, in mm	MS	HT	MS	HT	MS	HT
$t \leq 15$	A	AH	A	AH	A	AH
$15 < t \leq 20$	A	AH	A	AH	B	AH
$20 < t \leq 25$	A	AH	B	AH	D	DH
$25 < t \leq 30$	A	AH	D	DH	D	DH
$30 < t \leq 35$	B	AH	D	DH	E	EH
$35 < t \leq 40$	B	AH	D	DH	E	EH
$40 < t \leq 50$	D	DH	E	EH	E	EH

2.3.2

For strength members not mentioned in Table 3 to Table 6, Grade A/AH may be used upon agreement of the Society.

ISC 2.3.2a For strength members not mentioned in Table 3 to Table 6, Grade A/AH is generally to be used.

2.3.3

Plating materials for stern frames and shaft brackets are in general not to be of lower grades than corresponding to Class II.

2.4 Structures exposed to low air temperature

2.4.1

For ships intended to operate in areas with low air temperatures refer to Ch1, Sec 2, [3.4.4].

ISC 2.4.1a For ships intended to operate in areas with low air temperatures (with design temperature below and including -10 ºC),e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D of ISC 2.4.1e and in accordance with the provisions of ISC 2.4.1b to ISC 2.4.1e.

ISC 2.4.1b Grades of hull structural steel above the lowest ballast waterline (BWL) exposed to low air temperatures are not to be lower than those as given in Table ISC 2.4.1b.

ISC 2.4.1c Grades of steel for hull structural members of different material classes are to be selected according to Table ISC 2.4.1cdepending on plate thickness and design temperature. Where the design temperature t_D is below -55ºC, the grades of steel are to be subject to special consideration by ISC.

ISC 2.4.1d Single *strakes required to be of Class III or of grade E/EH or FH are to have breadths not less than 800+5L mm (L being length of the ship), but need not be greater than 1,800 mm.*

Material Classes at Low Air Temperatures ***Table ISC 2.4.1b***

Structural member category	*Structural member*	*Material class*	
		Within 0.4L amidships	*Outside 0.4L amidships*
Secondary	*Deck plating exposed to weather in general, side plating above BWL, transverse bulkheads above BWL*	*I*	*I*
Primary	*Strength deck plating*① *Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings* *Longitudinal bulkhead above BWL* *Top wing tank bulkhead above BWL*	*II*	*I*
Special	*Sheer strake at strength deck, including rounded gunwale*② *Stringer plate in strength deck*② *Deck strake at longitudinal bulkhead*③ *Continuous longitudinal hatch coamings*④	*III*	*II*

*Notes:*① *Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur.*

② *Not to be less than grade E/EH within 0.4 L amidships in ships with length exceeding 250 m.*

③ *In ships with breadth exceeding 70 m at least three deck strakes to be Class III.*

④ *Not to be less than grade D/DH.*

Note: "–" in the Table = Not applicable.

ISC 2.4.1e The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation, where:

mean: statistical mean over observation period (at least 20 years)

average: average during one day and night

lowest: lowest during year

For seasonally restricted service the lowest value within the period of operation applies. Figure

ISC 2.4.1e illustrates the temperature definition.

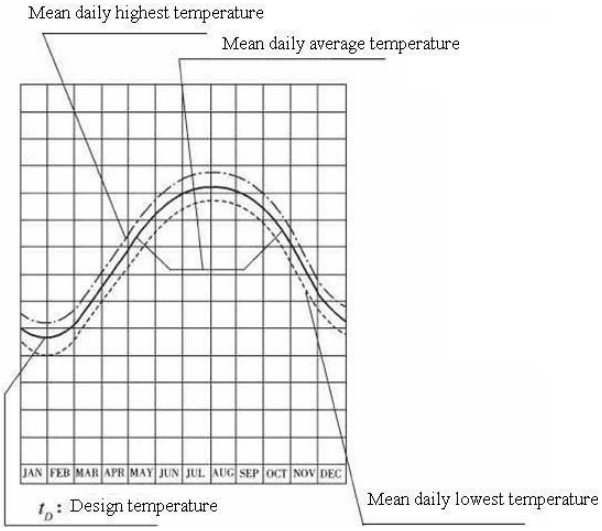

Figure ISC 2.4.1e Commonly Used Definitions of Temperatures

2.4 *Through thickness property 2.5.1*

Where tee or cruciform connections employ partial or full penetration welds, and the plate material is subject to significant tensile strain in a direction perpendicular to the rolled surfaces, consideration is to be given to the use of special material with specified through thickness properties, in accordance with the Rules for Materials of the Society. These steels are to be designated on the approved plan by the required steel strength grade followed by the letter Z (e.g. EH36Z).

ISC 2.5.1a Where tee or cruciform connections employ full penetration welds, and the plate material is subject to significant stress in through-thickness direction, Z-direction steels with full thickness properties are to be used, which are to comply with the requirements of Section 10, Chapter 3, PART ONE of ISC Rules for Materials and Welding.

2.5 *Stainless steel*

2.6.1

The reduction of strength of stainless steel with increasing temperature is to be taken into account in the calculation of the material factor, *k* and in the material Young's modulus, *E*.

Stainless steels are considered by the Society on a case-by-case basis.

ISC 2.6.1a The material Young's modulus, E, the material factor, k, and minimum yield stress, R_{eH}, are to comply with the requirements respectively, for elastic modulus specified in [1.3.6.2] and for material factor K and minimum yield strength Re_{HT} specified in [1.3.6.3], Section 3, Chapter 1, Part 2 of ISC Rules for Classification of Sea-Going Steel Ships.

3 STEELS FOR FORGING AND CASTING

3.1 General

3.1.1

Mechanical and chemical properties of steels for forging and casting to be used for structural members are to comply with the applicable requirements of the Rules for Materials of the Society.

ISC 3.1.1a Mechanical properties and chemical composition of steel forgings and castings to be used for structural members are to comply with the requirements of Section 2, Chapter 5 and Section 2, Chapter 6 of PART ONE of ISC Rules for Materials and Welding.

3.1.2
Steels of structural members intended to be welded are to have mechanical and chemical properties deemed appropriate for this purpose by the Society on a case-by-case basis.

ISC 3.1.2a Steels of structural members intended to be welded are to comply with the applicable requirements of Section 2, Chapter 5 and Section 2, Chapter 6 of PART ONE of ISC Rules for Materials and Welding.

3.1.3
The steels used are to be tested in accordance with the applicable requirements of the Rules for Materials of the Society.
ISC 3.1.3a The steel forgings and castings used are to be tested in accordance with the applicable requirements of 5.1.5, Section 1, Chapter 5 and 6.1.6, Section 1, Chapter 6 of PART ONE of ISC Rules for Materials and Welding.

3.2 Steels for forging
3.2.1
Rolled bars may be accepted in lieu of forged products, after consideration by the Society on a case-by-case basis. In such case, compliance with the applicable requirements of the Rules for Materials of the Society, relevant to the quality and testing of rolled parts accepted in lieu of forged parts, may be required.

ISC 3.2.1a Rolled bars in general may not be accepted in lieu of steel forgings for primary hull structures (e.g. rudder stock). Where they are used for those other than primary structural members, they are to be subject to the agreement of ISC. In this case, the quality and testing are to comply with relevant requirements for forgings in Chapter 5, PART ONE of ISC Rules for Materials and Welding.

3.3 Steels for casting
3.3.1
Cast parts intended for stems and stern frames in general may be made of C and C-Mn weldable steels, having specified minimum tensile strength, R_m=400N/mm^2, in accordance with the applicable requirements of the Society's Rules for Materials.

ISC 3.3.1a Steel castings intended for stems, stern frames, rudders, parts of steering gear and deck machinery are to comply with the requirements for carbon and carbon-manganese weldable steels having minimum tensile strength, R_m= 400 N/mm^2, specified in Section 2, Chapter 6, PART ONE of ISC Rules for Materials and Welding.

3.3.2
The welding of cast parts to main plating contributing to hull strength members is considered by the Society on a case-by-case basis.

The Society may require additional properties and tests for such casting, in particular impact properties which are appropriate to those of the steel plating on which the cast parts are to be welded and non-destructive examinations.

ISC 3.3.2a For the welding of steel castings to main plating contributing to hull strength members, the technological measures such as preheating temperature and post-weld heat treatment are to be determined in accordance with the carbon equivalent and structural rigidness, subject to the agreement of ISC.
The impact properties and non-destructive examinations of steel castings for primary hull structures are to comply with the respective requirements of 6.2.4.3, Section 2 and 6.1.8, Section 1, Chapter 6, PART ONE of ISC Rules for Materials and Welding.

4 ALUMINIUM ALLOYS

4.1 General

4.1.1

The use of aluminium alloys in superstructures, deckhouses, hatch covers, helicopter platforms, or other local components is to be specially considered. A specification of the proposed alloys and their proposed method of fabrication is to be submitted for approval.

Material requirements and scantlings are to comply with the Rules for Materials of the Society. Series 5000 aluminium-magnesium alloys or series 6000 aluminium-magnesium-silicon alloys are to be used.

ISC 4.1.1a Aluminium alloys are to comply with the requirements of Chapter 8, PART ONE of ISC Rules for Materials and Welding.

4.1.2

In the case of structures subjected to low service temperatures or intended for other specific applications, the alloys to be employed are to be agreed by the Society.

ISC 4.1.2a When the design temperature of aluminium alloy structures for low temperature service is lower than -55ºC, 5083 aluminium alloys in annealed condition are to be used.

4.1.3

Unless otherwise agreed, the Young's modulus for aluminium alloys is equal to 70,000 N/mm^2 and the Poisson's ratio equal to 0.33.

4.1.4

Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.

4.2 *Extruded plating*

4.2.1

Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

4.2.2

In general, the application of extruded plating is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by the Society on a case-by-case basis.

ISC 4.2.2a In general, the application of extruded plating is limited to decks, bulkheads, superstructures and deckhouses. For other uses, equivalence or substitution is to be granted in accordance with paragraph 2.2.5, Section 2, Chapter 2 of the Rules.

4.2.3

Extruded plating is to be oriented so that the stiffeners are parallel to the direction of main stresses.

4.2.4

Connections between extruded plating and primary members are to be given special attention.

4.3 Mechanical properties of weld joints

4.3.1

Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

4.3.2

The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111. Higher mechanical characteristics may be considered, provided they are duly justified.

4.3.3

The as-welded properties of aluminium alloys of series 6000 are to be agreed by the Society.

ISC 4.3.3a The as-welded properties of aluminium alloys of series 6000 are to comply with the requirements of 3.2.6.1, Section 2, Chapter 3, PART THREE of ISC Rules for Materials and Welding.

4.3 *Material factor, k*

4.4.1

The material factor, k for aluminium alloys is to be obtained from the following formula:

$$k = \frac{235}{R'_{\text{lim}}}$$

where:

R'_{lim} : Minimum guaranteed yield stress of the parent metal in welded condition $R'_{p0.2}$, in N/mm^2, but not to be taken greater than 70% of the minimum guaranteed tensile strength of the parent metal in welded condition R'_m, in N/mm^2.

$R'_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of material in welded condition.
$R'_{p0.2} = \eta_1 R_{p0.2}$

R'_m : Minimum guaranteed tensile strength, in N/mm^2, of material in welded condition.
$R'_m = \eta_2 R_m$

$R_{p0.2}$: Minimum guaranteed yield stress, in N/mm^2, of the parent metal in delivery condition.

R_m : Minimum guaranteed tensile strength, in N/mm^2, of the parent metal in delivery condition.

η_1, η_2 : Specified in Table 8.

Aluminium alloys - Coefficients for welded construction **Table 8**

Aluminium alloy	η_1	η_2
Alloys without work-hardening treatment (series 5000 in annealed condition O or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition O or H111)	$R'_{p0.2}/R_{p0.2}$	R'_m/R_m
Alloys hardened by heat treatment (series 6000) (1)	$R'_{p0.2}/R_{p0.2}$	0.6
(1) When no information is available, coefficient η_1, is to be taken equal to the metallurgical efficiency coefficient β as defined in Table 9.		

Aluminium alloys - Metallurgical efficiency coefficient **Table 9**

Aluminium alloy	Temper condition	As-built thickness, in mm	β
6005A(Open sections)	T5 or T6	$t \leq 6$	0.45
		$t > 6$	0.40
6005A(Closed sections)	T5 or T6	All	0.50
6061 (Sections)	T6	All	0.53
6082 (Sections)	T6	All	0.45

4.4.2

In the case of welding of two different aluminium alloys, the material factor, k to be considered for the scantlings is the greater material factor of the aluminium alloys of the assembly.

4.4 *Others*

4.5.1

Aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided. Where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump rooms are to satisfy the requirements of Pt 2, Ch2, Sec 2, [1.2] for aluminium anodes.

4.5.2
The underside of heavy portable aluminium structures such as gangways, is to be protected by means of a hard plastic or wood cover, or other approved means, in order to avoid the creation of smears. Such protection is to be permanently and securely attached to the structures.

5 OTHER MATERIALS AND PRODUCTS

5.1 General

5.1.1
Other materials and products such as parts made of iron castings, where allowed, products made of copper and copper alloys, rivets, anchors, chain cables, cranes, masts, derrick posts, derricks, accessories and wire ropes are to comply with the applicable requirements of the Rules for Materials of the Society.

ISC 5.1.1a Other materials and products such as parts made of iron castings, products made of copper alloys, rivets, anchors, chain cables and wire ropes are in general to comply with the applicable requirements of Chapters 7 to 10 of PART ONE of ISC Rules for Materials and Welding.

ISC 5.1.1b The materials of cranes, masts, derrick posts, derricks and accessories are to be selected based on factors such as design temperatures, plate thickness and type of cranes in accordance with the requirements of Chapter 6 of ISC Rules for Lifting Appliances of Ships and Offshore Installations.

5.1.2
The use of plastics or other special materials not covered by these Rules is to be considered by the Society on a case-by-case basis. In such cases, the requirements for the acceptance of the materials concerned are to be agreed by the Society.

ISC 5.1.2a Plastics and other non-metallic materials are to comply with the requirements of PART TWO of ISC Rules for Materials and Welding.

5.2 Iron cast parts

5.2.1
As a rule, the use of grey iron, malleable iron or spheroidal graphite iron cast parts with combined ferritic/perlitic structure is allowed only to manufacture low stressed elements of secondary importance.

5.2.2
Ordinary iron cast parts may not be used for windows or sidescuttles; the use of high grade iron cast parts of a suitable type is to be considered by the Society on a case-by-case basis.

ISC 5.2.2a Iron castings are in general not be used for windows or sidescuttles. Iron castings not less than 300 N/mm^2 in specified minimum tensile strength and not less than 15% in specified minimum elongation may be used subject to the agreement of ISC.

Section 2 NET SCANTLING APPROACH

SYMBOLS

For symbols not defined in this section, refer to Ch1, Sec 4

t : Net thickness in mm.

t_c : Corrosion addition in mm.

t_{gr} : Gross thickness in mm.

h_{stf} : Height of stiffener or primary supporting member in mm.

h_w : Web height of stiffener or primary supporting member in mm.

t_w : Web thickness of stiffener or primary supporting member in mm.

b_f : Face plate width of stiffener or primary supporting member in mm.

t_f : Face plate thickness of stiffener or primary supporting member in mm.

t_p : Thickness of the plating attached to a stiffener or to a primary supporting member in mm.

d_f : Distance in mm, for the extension of flange for L2 profiles, see Figure 3.

t_{as_built} : As-built thickness, in mm, taken as the actual thickness provided at the newbuilding stage.

t_{gr_off} : Gross offered thickness, in mm, as defined in [1.2.2].

t_{gr_req} : Gross required thickness, in mm, as defined in [1.2.1].

t_{off} : Net offered thickness, in mm, as defined in [1.2.3].

t_{dm} : Design production margin, in mm, taken as the thickness difference between offered gross thickness and required gross thickness (equal also to the difference between offered net and required net thickness) as a result of scantlings applied by the designer or builder to suit design or production situation. This difference in thickness is not to be considered as an additional corrosion margin.

t_{req} : Net required thickness, in mm, as required in [1.3.1].

t_{vol_add} : Thickness for voluntary addition, in mm, taken as the thickness voluntarily added as the owner's extra margin or builder's extra margin for corrosion wastage in addition to t_c.

t_{res} : Reserve thickness, in mm, taken equal to 0.5 mm.

t_{c1}, t_{c2} : Corrosion addition on one side of the considered structural member, in mm, as defined in Ch3, Sec 3, Table 1.

1 GENERAL

1.1 Application

1.1.1 Net thickness approach

The net thickness, t, of a structural element is required for structural strength in compliance with the design basis. The corrosion addition, t_c, for a structural element is derived independently from the net scantling requirements as shown in Figure 1. This approach clearly separates the net thickness from the thickness added to address the corrosion that is likely to occur during the ship-in-operation phase. This approach enables the status of the structure with respect to corrosion to be clearly ascertained throughout the life of the ship.

1.1.2 *Local and global corrosion*

The net thickness approach distinguishes between local and global corrosion. Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener. Global corrosion is defined as the average corrosion of larger areas, such as primary supporting members and the hull girder.

1.1.3 *Exceptions in gross scantling*

Items that are directly determined in terms of gross scantlings do not follow the net scantling approach, i.e. they already include additions for corrosion but without any owner's extra margin. Gross scantling requirements are identified with the suffix "gr" and examples are:

- Scantlings of superstructures and deckhouses as given in Ch11, Sec 1.
- Scantlings of massive pieces made of steel forgings and steel castings.

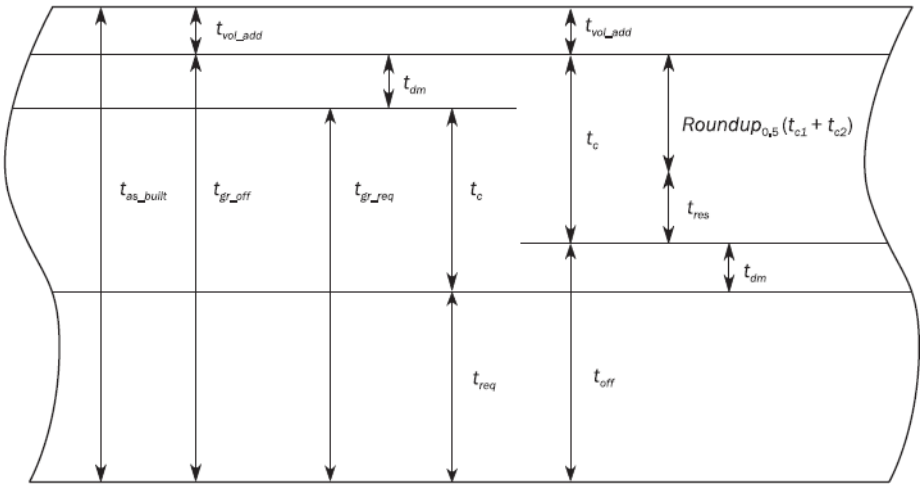

Figure1 Net scantling approach scheme

1.2 Gross and net scantling definitions

1.2.1 Gross required thickness

The gross required thickness, t_{gr_req}, is the thickness obtained by adding the corrosion addition as defined in Ch3, Sec 3 to the net required thickness, as follows:

$t_{gr_req} = t_{req} + t_c$

1.2.2 *Gross offered thickness*

The gross offered thickness, t_{gr_off}, is the gross thickness provided at the newbuilding stage, which is obtained by deducting any thickness for voluntary addition from the as-built thickness, as follows:

$t_{gr_off} = t_{as_built} - t_{vol_add}$

1.2.3 *Net offered thickness*

The net offered thickness, t_{off}, is obtained by subtracting the corrosion addition from the gross offered thickness, as follows:

$t_{off} = t_{gr_off} - t_c = t_{as_built} - t_{vol_add} - t_c$

1.3 *Scantling compliance*

1.3.1

The net required thickness, t_{req}, is obtained by rounding the net thickness calculated according to the Rules to the nearest half millimetre. For example:

1.3.1 For $10.75 \leq t < 11.25$ mm, the Rule required net thickness is 11.0 mm.

1.3.2 For $11.25 \leq t < 11.75$ mm, the Rule required net thickness is 11.5 mm.

1.3.2

Scantling compliance in relation to the Rules is as follow:

- The net offered thickness of plating is to be equal to or greater than the net required thickness of plating.
- The required net section modulus, moment of inertia and shear area properties of local supporting members are to be calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are defined in Figure 2. The required section modulus and web net thickness apply to areas clear of the end brackets.
- The offered net sectional properties of primary supporting members and the hull girder are to be equal to or greater than the required net sectional properties which are to be based on the gross offered scantling with a reduction of the applicable corrosion addition, as specified in Table 1, applied to all component structural members.
- The strength assessment methods prescribed are to be assessed by applying the corrosion reduction specified in Table 1 to the offered gross scantlings. Half of the applied corrosion addition specified in Table 1 is to be deducted from both sides of the

structural members being considered.

- Corrosion additions are not to be taken less than those given in Ch3, Sec 3, [1.2].

Any additional thickness specified by the owner or the builder is not to be included when considering the compliance with the Rules.

The net cross-sectional area, the moment of inertia about the y-axis and the associated neutral axis position are to be determined applying a corrosion magnitude of 0.5 t_c deducted from the surface of the profile cross- section.

Assessment for corrosion applied to the gross scantlings Table1

Structural requirement	Property/analysis type	Applied corrosion addition
Minimum thickness (all members including PSM)	Thickness	t_c
Local strength (plates, stiffeners, and hold frames)	Thickness/sectional properties	t_c
	Stiffness / proportions /Buckling capacity	t_c
Primary supporting members (prescriptive)	Sectional properties	$0.5t_c$
	Stiffness/proportions of web and flange Buckling capacity	t_c
Strength assessment by FEM	Cargo tank/cargo hold	$0.5t_c$
	Buckling capacity	t_c
	Local fine mesh	$0.5t_c$
	Specified fine mesh areas	$0.5t_c$
Hull girder strength	Sectional properties	$0.5t_c$
	Buckling capacity	t_c
Hull girder ultimate strength Hull girder residual strength	Sectional properties	$0.5t_c$
	Buckling/collapse capacity	$0.5t_c$
Fatigue assessment (simplified stress analysis)	Hull girder section properties Local support member	$0.5t_c$
Fatigue assessment (FE Stress analysis)	Coarse mesh FE model Very fine mesh portion	$0.5t_c$

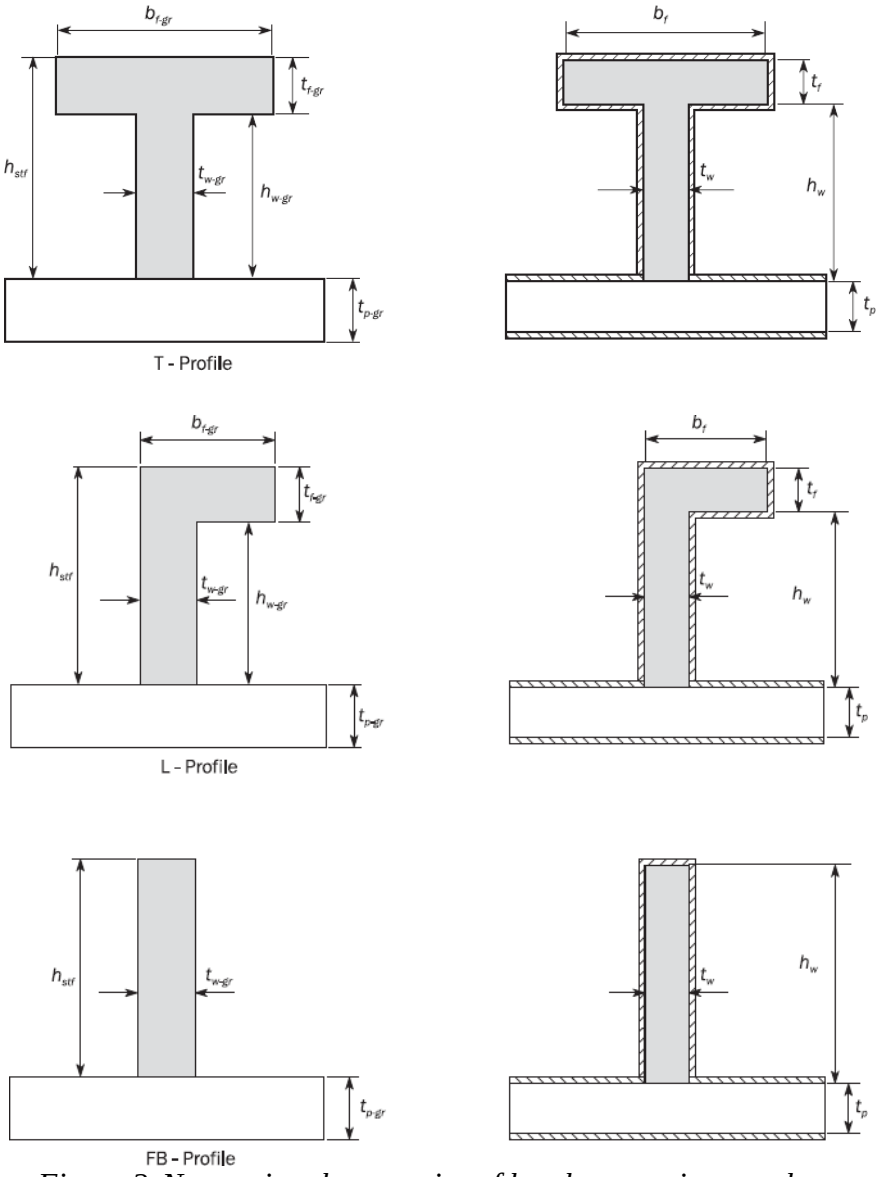

Figure 2 Net sectional properties of local supporting members

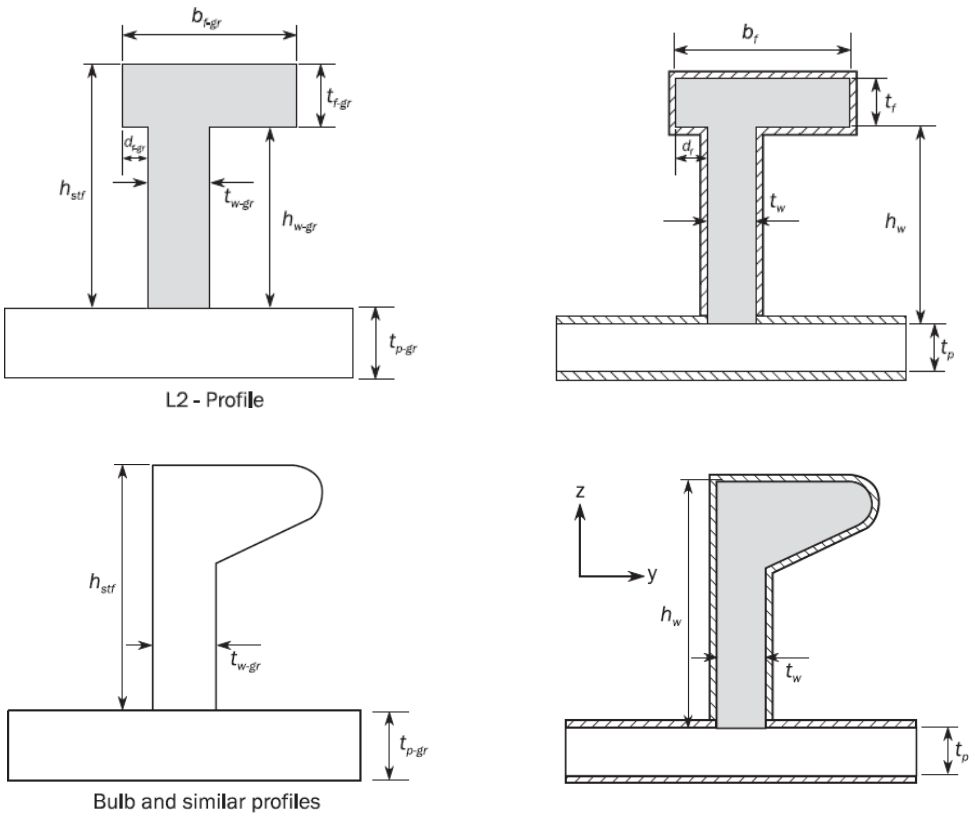

Figure 3 Net sectional properties of local supporting members (continued)

Section 3 CORROSION ADDITIONS

SYMBOLS

t_c : Corrosion addition, in mm.

t_{c1}, t_{c2} : Corrosion addition, in mm, on one side of the considered structural member, as defined in Table 1.

t_{res} : Reserve thickness, taken as 0.5 mm.

1 GENERAL

1.1 Applicability

1.1.1

The corrosion additions given in these Rules are applicable to carbon-manganese steels, stainless steels, stainless clad steels and aluminium alloys. Corrosion addition for the exposed carbon steel side of stainless clad structure is to be as required in Table 1 for the corresponding compartment.

The corrosion additions for other materials are to be in accordance with the requirements of the Society.

ISC 1.1.1a Where other materials are used, the corrosion additions of materials are to be determined in accordance with the submitted corrosion resistance information of materials. Such information is to include testing and/or historic data demonstrating that corrosion additions meet the design life of 25 years and is subject to the agreement of ISC.

1.2 *Corrosion addition determination 1.2.1*

The corrosion addition for each of the two sides of a structural member, t_{c1} or t_{c2}, is specified in Table 1.

The total corrosion addition, *tc*, in mm, for both sides of the structural member is obtained by the following formula:

$t_c = Roundup_{0.5}(t_{c1} + t_{c2}) + t_{res}$

For an internal member within a given compartment, the total corrosion addition, *tc* is obtained from the following formula:

$t_c = Roundup_{0.5} (2t_{c1}) + t_{res}$

where t_{c1} is the value specified in Table 1 for one side exposure to that compartment.

$Roundup_{0.5}$ (t) means that *t* is rounded to the upper half millimetre.

The total corrosion addition, t_c, in mm, for compartment boundaries and internal members made from stainless steel, or aluminium is to be taken as:

$t_c = t_{res} = 0.5$

In case of stainless clad steel, the corrosion additions, t_{c1}, for the carbon steel side and t_{c2}, for the stainless steel side are respectively to be taken as:

- t_{c1} as specified for the corresponding compartment in Table 1
- $t_{c2} = 0$

1.2.2 *Minimum value of total corrosion addition*

The total corrosion addition is not to be taken less than 2 mm except for web and face plate of stiffeners or in way of internals of dry spaces where 1.5 mm is applicable.

These minimum values of corrosion addition are not applicable to structural members made of stainless steels, stainless clad steels or aluminium alloys.

1.2.3 *Stiffener*

The corrosion addition of a stiffener is determined according to the location of its connection to the attached plating.

1.2.4
When a local structural member/plate is affected by more than one value of corrosion addition, the most onerous value is to be applied to the entire strake.

However, for the vertical corrugations arranged by vertical seams in oil tankers, the actual corrosion additions above and below the line 3m below top of tank (as defined in Table 1) can be used for the parts above and below the line, respectively.

</table>

Compartment type	Structural member	t_{c1} or t_{c2}		
		Oil tankers	BC-A or BC-B ships with $L_{LL} \geq 150$ m	Other BC ships

(1) 1.0 mm is to be added to the plate surface within 3m above the upper surface of the chain locker bottom.
(2) 0.5 mm is to be added to the plate surface exposed to ballast for the plate boundary between water ballast and heated cargo oil tanks/slop tanks. 0.3mm is to be added to each surface of the web and face plate of a stiffener in a ballast tank and attached to the boundary between water ballast and heated cargo oil tanks or heated fuel/lube oil tanks/slop tanks. Heated oil tanks are defined as tanks/slop tanks arranged with any form of heating capability (the most common type is heating coils).
(3) 0.7 mm is to be added to the plate surface exposed to ballast for the plate boundary between water ballast and heated fuel oil or lube oil tanks.
(4) Only applicable to cargo tanks/slop tanks and ballast tanks with weather deck as the tank top. The 3 m distance is measured vertically from and parallel to the top of the tank.
(5) Dry bulk cargo hold includes holds intended for the carriage of dry bulk cargoes, which may carry water ballast.
(6) Upper part of the cargo holds correspond to an area above the connection between the topside and the inner hull or side shell.
If there is no topside, the upper part corresponds to the upper one third of the cargo hold height (where a plane bulkhead is fitted in way of a dry bulk cargo hold, the upper part of the bulkhead is defined in the same manner).
(7) If there is no lower stool fitted (i.e. engine room bulkhead or fore peak bulkhead) or if a plane bulkhead is fitted, then this corrosion addition should be applied up to a height level with the opposing bulkhead stool in that hold. In the case where a stool is not fitted on the opposing bulkhead, the vertical extent of this zone is to be from the inner bottom to a height level with the top of the adjacent hopper sloping plate, but need not be taken as more than 3 m.
(8) For the determination of the corrosion addition of the outer shell plating, the pipe tunnel is considered as for a water ballast tank.

Section 4 CORROSION PROTECTION

1 GENERAL

1.1 Structures to be protected

1.1.1 Dedicated seawater ballast tanks

All dedicated seawater ballast tanks are to have an efficient corrosion prevention system.

ISC 1.1.1a Dedicated seawater ballast tanks of all types of ships of not less than 500 gross tonnage and double-side skin spaces arranged in bulk carriers of 150 m in length and upwards are to comply with the requirements of IMO SOLAS Regulation II-1/3-2 and to be coated during construction in accordance with the Performance standard for protective coatings for dedicated seawater ballast tanks in all types of ships and double-side skin spaces of bulk carriers (PSPC-WBT).

1.1.2 *Cargo oil tanks*

Cargo oil tanks are to be protected in compliance with the requirements specified in Pt 2, Ch2, Sec 2, [1].

ISC 1.1.2a Cargo oil tanks of crude oil tankers of 5,000 tons deadweight and above are to comply with the requirements of IMO SOLAS Regulation II-1/3-11 and to be coated during construction in accordance with the Performance standard for protective coatings for cargo oil tanks of crude oil tankers (PSPC-COT) or protected by alternative means of corrosion protection or utilization of corrosion resistance material to maintain required structural integrity for 25 years in accordance with the Performance standard for alternative means of corrosion protection for cargo oil tanks of crude oil tankers.

1.1.3 *Bulk carriers*

Void double side skin spaces and cargo holds of bulk carriers are to be protected in compliance with the requirements specified respectively in Pt 2, Ch1, Sec 2, [2.2] and Pt 2, Ch1, Sec 2, [2.3].

1.1.4 *Narrow spaces*

Narrow spaces are generally to be filled by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

2 *SACRIFICIAL ANODES*

2.1 Attachment of anodes to the hull

2.1.1

All anodes are to be attached to the structure in such a way that they remain securely fastened both initially and during service even when it is wasted. The following methods are acceptable:

a) Steel core connected to the structure by continuous fillet welds.
b) Attachment to separate supports by bolting, provided a minimum of two bolts with lock nuts are used. However, other mechanical means of clamping may be accepted.

2.1.2

Anodes are to be attached to stiffeners or aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

2.1.3

Where cores or supports are welded to local support members or primary supporting members, they are to be kept clear of end supports, toes of brackets and similar stress raisers. Where they are welded to asymmetrical members, the welding is to be at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate, but well clear of the free edges. Generally, anodes are not to be fitted to a face plate of higher strength steel.

2.1.4 *Cargo oil tanks*

Cathodic protection systems, if fitted in cargo oil tanks, are to comply the requirements specified Pt 2, Ch2, Sec 2, [1].

Section 5 LIMIT STATES

1 GENERAL

1.1 Limit states

1.1.1 Definition

A limit state is defined as a state beyond which the structure no longer satisfies the requirements. The following categories of limit states are relevant for structures:

- Serviceability limit state (SLS), which corresponds to conditions beyond which specified requirements are no longer met.
- Ultimate limit state (ULS), which corresponds to the maximum load carrying-capacity or, in some cases, to the maximum applicable strain or deformation, under intact (undamaged) conditions.
- Fatigue limit state (FLS), which corresponds to degradation due to effect of time varying (cyclic) loading.
- Accidental limit state (ALS), which concerns the ability of the structure to resist accident situations.

1.1.2 *Serviceability limit state*

Serviceability limit state, which concerns the normal use, includes:

- Local damage which may reduce the working life of the structure or affect the efficiency or appearance of structural members or non-structural elements.
- Unacceptable deformations which affect the efficient use and appearance of structural or non- structural elements or the functioning of safety equipment.

In the context of serviceability limit state, the term ‘appearance’ is concerned with such criteria as high deflection and extensive cracking, rather than aesthetics.

1.1.3 *Ultimate limit state*

Ultimate limit state, which corresponds to the maximum load-carrying capacity, or in some cases, the maximum applicable strain or deformation, includes:

- Attainment of the maximum resistance capacity of sections, members or connections by rupture or excessive deformations or instability (buckling).
- Excessive yielding, transforming the structure or part of it into a plastic mechanism.

1.1.4 *Fatigue limit state*

Fatigue limit states assess that the fatigue capacity of structural members due to cyclic loads is greater than the design fatigue life.

1.1.5 *Accidental limit state*

Accidental limit states are concerned with the ability of the structure to resist accident situations or abnormal events. Flooded conditions of any compartment without progression of the flooding to another compartment are considered. The limit states are concerned with the following in intact (undamaged) conditions with accidental or abnormal loads, or in damaged conditions with environmental loads the ship meets during a limited time frame:

- The safety of life.
- Environment.
- Property (ship and cargo).

Accidental limit state includes:

- Loss of structural strength without loss of containment.
- Loss of structural strength and loss of containment.

1.2 *Failure modes*

1.2.1

A number of possible failure modes may be relevant for the various parts of the ship structure. For each failure mode, one or more limit states may be relevant. The failure modes to be considered for the assessment of ship structural safety with relation to the limit states are shown in Table 1.

Failure modes in relation to the limit states to be considered *Table1*

Possible failure modes to be considered	Limit states(1)			
	SLS	ULS	FLS	ALS
Yielding	Y	Y	-	Y
Plastic collapse	-	Y	-	Y
Buckling	Y	Y	-	Y
Rupture	-	Y	-	Y
Fatigue cracking	-	-	Y	-
Brittle fracture (2)	-	-	-	-

(1) "Y" indicates that the structural assessment is to be carried out.
(2) Controlled by the material rule requirement of steel grade.

1.2.2 Yielding

The yielding failure mode is the mode in which plastic strain locally occurs in the structural members to be considered under combined in-plane and normal stresses. Local plastic strain is controlled in SLS, ULS and ALS by checking that the stresses caused in the structural members remains below a permissible value.

1.2.3 *Plastic collapse*

The plastic collapse failure mode usually appears in the local structural members under large lateral impact pressure. In this failure mode, permanent lateral deflection in the local structural members occurs, but does not influence the global strength. This mode is controlled in ULS and ALS by using conventional plastic design method.

1.2.4 *Buckling*

The buckling failure mode is the instability phenomena of structural members under compressive loads. When the stress in structural members just attains the elastic buckling stress, elastic (reversible) buckling occurs during the compressive load. This buckling failure mode is controlled in SLS. By further increasing the compressive load, stress redistribution occurs due to buckling of the weakest structural member and the stress in some structural members reaches the yield stress. This buckling failure mode with large elastic deflection is controlled in ULS or ALS. When compression is unloaded, no consequence of failure due to buckling is seen.

On the other hand, plastic (irreversible) buckling occurs when the stress in structural members exceeds the yield stress. As a result, the substantial permanent deflections due to plastic buckling appear. This irreversible buckling failure mode is controlled only in ULS or ALS for global hull girder strength.

1.2.5 *Rupture*

The rupture failure mode is the mode in which breaking occurs in the structural members to be considered under large tensile stress beyond the yield stress of the material. This failure mode is controlled in ULS or ALS, but the assessment of this failure mode is covered by controlling the yielding failure.

1.2.6 *Brittle fracture*

Brittle fracture is dependent upon the material, temperature and thickness. Therefore, this mode is controlled by the material rule requirement of steel grade.

1.2.7 *Fatigue cracking*

This failure mode is different from the failure modes mentioned above and is controlled in FLS.

2 CRITERIA

2.1 General

2.1.1

Criteria are prescribed in the Rules to check the relevant limit states for the various structural elements. The strength assessments included in the Rules are defined in terms of yield check, buckling check, ultimate strength check, and fatigue check as indicated in Table 2.

Structural assessment **Table2**

Structural Elements (1)		Yielding check	Buckling check	Ultimate strength check	Fatigue check
Local Structures	Stiffeners	Y	Y	Y(2)	Y
	Plating	Y	Y	Y(3)	-
Primary supporting members		Y	Y	Y(2)	Y
Hull girder		Y	Y(4)	Y	-

(1) "Y" indicates that the structural assessment is to be carried out.
(2) The ultimate strength check is included in the buckling check.
(3) The ultimate strength check of plating is included in the yielding check formula of plating.
(4) The buckling check of stiffeners and plating taking part in hull girder strength is performed against stress due to hull girder bending moment and hull girder shear force.

2.2 Serviceability limit states

2.2.1 Hull girder

For the yielding check of the hull girder, the stress corresponds to a load at 10-8 probability level.

2.2.2 *Plating*

For the yielding check and buckling check of platings constituting a primary supporting member, the stress corresponds to a load at 10^{-8} probability level.

2.2.3 *Stiffeners*

For the yielding check of stiffeners, the stress corresponds to a load at 10-8 probability level.

2.3 *Ultimate limit states*

2.3.1 Hull girder

The ultimate strength of the hull girder is to be checked against the hull girder loads at 10^{-8} probability level, amplified with the partial safety factor.

2.3.2 *Plating*

The ultimate strength of the plating between stiffeners and primary supporting members is to be checked against the loads at 10^{-8} probability level.

2.3.3 *Stiffeners*

The ultimate strength of stiffeners is to be checked against the loads at 10^{-8} probability level.

2.4 *Fatigue limit state*

2.4.1 Structural details

The fatigue life of representative welded structural details such as connections of stiffeners and primary supporting members and free edge of bulk carrier deck plating in way of hatch corner is to be assessed from long term distribution loads based on loads at 10^{-2} probability level including the whipping-springing effects.

2.5 *Accidental limit state*

2.5.1 Hull girder

For bulk carriers, the yielding and ultimate strength of the hull girder in cargo hold flooded condition and in the damaged condition is to be assessed in accordance with Ch 5, Sec 1 and Ch 5, Sec 2.

The residual strength of oil tankers and bulk carriers is to be assessed according to Ch 5, Sec 3, for damages resulting from collision or grounding.

2.5.2 *Double bottom structure*

For bulk carriers, the double bottom structure in cargo hold flooded condition is to be assessed in accordance with Pt 2, Ch 1, Sec 3.

2.5.3 *Bulkhead structure*

For bulk carriers, the bulkhead structure in cargo hold flooded condition is to be assessed in accordance with Pt 2, Ch 1, Sec 3 and Pt 2, Ch 1, Sec 4.

2.5.4 *Plating, stiffeners and PSM*

The plating, stiffeners and PSM are to be assessed in flooded conditions in accordance with Ch 6 for yielding criteria and with Ch 8, Sec 3 for buckling criteria.

3 STRENGTH CHECK AGAINST IMPACT LOADS

3.1 General

3.1.1

Structural response against impact loads such as forward bottom slamming, bow impact and grab chocks depends on the loaded area, magnitude of loads and structural grillage.

3.1.2

The ultimate strength of structural members that constitute the grillagei.e. platings between stiffeners and primary supporting members and stiffeners with attached platingis to be checked against the maximum impact loads acting on them.

Section 6 STRUCTURAL DETAIL PRINCIPLES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 APPLICATION

1.1 General

1.1.1

If not specified otherwise, the requirements of this section apply to the hull structure except superstructures and deckhouses.

2 GENERAL PRINCIPLES

2.1 Structural continuity

2.1.1 General

Attention is to be paid to the structural continuity, in particular in the following areas:

- In way of changes in the framing system.
- At end connections of primary supporting members or ordinary stiffeners.
- In way of the transition zones between cargo hold region and fore part, aft part and machinery space.
- In way of side and end bulkheads of superstructures.

At the termination of a structural member, structural continuity is to be maintained by the fitting of suitable supporting structure.

Abrupt changes in transverse section properties of longitudinal members are to be avoided. Smooth transitions are to be provided.

2.1.2 *Longitudinal members*

Longitudinal members are to be arranged in such a way that continuity of strength is maintained.

Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously as far as practicable towards the ends of the ship.

In particular, the structural continuity in way of longitudinal bulkheads within the cargo hold region, is to be maintained outside the cargo hold region. Large transition brackets (e.g. scarfing brackets) fitted in line with the longitudinal bulkhead are a possible means to achieve such structural continuity.

2.1.3 *Primary supporting members*

Primary supporting members are to be arranged in such a way that continuity of strength is maintained. Abrupt changes of web height or cross section are to be avoided.

2.1.4 *Stiffeners*

Stiffeners are to be arranged in such a way that continuity of strength is maintained.

Stiffeners contributing to the hull girder longitudinal strength are to be continuous when crossing primary supporting members within the 0.4L amidships and as far as practicable outside 0.4L amidships.

Where stiffeners are terminated in way of large openings, foundations and partial girders, compensation is to be arranged to provide structural continuity in way of the end connection.

2.1.5 *Plating*

Where plates with different thicknesses are joined, the change in the as-built plate thickness is not to exceed 50% of larger plate thickness in the load carrying direction. This also applies to the strengthening by local inserts, e.g. insert plates in double bottom girders, floors and inner bottom.

2.1.6 *Weld joints*

Weld joints are to be avoided in areas with high stress concentration.

2.2 *Local reinforcements*

2.2.1 Reinforcements at knuckles

a) Knuckles are in general to be stiffened to achieve out-of-plane stiffness by fitting ordinary stiffeners or equivalent means in line with the knuckle.

b) Whenever a knuckle in a main member (shell, longitudinal bulkhead etc) is arranged, stiffening in the form of webs, brackets or profiles is to be connected to the members to which they are to transfer the load (in shear). See example of reinforcement at upper hopper knuckle in Figure 1.

c) For longitudinal shallow knuckles, closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.

d) Generally, the distance between the knuckle and the support stiffening in line with the knuckle is not to be greater than 50 mm. Otherwise, fatigue analysis according to Ch 9 is to be submitted by the designer.

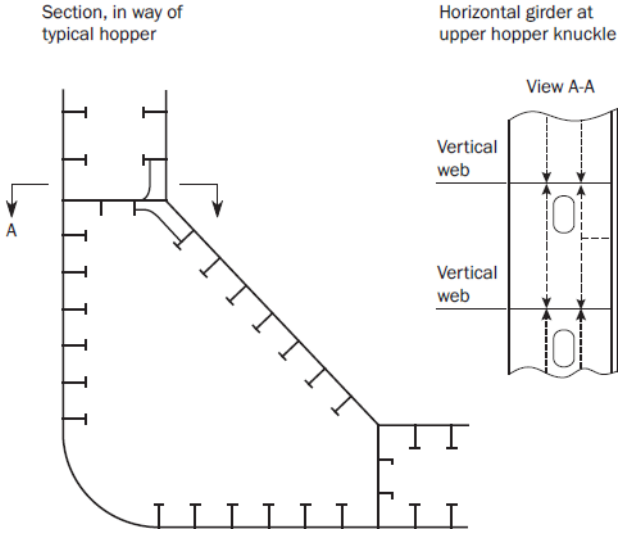

Figure 1 Example of reinforcement at knuckles

2.2.2 Reinforcement in way of attachments for permanent means of access

Local reinforcement, considering location and strength, is to be provided in way of attachments to the hull structure for permanent means of access.

2.2.3 *Reinforcement of deck structure in way of concentrated loads*

The deck structure is to be reinforced in way of concentrated loads, such as anchor windlass, deck machinery, cranes, masts and derrick posts.

2.2.4 *Reinforcement by insert plates*

Insert plates are to be made of materials with, at least, the same specified minimum yield stress and the same grade as the plates to which they are welded. See also [2.1.5].

2.3 *Connection of longitudinal members not contributing to the hull girder longitudinal strength*

2.3.1

Where the hull girder stress at the strength deck or at the bottom as defined in Ch 5, Sec 1, [2.2.2] is higher than the permissible stress as defined in Ch 5, Sec 1, [2.2.1] for normal strength steel, longitudinal members not contributing to the hull girder longitudinal strength and welded to the strength deck or bottom plating and bilge plating, such as longitudinal hatch coamings, gutter bars, strengthening of deck openings, bilge keel, are to be made of steel with the same specified

minimum yield stress as the strength deck or bottom structure steel.

2.3.2
The requirement in [2.3.1] is also applicable to non-continuous longitudinal stiffeners welded on the web of a primary structural member contributing to the hull girder longitudinal strength such as hatch coamings, stringers and girders or on the inner bottom when the hull girder stress on those members is higher than the permissible stress as defined in Ch 5, Sec 1, [2.2.1] for normal strength steel.

3 STIFFENERS

3.1 General

3.1.1
All types of stiffeners (excluding web stiffeners) are to be connected at their ends. However, in special cases such as isolated areas of the ship where end connections cannot be applied, sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in [3.2] to [3.4].

3.1.2
Where the angle between the web plate of the stiffener and the attached plating is less than 50 deg as shown on Figure 2, a tripping bracket is to be fitted. If the angle between the web plate of an unsymmetrical stiffener and the attached plating is less than 50 deg, the face plate of the stiffener is to be fitted on the side of open angle.

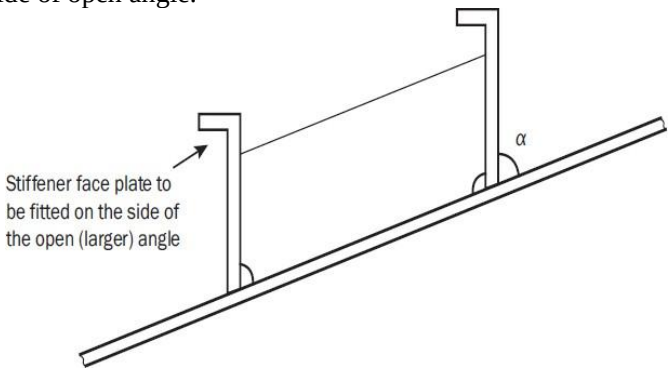

Figure 2 Stiffener on attached plating with an angle less than 50 deg

3.2 Bracketed end connections of non-continuous stiffeners

3.2.1
Where continuity of strength of longitudinal members is provided by brackets, the alignment of the brackets on each side of the primary supporting member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross sectional area are not less than those of the member.

3.2.2
At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member.

3.2.3
The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection, is the section modulus to be less than that required for the stiffener.

3.2.4 *Net web thickness*
The net bracket web thickness, t_b, in mm, is to comply with the following:

$$t_b \geq (2 + f_{bkt}\sqrt{Z})\sqrt{\frac{R_{eH-stf}}{R_{eH-bkt}}} \text{ and need not be greater than 13.5 mm.}$$

where:
f_{bkt} : Coefficient taken as:

f_{bkt} = 0.2 for brackets with flange or edge stiffener.
f_{bkt} = 0.3 for brackets without flange or edge stiffener.

Z : Net required section modulus, of the stiffener, in cm*3*. In the case of two stiffeners connected, Z is the smallest net required section modulus of the two connected stiffeners.

$R_{eH\text{-}stf}$: Specified minimum yield stress of the stiffener material, in N/mm^2.

$R_{eH\text{-}bkt}$: Specified minimum yield stress of the bracket material, in N/mm^2.

3.2.5 *Brackets at the ends of non-continuous stiffeners*

Brackets are to be fitted at the ends of non-continuous stiffeners, with arm lengths, l_{bkt}, in mm, taken as:

$$l_{bkt} = c_{bkt}\sqrt{\frac{Z}{t_b}}$$

l_{bkt} is not to be taken less than:

- l_{bkt} = 1.8h_{stf} for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, see item (c) in Figure 3.
- l_{bkt} = 2.0h_{stf} for other cases, see items (a), (b) and (d) in Figure 3.

where:

c_{bkt}: Coefficient taken as:

- c_{bkt} =65 for brackets with flange or edge stiffener.
- c_{bkt} =70 for brackets without flange or edge stiffener.

Z: Net required section modulus, for the stiffener, in cm*3*, as defined in [3.2.4].

t_b: Minimum net bracket thickness, in mm, as defined in [3.2.4].

For connections similar to item (b) in Figure 3, but not lapped, the bracket arm length is to comply with $l_{bkt} \geq 2.0h_{stf.}$

For connections similar to items (c) and (d) in Figure 3 where the smaller stiffener is connected to a primary supporting member or bulkhead, the bracket arm length is not to be less than two times of h_{stf}.

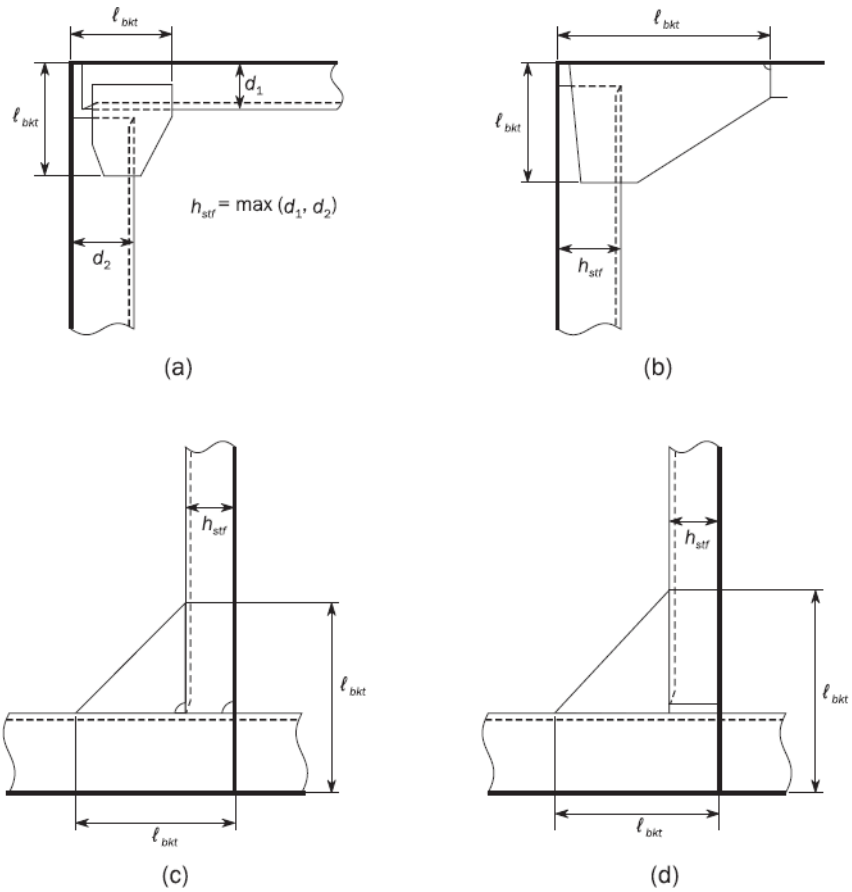

Figure 3 Bracket arm length of non-continuous stiffeners

3.2.6 Brackets with different arm lengths

The lengths of the arms, measured from the plating to the toe of the bracket, are to be such that the sum of them is greater than $2l_{bkt}$ and each arm not to be less than 0.8 l_{bkt}, where l_{bkt} is as defined in [3.2.5].

3.2.7 *Edge stiffening of bracket*

Where an edge stiffener is required, the web height of the edge stiffener, h_w, in mm, is not to be less than:

$$h_w = 45\left(1+\frac{Z}{2000}\right) \quad \text{but not less than 50 mm.}$$

where:

Z : Net section modulus, of the stiffener, in cm^3, as defined in [3.2.4].

3.3 *Bracketless connections*

3.3.1

The design of bracketless connections is to be such as to provide adequate resistance to rotation and displacement of the connection.

3.4 *Sniped ends*

3.4.1

Sniped ends may be used where dynamic loads are small, provided the net thickness of plating supported by the stiffener, t_p, is not less than:

$$t_p = c_1\sqrt{\left(1000l-\frac{s}{2}\right)\frac{sPk}{10^6}}$$

where:

P : Design pressure for the stiffener for the design load set being considered, in kN/m^2.

c_1 : Coefficient for the design load set being considered, to be taken as:

c_1 = 1.2 for acceptance criteria set AC-S.
c_1 = 1.1 for acceptance criteria set AC-SD.

Sniped stiffeners are not to be used on structures in the vicinity of engines or generators in the machinery space, propeller impulse zone in the stern area nor on the shell envelope.

3.4.2
Bracket toes and sniped stiffeners ends are to be terminated close to the adjacent member. The distance is not to exceed 40 mm unless the bracket or member is supported by another member on the opposite side of the plating. Tapering of the sniped end is not to be more than 30 deg, where it is not practical to comply with this requirement, alternative arrangements are specially considered. The depth of toe or sniped end is, generally, not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15 mm.

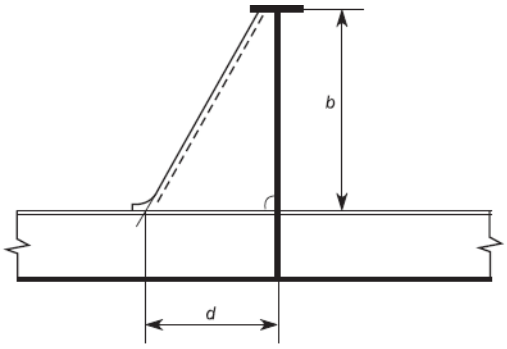
4 PRIMARY SUPPORTING MEMBERS (PSM)

4.1 General

4.1.1
Primary supporting members web stiffeners, tripping brackets and end brackets are to comply with [4.2] to [4.4]. Where the structural arrangement is such that these requirements cannot be complied with, adequate alternative arrangement has to be demonstrated by the designer.

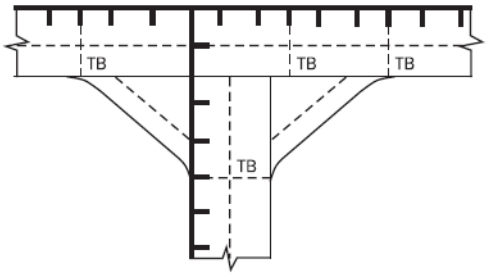
4.2 *Web stiffening*

arrangement 4.2.1
Web stiffeners arranged on primary supporting members are to comply with the requirements to scantlings of such stiffeners are given in Ch 8, Sec 2, [4.2].



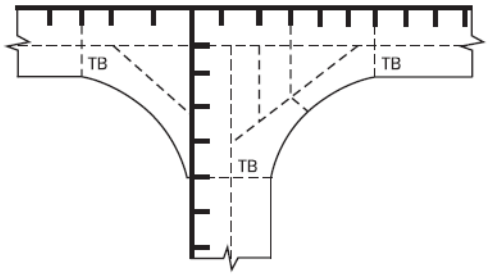
4.3 *Tripping bracket*

arrangement 4.3.1
Tripping brackets (see Figure 4) are generally to be fitted:



- At positions along the member span such that it satisfies the criteria of Ch 8, Sec 2, [5.1] for tripping bracket spacing and flange slenderness.
- At the toe of end brackets.
- At ends of continuous curved face plates.
- In way of concentrated loads.
- Near the change of section.

4.3.2
Where the width of the symmetrical face plate is greater than 400 mm, backing brackets are to be fitted in way of the tripping brackets.



4.3.3
Where the face plate of the primary supporting member exceeds 180 mm on either side of the web, a tripping bracket is to support the face plate.

Tripping bracket in way of stiffener

Tripping brackets at the toe of end brackets

Tripping brackets at the ends of continuous curved face plates

Figure 4 Primary supporting member: Tripping bracket arrangement

4.3.4 Arm length

The arm length of tripping brackets is not to be less than the greater of the following values, in m:

$d = 0.38\,b$

$$d = 0.85b\sqrt{\frac{s_t}{t}}$$

where:

b : Height, in m, of tripping brackets, shown in Figure 4.

s_t : Spacing, in m, of tripping brackets.

t : Net thickness, in mm, of tripping brackets.

For tripping brackets in way of superstructures or deckhouses, only $d = 0.38\,b$ is to be applied.

4.4 *End connections*

4.4.1 General

Brackets or equivalent structure are to be provided at ends of primary supporting members. End brackets are generally to be soft-toed.

Bracketless connections may be applied provided that there is adequate support of adjoining face plates.

4.4.2 *Scantling of end brackets*

In general, the arm lengths of brackets connecting PSMs, as shown in Figure 5 are not to be less than the web depth of the member, and need not be taken greater than 1.5 times the web depth.

Within the cargo hold region the thickness of the bracket is, in general, not to be less than that of the adjoining PSM web plate. Outside of the cargo hold region the thickness of the bracket is not to be less than that of the PSM web plate.

Scantlings of the end brackets are to be such that the section modulus of the PSM with end bracket, excluding face plate where it is sniped, is not to be less than that of the primary supporting member at mid-span.

The net cross sectional area, A_f, in cm^2, of face plates of brackets is not to be less than:
$A_f = l_b\, t_b$
where:
l_b : Length of bracket edge, in m, see Figure 5. For brackets that are curved, the length of the bracket edge may be taken as the length of the tangent at the midpoint of the edge.
t_b: Minimum net bracket thickness, in mm, as defined in [3.2.4].

Moreover, the net thickness of the face plate is to be not less than that of the bracket web.

4.4.3 *Arrangement of end brackets*
Where the length of free edge of bracket, l_b, is greater than 1.5m, the web of the bracket is to be stiffened as follows:

- The net sectional area, in cm^2, of web stiffeners is to be not less than $16.5l$, where l is the span, in m, of the stiffener.
- Tripping flat bars are to be fitted. Where the width of the symmetrical face plate is greater than 400 mm, additional backing brackets are to be fitted.

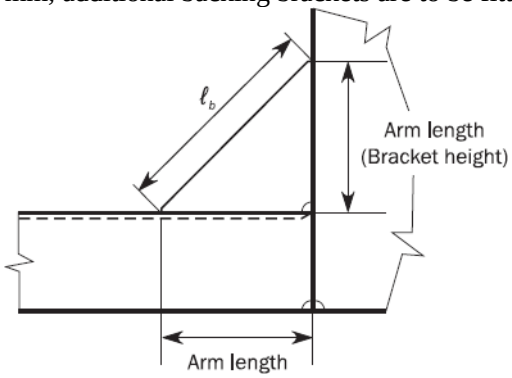


Figure 5 Dimension of brackets

For a ring system where the end bracket is integral with the webs of the members and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained close to the mid-point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the bracket toes.

Where a wide face plate abuts a narrower one, the taper is not to be greater than 1 to 4.

The toes of brackets are not to land on unstiffened plating. The toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15 mm. In general, the end brackets of primary supporting members are to be soft-toed. Where primary supporting members are constructed of higher strength steel, particular attention is to be paid to the design of the end bracket toes in order to minimise stress concentrations.

Where a face plate is welded onto the edge or welded adjacent to the edge of the end bracket (see Figure 6), the face plate is to be sniped and tapered at an angle not greater than 30°.

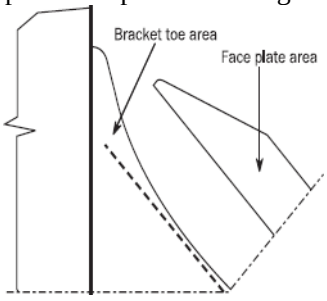

Figure 6 Bracket face plate adjacent to the edge

The details shown in this figure are only used to illustrate items described in the text and are not

intended to represent design guidance or recommendations.

5 INTERSECTION OF STIFFENERS AND PRIMARY SUPPORTING MEMBERS

5.1 Cut-outs

5.1.1

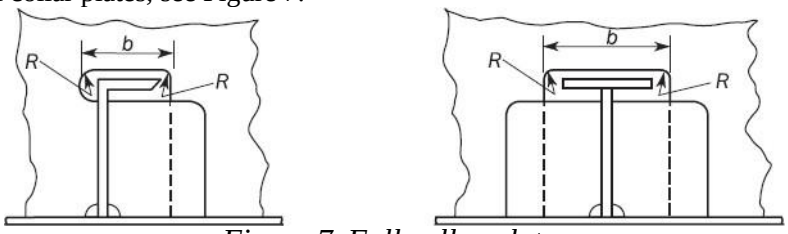
Cut-outs for the passage of stiffeners through the web of primary supporting members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and on the attached web stiffeners.

5.1.2

The total depth of cut-outs without collar plate is to be not greater than 50% of the depth of the primary supporting member.

5.1.3

Cut-outs in way of cross tie ends and floors under bulkhead stools or in high stress areas are to be fitted with full collar plates, see Figure 7.



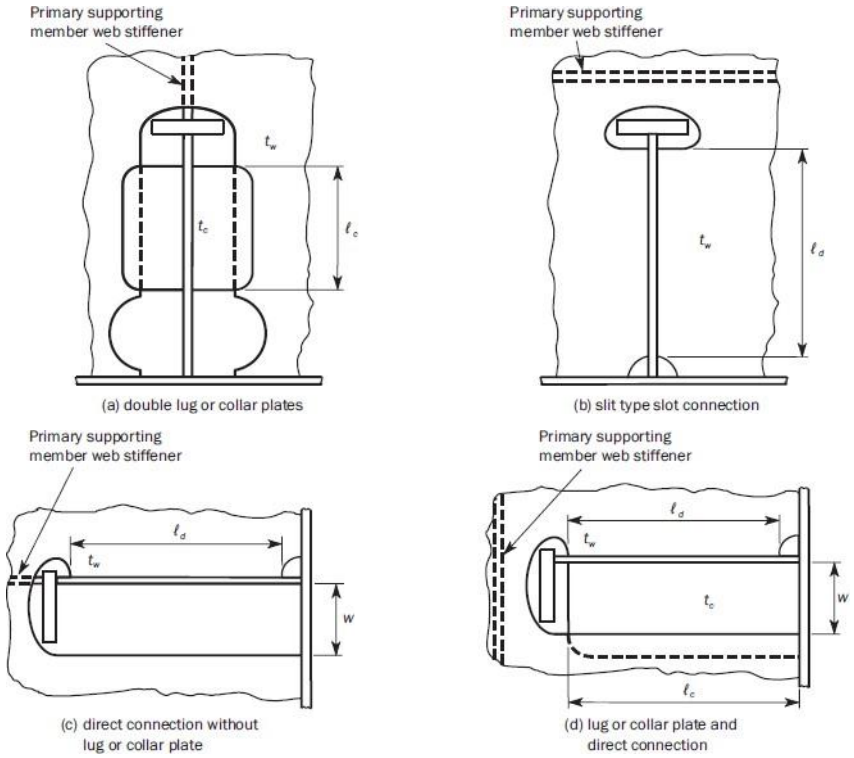


Figure 7 Full collar plates

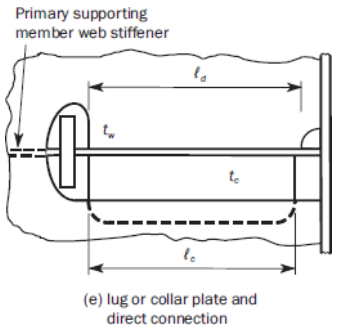
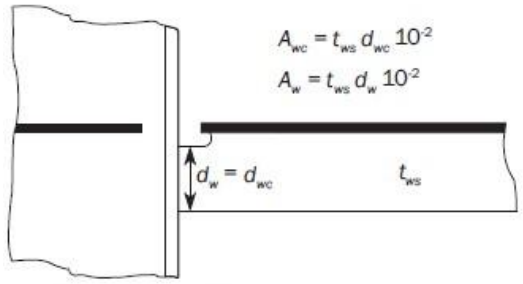
$R \geq 0.2b$ but not less than 25 mm.





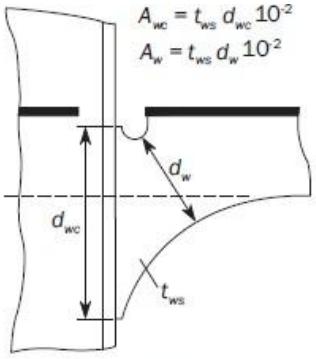


Figure 8 Symmetric and asymmetric cut-outs

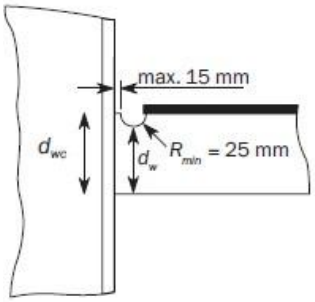
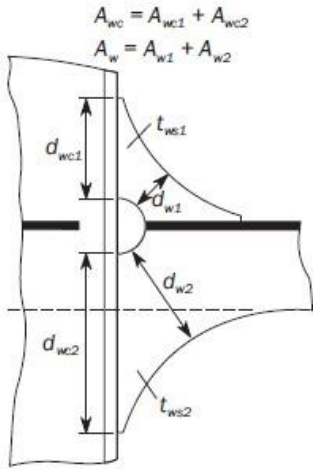


The details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance.



(a) Straight heel no bracket

(b) Soft toe and soft heel

(c) Keyhole in way of soft heel

(d) Symmetrical soft toe brackets

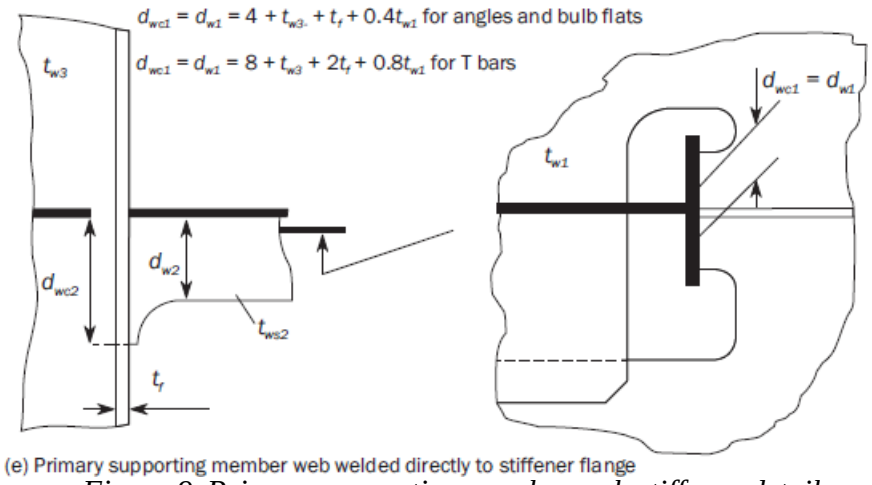


Figure 9 Primary supporting member web stiffener details

t_{ws}, t_{ws1}, t_{ws2} : Net thickness of the primary supporting member web stiffener/backing bracket, in mm.

d_w, d_{w1}, d_{w2} : Minimum depth of the primary supporting member web stiffener/backing bracket, in mm.

d_{wc}, d_{wc1}, d_{wc2}: Length of connection between the primary supporting member web stiffener/backing bracket and the stiffener, in mm.

t_f : Net thickness of the flange in mm. For bulb profile, t_f is to be obtained as defined in Pt.1 Ch.3 Sec.7 [1.4.1].

5.1.4

Lug type collar plates are to be fitted in cut-outs where required for compliance with the requirements of [5.2], and in areas of high stress concentrations, e.g. in way of primary supporting member toes. See Figure 8 for typical lug arrangements.

5.1.5

At connection to shell envelope longitudinals below the scantling draught, T_{sc} and at connection to inner bottom longitudinals, a soft heel is to be provided in way of the heel of the primary supporting member web stiffeners when the calculated direct stress, σ_w, in the primary supporting member web stiffener according to [5.2] exceeds 80% of the permissible values. The soft heel is to have a keyhole, similar to that shown in item (c) in Figure 9.

A soft heel is not required at the intersection with watertight bulkheads and primary supporting members, where a back bracket is fitted or where the primary supporting member web is welded to the stiffener face plate.

When calculating the direct stress, σ_w, the bottom slamming or bow impact loads using the design pressures defined in Ch 4, Sec 5, [3.2] and [3.3] need not be applied.

5.1.6

Cut-outs are to have rounded corners and the corner radii, R, are to be as large as practicable, with a minimum of 20% of the breadth, b, of the cut-out or 25 mm, whichever is greater. The corner radii, R, does not need to be greater than 50 mm, see Figure 7. Consideration is to be given to other shapes on the basis of maintaining equivalent strength and minimising stress concentration.

Note 1: Except where specific dimensions are noted for the details of the keyhole in way of the soft heel, the details shown in this figure are only used to illustrate symbols and definitions and are not intended to represent design guidance or recommendations.

5.2 *Connection of stiffeners to PSM*

5.2.1 General

For connection of stiffeners to PSM in case of lateral pressure, [5.2.2] and [5.2.3] are to be applied.

The cross sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with its appropriate permissible stress.

5.2.2

The load, W_1, in kN, transmitted through the shear connection is to be taken as follows.

- If the web stiffener is connected to the intersecting stiffener:

$$W_1 = W\left(\alpha_\alpha + \frac{A_1}{4 f_c A_w + A_1}\right)$$

- If the web stiffener is not connected to the intersecting stiffener:
  $W_1 = W$

where:

W: Total load, in kN, transmitted through the stiffener connection to the PSM taken equal to:

$$W = \frac{P_1 s_1\left(S_1 - \frac{s_1}{2000}\right) + P_2 s_2\left(S_2 - \frac{s_2}{2000}\right)}{2\sin\varphi_{w1}\sin\varphi_{w2}} 10^{-3}$$

P_1, P_2 : Design pressure applied on the stiffener for the design load set being considered, in kN/m^2, on each side of the considered connection. For bottom slamming or bow impact loads, P_1 and P_2 are the design pressure as defined in Ch 4, Sec 5, [3.2] and [3.3] respectively.

S_1, S_2: Spacing between the considered and the adjacent PSM on each side of the considered connection, in m.

s_1, s_2: Spacing of the stiffener, in mm, on each side of the considered connection.

α_a : Panel aspect ratio, not to be taken greater than 0.25.

$$\alpha_a = \frac{s}{1000S}$$

$$S = \frac{S_1 + S_2}{2}$$

$$s = \frac{s_1 + s_2}{2}$$

φ_{w1} : Angle between primary supporting member and attached plating, in deg, as defined in Ch 3 , Sec 7, Symbols and Ch 10, Sec 1, Figure 5.

φ_{w2} : Angle between stiffener and attached plating, in deg, as defined in Ch 3, Sec 7, Symbols and Ch 3, Sec 7,Figure 14.

A_1 : Effective net shear area, in cm^2, of the connection, to be taken equal to:

$A_1 = A_{1d} + A_{1c}$

In case of a slit type slot connections area, A_1, is given by:

$A_1 = 2A_{1d}$

In case of a typical double lug or collar plate connection area, A_1, is given by:

$A_1 = 2A_{1c}$

A_{1d} : Net shear connection area, in cm^2, excluding lug or collar plate, as given by:

$A_{1d} = l_d\, t_w\, 10^{-2}$

l_d : Length of direct connection between stiffener and PSM web, in mm.

t_w : Net web thickness of the primary supporting member, in mm.

A_{1c} : Net shear connection area, in cm^2, with lug or collar plate, given by:

$A_{1c} = f_1\, l_c\, t_c\, 10^{-2}$

l_c : Length of connection between lug or collar plate and PSM, in mm.

t_c : Net thickness of lug or collar plate, not to be taken greater than the net thickness of the adjacent PSM web, in mm.

f_1 : Shear stiffness coefficient, taken as:

$f_1 = 1.0$, for stiffeners of symmetrical cross section.

$f_1 = 140/w$, not to be taken greater than 1.0, for stiffeners of asymmetrical cross section.

w : Width of the cut-out for an asymmetrical stiffener, measured from the cut-out side of the stiffener web, in mm, as indicated in Figure 8.

A_w : Effective net cross sectional area, in cm^2, of the PSM web stiffener in way of the connection including backing bracket where fitted, as shown in Figure 9. If the PSM web stiffener incorporates a soft heel ending or soft heel and soft toe ending, A_w is to be measured at the throat of the connection, as shown in Figure 9.

f_c : Collar load factor taken equal to:

For intersecting stiffeners of symmetrical cross section:

$f_c = 1.85$ for $A_w \leq 14$

$f_c = 1.85 - 0.0441(A_w - 14)$ for $14 < A_w \leq 31$

$f_c = 1.1 - 0.013(A_w - 31)$ for $31 < A_w \leq 58$

$f_c = 0.75$ for $A_w > 58$

For intersecting stiffeners of asymmetrical cross section:

$$f_c = 0.68 + 0.0172 \frac{l_s}{A_w}$$

ls : Connection length equal to:

For a single lug or collar plate connection to the PSM:

$l_s = l_c$

For a single sided direct connection to the PSM:

$l_s = l_d$

In the case of a lug or collar plus a direct connection:

$l_s = 0.5\ (l_c + l_d)$

5.2.3

The load, W_2, in kN, transmitted through the PSM web stiffener is to be taken as:

- If the web stiffener is connected to the intersecting stiffener:

$$W_2 = W\left(1 - \alpha_\alpha - \frac{A_1}{4 f_c A_w + A_1}\right)$$

- If the web stiffener is not connected to the intersecting stiffener:

$W_2 = 0$

The values of A_w, A_{wc} and A_1 are to be such that the calculated stresses satisfy the following criteria:

- For the connection to the PSM web stiffener not in way of the weld: $\sigma_w \leq \sigma_{perm}$
- For the connection to the PSM web stiffener in way of the weld: $\sigma_{wc} \leq \sigma_{perm}$
- For the shear connection to the PSM web: $\tau_w \leq \tau_{perm}$

where:

W : Load, in kN, as defined in [5.2.2].

f_c : Collar load factor as defined in [5.2.2].

α_a : Panel aspect ratio, as defined in [5.2.2].

A_1 : Effective net shear area, in cm^2, as defined in [5.2.2].

A_w : Effective net cross sectional area, in cm^2, as defined in [5.2.2].

w : Direct stress, in N/mm^2, in the PSM web stiffener at the minimum bracket area away from the weld connection:

$$\sigma_w = \frac{10 W_2}{A_w}$$

σ_{wc} : Direct stress, in N/mm^2, in the PSM web stiffener in way of the weld connection:

$$\sigma_{wc} = \frac{10 W_2}{A_{wc}}$$

τ_w : Shear stress, in N/mm^2, in the shear connection to the PSM web:

$$\tau_w = \frac{10 W_1}{A_1}$$

A_{wc} : Effective net area, in cm^2, of the PSM web stiffener in way of the weld as shown in Figure 9.

σ_{perm} : Permissible direct stress given in Table 1 for AC-S ,AC-SD and AC-I, in N/mm^2.

τ_{perm} : Permissible shear stress given in Table 1 for AC-S , AC-SD and AC-I, in N/mm^2.

5.2.4
Where a backing bracket is fitted in addition to the PSM web stiffener, it is to be aligned with the web stiffener. The arm length of the backing bracket is not to be less than the depth of the web stiffener. The net cross sectional area through the throat of the bracket is to be included in the calculation of A_w as shown in Figure 9.

5.2.5
Lapped connections of PSM web stiffeners or tripping brackets to stiffeners are not permitted in the cargo hold region.

5.2.6
Where built-up stiffeners have their face plate welded to the side of the web, a symmetrical arrangement of connection to the PSM is to be fitted. This may be achieved by fitting backing brackets on the opposite side of the PSM or bulkhead. In way of the cargo hold region, the PSM web stiffener and backing brackets are to be butt welded to the intersecting stiffener web.

5.2.7
Where the web stiffener of the PSM is parallel to the web of the intersecting stiffener, but not connected to it, the offset PSM web stiffener is to be located in close proximity to the slot edge as shown in Figure 10. The ends of the offset web stiffeners are to be suitably tapered and softened.

ISC 5.2.7a Alternative arrangements are to be based on their ability to transmit load with equivalent effectiveness, and equivalence or substitution is to be granted in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules.

Permissible stresses for connection between stiffeners and PSMs

Table 1

Item	Direct stress, σ_{perm}, in N/mm^2			Shear stress, τ_{perm}, in N/mm^2		
	Acceptance criteria set			Acceptance criteria set		
	AC-S	AC-SD	AC-I	AC-S	AC-SD	AC-I
PSM web stiffener	$0.83R_{eH}$ (2)	R_{eH}	R_{eH}	-	-	-
PSM web stiffener to intersecting stiffener in way of weld connection: • Double continuous fillet • Partial penetration weld	$0.58R_{eH}$ (2) $0.83R_{eH}$ (1)(2)	$0.7R_{eH}$ (2) R_{eH} (1)	R_{eH} R_{eH}	- -	- -	- -
PSM stiffener to intersecting stiffener in way of lapped welding	$0.50R_{eH}$	$0.60R_{eH}$	R_{eH}	-	-	-
Shear connection including lugs or collar plates: • Single sided connection • Double sided connection	- -	- -	- -	$0.71\tau_{eH}$ $0.83\tau_{eH}$	$0.85\tau_{eH}$ τ_{eH}	τ_{eH} τ_{eH}

(1) The root face is not to be greater than one third of the gross thickness of the PSM stiffener.
(2) Permissible stresses may be increased by 5 percent where a soft heel is provided in way of the heel of the PSM web stiffener.

5.2.8
The size of the fillet welds is to be calculated according to Ch 12, Sec 3, [2.5] based on the weld factors given in Table 2. For the welding in way of the shear connection the size is not to be less than that required for the PSM web plate for the location under consideration.

Weld factors for connection between stiffeners and PSMs Table 2

Item	Acceptance criteria	Weld factor
PSM stiffener to intersecting stiffener	AC-S AC-SD AC-I	$0.6\sigma_{wc}/\sigma_{perm}$ not to be less than 0.38
Shear connection inclusive of lug or collar plate	AC-S AC-SD AC-I	0.38
Shear connection inclusive of lug or collar plate, where the web stiffener of the PSM is not connected to the intersection stiffener	AC-S AC-SD AC-I	$0.6\ \tau_w/\tau_{perm}$ not to be less than 0.44

Note 1:
τ_w : Shear stress, in N/mm^2, as defined in [5.2.3].
σ_{wc} : Stress, in N/mm^2, as defined in [5.2.3].
τ_{perm} : Permissible shear stress, in N/mm^2, see Table 1.
σ_{perm} : Permissible direct stress, in N/mm^2, see Table 1.
W : Load, in kN, as defined in [5.2.2].
A_1 : Effective net shear area, in cm^2, as defined in [5.2.2].
A_w : Effective net cross sectional area, in cm^2, as defined in [5.2.2].

6 OPENINGS

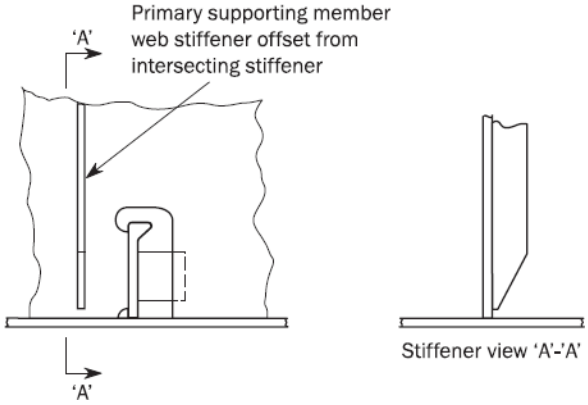
6.1 Openings and scallops in stiffeners

6.1.1

Figure 11 shows examples of air holes, drain holes and scallops. In general, the ratio of a/b, as defined in Figure 11, is to be between 0.5 and 1.0. In fatigue sensitive areas further consideration may be required with respect to the details and arrangements of openings and scallops.

6.1.2

Openings and scallops are to be kept at least 200 mm clear of the toes of end brackets, end connections and other areas of high stress concentration, measured along the length of the stiffener toward the mid-span and 50 mm measured along the length in the opposite direction, see Figure 12. In areas where the shear stress is less than 60 percent of the permissible stress, alternative arrangements may be accepted.



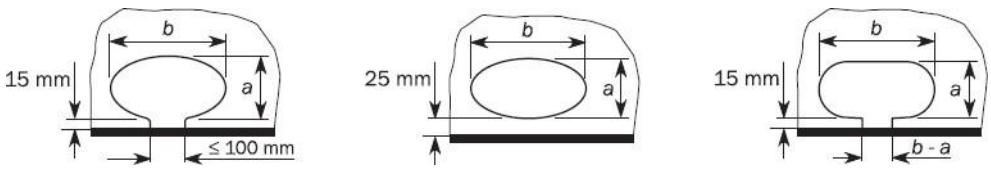


Figure 10 Offset PSM web stiffeners

The details shown in this figure are for guidance and illustration only.

Figure 11 Examples of air holes, drain holes and scallops

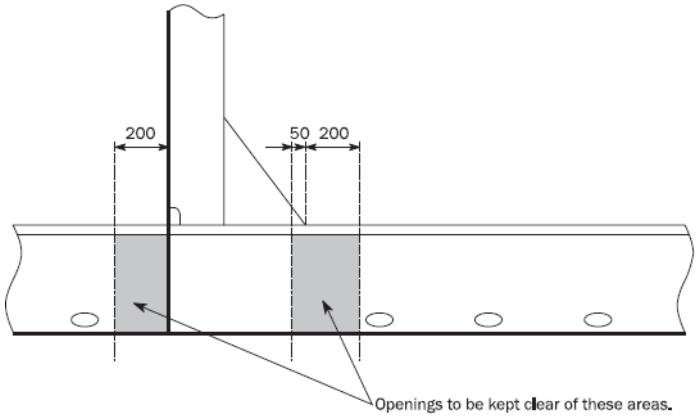

Figure 12 Location of air and drain holes

6.1.3

Closely spaced scallops or drain holes, i.e. where the distance between scallops/drain holes is less than twice the width *b* as shown in Figure 11, are not permitted in stiffeners contributing to the longitudinal strength. For other stiffeners, closely spaced scallops/drain holes are not permitted within 20% of the stiffener span measured from the end of the stiffener. Widely spaced air or drain holes may be permitted provided that they are of elliptical shape or equivalent to minimise stress concentration and are, cut clear of the welds.

6.2 *Openings in primary supporting members*

6.2.1 General

Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

Examples of high stress areas include:

- Vertical or horizontal diaphragm plates in narrow cofferdams/double plate bulkheads within one-sixth of their length from either end.
- Floors or double bottom girders close to their span ends.
- Primary supporting member webs in way of end bracket toes.
- Above the heads and below the heels of pillars.

Where openings are arranged, the shape of openings is to be such that the stress concentration remains within acceptable limits.

Openings are to be well rounded with smooth edges.

6.2.2 *Manholes and lightening holes*

Web openings as indicated below do not require reinforcement

- In single skin sections, having depth not exceeding 25% of the web depth and located so that the edges are not less than 40% of the web depth from the faceplate.
- In double skin sections, having depth not exceeding 50% of the web depth and located so that the edges are well clear of cut outs for the passage of stiffeners.

The length of openings is not to be greater than:

- At the mid-span of primary supporting members: the distance between adjacent openings.
- At the ends of the span: 25% of the distance between adjacent openings.

For openings cut in single skin sections, the length of opening is not to be greater than the web depth or 60% of the stiffener spacing, whichever is greater.

The ends of the openings are to be equidistant from the cut outs for stiffeners.

Where lightening holes are cut in the brackets, the distance from the circumference of the hole to the free flange of brackets is not to be less than the diameter of the lightening hole.

Openings not complying with this requirement are to be reinforced according to [6.2.3].

6.2.3 *Reinforcements around openings*

Manholes and lightening holes are to be stiffened according to this requirement, except where alternative arrangements are demonstrated as satisfactory, in accordance with the analysis methods described in Ch7.

On members contributing to longitudinal strength, stiffeners are to be fitted along the free edges of the openings parallel to the vertical and horizontal axis of the opening. Stiffeners may be omitted in one direction if the shortest axis is less than 400 mm and in both directions if length of both axes is less than 300 mm. Edge reinforcement may be used as an alternative to stiffeners, see Figure 13.

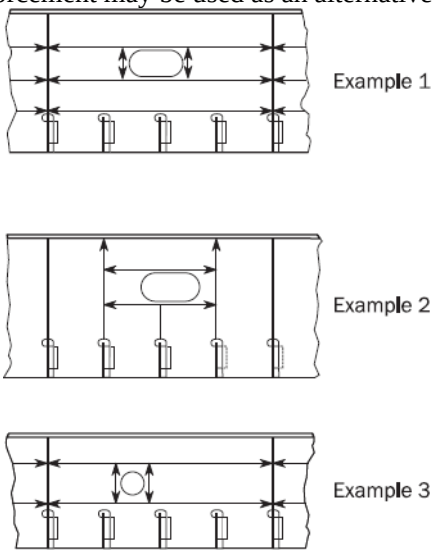

Figure 13 Web plate with openings

In the case of large openings in the web of PSMs (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in PSMs are to be considered for the reinforcement of these openings.

Where no FE analysis is performed, this may be carried out by assigning an equivalent net shear sectional area to the PSM obtained, in cm^2, according from the following formula:

$$A_{s-n50} = \frac{A_{1-n50}}{1+\frac{32 l_{shr}^2 A_{1-n50}}{I_{1-n50}}} + \frac{A_{2-n50}}{1+\frac{32 l_{shr}^2 A_{2-n50}}{I_{2-n50}}}$$

where:

$I_{1\text{-}n50}$, $I_{2\text{-}n50}$: Net moments of inertia, in cm^4, of deep webs (1) and (2), respectively, with attached plating around their neutral axes parallel to the plating.

$A_{1\text{-}n50}$, $A_{2\text{-}n50}$: Net shear sectional areas, in cm^2, of deep webs (1) and (2), respectively, taking account of the web height reduction by the depth of the cut out for the passage of the ordinary stiffeners, if any.

l_{shr} : Shear span, in m, of deep webs (1) and (2) as defined in Ch3, Sec 7, [1.1.2]. Deep web (1) and (2) are defined in Figure 14.

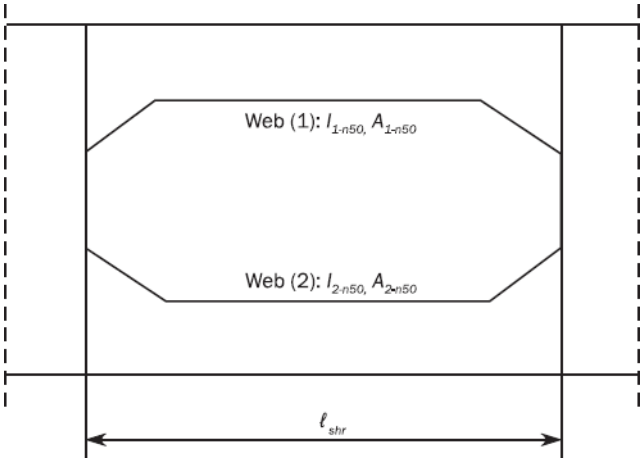

Figure 14 Large openings in the web of primary supporting members

6.3 Openings in the strength deck

6.3.1 General

Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the ends of superstructures. Openings are to be located as far as practicable from high stress regions such as side shell platings, hatchway corners, or hatch side coamings.

6.3.2 *Small opening location*

Openings are generally to be located outside the limits as shown in Figure 15 in dashed area, defined by:

- The bent area of a rounded sheer strake, if any, or the side shell.
- $e = 0.25\ (B - b)$ from the edge of opening.
- $c = 0.07l + 0.1b$ or $0.25b$, whichever is greater.

where:

b : Width, in m, of the hatchway considered, measured in the transverse direction, see Figure 15.

l :Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction, see Figure 15.

Transverse distance between the above limits and openings or between hatchways and openings as shown in Figure 15 is not to be less than:

- $g_2 = 2a_2$ for circular openings.
- $g_1 = a_1$ for elliptical openings.

Transverse distance between openings as shown in Figure 16 is not to be less than:

- $2\ (a_1 + a_2)$ for circular openings.
- $1.5\ (a_1 + a_2)$ for elliptical openings.

where:

a_1 : Transverse dimension of elliptical openings, or diameter of circular openings.

a_2 : Transverse dimension of elliptical openings, or diameter of circular openings.

a_3 : Longitudinal dimension of elliptical openings, or diameter of circular openings.

Longitudinal distance between openings is not to be less than:

- $(a_1 + a_3)$ for circular openings.
- $0.75\ (a_1 + a_3)$ for elliptical openings and for an elliptical opening in line with a circular one.

If the opening arrangements do not comply with these requirements, the hull girder longitudinal strength assessment is to be carried out by subtracting such opening areas, see Ch5, Sec 1, [1.2.11].

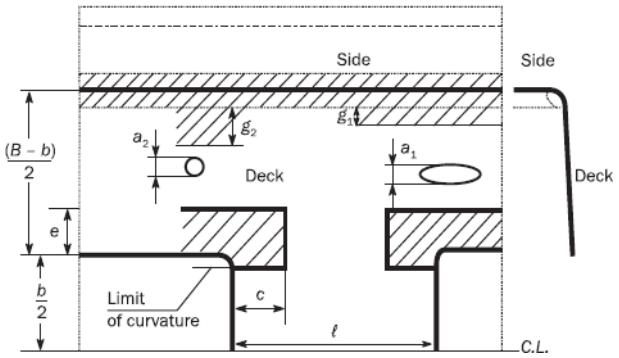

Figure 15 Position of openings in strength deck

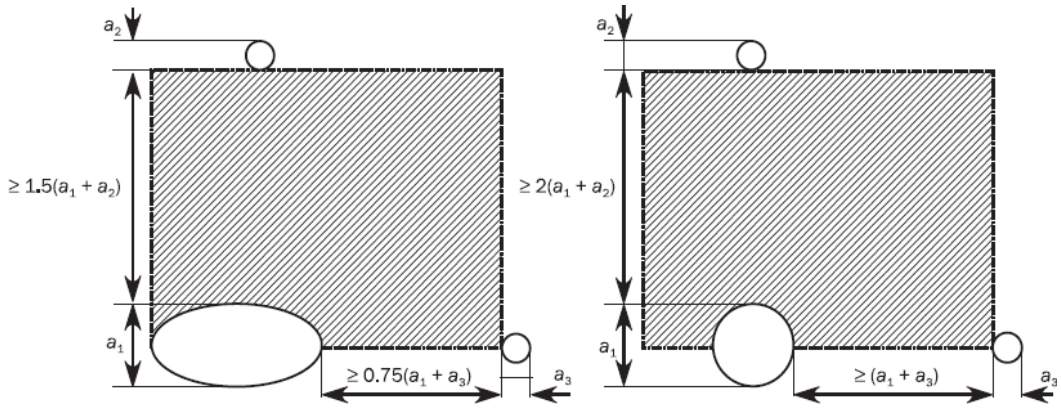

Figure 16 Elliptical and circular openings in strength deck

7 DOUBLE BOTTOM STRUCTURE

7.1 General

7.1.1 Framing system

For ships greater than 120 m in length, the bottom shell, the inner bottom and the sloped bulkheads of hopper tanks, if any, are to be longitudinally framed within the cargo hold region. Where it is not practicable to apply the longitudinal framing system to fore and aft parts of the cargo hold region due to the hull form, transverse framing may be accepted on a case-by-case basis subject to appropriate brackets and other arrangements being incorporated to provide structural continuity in way of changes to the framing system.

7.1.2 *Variation in height of double bottom*

Any variation in the height of the double bottom is to be made gradually and over an adequate length; the knuckles of inner bottom plating are to be located in way of plate floors. Where such arrangement is not possible, suitable longitudinal structures such as partial girders, longitudinal brackets, fitted across the knuckle are to be arranged.

7.1.3 *Breadth of inner bottom*

Breadth of inner bottom, in m, is to be measured at mid-length of the cargo hold as shown in Figure 17.

7.1.4 *Drainage of tank top*

For ships designed to carry solid cargoes, effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, such wells are not to extend for more than one-half height of the double bottom.

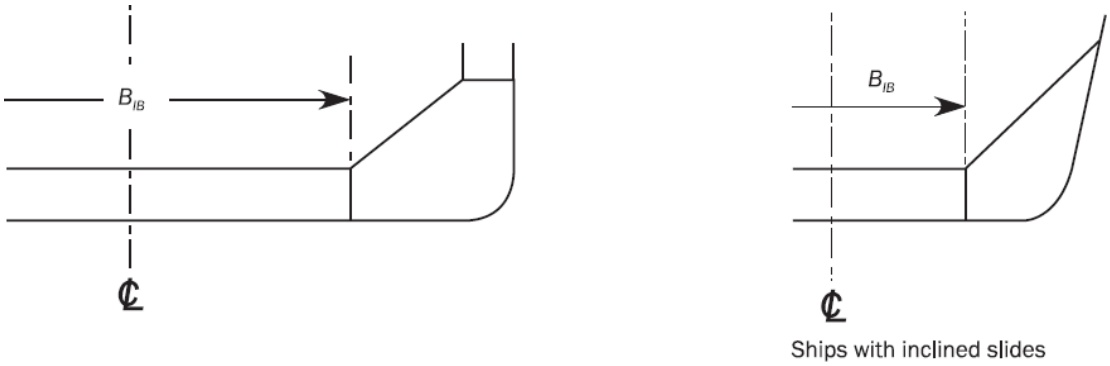

Figure 17 Breadth of inner bottom

7.1.5 Striking plate

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the plating.

7.1.6 *Duct keel*

Where a duct keel is arranged, the centre girder may be replaced by two girders spaced, no more than 3 m apart. Otherwise, for a spacing wider than 3 m, the two girders are to be provided with support of adjacent structure and subject to the Society's approval.

The structures in way of the floors are to provide sufficient continuity of the latter.

7.2 *Keel plate*

7.2.1

Keel plating is to extend over the flat of bottom for the full length of the ship.

The width of the keel, in m, is not to be less than $0.8 + L/200$, without being taken greater than 2.3 m.

7.3 *Girders*

7.3.1 Centre girder

When fitted, the centre girder is to extend within the cargo hold region and is to extend forward and aft as far as practicable. Structural continuity of the centre girder is to be maintained within the full length of the ship.

Where double bottom compartments are used for the carriage of fuel oil, fresh water or ballast water, the centre girder is to be watertight, except for the case such as narrow tanks at the end parts or when other watertight girders are provided within $0.25\,B$ from the centreline.

7.3.2 *Side girders*

The side girders are to extend within the parallel part of the cargo hold region and are to extend forward and aft of the cargo hold region as far as practicable.

7.4 *Floors*

7.4.1 Web stiffeners

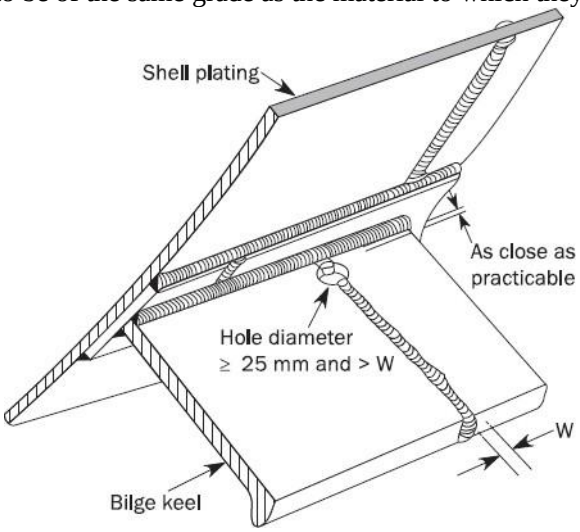
Floors are to be provided with web stiffeners in way of longitudinal ordinary stiffeners. Where the web stiffeners are not welded to the longitudinal stiffeners, design standard as given in Ch9, Sec 6, [2] applies unless fatigue strength assessment for the cut out and connection of longitudinal stiffener is carried out.

7.5 *Bilge keel*

7.5.1 Material

The material of the bilge keel and ground bar is to be of the same yield stress as the material to which they are attached.

In addition, when the bilge keel extends over a length more than 0.15 *L*, the material of the bilge keel and ground bar is to be of the same grade as the material to which they are attached.



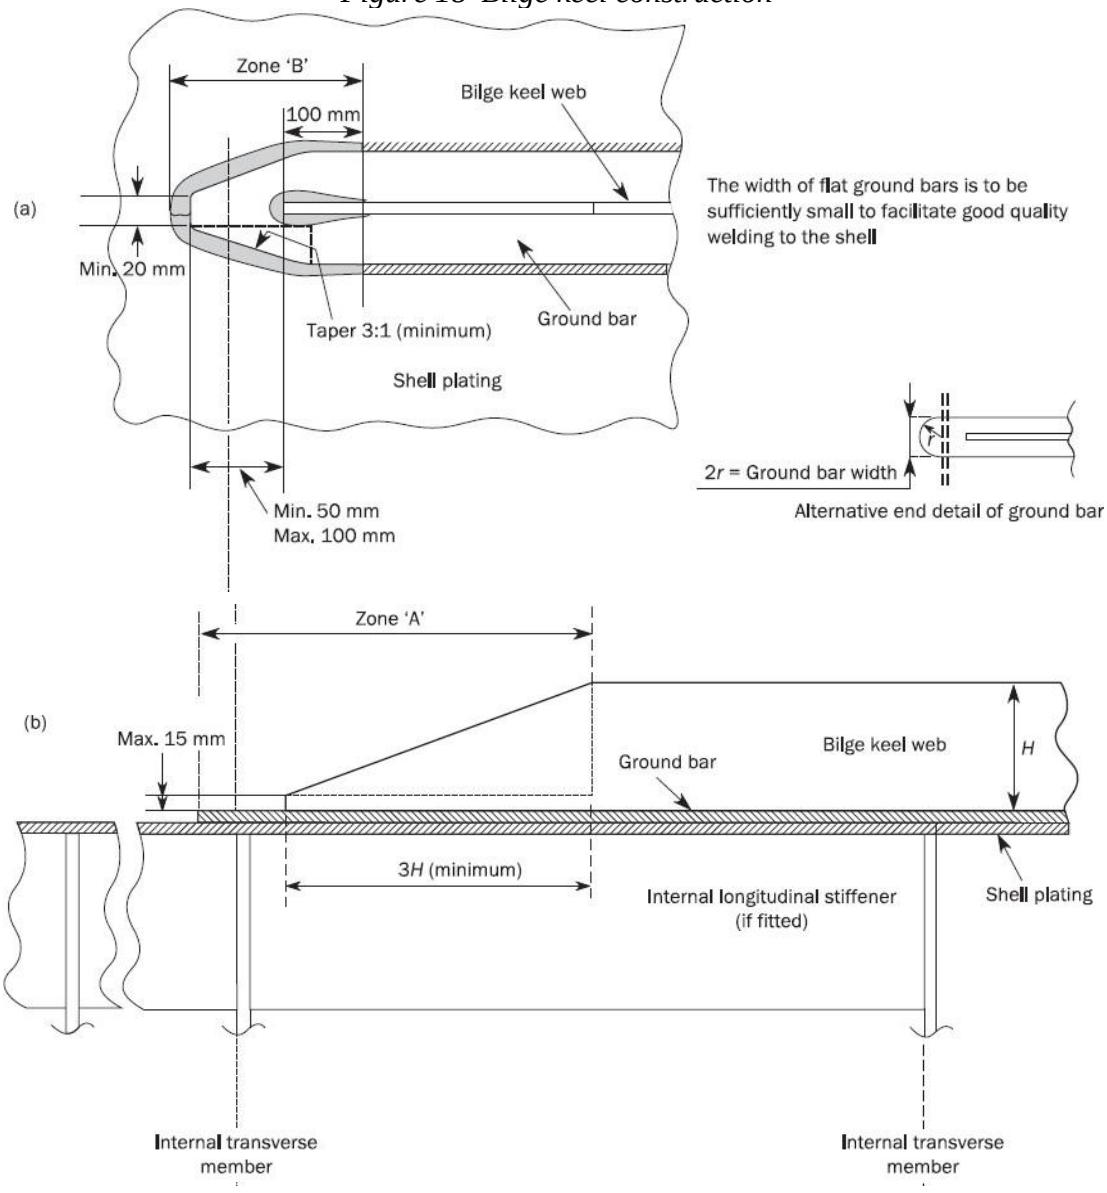


Figure 18 Bilge keel construction

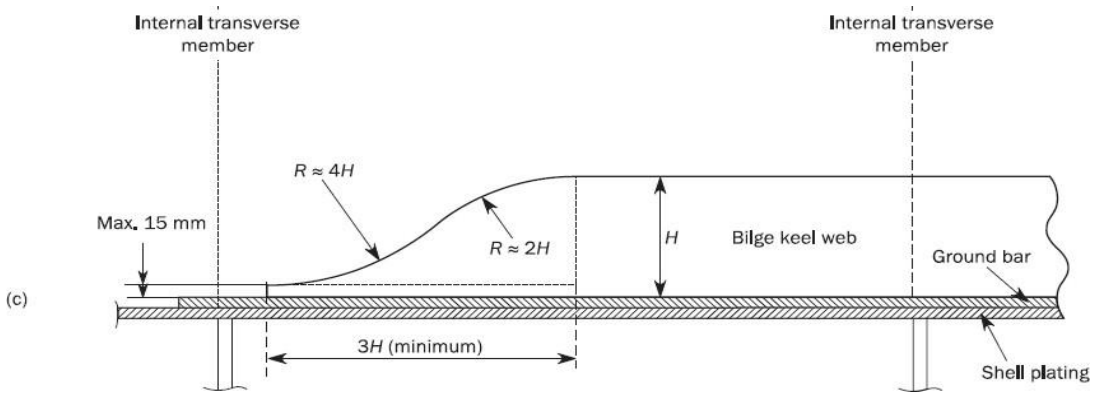

Figure 19 Bilge keel end design

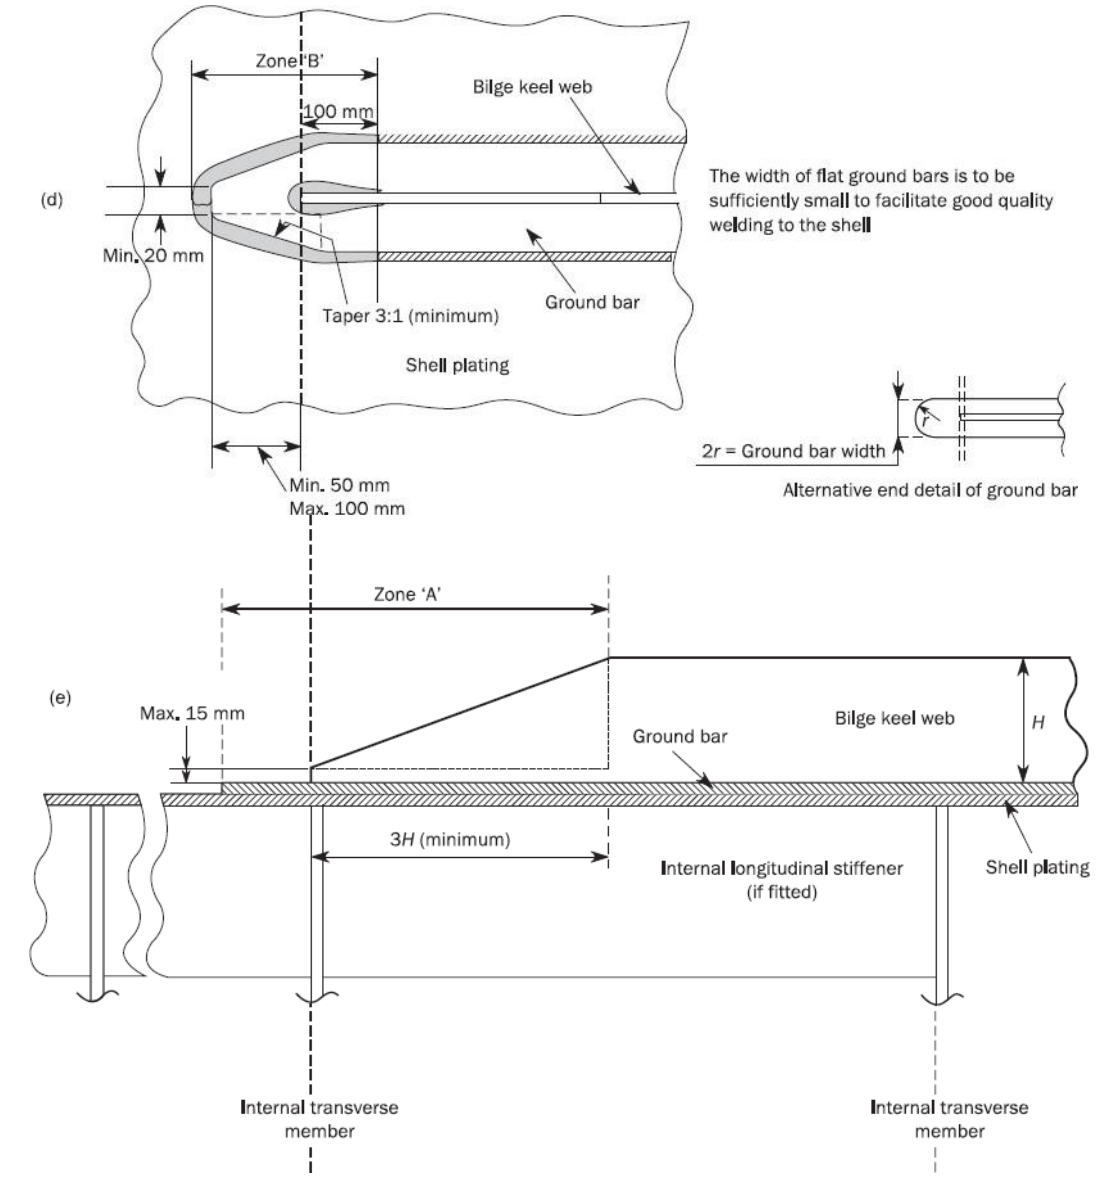

Figure 20 Bilge keel end design (continued)

7.5.2 Design

The design of single web bilge keels is to be such that failure to the web occurs before failure of the ground bar. This may be achieved by ensuring the web thickness of the bilge keel does not

exceed that of the ground bar.

Bilge keels of a different design, from that shown in Figure 18, are to be specially considered by the Society.

ISC 7.5.2a Where bilge keels are fitted, they are not to be welded directly to the shell plating. A ground bar, or doubler, is to be fitted on the shell plating and the ground bar or doubler may be welded directly to the shell and kept continuous. Butt welds, in the bilge keel and ground bar, are to be well clear of each other and of butts in the shell plating.

7.5.3 *Ground bars*

Bilge keels are not to be welded directly to the shell plating. A ground bar, or doubler, is to be fitted on the shell plating as shown in Figure 18 and Figure 19. In general, the ground bar is to be continuous.

The gross thickness of the ground bar is not to be less than the gross thickness of the bilge plating or 14mm, whichever is the lesser.

7.5.4 *End details*

The ground bar and bilge keel ends are to be tapered or rounded. Tapering is to be gradual with a minimum ratio of 3:1, see items (a), (b), (d) and (e) in Figure 19/Figure 20. Rounded ends are to be as shown in item (c) of Figure 19. Cut-outs on the bilge keel web, within zone 'A' (see items (b) and (e) of Figure 19/Figure 20) are not permitted.

The end of the bilge keel web is to be not less than 50 mm and not greater than 100 mm from the end of the ground bar, see items (a) and (d) of Figure 19/Figure 20.

Ends of the bilge keel and ground bar are to be supported by either transverse or longitudinal members inside the hull, as indicated as follows:

- Transverse support member is to be fitted at mid length between the end of the bilge keel web and the end of the ground bar, see items (a), (b) and (c) of Figure 19.
- Longitudinal stiffener is to be fitted in line with the bilge keel web, it is to extend to at least the nearest transverse member forward and aft of zone 'A' (see items (b) and (e) of Figure 19/Figure 20).

Alternative end arrangements may be accepted, provided that they are considered equivalent.

ISC 7.5.4a Other types of end detail design may be accepted provided that bilge keels and flat bars are gradually tapered at their ends and equivalent to 7.5.4.

7.6 *Docking*

7.6.1 General

The drydocking arrangement itself is not covered in these Rules.

The bottom structure is to withstand the forces imposed by drydocking the ship.

7.6.2 *Docking brackets*

Docking brackets connecting the centreline girder to the bottom plating, are to be connected to the adjacent bottom longitudinals.

8 DOUBLE SIDE STRUCTURE

8.1 General

8.1.1

Side shell and inner hull bulkheads are generally to be longitudinally framed. Where the side shell is longitudinally framed, the inner hull bulkheads are to be longitudinally framed. Alternative framing arrangements are to be specially considered by the Society.

ISC 8.1.1a Alternative types of framing are to be based on compliance with the requirements for strength and structural arrangements in this PART, and equivalence or substitution is to be granted in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules.

8.1.2
Where the double side space of bulk carriers is void, the structural members bounding this space are to be structurally designed as a water ballast tank. In such a case the corresponding air pipe is considered as extending 0.76 m above the freeboard deck at side. For corrosion addition, the space is to be considered as a void space.

8.2 *Structural arrangement*

8.2.1 Primary supporting members

Double side web frames are to be fitted in line with web frames in hopper tanks. In addition, double side web frames are to be aligned with web frames or large brackets in topside tanks.

Vertical primary supporting members are to be fitted in way of hatch end beams of bulk carriers or similar large deck opening supporting transverse structure.

In general, horizontal side stringers are to be fitted aft of the collision bulkhead, up to 0.2 *L* aft of the fore end, in line with fore peak stringers.

8.2.2 *Transverse stiffeners*

Transverse stiffeners on side shell and inner side, where fitted, are to be continuous or fitted with bracket end connections within the height of the double side. The transverse stiffeners are to be effectively connected to stringers. At their upper and lower ends, shell and inner side transverse stiffeners are to be connected by brackets to supporting stringer plates.

8.2.3 *Longitudinal stiffeners*

Longitudinal stiffeners on side shell and inner side, where fitted, are to be continuous within the length of the parallel part of the cargo hold region. They are to be fitted with soft toe brackets in way of transverse bulkheads aligned with cargo hold bulkheads and are to be effectively connected to transverse web frames of the double side structure.

Longitudinal framing of the side shell is to extend outside the cargo hold region as far forward as practicable.

8.2.4 *Sheer strake*

Sheer strakes are to have breadths not less than 0.8+ *L*/200 m, measured vertically, but need not be greater than 1.8 m.

The heer strake may be either welded to the stringer plate or rounded.

If the sheer strake is rounded, its radius, in mm, is to be not less than $17t_s$, where t_s is the net thickness, in mm, of the sheer strake.

The upper edge of the welded sheer strake is to be rounded smooth and free of notches. Fixtures such as bulwarks, eye plates are not to be directly welded on the upper edge of sheer strake, except in fore and aft parts. Drainage openings with a smooth transition in the longitudinal direction may be permitted.

Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thicknesses of the sheer strake.

The welding of deck fittings to rounded sheer strakes is to be avoided within 0.6 *L* amidships.

The transition from a rounded sheer strake to an angled sheer strake associated with the arrangement of superstructures is to be designed to avoid any discontinuities.

8.2.5 *Plating connection*
Connection between the inner hull plating and the inner bottom plating is to be designed such that stress concentration is avoided.

The connections of hopper tanks plating with inner hull and with inner bottom are to be supported by a primary supporting member.

9 DECK STRUCTURE
9.1 Structural arrangement
9.1.1 Framing system
Deck areas contributing to the longitudinal strength are to be longitudinally framed.

9.1.2 *Stringer plate*
Stringer plates are to have breadths not less than $0.8 + L/200$ m, measured parallel to the deck, but need not be greater than 1.8 m.

Rounded stringer plates, where adopted, are to comply with the requirements in [8.2.4].

9.1.3 *Connection of deckhouses and superstructures*
Connection of deckhouses and superstructures to the strength deck are to be designed such that loads are transmitted into the under deck supporting structure.

9.2 *Deck scantlings*
9.2.1
The web depth of deck stiffeners is not to be less than 60 mm.

The web depth of PSMs is not to be less than 10% and 7% of the unsupported span in bending in tanks and in dry spaces, respectively, and is not to be less than 2.5 times the depth of the slots if the slots are not closed. Unsupported span in bending is the bending span as defined in Ch3, Sec 7 or in case of a grillage structure, the distance between connections to other PSMs.

10 BULKHEAD STRUCTURE
10.1 Application
10.1.1
The requirements of this article apply to longitudinal and transverse bulkheads, which may be plane or corrugated.

10.2 *General*
10.2.1
The web height of vertical PSMs on bulkheads may be gradually tapered from bottom to deck.

10.2.2
Bulkheads are to be stiffened in way of deck girders.

10.2.3
Bulkheads that support girders, or pillars and longitudinal bulkheads which are fitted in lieu of girders, are to be stiffened to provide supports not less effective than required for stanchions or pillars that would be located at the same position.

10.2.4
Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way of the connection are to be adequate for the loads imparted to the bulkheads by the hydraulic forces in the pipes.

10.3 *Plane bulkheads*
10.3.1 General
Plane bulkheads may be horizontally or vertically stiffened.

Horizontally framed bulkheads are made of horizontal stiffeners supported by vertical primary supporting members.

Vertically framed bulkheads are made of vertical stiffeners supported by horizontal stringers, if needed.

The bulkhead stiffener webs of hopper and topside tank watertight bulkheads are to be aligned with the webs of longitudinal stiffeners of sloping plates of inner hull.

Floors are to be fitted in the double bottom in line with the plane transverse bulkhead.

10.3.2 *End connection of stiffeners*

The crossing of stiffeners through a watertight bulkhead is to be watertight.

End connections of stiffeners are to be bracketed. For isolated areas of the ship where bracketed end connections cannot be applied due to hull lines, other arrangements including sniped ends are acceptable.

10.3.3 *Sniped end of stiffener*

Sniped ends may be used on bulkheads subject to hydrostatic pressure provided they comply with [3.4].

10.4 *Corrugated bulkheads*

10.4.1 General

For ships of 18 m moulded depth and above, the transverse vertically corrugated watertight bulkheads are to be fitted with a lower stool, and generally with an upper stool below deck. For ships of 16 m moulded depth and above, the transverse vertically corrugated watertight bulkheads subject to liquid pressure, e.g. tank bulkheads and ballast hold bulkheads, are to be fitted with a lower stool, and generally with an upper stool below deck.Otherwise corrugations may extend from inner bottom to deck.

10.4.2 *Construction*

The main dimensions $b_{f\text{-}cg}$, R, $b_{w\text{-}cg}$, d_{cg}, t_f, t_w, s_{cg} of corrugated bulkheads are defined in Figure 21.
The corrugation angle φ is not to be less than 55°.
When welds in a direction parallel to the bend axis are provided in the zone of the bend, the welding procedures are to be submitted to the Society for approval.

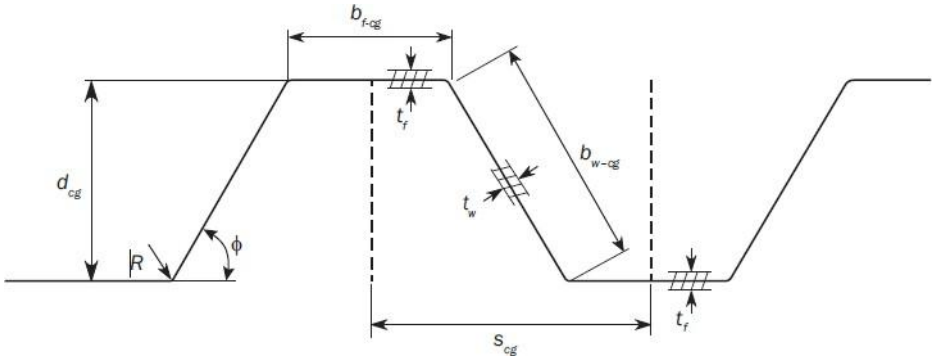

Figure 21 Dimensions of a corrugated bulkhead

10.4.3 Corrugated bulkhead depth

The depth of the corrugation, d, in mm, is not to be less than:

$$d_{cg} = \frac{1000 l_c}{C}$$

where:

l_c : Mean span of considered corrugation, in m, as defined in [10.4.5].

C : Coefficient to be taken as:

C = 15 for tank and water ballast cargo hold bulkheads.

C = 18 for dry cargo hold bulkheads.

10.4.4 *Actual section modulus of corrugations*

The net section modulus of a corrugation may be obtained, in cm3, from the following formula:

$$Z = \left[\frac{d_{cg}\left(3b_{f-cg}t_f + b_{w-cg}t_w\right)}{6} \right] 10^{-3}$$

where:

t_f, t_w : Net thickness of the plating of the corrugation, in mm, shown in Figure 21.

d_{cg}, $b_{f\text{-}cg}$, $b_{w\text{-}cg}$: Dimensions of the corrugation, in mm, shown in Figure 21.

Where the web continuity is not ensured at ends of the bulkhead, the net section modulus of a corrugation is to be obtained, in cm^3, from the following formula:

$Z = 0.5 b_{f\text{-}cg}\, t_f\, d_{cg} 10^{-3}$

10.4.5 *Span of corrugations*

The span l_C of the corrugations is to be taken as the distance shown in Figure 22.

For the definition of l_C, the bottom of the upper stool is not to be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, for non rectangular stool.
- 2 times the depth of corrugation, for rectangular stool.

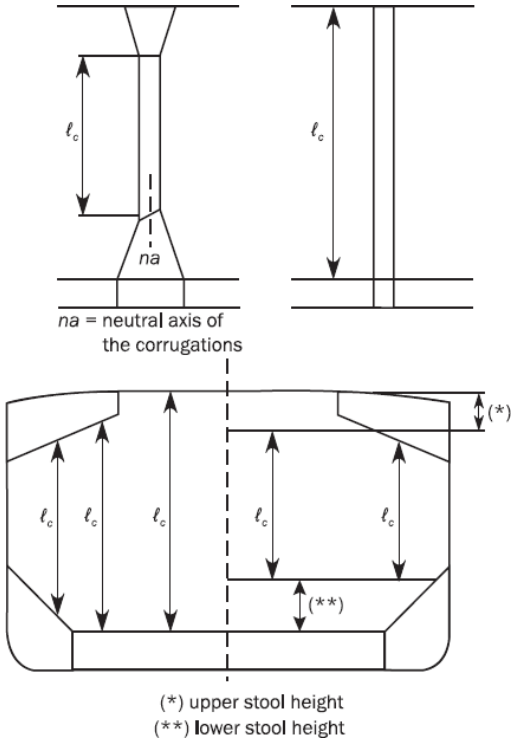

Figure 22 Span of the corrugations

10.4.6 Structural arrangements

Where corrugated bulkheads are cut in way of primary supporting members, corrugations on each side of the primary member are to be aligned with each other.

10.4.7 *Bulkhead end supports*

The strength continuity of corrugated bulkheads is to be maintained at the ends of corrugations.

Where a bulkhead is provided with a lower stool, floors or girders are to be fitted in line with both sides of the lower stool. Where a bulkhead is not provided with a lower stool, floors or girders are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead.

The supporting floors or girders are to be connected to each other by suitably designed shear plates.

At deck, if no upper stool is fitted, transverse or longitudinal stiffeners are to be fitted in line with the corrugation flanges.

When the corrugation flange connected to the adjoining boundary structures (i.e. inner hull, side shell, longitudinal bulkhead, trunk, etc) is smaller than 50% of the width of the typical corrugation flange, an advanced analysis of the connection is required.

10.4.8 *Bulkhead stools*

Stool side plating is to be aligned with the corrugation flanges.

10.4.9 *Lower stool*

The lower stool, when fitted, is to have a height in general not less than:

- 3 corrugation depths, for bulk carriers.
- One corrugation depth, for oil tankers.

The ends of stool side ordinary stiffeners, when fitted in a vertical plane, are to be attached to brackets at the upper and lower ends of the stool. Lower stool side vertical stiffeners and their brackets in the stool are to be aligned with the inner bottom structures such as longitudinals or similar. Lower stool side plating is not to be knuckled anywhere between the inner bottom plating and the stool top plate.

The distance *d* from the edge of the stool top plate to the surface of the corrugation flange is to be in accordance with Figure 23.

The lower part of the stool side plates is to be in line with double bottom floors or girders as the case may be, and the stool bottom is to have a width not less than:

- 2.5 corrugation depths, for bulk carriers.
- One corrugation depth, for oil tankers.

The stool is to be fitted with diaphragms in line with the longitudinal double bottom girders or floors. Scallops in the brackets and diaphragms in way of the connections to the stool top plate are to be avoided.

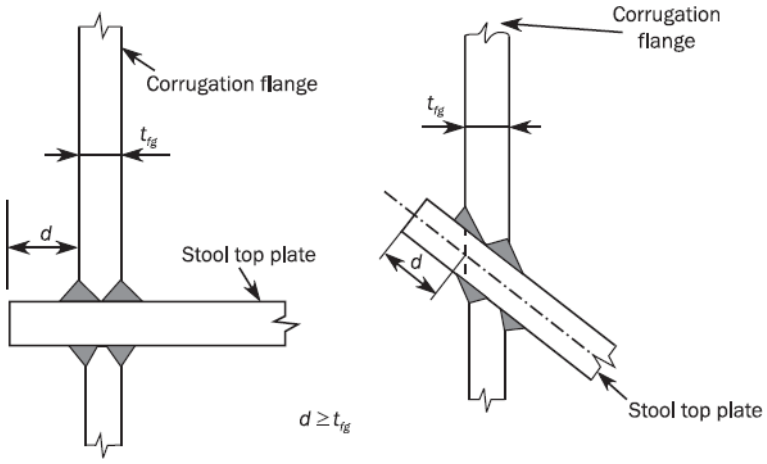

Figure 23 Permitted distance, d, from the edge of the stool top plate to the surface of the corrugation flange

The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

10.4.10 *Upper stool*

The upper stool, when fitted, is to have a height:

- Not less than two times the corrugation depth, for bulk carriers.
- At least one corrugation depth, for oil tankers.

Rectangular stools are to have a height in general equal to twice the depth of corrugations, measured from the deck level and at the hatch side girder or at the inner hull as applicable. Brackets or deep webs are to be fitted to connect the upper stool to the deck transverse or hatch end beams.

The upper stool of a transverse bulkhead is to be properly supported by deck girders or deep brackets between the adjacent hatch end beams. The width of the upper stool bottom plate is generally to be the same as that of the lower stool top plate. The stool top of non-rectangular stools of bulk carriers is to have a width not less than twice the depth of corrugations. The ends of stool side ordinary stiffeners when fitted in a vertical plane, are to be attached to brackets at the upper and lower end of the stool.

The stool is to be fitted with diaphragms in line with and effectively attached to longitudinal deck girders extending to the hatch end coaming girders or transverse deck primary supporting members. Scallops in the brackets and diaphragms in way of the connection to the stool bottom plate are to be avoided.

10.5 *Non-tight bulkheads*

10.5.1 General

In general, openings in wash bulkheads are to have generous radii and their aggregate area is not to be less than 10% of the area of the bulkhead. The area of non-tight bulkhead is the whole cross sectional area in one plane that covers the tank boundaries.

10.5.2 *Non-tight bulkheads not acting as pillars*

In general, the maximum spacing of stiffeners fitted on non-tight bulkheads not acting as pillars is to be:

- 0.9 m, for transverse bulkheads.
- Two frame spacings, with a maximum of 1.5 m, for longitudinal bulkheads.

The net thickness of bulkhead stiffener, in mm, is not to be less than:

$t = 3 + 0.015\ L_2$

The depth of bulkhead stiffener of flat bar type is in general not to be less than 1/12 of stiffener length.

A smaller depth of stiffener may be accepted based on calculations showing compliance with Ch10, Sec4, [2.2] and Ch8.

10.5.3 *Non-tight bulkheads acting as pillars*

Non-tight bulkheads acting as pillars are to be provided with bulkhead stiffeners with a maximum spacing equal to:

- Two frame spacings, when the frame spacing does not exceed 0.75 m.
- One frame spacing, when the frame spacing is greater than 0.75 m.

Where non-tight bulkheads are corrugated, the depth of the corrugation is not to be less than 100 mm.

Each vertical stiffener, in association with a width of plating equal to 35 times the plating net thickness, 1/12 of stiffener length or the stiffener spacing, whichever is the smaller, is to comply

with the applicable requirements in Ch6, for the load being supported.

10.6 *Watertight bulkheads of trunks and tunnels 10.6.1*

Watertight trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be to the satisfaction of the Society.

ISC 10.6.1a Watertight trunks, tunnels, duct keels and ventilators are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be in compliance with the requirements of Section3, Chapter 4, PART ONE of the Rules.

11 PILLARS

11.1 General

11.1.1

Pillars are to be fitted in the same vertical line wherever possible. If not possible, effective means are to be provided for transmitting their loads to the supports below. Effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

11.1.2

Pillars are to be provided in line with the double bottom girder or as close thereto as practicable, and the structure above and below the pillars is to be of sufficient strength to provide effective distribution of the load. Where pillars connected to the inner bottom are not located in way of the intersection of floors and girders, partial floors or girders or equivalent structures are to be fitted as necessary to support the pillars.

11.1.3

Pillars provided in tanks are to be of solid or open section type.

Where the hydrostatic pressure may result in tensile stresses in the pillar, the tensile stress in the pillar and its end connections is not to exceed 45% of the specified minimum yield stress of the material.

11.2 *Connections*

11.2.1

Heads and heels of pillars are to be secured by thick doubling plates and brackets as necessary. Alternative arrangements for doubling plates may be accepted, provided that they are considered equivalent as deemed appropriate by the Society. Where the pillars are likely to be subjected to tensile loads, the head and heel of pillars are to be efficiently secured to withstand the tensile loads and the doubling plates replaced by insert plate.

The net thickness of doubling plates, when fitted, is to be not less than 1.5 times the net thickness of the pillar. Pillars are to be attached at their heads and heels by continuous welding.

ISC 11.2.1a Where heads or heels of pillars are secured by alternative arrangements for doubling plates, it is to be ensured that the force acting on heads or heels of pillars can be effectively transmitted and any abrupt change of transmitted force is to be avoided.

Section 7 STRUCTURAL IDEALISATION

SYMBOLS
For symbols not defined in this section, refer to Ch 1, Sec 4.

φ_w : Angle, in deg, between the stiffener or primary supporting member web and the attached plating, see Figure 14 for stiffener and Ch 10, Sec 1, Figure 5 for primary supporting member. φ_w is to be taken equal to 90 deg if the angle is between 75 and 105 deg including 75 and 105 deg.
l_{bdg} : Effective bending span, in m, as defined in [1.1.2] for stiffeners and [1.1.6] for primary supporting members.
l_{shr} : Effective shear span, in m, as defined in [1.1.3] for stiffeners and [1.1.7] for primary supporting members.
l : Full length of stiffener or of primary supporting member, in m, between their supports.
s : Stiffener spacing, in mm, as defined in [1.2].
S : Primary supporting member spacing, in m, as defined in [1.2].
a : Length, in mm, of EPP as defined in [2.1.1].
b : Breadth, in mm, of EPP as defined in [2.1.1].
h_{stf} : Stiffener height, including the face plate, in mm.
t_p : Net thickness of attached plate, in mm.
t_w : Net web thickness, in mm. For bulb profiles, see [1.4.1].
b_f : Breadth of flange, in mm, see Ch 3, Sec 2, Figure 2. For bulb profiles, see [1.4.1].
t_f : Net thickness of flange, in mm.
PSM : Primary Supporting Member.
EPP : Elementary Plate Panel.
LCP : Load Calculation Point.

1 STRUCTURAL IDEALISATION OF STIFFENERS AND PRIMARY SUPPORTING MEMBERS

1.1 Effective spans

1.1.1 General

Where arrangements differ from those defined in this article, span definition may be specially considered.

ISC 1.1.1a For the definition of a span where the structural arrangement is different from that defined in this Section, equivalence or substitution is to be, based on the geometrical characteristics of end brackets of stiffeners and primary supporting members, their end constraints and actual load-carrying capacity, granted in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules.

1.1.2 *Effective bending span of stiffeners*

The effective bending span l_{bdg} of stiffeners is to be measured as shown in Figure 1 for single skin structures and Figure 2 for double skin structures.

If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full length between PSMs unless a backing bracket is fitted, see Figure 1.

The effective bending span may be reduced where brackets are fitted to the flange or free edge of the stiffener. Brackets fitted on the side opposite to that of the stiffener with respect to attached plating are not to be considered as effective in reducing the effective bending span.

In single skin structures, the effective bending span of a stiffener supported by a bracket or by a web stiffener on one side only of the primary supporting member web, is to be taken as the total span between primary supporting members as shown in item (a) of Figure 1. If brackets are fitted on both sides of the primary supporting member, the effective bending span is to be taken as in

items (b), (c) and (d) of Figure 1.

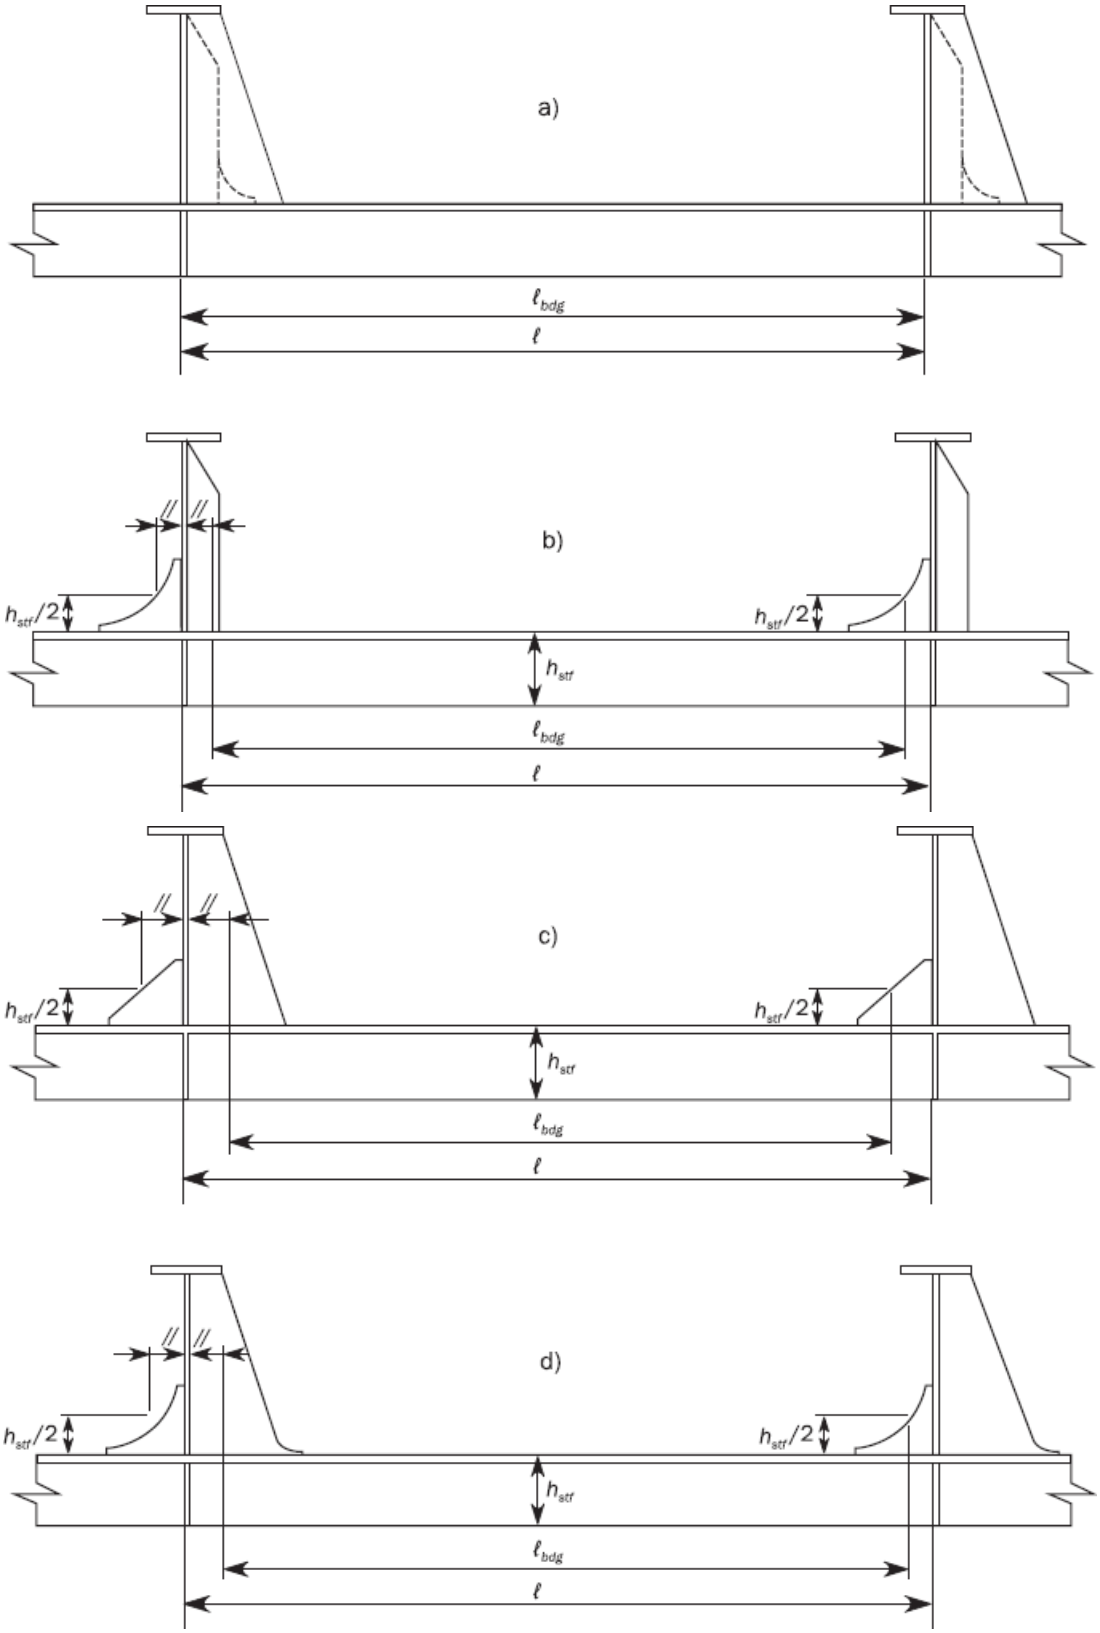

Figure 1 Effective bending span of stiffeners supported by web stiffeners (single skin construction)

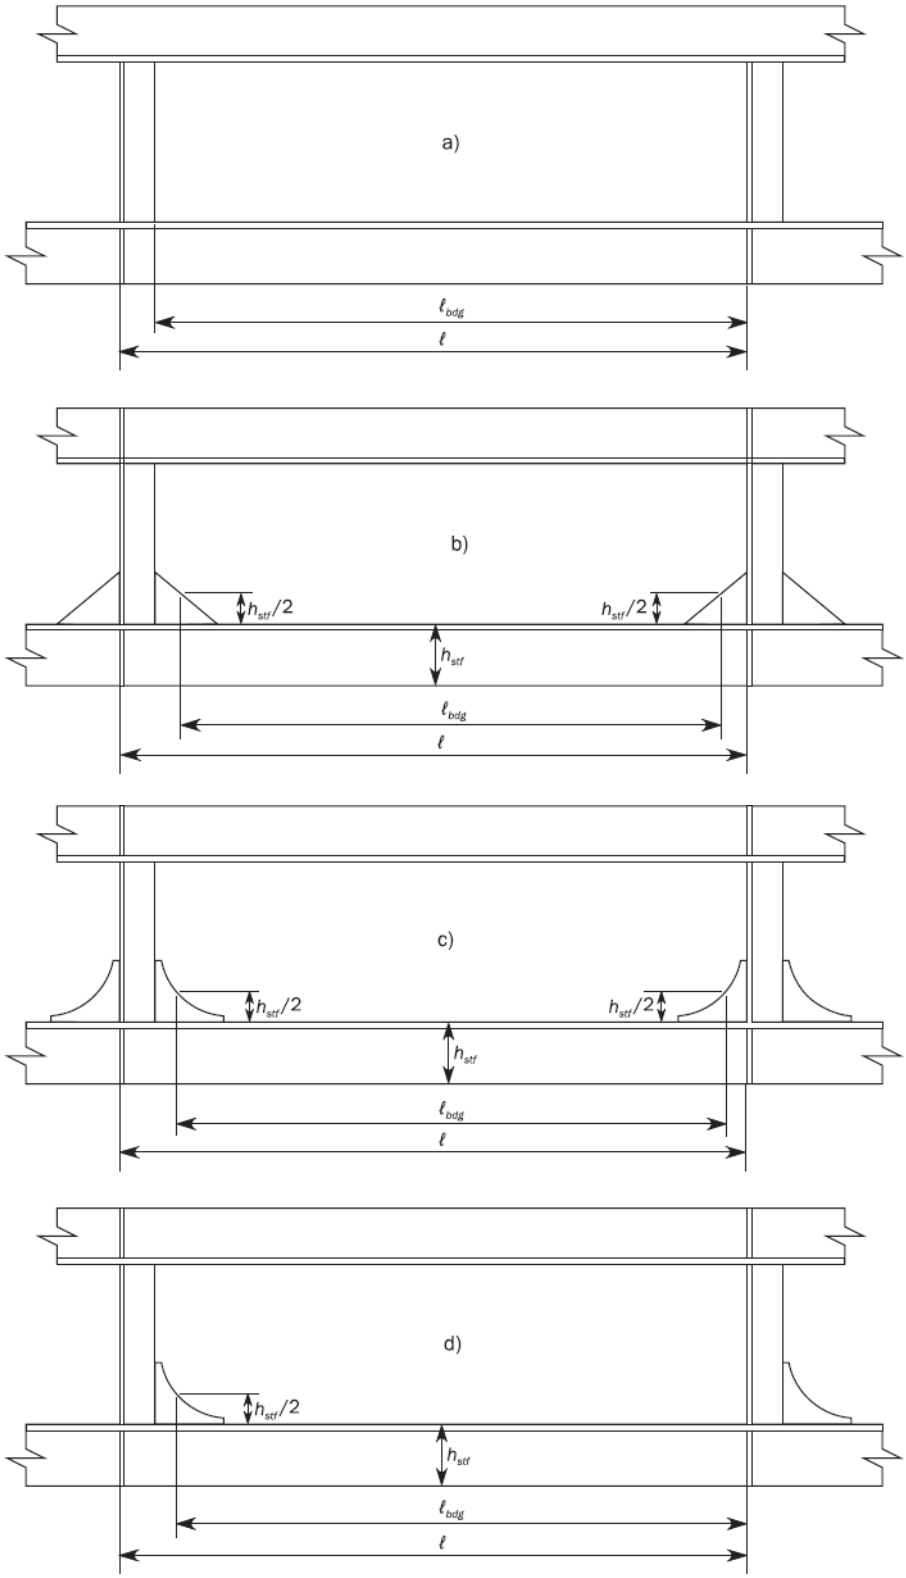

Figure 2 Effective bending span of stiffeners supported by web stiffeners (double skin construction)

Where the face plate of the stiffener is continuous al ong the edge of the bracket the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener see Figure 3.

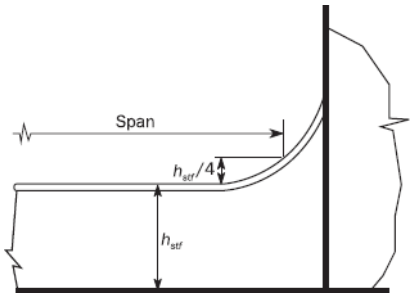

Figure 3 Effective bending span for local support members with continuous face plate along bracket edge

1.1.3 Effective shear span of stiffeners

The effective shear span, l_{shr} in m, of stiffeners is to be measured as shown in Figure 4 for single skin structures and Figure 5 for double skin structures.

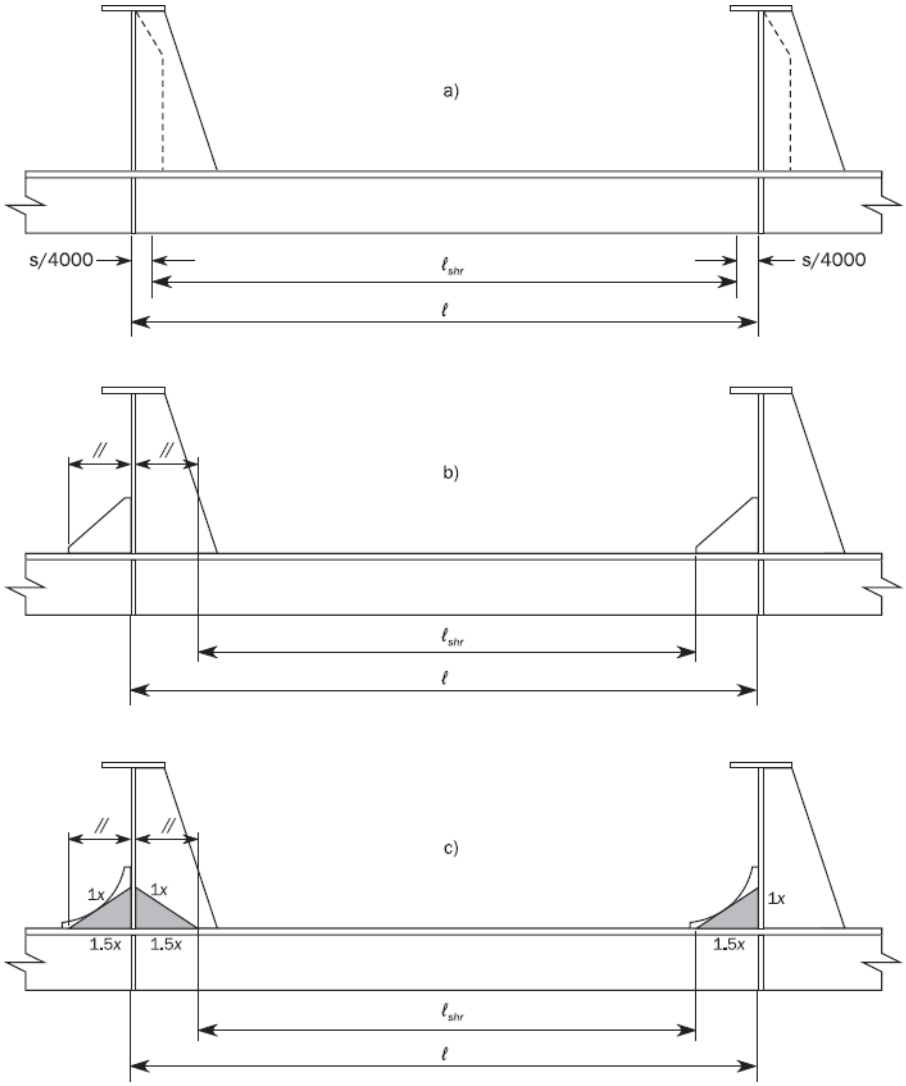

Figure 4 Effective shear span of stiffeners supported by web stiffeners (single skin construction)

The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the stiffener, or for brackets fitted to the attached plating on the side opposite to that of the stiffener.

If brackets are fitted at both the flange or free edge of the stiffener, and to the attached plating on the side opposite to the stiffener the effective shear span may be reduced using the longer effective bracket arm.

Regardless of support detail, the full length of the stiffener may be reduced by a minimum of s/4000 m at each end of the member, hence the effective shear span l_{shr}, is not to be taken greater than:

$$l_{shr} \leq l - \frac{s}{2000}$$

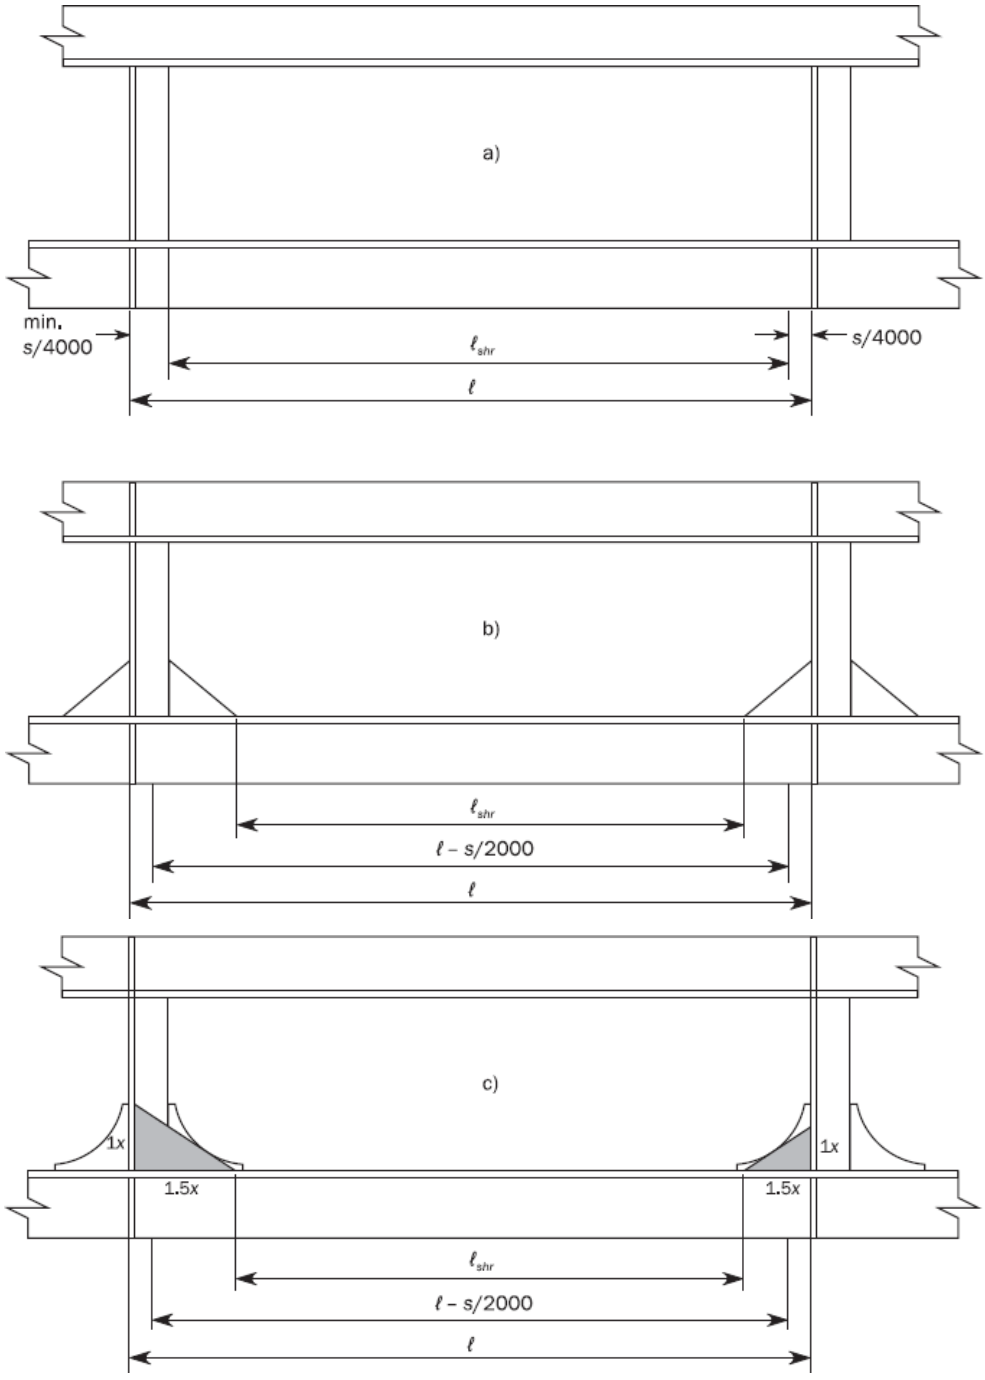

Figure 5 Effective shear span of stiffeners supported by web stiffeners (double skin construction)

For curved and/or long brackets (high length/height ratio), the effective bracket length is to be

taken as the maximum inscribed 1:1.5 right angled triangle as shown in item (c) of both Figure 4 and Figure 5.

Where the face plate of the stiffener is continuous along the curved edge of the bracket, the bracket length to be considered for determination of the span point location is not to be taken greater than 1.5 times the length of the bracket arm as shown in Figure 6.

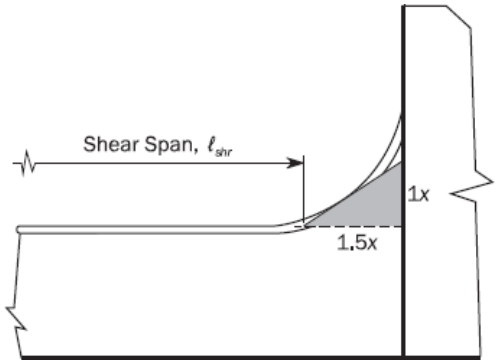

Figure 6 Effective shear span for local support members with continuous face plate along bracket edge

1.1.4 Effect of hull form shape on span of stiffeners

For curved stiffeners, the span is defined as the chord length between span points to be measured at the flange for stiffeners with a flange, and at the free edge for flat bar stiffeners. The calculation of the effective span is to be in accordance with requirements given in [1.1.2] and [1.1.3].

1.1.5 *Effective span of stiffeners supported by struts*

The arrangement of stiffeners supported by struts is not allowed for ships over 120 m in length. The span, l of stiffeners supported by one strut fitted at mid distance of the primary supporting members is to be taken as $0.7l_2$.

In case where two struts are fitted at 1/3 and 2/3 length between primary supporting members, the span, l of stiffeners is to be taken as $0.7l_2$.

l_1 and l_2 are the spans defined in Figure 7 and Figure 8.

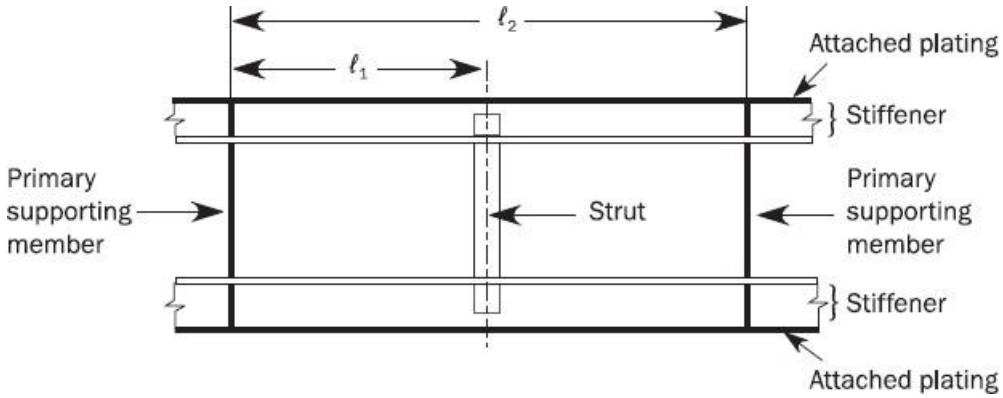

Figure 7 Span of stiffeners with one strut

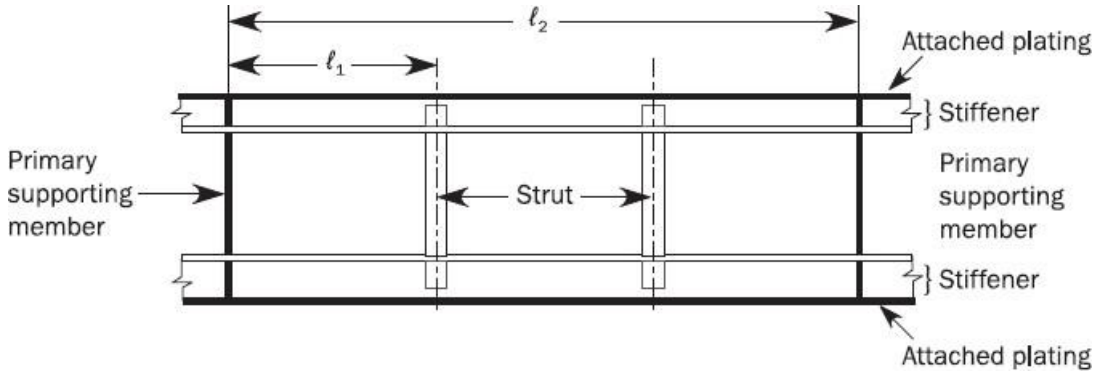

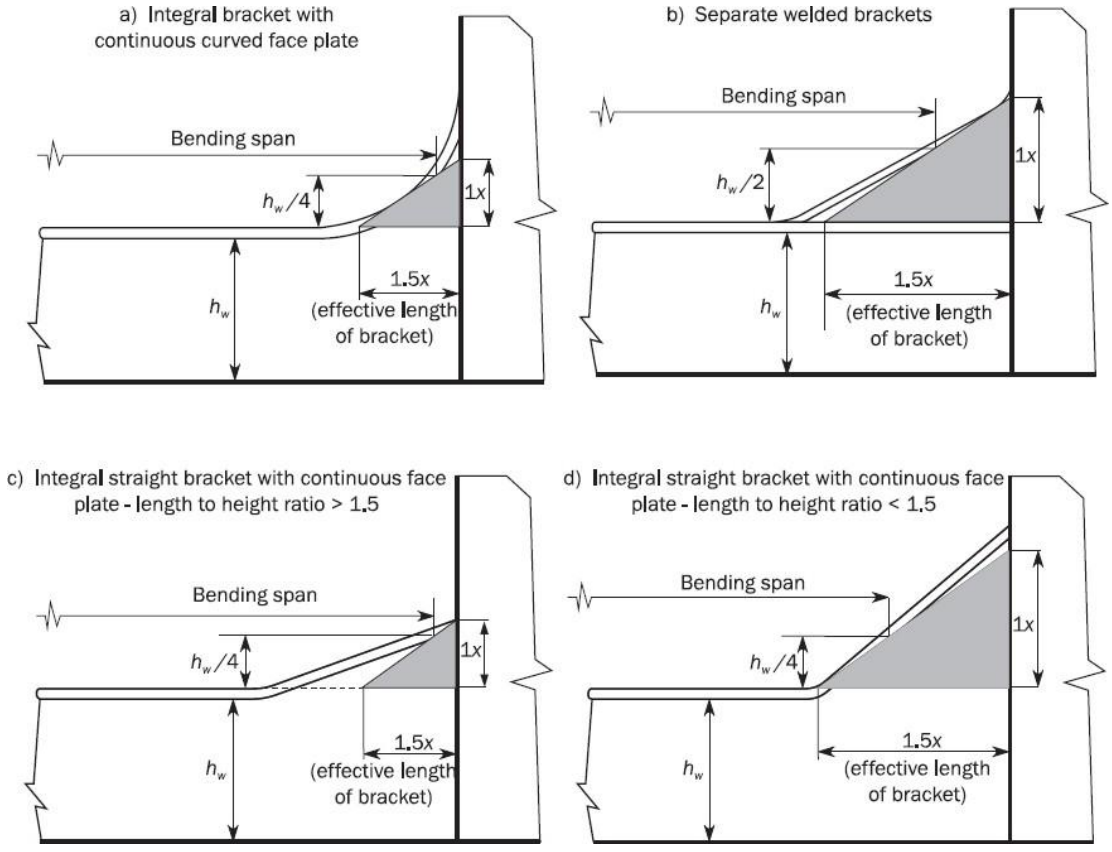

Figure 8 Span of stiffeners with two struts

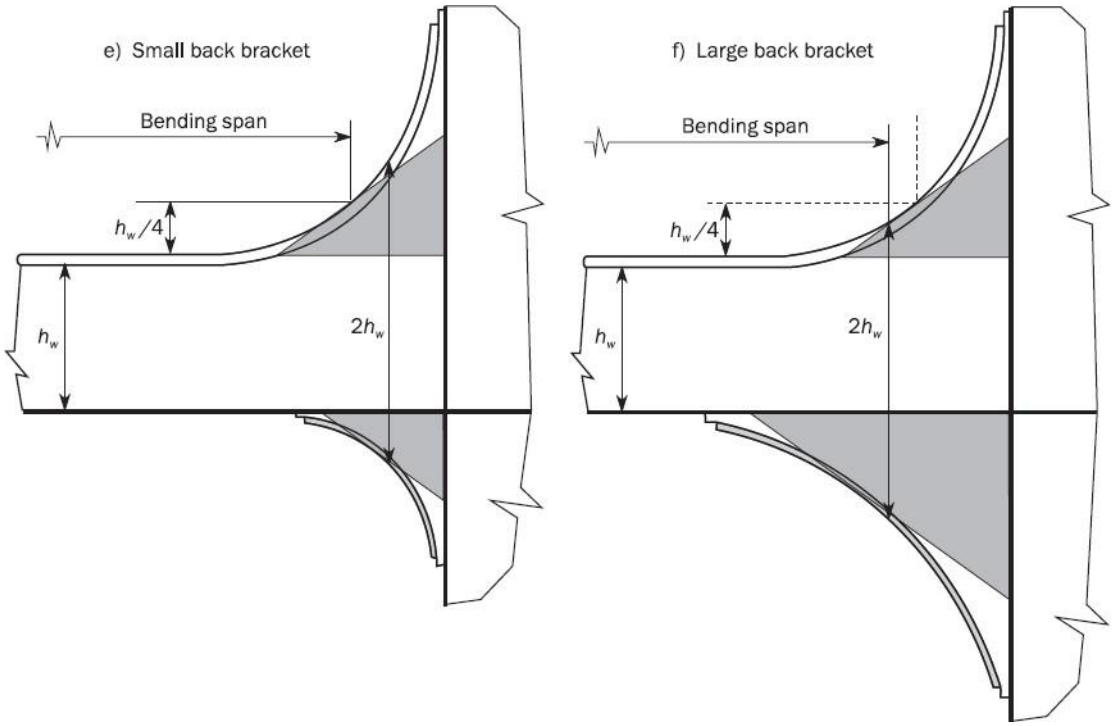

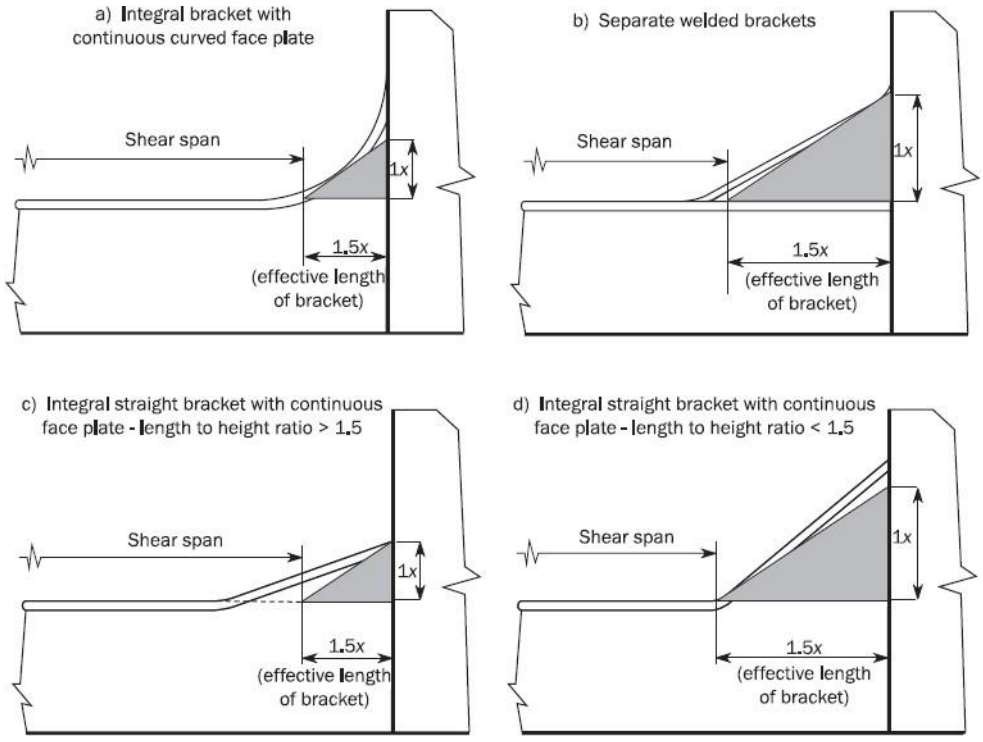

Figure 9 Effective bending span of primary supporting member

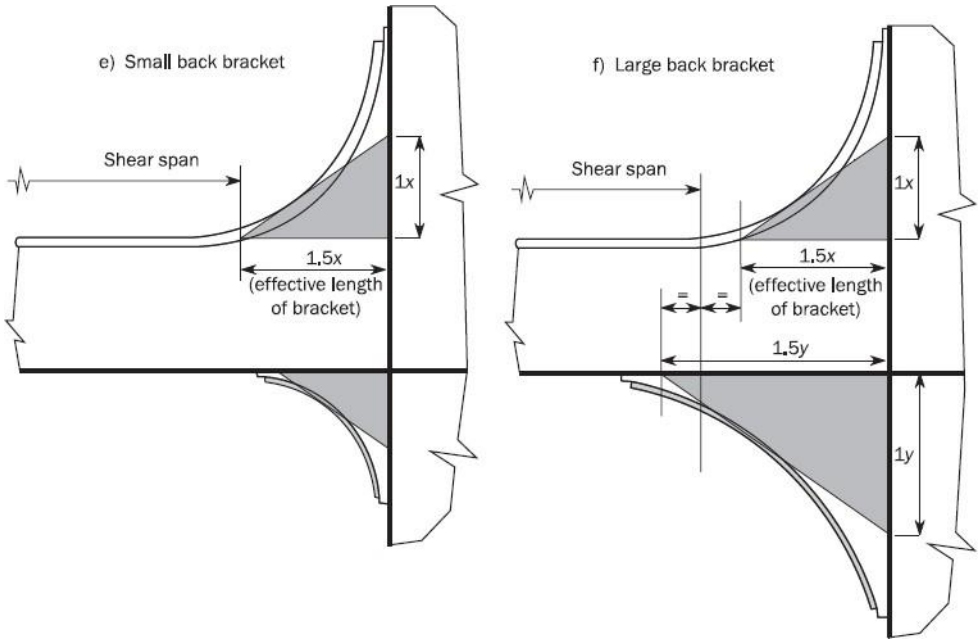

Figure 10 Effective shear span of primary supporting member

1.1.6 Effective bending span of primary supporting members

The effective bending span, l_{bdg}, in m, of a primary supporting member without end bracket is to be taken as the length of the member between supports.

The effective bending span, l_{bdg}, of a primary supporting member may be taken as less than the full length of the member between supports provided that suitable end brackets are fitted.
The effective bending span l_{bdg}, in m, of a primary supporting member with end brackets is taken between points where the depth of the bracket is equal to half the web height of the primary supporting member as shown in item (b) of Figure 9. The effective bracket used to define these span points is to be taken as given in [1.1.8].

In case of brackets where the face plate of the member is continuous along the face of the bracket, as shown in items (a), (c) and (d) of Figure 9, the effective bending span l_{bdg}, in m, is taken between points where the depth of the bracket is equal to one quarter the web height of the primary supporting member. The effective bracket used to define these span points is to be taken as given in [1.1.8].

For straight brackets with a length to height ratio greater than 1.5, the span point is to be taken to the effective bracket; otherwise the span point is to be taken to the fitted bracket.

For curved brackets, for span positions above the tangent point between fitted bracket and effective bracket, the span point is to be taken to the fitted bracket; otherwise, the span point is to be taken to the effective bracket.

For arrangements where the primary supporting member face plate is carried on to the bracket and backing brackets are fitted; the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary supporting member. Arrangements with small and large backing brackets are shown in items (e) and (f) of Figure 9.

For arrangements where the height of the primary supporting member is maintained and the face plate width is increased towards the support; the effective bending span may be taken to a position where the face plate breadth reaches twice the nominal breadth.

1.1.7 *Effective shear span of primary supporting members*

The effective shear span of the primary supporting member may be reduced compared to effective bending span, and taken between the toes of the effective brackets supporting the member, where the toes of effective brackets are as shown in Figure 10. The effective bracket used to define the toe point is given in [1.1.8].

For arrangements where the effective backing bracket is larger than the effective bracket in way of face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in item (f) of Figure 10.

1.1.8 *Effective bracket definition*

The effective bracket is defined as the maximum size of right angled triangular bracket with a length to height ratio of 1.5 that fits inside the fitted bracket. See Figure 9 for examples.

1.2 *Spacing and load supporting breadth*

1.2.1 Stiffeners

Stiffeners spacing, *s*, in mm, for the calculation of the effective attached plating of stiffeners is to be taken as the mean spacing between stiffeners and taken equal to, see Figure 11.

$$s = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

b_1, b_2, b_3, b_4: Spacings between stiffeners at ends, in mm.

In general, the loading breadth supported by stiffener is to be taken equal to *s*.

1.2.2 *Primary supporting member*

Primary supporting member spacing, *S*, for the calculation of the effective attached plating of primary supporting members is to be taken as the mean spacing between adjacent primary supporting members, and taken equal to, see Figure 11.

$$s = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

b_1, b_2, b_3, b_4: Spacings between primary supporting members at ends.

In general, the loading breadth supported by a primary supporting member is to be taken equal to *S*.

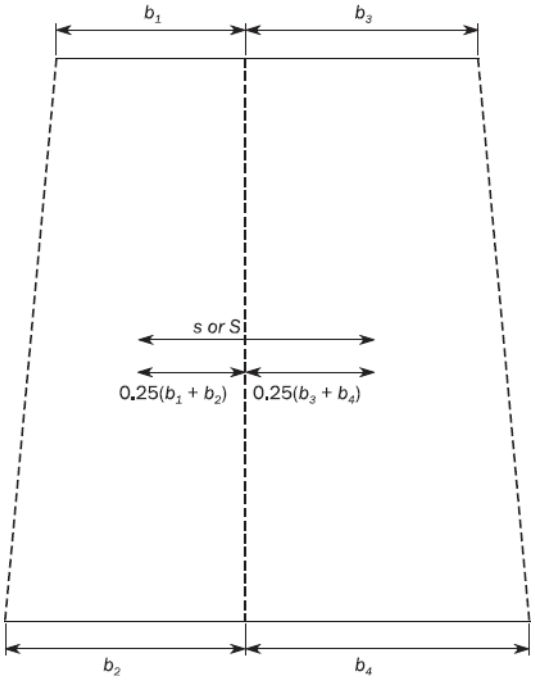

Figure 11 Spacing of plating

1.2.3 *Spacing of curved plating*

For curved plating, the stiffener spacing, *s* or the primary supporting member spacing, *S* is to be measured on the mean chord between members.

1.3 *Effective breadth*

1.3.1 Stiffeners

The effective breadth, b_{eff}, in mm, of the attached plating to be considered in the actual net section modulus for the yielding check of stiffeners is to be obtained from the following formulae:

- Where the plating extends on both sides of the stiffener:
  $b_{eff} = 200l$, or
  $b_{eff} = s$
  Whichever is lesser.
- Where the plating extends on one side of the stiffener (i.e. stiffeners bounding openings):
  $b_{eff} = 100l$, or
  $b_{eff} = 0.5\ s$
  Whichever is lesser.

However, where the attached plate net thickness is less than 8 mm, the effective breadth is not to be taken greater than 600 mm.

The effective breadth, b_{eff}, in mm, of the attached plating to be considered for the buckling check of stiffeners is given in Ch8, Sec 5, [2.3.5].

1.3.2 *Primary supporting members*

The effective breadth of attached plating, b_{eff}, in m, for calculating the section modulus and/or moment of inertia of a primary supporting member is to be taken as:

$$b_{eff} = S \min\left[\frac{1.12}{1+\frac{1.75}{\left(\frac{l_{bdg}}{S\sqrt{3}}\right)^{1.6}}};1.0\right] \quad \text{for } \frac{l_{bdg}}{S\sqrt{3}} \geq 1$$

$$b_{eff} = 0.407\frac{l_{bdg}}{\sqrt{3}} \quad \text{for } \frac{l_{bdg}}{S\sqrt{3}} < 1$$

1.3.3 *Effective area of curved face plate and attached plating of primary supporting members*

The effective net area given in a) and b) is only applicable to curved face plates and curved attached plating of primary supporting members. This is not applicable for the area of web stiffeners parallel to the face plate.

The effective net area is applicable to primary supporting members for the following calculations:

- Actual net section modulus used for comparison with the scantling requirements in Ch6.
- Actual effective net area of curved face plates, modelled by beam elements, used in Ch7.

a) The effective net area, $A_{eff\text{-}n50}$, in mm^2, is to be taken as:

$A_{eff\text{-}n50} = C_f\, t_{f\text{-}n50}\, b_f$

where:

C_f : Flange efficiency coefficient is to be obtained from the following formula but not to be greater than 1.0:

$$C_f = C_{f1}\frac{1.285}{\beta k_1} \quad \text{for symmetrical face plate}$$

$$C_f = 0.18 + \frac{0.08}{\beta^2}$$ for unsymmetrical face plate

$$C_f = C_{f1}\frac{1.285}{\beta k_1}$$ for attached plating of box girders

C_{f1} : Coefficient taken equal to:

- For symmetrical face plates,

$$C_{f1} = \frac{(\sinh k_1\beta \cosh k_1\beta + \sin k_1\beta \cos k_1\beta)}{(\cos hk_1\beta)^2 + (\cos k_1\beta)^2}$$

- For attached plating of box girders with two webs,

$$C_{f1} = \frac{0.78\ (\sinh \beta + \sin \beta)(\cosh \beta - \cos \beta)}{\sinh^2 \beta + \sin^2 \beta}$$

- For attached plating of box girders with multiple webs,

$$C_{f1} = \frac{1.56\ (\cosh \beta - \cos \beta)}{\sinh \beta + \sin \beta}$$

k_1 : Coefficient calculated as:

$k_1 = 1.4 + 1.25(1.4 - \beta)^3$ for $\beta < 1.4$

$k_1 = 1.4$ for $\beta \geq 1.4$

β : Coefficient calculated as:

$$\beta = \frac{1.285\ b_1}{\sqrt{r_f\ t_{f-n50}}}$$, in rad.

b_1 : Breadth, in mm, to be taken equal to:

- For symmetrical face plates, $b_1 = 0.5\ (b_f - t_w\text{-}n_{50})$
- For unsymmetrical face plates, $b_1 = b_f$
- For attached plating of box girders, $b_1 = s_w - t_w\text{-}n_{50}$

s_w : Spacing of supporting webs for box girders, in mm.

$t_{f\text{-}n50}$: Net flange thickness, in mm. For calculation of C_f and β of unsymmetrical face plates, $t_{f\text{-}n50}$ is not to be taken greater than $t_{w\text{-}n50}$.

$t_{w\text{-}n50}$: Net web plate thickness, in mm.

r_f : Radius of curved face plate or attached plating, in mm, see Figure 12 at mid thickness.

b_f : Breadth of face plate or attached plating, in mm, see Figure 12.

b) The effective net area, in mm^2, of curved face plates supported by radial brackets, or attached plating supported by cylindrical stiffeners, is given by:

$$A_{eff-n50} = \left(\frac{3r_f t_{f-n50} + C_f s_r^2}{3r_f t_{f-n50} + s_r^2} \right) t_{f-n50} b_f$$

where:

s_r : Spacing of tripping brackets or web stiffeners or stiffeners normal to the web plating, in mm, see Figure 12.

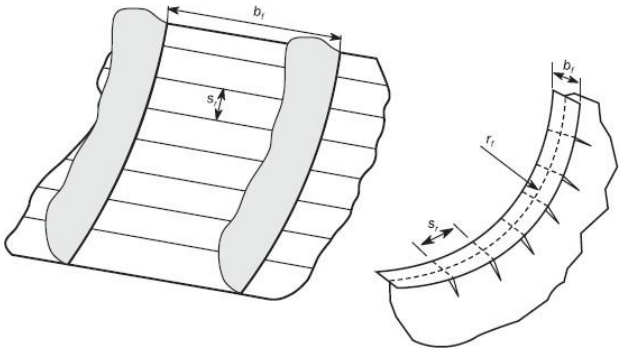

Figure 12 Curved shell panel and face plate

1.4 *Geometrical properties of stiffeners and primary supporting members*

1.4.1 Stiffener profile with a bulb section

The properties of bulb profile sections are to be determined by direct calculations.

Where direct calculation of properties is not possible, a bulb section may be taken equivalent to a built-up section. The net dimensions of the equivalent built-up section are to be obtained, in mm, from the following formulae.

$$h_w = h'_w - \frac{h'_w}{9.2} + 2$$

$$b_f = \alpha\left(t'_w + \frac{h'_w}{6.7} - 2\right)$$

$$t_f = \frac{h'_w}{9.2} - 2$$

$$t_w = t'_w$$

where:

h'_w, t'_w : Net height and thickness of a bulb section, in mm, as shown in Figure 13.

α : Coefficient equal to:

$$\alpha = 1.1 + \frac{(120 - h'_w)^2}{3000} \quad \text{for } h'_w \leq 120$$

$$\alpha = 1.0 \quad \text{for } h'_w > 120$$

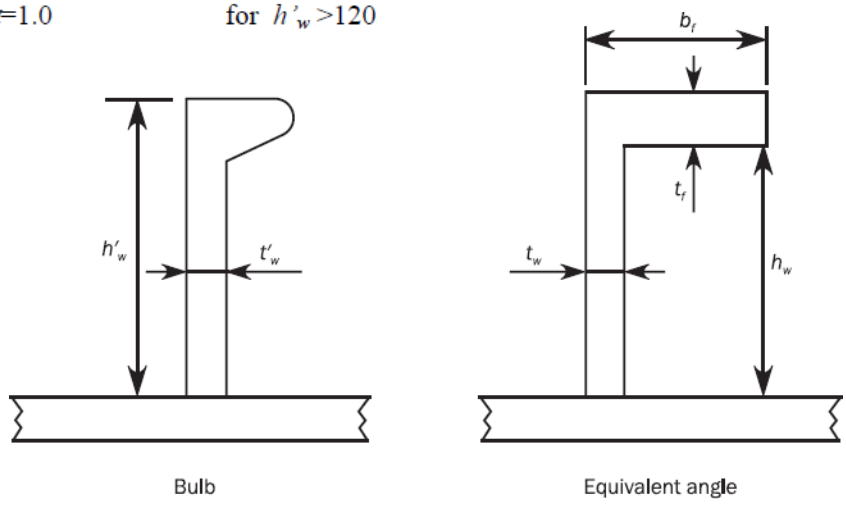

Figure 13 Dimensions of stiffeners

1.4.2 Net elastic shear area of stiffeners

The net elastic shear area, A_{shr}, in cm^2, of stiffeners is to be taken as:

$$A_{sh} = d_{shr}\, t_w 10^{-2}$$

d_{shr} : Effective shear depth of stiffener, in mm, as defined in [1.4.3].

t_w : Net web thickness of the stiffener, in mm, as defined in Ch 3, Sec 2, Figure 2.

1.4.3 *Effective shear depth of stiffeners*

The effective shear depth of stiffeners, d_{shr}, in mm, is to be taken as:

$$d_{shr} = (h_{stf} - 0.5t_{c\text{-}stf} + t_p + 0.5t_{c\text{-}pl})\sin\varphi_w$$

where:

h_{stf}: Height of stiffener, in mm, as defined in Ch 3, Sec 2, Figure 2.

t_p : Net thickness of the stiffener attached plating, in mm, as defined in Ch 3, Sec 2, Figure 2.

t_{c_stf} :Corrosion addition, in mm, of considered stiffener as given in Ch 3, Sec 3.

t_{c_pl} : Corrosion addition, in mm, of attached plate of the stiffener considered as given in Ch 3, Sec 3.

1.4.4 *Elastic net section modulus and net moment of inertia of stiffeners*

The elastic net section modulus, Z , in cm^3 and the net moment of inertia, I, in cm^4 of stiffeners, is to be taken as:

$Z = Z_{stf} \sin \varphi_w$

$I = I_{st} \sin^2 \varphi_w$

where:

Z_{stf} : Net section modulus of the stiffener, in cm^3, considered perpendicular to its attached plate, i.e. with φ_w = 90 deg.

I_{st}: Net moment of inertia of the stiffener, in cm^4, considered perpendicular to its attached plate, i.e. with φ_w = 90 deg.

Figure 14 Angle between stiffener web and attached plating

1.4.5 Effective net plastic shear area of stiffeners

The net plastic shear area, $A_{shr\text{-}pl}$, of stiffeners, in cm^2, which is used for assessment against impact loads is to be taken as:

$A_{shr\text{-}pl} = A_{shr}$

where:

A_{shr} : Net elastic shear area, in cm^2, as defined in [1.4.2].

1.4.6 *Effective net plastic section modulus of stiffeners*

The effective net plastic section modulus, Z_{pl}, of stiffeners, in cm^3, which is used for assessment against impact loads, is to be taken as:

$$Z_{pl} = \frac{f_w \, h_w{}^2 \, t_w}{2000} + \frac{(2\gamma - 1) A_f h_{f-ctr}}{1000} \quad \text{for } 75^\circ \leqslant \varphi_w \leqslant 105^\circ$$

$$Z_{pl} = \frac{f_w \, h_w{}^2 \, t_w \sin\phi_w}{2000} + \frac{(2\gamma - 1) A_f \left(h_{f-ctr} \sin\phi_w - b_{f-ctr} \left| \cos\phi_w \right| \right)}{1000} \quad \text{for } \varphi_w < 75^\circ \text{ or } \varphi_w > 105^\circ$$

where:

f_w : Web shear stress factor, taken equal to:

- For flanged profile cross sections with n = 1 or 2, f_w = 0.75.
- For flanged profile cross sections with n = 0, f_w = 1.0.
- For flat bar stiffeners, f_w = 1.0.

n : Number of plastic hinges at end supports of each member, taken equal to: 0, 1 or 2.

A plastic hinge at end support may be considered where:

- The stiffener is continuous at the support.
- The stiffener passes through the support plate while it is connected at its termination point by a carling (or equivalent) to adjacent stiffeners.
- The stiffener is attached to an abutting stiffener effective in bending (not a buckling stiffener).
- The stiffener is attached to a bracket effective in bending. The bracket is assumed to be effective in bending when it is attached to another stiffener (not a buckling stiffener).

h_w: Depth of stiffener web, in mm, taken equal to:

- For T, L (rolled and built-up) profiles and flat bar, as defined in Ch 3, Sec 2, Figure 2

- For L2 profile as defined in Ch 3, Sec 2, Figure 3,
- For bulb profiles, to be taken as defined in [1.4.1].

γ : Coefficient equal to:

$$\gamma = \frac{1+\sqrt{3+12\beta}}{4}$$

β : Coefficient equal to:

- $\beta = \frac{t_w^2 f_b l_{shr}^{\ 2}}{80 b_f^2 t_f h_{f-ctr}} 10^6 + \frac{t_w}{2b_f}$ for L profiles without a mid-span tripping bracket,but not to be taken greater than 0.5.
- β= 0.5 for other cases.

A_f :Net cross sectional area of flange, in mm^2:

- A_f = 0 for flat bar stiffeners.
- $A_f = b_f t_f$ for other stiffeners.

$b_{f\text{-}ctr}$: Distance from mid thickness of stiffener web to the centre of the flange area:

- $b_{f\text{-}ctr} = 0.5\ (b_f - t_w)$ for rolled angle profiles and bulb profiles.
- $b_{f\text{-}ctr}$ = 0 for T profiles.

$h_{f\text{-}ctr}$: Height of stiffener measured to the mid thickness of the flange:

- $h_{f\text{-}ctr} = h_w + 0.5t_f$ for profiles with flange of rectangular shape and for bulb profiles.

f_b : Coefficient taken equal to:

- f_b = 0.8 for flanges continuous through the primary supporting member, with end bracket(s).
- f_b= 0.7 for flanges sniped at the primary supporting member or terminated at the support without aligned structure on the other side of the support, and with end bracket(s).
- f_b = 1.0 for other stiffeners.

t_f : Net flange thickness, in mm.

- t_f = 0 for flat bar stiffeners.
- For bulb profiles t_f is defined in [1.4.1].

1.4.7 *Primary supporting member web not perpendicular to attached plating*

Where the primary supporting member web is not perpendicular to the attached plating, the actual net shear area, in cm^2, and the actual net section modulus, in cm3, can be obtained from the following formulae:

- Actual net shear area:
  $A_{sh-n50} = A_{sh-0-n50}\sin\varphi_w$
- Actual net section modulus:
  $Z_{n50} = Z_{perp-n50}\sin\varphi_w$

where:

$A_{sh-0-n50}$: Actual net shear area, in cm^2, of the primary supporting member assumed to be perpendicular to the attached plating, to be taken equal to:

$$A_{sh-0-n50} = \left(h_{eff} + t_{f-n50} + t_{p-n50}\right) t_{w-n50}\, 10^{-2}$$

$Z_{perp-n50}$: Actual section modulus, in cm^3, with its attached plating of the primary supporting member assumed to be perpendicular to the attached plating.

1.4.8 *Shear area of primary supporting members with web openings*

The effective web height, h_{eff}, in mm, to be considered for calculating the effective net shear area, $A_{sh\text{-}n50}$ is to be taken as the lesser of:

$h_{eff} = h_w$

$h_{eff} = h_{w3} + h_{w4}$

$h_{eff} = h_{w1} + h_{w2} + h_{w4}$

where:

h_w : Web height of primary supporting member, in mm.

h_{w1}, h_{w2}, h_{w3}, h_{w4} : Dimensions as shown in Figure 16.

Where an opening is located at a distance less than $h_w/3$ from the cross-section considered, h_{eff} is to be taken as the smaller of the net height and the net distance through the opening. See Figure 16.

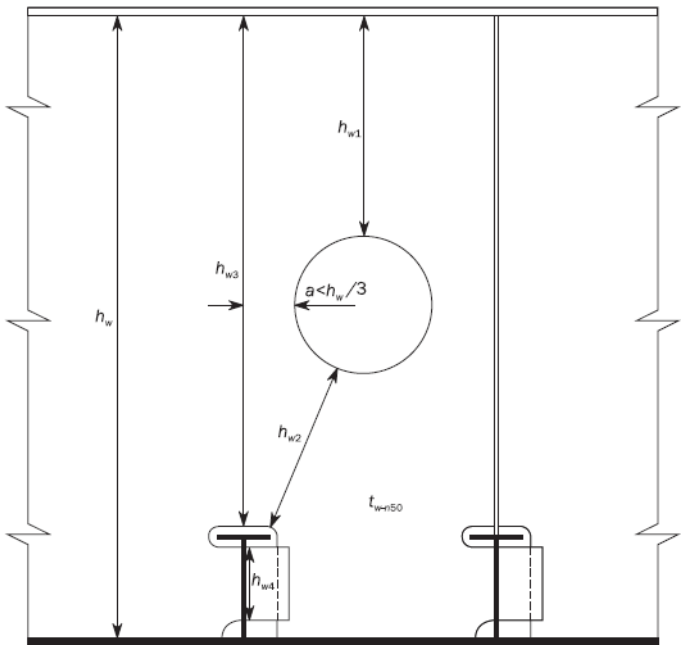

Figure 15 Effective shear area in way of web openings

1.4.9 Stiffener flange width

In case the stiffener flange thickness requirement in Ch 8, Sec 2, [3.1.1] b) is not fulfilled, the effective free flange outstand, used in strength assessment including the calculation of actual net section modulus, is to be taken as $b_{f\text{-}out\text{-}max}$ defined in Ch 8, Sec 2, [3.1.1].

2 PLATES

2.1 Idealisation of EPP

2.1.1 EPP

An elementary plate panel (EPP) is the unstiffened part of the plating between stiffeners and/or primary supporting members. The plate panel length, *a*, and breadth, *b*, of the EPP are defined respectively as the longest and shortest plate edges, as shown in Figure 16.

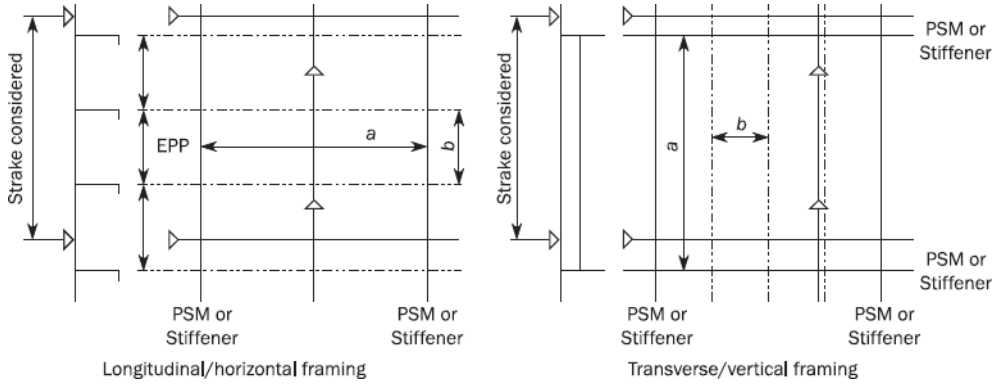

Figure 16 Elementary Plate Panel (EPP) definition

2.1.2 Strake required thickness

The required thickness of a plate strake is to be taken as the greatest value required for each EPP within that strake. The requirements given in Table 1 are to be applied for the selection of strakes to be considered as shown in Figure 17.

The maximum corrosion addition within a strake is to be applied according to Ch3, Sec 3, [1.2.4].

Strake considered in a given EPP *Table 1*

	$a/b>2$	$a/b\leq 2$
$a_1>b/2$	All strakes (St1, St2, St3, St4)	All strakes (St1, St2, St3, St4)

	$a/b>2$	$a/b\leq 2$
$a_1 \leq b / 2$	Strakes St2 and St4	All strakes (St1, St2, St3, St4)

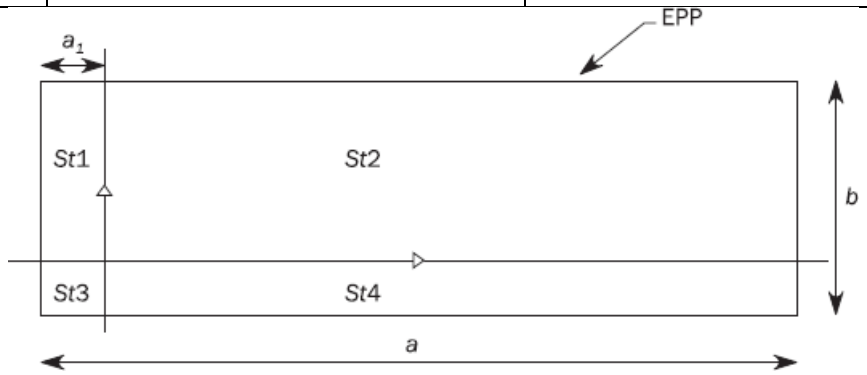

Figure 17 Strake considered in a given EPP

where:

a_1 : Distance, in mm, measured inside the considered strake in the direction of the long edge of the EPP, between the strake boundary weld seam and the EPP edge.

2.1.3

For direct strength assessment, the EPP is idealised with the mesh arrangement in the finite element model.

2.2 *Load calculation point*

2.2.1 Yielding

For the yielding check, the local pressure and hull girder stress, used for the calculation of the local scantling requirements are to be taken at the Load Calculation Point (LCP) having coordinates *x*, *y* and *z* as defined in Table 2.

LCP coordinates for yielding *Table 2*

LCP coordinates	General (1)		Horizontal plating		Vertical transverse structure and transverse stool plating	
	Longitudinal framing (Figure 18)	Transverse framing (Figure 19)	Longitudinal framing	Transverse framing	Horizontal framing (Figure 20)	Vertical framing (Figure 21)
x coordinate	Mid-length of the EPP		Mid-length of the EPP		Corresponding to y and z values	
y coordinate	Corresponding to *x* and *z* coordinates		Outboard y value of the EPP		Outboard y value of the EPP, taken at z level(2)	
z coordinate	Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake	Corresponding to x and y values		Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake

(1) All structures other than horizontal platings or vertical transverse structures.
(2) For transom plate, the y coordinate of the load calculation point is to be taken corresponding to y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation.

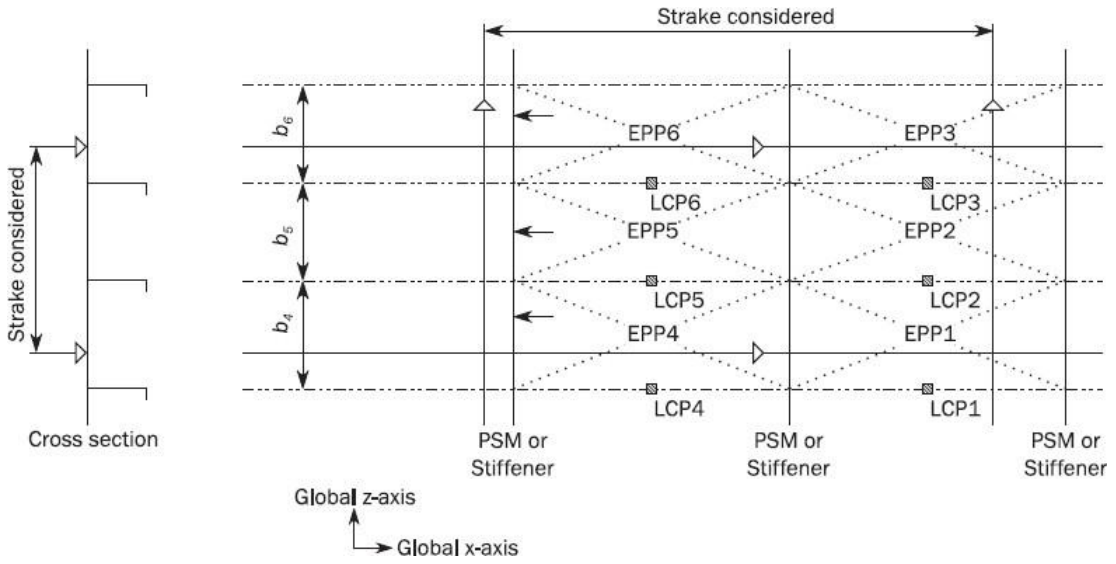

Figure 18 Load calculation point (LCP) for longitudinal framing

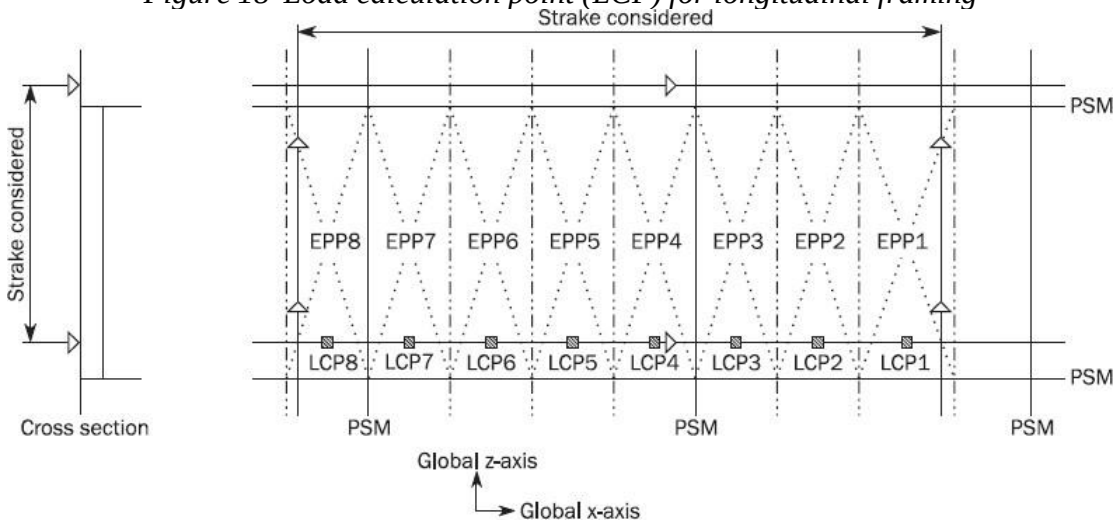

Figure 19 Load calculation point for transverse framing

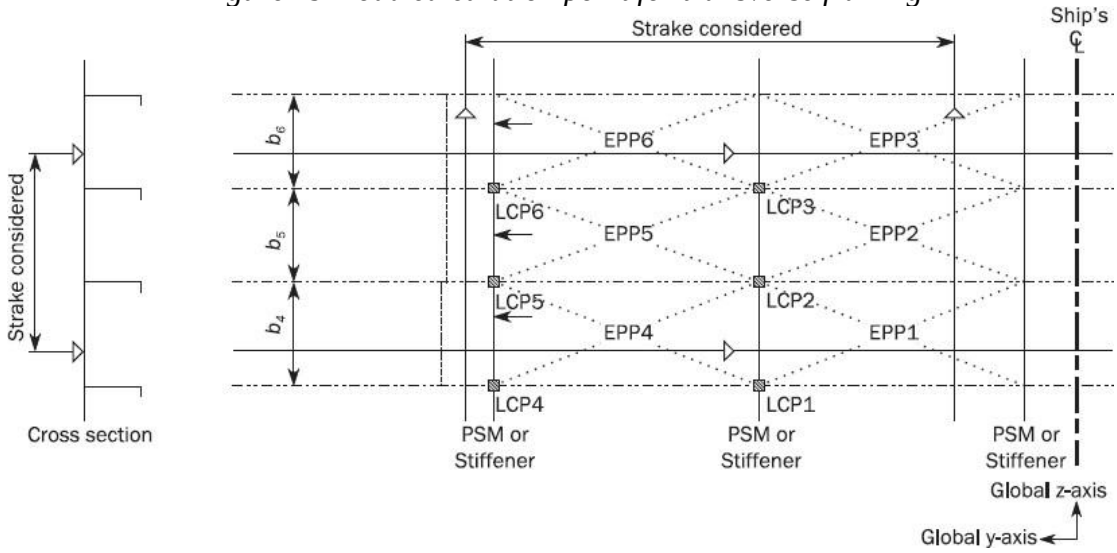

Figure 20 Load calculation point for horizontal framing on transverse vertical structure

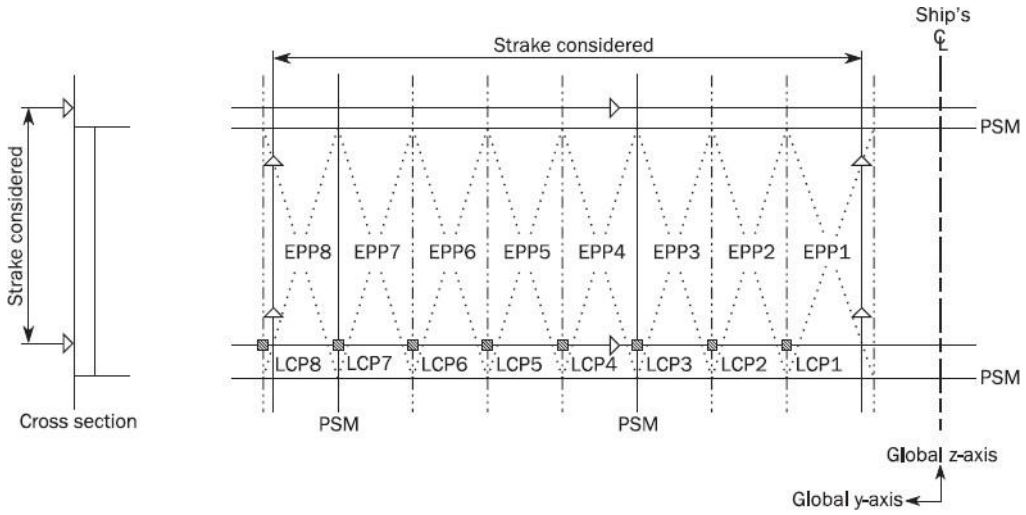

Figure 21 Load calculation point for vertical framing on transverse vertical structure

2.2.2 Buckling

For the prescriptive buckling check of the EPP according to Ch 8, Sec 3, the LCP for the pressure and for the hull girder stresses are defined in Table 3.

For the FE buckling check, Ch 8, Sec 4 is applicable.

LCP coordinates for plate buckling *Table 3*

LCP coordinates	LCP for pressure	LCP for hull girder stresses (Figure 22)		
		Bending stresses(1)		Shear stresses
		Non horizontal plate	Horizontal plate	
x coordinate	Same coordinates as LCP for yielding See Table 2	Mid-length of the EPP		
y coordinate		Corresponding to *x* and *z* values	Outboard and inboard ends of the EPP (points A1 and A2)	Mid-point of EPP (point B)
z coordinate		Both upper and lower ends of the EPP (points A1 and A2)	Corresponding to *x* and *y* values	
(1) The bending stress for curved plate panel is the mean value of the stresses calculated at points A1 and A2.				

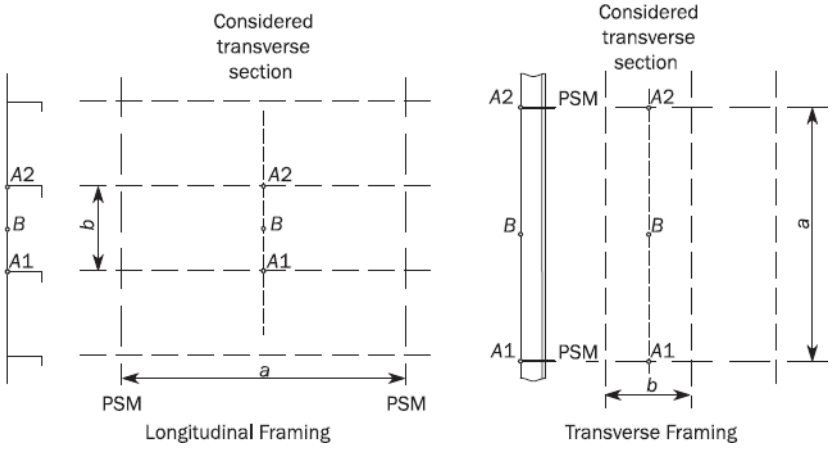

Figure 22 LCP for plate buckling – hull girder stresses

3 STIFFENERS

3.1 Reference point

3.1.1

The requirements of section modulus for stiffeners relate to the reference point giving the minimum section modulus. This reference point is generally located as shown in Figure 23 for typical profiles.

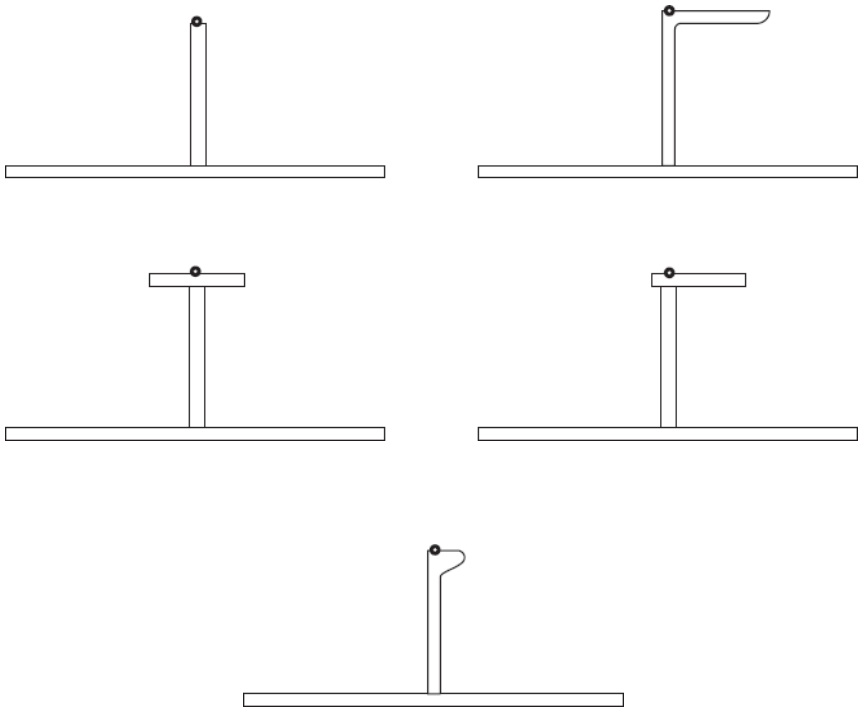

Figure 23 Reference point for calculation of section modulus and hull girder stress for local scantling assessment

3.2 Load calculation points

3.2.1 LCP for Pressure

The load calculation point for the pressure is located at:

- Middle of the full length, *l*, of the considered stiffener.
- The intersection point between the stiffener and its attached plate.

For stiffeners located on transom plate, the y coordinate of the load calculation point is to be taken corresponding to y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation.

3.2.2 *LCP for hull girder bending stress*

The load calculation point for the hull girder bending stresses is defined as follows:

- For prescriptive yielding verification according to Ch 6 and Ch 10, Sec 4:
  - At the middle of the full length, l, of the considered stiffener.
  - At the reference point given in Figure 23.
- For prescriptive buckling requirements according to Ch 8:
  - At the middle of the full length, *l*, of the considered stiffener.
  - At the intersection point between the stiffener and its attached plate.

3.2.3 *Non-horizontal stiffeners*

The lateral pressure, *P* is to be calculated as the maximum between the value obtained at middle of the full length, *l*, and the value obtained from the following formulae:

$P = \frac{p_U + p_L}{2}$ when the upper end of the vertical stiffener is below the lowest zero pressure level.

$P = \frac{l_1}{l}\frac{p_L}{2}$ when the upper end of the vertical stiffener is at or above the lowest zero pressure

level, see Figure24.

where:

l_1 : Distance, in m, between the lower end of vertical stiffener and the lowest zero pressure level.

P_U, P_L : Lateral pressures at the upper and lower end of the vertical stiffener span l, respectively.

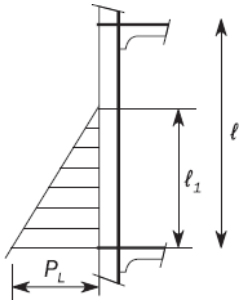

Figure 24 Definition of pressure for vertical

stiffeners 4 PRIMARY SUPPORTING MEMBERS

4.1 Load calculation point

4.1.1

The load calculation point is located at the middle of the full length, *S*, at the attachment point of the primary supporting member with its attached plate. However, for primary supporting members in the cargo hold region the requirements in Pt 2, Ch 1, Sec 4, [4], as applicable, for bulk carriers and Pt 2, Ch 2, Sec 3, [1] for oil tankers are to be followed.

For primary supporting members located on transom plate, the y coordinate of the load calculation point is to be taken corresponding to y value at side shell at z level of load calculation point for the external dynamic pressure calculation.

Chapter 4 LOADS

Section 1 INTRODUCTION

SYMBOLS
For symbols not defined in this section, refer to Ch 1, Sec 4.
S : Static load case.
S+D: Static plus dynamic load case.

1 GENERAL
1.1 Application
1.1.1 Scope
This chapter provides the design load for strength and fatigue assessments.

The load combinations are to be derived for the design load scenarios specified in Ch4, Sec 7. This section uses the concept of design load scenarios to specify consistent design load sets which cover the appropriate operating modes of a bulk carrier or oil tanker.

1.1.2 *Equivalent Design Wave EDW*
The dynamic loads associated with each dynamic load case are based on the Equivalent Design Wave (EDW) concept. The EDW concept applies a consistent set of dynamic loads to the ship such that specified dominant load response is equivalent to the required long term response value.

1.1.3 *Probability level for strength and fatigue assessments*
In this chapter, the assessments are to be understood as follows:

- Strength assessment means the assessment for the strength criteria excluding fatigue, for the loads corresponding to the probability level of 10^{-8}, for the ballast water exchange, for harbour conditions and for flooded conditions.
- Fatigue assessment means the assessment for the fatigue criteria for the loads corresponding to the probability level of 10^{-2}.

1.1.4 *Dynamic load components*
All dynamic load components are to be concurrent values calculated for each dynamic load case.

1.1.5 *Loads for strength assessment*
The strength assessment is to be undertaken for all design load scenarios and the final assessment is to be made on the most onerous strength requirement.

Each design load scenario for strength assessment is composed of a Static (S) load case or a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.
The static loads are defined in the following sections:

- Still water hull girder loads in Ch4, Sec 4.
- External loads in Ch4, Sec 5.
- Internal loads in Ch4, Sec 6.

The EDWs for the strength assessment and the dynamic load combination factors for global loads are listed in Ch4, Sec 2, [2].

The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Ch4, Sec 4.
- External loads in Ch4, Sec 5.
- Internal loads in Ch4, Sec 6.

1.1.6 *Loads for fatigue assessment*

Each design load scenario for fatigue assessment is composed of a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered. The static loads are defined in the following sections:

- Still water hull girder loads in Ch4, Sec 4.
- External loads in Ch4, Sec 5.
- Internal loads in Ch4, Sec 6.

The EDWs for the fatigue assessment are listed in Ch4, Sec 2, [3]. The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Ch 4, Sec 4.
- External loads in Ch4, Sec 5.
- Internal loads in Ch4, Sec 6.

1.2 *Definitions*

1.2.1 Coordinate system

The coordinate system is defined in Ch 1, Sec 4, [3.6.1].

1.2.2 *Sign convention for ship motions*

The ship motions are defined with respect to the ship's centre of gravity (COG) as shown in Figure 1, where:

- Positive surge is translation in the X-axis direction (positive forward).
- Positive sway is translation in the Y-axis direction (positive towards port side of ship).
- Positive heave is translation in the Z-axis direction (positive upwards).
- Positive roll motion is positive rotation about a longitudinal axis through the COG (starboard down and port up).
- Positive pitch motion is positive rotation about a transverse axis through the COG (bow down and stern up).
- Positive yaw motion is positive rotation about a vertical axis through the COG (bow moving to port and stern to starboard).

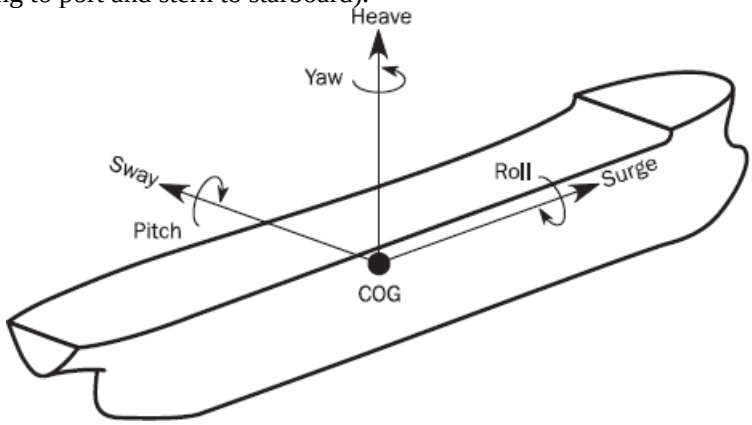

Figure 1 Definition of positive Motions

1.2.3 Sign convention for hull girder loads

The sign conventions of vertical bending moments, vertical shear forces, horizontal bending moments and torsional moments at any ship transverse section are as shown in Figure 2, namely:

- The vertical bending moments M_{sw} and M_{wv} are positive when they induce tensile stresses in the strength deck (hogging bending moment) and negative when they induce tensile stresses in the bottom (sagging bending moment).
- The vertical shear forces Q_{sw}, Q_{wv} are positive in the case of downward resulting forces acting aft of the transverse section and upward resulting forces acting forward of the transverse section under consideration.
- The horizontal bending moment M_{wh} is positive when it induces tensile stresses in the starboard side and negative when it induces tensile stresses in the port side.

- The torsional moment M_{wt} is positive in the case of resulting moment acting aft of the transverse section following negative rotation around the *X*-axis, and of resulting moment acting forward of the transverse section following positive rotation around the *X*-axis.

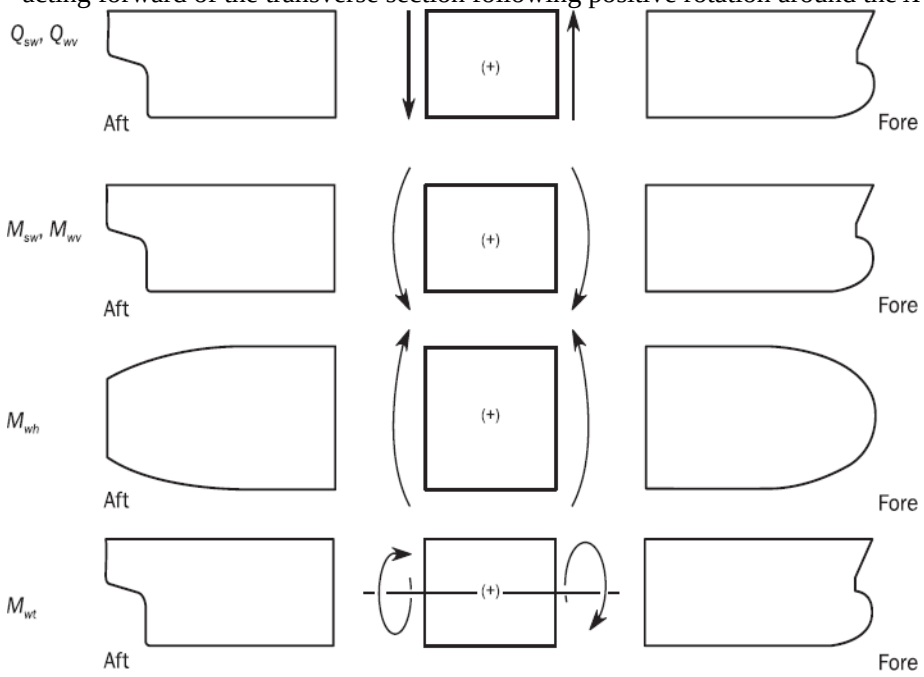

Figure 2 Sign conventions for shear forces Q_{sw}, Q_{wv} and bending moments M_{sw}, M_{wv}, M_{wh} **and M_{wt}**

Section 2 DYNAMIC LOAD CASES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a_{surge}, $a_{pitch\text{-}x}$, a_{sway}, $a_{roll\text{-}y}$, a_{heave}, $a_{roll\text{-}z}$, $a_{pitch\text{-}z}$: Acceleration components, as defined in Ch 4, Sec 3.

f_{xL} : Ratio between X-coordinate of the load point and L, to be taken as:

$$f_{xL} = \frac{x}{L}$$, but not to be taken less than 0.0 or greater than 1.0.

f_T : Ratio between draught at a loading condition and scantling draught, as defined in Ch 4, Sec 3.

f_{lp} : Factor depending on longitudinal position along the ship, to be taken as:

$f_{lp} = 1.0$ for $x/L \leq 0.5$

$f_{lp} = -1.0$ for $0.5 < x/L$

$f_{lp\text{-}OST}$: Factor for the longitudinal distribution of the torsional moment for the OST load case, to be taken as:

$f_{lp\text{-}OST} = 5f_{xL}$ for $x/L < 0.2$

$f_{lp\text{-}OST} = 1.0$ for $0.2 \leq x/L < 0.4$

$f_{lp\text{-}OST} = -7.6f_{xL} + 4.04$ for $0.4 \leq x/L < 0.65$

$f_{lp\text{-}OST} = -0.9$ for $0.65 \leq x/L < 0.85$

$f_{lp\text{-}OST} = 6f_{xL} - 6$ for $0.85 \leq x/L$

$f_{lp\text{-}OSA}$: Factor for the longitudinal distribution of the torsional moment for the OSA load case, to be taken as:

$f_{lp\text{-}OSA} = -(0.2 + 0.3\, f_T)$ for $x/L < 0.4$

$f_{lp\text{-}OSA} = -(0.2 + 0.3\, f_T)(5.6 - 11.5\, f_{xL})$ for $0.4 \leq x/L < 0.6$

$f_{lp\text{-}OSA} = 1.3(0.2 + 0.3\, f_T)$ for $0.6 \leq x/L$

WS : Weather side, side of the ship exposed to the incoming waves.

LS : Lee side, sheltered side of the ship away from the incoming waves.

M_{WV} : Vertical wave bending moment, in kNm, defined in Ch 4, Sec 4.

Q_{WV} : Vertical wave shear force, in kN, defined in Ch 4, Sec 4.

M_{WH} : Horizontal wave bending moment, in kNm, defined in Ch 4, Sec 4.

M_{WT} : Torsional wave bending moment, in kNm, defined in Ch 4, Sec 4.

C_{WV} : Load combination factor to be applied to the vertical wave bending moment.

C_{QW} : Load combination factor to be applied to the vertical wave shear force.

C_{WH} : Load combination factor to be applied to the horizontal wave bending moment.

C_{WT} : Load combination factor to be applied to the wave torsional moment.

C_{XS} : Load combination factor to be applied to the surge acceleration.

C_{XP} : Load combination factor to be applied to the longitudinal acceleration due to pitch.

C_{XG} : Load combination factor to be applied to the longitudinal acceleration due to pitch motion.

C_{YS} : Load combination factor to be applied to the sway acceleration.

C_{YR} : Load combination factor to be applied to the transverse acceleration due to roll.

C_{YG} : Load combination factor to be applied to the transverse acceleration due to roll motion.

C_{ZH} : Load combination factor to be applied to the heave acceleration.

C_{ZR} : Load combination factor to be applied to the vertical acceleration due to roll.

C_{ZP} : Load combination factor to be applied to the vertical acceleration due to pitch.

θ : Roll angle, in deg, as defined in Ch 4, Sec 3, [2.1.1].

φ : Pitch angle, in deg, as defined in Ch 4, Sec 3, [2.1.2].

1 *GENERAL*

1.1 Definition of dynamic load cases

1.1.1

The following Equivalent Design Waves (EDW) are to be used to generate the dynamic load cases for structural assessment:

- HSM load cases:
  HSM-1 and HSM-2: Head sea EDWs that minimise and maximise the vertical wave

bending moment amidships respectively.

- HSA load cases:
  HSA-1 and HSA-2: Head sea EDWs that maximise and minimise the head sea vertical acceleration at FP respectively.
- FSM load cases:
  FSM-1 and FSM-2: Following sea EDWs that minimise and maximise the vertical wave bending moment amidships respectively.
- BSR load cases:
  BSR-1P and BSR-2P: Beam sea EDWs that minimise and maximise the roll motion downward and upward on the port side respectively with waves from the port side.
  BSR-1S and BSR-2S: beam Sea EDWs that maximise and minimise the roll motion downward and upward on the starboard side respectively with waves from the starboard side.
- BSP load cases:
  BSP-1P and BSP-2P: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the port side respectively.
  BSP-1S and BSP-2S: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the starboard side respectively.
- OST load cases:
  OST-1P and OST-2P: Oblique sea EDWs that minimise and maximise the torsional moment at 0.25*L* from the AE with waves from the port side respectively.
  OST-1S and OST-2S: Oblique sea EDWs that maximise and minimise the torsional moment at 0.25*L* from the AE with waves from the starboard side respectively.
- OSA load cases:
  OSA-1P and OSA-2P: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the port side respectively.
  OSA-1S and OSA-2S: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the starboard side respectively.

Note 1: 1 and 2 denote the maximum or the minimum dominate load component for each EDW.
Note 2: P and S denote that the weather side is on port side and on starboard side respectively.
HSA and OSA load cases are not to be used for fatigue assessment.

1.2 *Application*

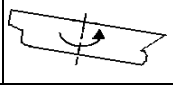
1.2.1

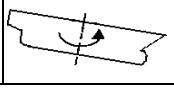
The dynamic load cases described in this section are to be used for determining the dynamic loads required by the design load scenarios described in Ch 4, Sec 7. These dynamic load cases are to be applied to the following structural assessments:

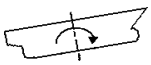
a) Strength assessment:
   - For plating, ordinary stiffeners and primary supporting members by prescriptive methods.
   - For the direct strength method (FE analysis) assessment of structural members.

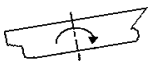
b) Fatigue assessment:
   - For structural details covered by simplified stress analysis.
   - For structural details covered by FE stress analysis.

2 *DYNAMIC LOAD CASES FOR STRENGTH ASSESSMENT*



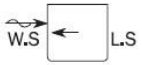


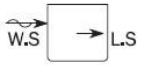


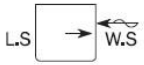


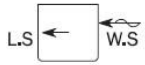
2.1 Description of dynamic load cases

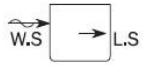
2.1.1

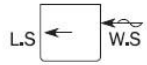


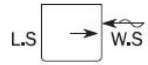


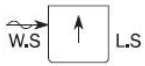


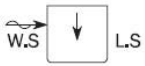


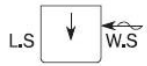


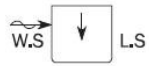


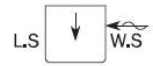












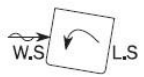


Table 1 to Table 3 describe the ship motions responses and the global loads corresponding to each dynamic load case to be considered for the strength assessment.

3.2 Load combination factors

3.2.1

The load combinations factors, LCFs for the global loads and inertial load components for fatigue assessment are defined in:

Table 10: LCFs for HSM and FSM load cases. Table 11: LCFs for BSR and BSP load cases. Table 12: LCFs for OST load case.

Load combination factors, LCFs for HSM and FSM load cases - Fatigue assessment

Section 3 SHIP MOTIONS AND ACCELERATIONS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a_0 : Acceleration parameter, to be taken as:

$$a_0 = (1.58 - 0.47C_B)\left[\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right]$$

T_θ : Roll period, in s, as defined in [2.1.1].

θ : Roll angle, in deg, as defined in [2.1.1].

T_φ : Pitch period, in s, as defined in [2.1.2].

φ : Pitch angle, in deg, as defined in [2.1.2].

R : Vertical coordinate, in m, of the ship rotation centre, to be taken as:

$$R = \min\left(\frac{D}{4} + \frac{T_{LC}}{2}, \frac{D}{2}\right)$$

C_{XG}, C_{XS}, C_{XP}, C_{YG}, C_{YS}, C_{YR}, C_{ZH}, C_{ZR}, *and* C_{ZP}: Load combination factors, as defined in Ch 4, Sec 2.

$a_{roll\text{-}y}$: Transverse acceleration due to roll, in m/s2, as defined in [3.3.2].

$a_{pitch\text{-}x}$: Longitudinal acceleration due to pitch, in m/s2, as defined in [3.3.1].

$a_{roll\text{-}z}$: Vertical acceleration due to roll, in m/s2, as defined in [3.3.3].

$a_{pitch\text{-}z}$: Vertical acceleration due to pitch, in m/s2, as defined in [3.3.3].

f_T : Ratio between draught at a loading condition and scantling draught, to be taken as:

$$f_T = \frac{T_{LC}}{T_{SC}} \text{ but is not to be taken less than 0.5}$$

T_{LC} : Draught, in m, amidships for the considered load case

x, y, z : X, Y and Z coordinates, in m, of the considered point with respect to the coordinate system, as defined in Ch 4, Sec 1, [1.2.1].

f_{ps} : Coefficient for strength assessments which is dependant on the applicable design load scenario specified in Ch 4, Sec 7, and to be taken as:

f_{ps} = 1.0 for extreme sea loads design load scenario.

f_{ps} = 0.8 for the ballast water exchange design load scenario.

f_{ps} = 0.8 for the accidental flooded design load scenario at sea.

f_{ps} = 0.4 for the harbour/sheltered water design load scenario.

f_{fa} : Fatigue coefficient to be taken as:

f_{fa} = 0.9

1 GENERAL

1.1 Definition

1.1.1

The ship motions and accelerations are assumed to be sinusoidal. The motion values defined by the formulae in this section are single amplitudes, i.e. half of the 'crest to trough' height.

2 SHIP MOTIONS AND ACCELERATIONS

2.1 Ship motions

2.1.1 Roll motion

The roll period T_θ, in s, to be taken as:

$$T_\theta = \frac{2.3\pi k_r}{\sqrt{gGM}}$$

The roll angle θ, in deg, to be taken as:

$$\theta = \frac{9000(1.25 - 0.025T_\theta) f_p f_{BK}}{(B + 75)\pi}$$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = f_{fa}(0.23\text{-}4f_T B\times 10^{-4})$ for fatigue assessment.

f_{BK} : To be taken as:

$f_{BK} = 1.2$ for ships without bilge keel.

$f_{BK} = 1.0$ for ships with bilge keel.

k_r : Roll radius of gyration, in m, in the considered loading condition. The values in Table 1 or Table 2 are to be adopted.

GM : Metacentric height, in m, in the considered loading condition. The values in Table 1 or Table 2 are to be adopted.

k_r and GM values for oil tankers **Table 1**

Loading condition (1) (2)	T_{LC}	k_r	GM
Full load condition	T_{SC}	0.35B	0.12B
Optional conditions that have a draught greater than $0.9T_{SC}$	Actual draught but $\geq 0.9T_{SC}$	0.35B	0.12B
Partial load condition	$\leq 0.6T_{SC}$	0.40B	0.24B
Ballast condition	T_{BAL}	0.45B	0.33B

(1) For optional loading conditions or gale/emergency ballast conditions with draught between $0.6T_{SC}$ and $0.9T_{SC}$, the values of k_r and GM, unless provided in the loading manual, are to be obtained by linear interpolation between the optional condition at $0.9T_{SC}$ and the partial load condition at $0.6T_{SC}$ based on the actual draught.

(2) For flooded loading conditions, the values of k_r and GM, unless provided in the loading manual, are to be taken as those for the full load condition.

k_r and GM values for bulk carriers **Table 2**

Loading condition (1) (2) (4)		Application	T_{LC}	k_r	GM
Full load condition	Homogeneous loading	All bulk carriers	T_{SC}	0.35B	0.12B
	Alternate heavy cargo	BC-A		0.40B	0.20B
	Alternate light cargo	BC-A		0.35B	0.12B
	Homogeneous heavy cargo	BC-B, BC-A		0.42B	0.25B
Steel coil loading (3)		All bulk carriers designated for the carriage of steel products		0.42B	0.25B
Heavy ballast condition		All bulk carriers	T_{BAL-H}	0.40B	0.25B
Normal ballast condition		All bulk carriers	T_{BAL}	0.45B	0.33B

(1) For Multi-port (MP) loading conditions with draught greater than or equal to $0.9T_{SC}$, the values of kr and GM, unless provided in the loading manual, are to be taken as those from the most appropriate full load condition. For Multi-port (MP) loading conditions with draught between T_{BAL-H} and $0.9T_{SC}$, the values of k_r and GM, unless provided in the loading manual, are to be obtained by linear interpolation, based on the draught, between the heavy ballast condition and the most appropriate full load condition.
For Multi-port (MP) loading conditions with a draught below T_{BAL-H}, the values of kr and GM for the heavy ballast condition are to be used.

(2) For flooded loading conditions, the values of k_r and GM, unless provided in the loading manual, are to be taken as those for the full load condition.

(3) When steel coil loading condition is provided by the designer according to Ch 1, Sec 2, [3.6] in the loading manual, this condition is to be assessed with draught, kr and GM values given in this table.

(4) Block Loading conditions are to be assessed with draught, k_r and GM values given in this table for Homogeneous heavy cargo loading condition.

2.1.2 Pitch motion

The pitch period T_φ, in s, is to be taken as:

$$T_\varphi = \sqrt{\frac{2\pi\lambda_\varphi}{g}}$$

where:
$\lambda_\varphi = 0.6(1+f_T)L$
The pitch angle φ, in deg, is to be taken as:

$$\varphi = 1350 f_p L^{-0.94} \left\{ 1.0 + \left(\frac{2.57}{\sqrt{gL}} \right)^{1.2} \right\}$$

where:
f_p : Coefficient to be taken as:
$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[(0.27-0.02f_T)-(13-5f_T)\, L\times10^{-5}]$ for fatigue assessment

2.2 *Ship accelerations at the centre of gravity*

2.2.1 Surge acceleration

The longitudinal acceleration due to surge, in m/s^2, is to be taken as:
$a_{surge} = 0.2 f_p a_0 g$
where:
f_p : Coefficient to be taken as:
$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[0.27-(15+4f_T)\, L\times10^{-5}]$ for fatigue assessment.

2.2.2 *Sway acceleration*

The transverse acceleration due to sway, in m/s^2, is to be taken as:
$a_{sway} = 0.3 f_p a_0 g$
where:
f_p ： Coefficient to be taken as:
$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[0.24-(6-2f_T)\, B\times10^{-4}]$ for fatigue assessment.

2.2.3 *Heave acceleration*

The vertical acceleration due to heave, in m/s^2, is to be taken as:
$a_{heave} = f_p a_0 g$
where:
f_p : Coefficient to be taken as:
$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[(0.27+0.02f_T)\, -17L\times10^{-5}]$ for fatigue assessment.

2.2.4 *Roll acceleration*

The roll acceleration, a_{roll}, in rad/s^2, is to be taken as:

$$a_{roll} = f_p \theta \frac{\pi}{180} \left(\frac{2\pi}{T_\theta} \right)^2$$

where:

θ : Roll angle using *fp* equal to 1.0.
f_p : Coefficient to be taken as:
$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[0.23-4f_T\, B\times10^{-4}]$ for fatigue assessment.

2.2.5 *Pitch acceleration*

The pitch acceleration, *apitch*, in rad/s2, is to be taken as:

$$a_{pitch} = f_p \theta \left(\frac{3.1}{\sqrt{gL}} + 1.0 \right) \varphi \frac{\pi}{180} \left(\frac{2\pi}{T_\varphi} \right)^2$$

where:

φ : Pitch angle using *fp* equal to 1.0.
f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.
$f_p = f_{fa}[0.28-(5+6f_T)\,L\times10^{-5}]$ for fatigue assessment.

3 ACCELERATIONS AT ANY POSITION

3.1 General

3.1.1

The accelerations used to derive the inertial loads at any position are defined with respect to the ship fixed coordinate system. Hence the acceleration values defined in [3.2] and [3.3] include the gravitational acceleration components due to the instantaneous roll and pitch angles.

3.1.2

The accelerations to be applied for the dynamic load cases defined in Ch 4, Sec 2 are given in [3.2].

3.1.3

The envelope accelerations as defined in [3.3] are provided for advisory purposes and may be used for other design purpose when the maximum design acceleration values are required, for example, crane foundations, machinery foundations, etc.

3.2 *Accelerations for dynamic load cases*

3.2.1 General

The accelerations to be applied for the dynamic load cases defined in Ch 4, Sec 2 are given in [3.2.2] to [3.2.4].

3.2.2 *Longitudinal acceleration*

The longitudinal acceleration at any position for each dynamic load case, in m/s^2, is to be taken as:

$a_X = -C_{XG}g\sin\varphi + C_{XS}a_{surge} + C_{XP}a_{pitch}(z-R)$

3.2.3 *Transverse acceleration*

The transverse acceleration at any position for each dynamic load case, in m/s^2, is to be taken as:

$a_Y = -C_{YG}g\sin\theta + C_{YS}a_{sway} - C_{YR}a_{roll}\,(z-R)$

3.2.4 *Vertical acceleration*

The vertical acceleration at any position for each dynamic load case, in m/s^2, is to be taken as:

$a_Z = -C_{ZH}\,a_{heave} + C_{ZR}a_{roll}y - C_{ZP}a_{pitch}\,(x-0.45L)$

3.3 *Envelope accelerations*

3.3.1 Longitudinal acceleration

The envelope longitudinal acceleration, $a_{x\text{-}env}$, in m/s^2, at any position, is to be taken as:

$$a_{x-env} = 0.7\sqrt{a_{surge}^2 + \left[\frac{L}{325}(g\sin\varphi + a_{pitch-x})\right]^2}$$

where:

$a_{pitch\text{-}x}$: Longitudinal acceleration due to pitch, in m/s^2

$a_{pitch\text{-}x} = a_{pitch}\,(z-R)$

3.3.2 *Transverse acceleration*

The envelope transverse acceleration, $a_{y\text{-}env}$, in m/s^2, at any position, is to be taken as:

$$a_{y-env} = \sqrt{a_{sway}^2 + (g\sin\theta + a_{roll-y})^2}$$

where:

$a_{roll\text{-}y}$: Transverse acceleration due to roll, in m/s^2.

$a_{roll\text{-}y} = a_{roll}\,(z-R)$

3.3.3 *Vertical acceleration*

The envelope vertical acceleration, $a_{z\text{-}env}$, in m/s^2, at any position, is to be taken as:

$$a_{z-env} = \sqrt{a_{heave}^2 + \left[\left(0.3 + \frac{L}{325}\right) a_{pitch-z}\right]^2 + (1.2 a_{roll-z})^2}$$

where:

$a_{picth\text{-}z}$: Vertical acceleration due to pitch, in m/s^2.

$a_{pitch\text{-}z} = a_{pitch}\,(x\text{-}0.45L)$

$a_{roll\text{-}z}$: Vertical acceleration due to roll, in m/s^2.

$a_{roll\text{-}z} = a_{roll} y$

Section 4 HULL GIRDER LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

x : X coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

C_w : Wave coefficient, to be taken as:

$$C_w = 10.75 - \left(\frac{300 - L}{100}\right)^{1.5} \quad \text{for } 90\text{m} \leqslant L \leqslant 300\text{m}$$

$$C_w = 10.75 \quad \text{for } 300\text{m} < L \leqslant 350\text{m}$$

$$C_w = 10.75 - \left(\frac{L - 350}{150}\right)^{1.5} \quad \text{for } 350\text{m} < L \leqslant 500\text{m}$$

f_β : Heading correction factor, to be taken as:

- For strength assessment:

  f_β =1.05 for HSM and FSM load cases for the extreme sea loads design load scenario.

  f_β =0.8 for BSR and BSP load cases for the extreme sea loads design load scenario.

  f_β =1.0 for HSA, OST and OSA load cases for the extreme sea loads design load scenario.

  f_β =1.0 for ballast water exchange at sea, harbour/sheltered water and accidental flooded design load scenarios.

- For fatigue assessment:

  f_β= 1.0.

f_{ps} : Coefficient, as defined in Ch 4, Sec 3.

BSR, *BSP*, *HSM*, *HSA*, *FSM*, *OST*, *OSA*: Dynamic load cases, as defined in Ch 4, Sec 2.

1 APPLICATION

1.1 General

1.1.1

The hull girder loads for the static (S) design load scenarios is to be taken as the still water loads defined in [2].

1.1.2

The total hull girder loads for the static plus dynamic (S+D) design load scenarios are to be derived for each dynamic load case and are to be taken as the sum of the still water loads defined in [2] and the dynamic loads defined in [3.5].

2 VERTICAL STILL WATER HULL GIRDER LOADS

2.1 General

2.1.1 Seagoing and harbour/sheltered water conditions

The designer is to provide the permissible still water bending moment and shear force for seagoing and harbour/sheltered water operations.

The permissible still water hull girder loads are to be given at each transverse bulkhead in the cargo hold region, at the middle of cargo compartments, at the collision bulkhead, at the engine room forward bulkhead and at the mid-point between the forward and aft engine room bulkheads. The permissible hull girder bending moments and shear forces at any other position may be obtained by linear interpolation.

Note1: It is recommended that, for initial design, the permissible hull girder hogging and sagging still water bending moments are at least 5% above the maximum still water bending moment from loading conditions in the loading manual, and the permissible hull girder shear forces are at least 10% above the maximum still water shear force from loading condition in the loading manual, to account for growth and design margins during the design and construction phase of the ship.

2.1.2 *Flooded condition*

The designer is to provide the envelope of permissible still water bending moment and shear force in flooded condition.

2.1.3 *Still water loads for the fatigue assessment*

The still water bending moment and shear force values and distribution to be used for the fatigue assessment are to be taken as the most typical values applicable for the loading conditions that the ship will operate in for most of its life. Typically, these conditions will be the normal ballast condition and full homogeneously loaded condition for double hull oil tankers. For bulk carriers, these will be the normal ballast condition, heavy ballast condition, full homogeneously loaded condition and full alternate loaded condition; note the latter is only applicable to BC-A bulk carriers. The definition of loading conditions to use is specified in Ch9.

2.2 *Vertical still water bending moment*

2.2.1 Minimum still water bending moment

The minimum still water bending moment, $M_{sw\text{-}h\text{-}min}$ and $M_{sw\text{-}s\text{-}min}$, in kNm, in hogging and sagging condition, respectively is to be taken as:

Hogging conditions:

$$M_{sw\text{-}h\text{-}min}=f_{sw}(171C_wL^2B(C_B+0.7)10^{-3}-M_{wv\text{-}h\text{-}mid})$$

Sagging conditions:

$$M_{sw\text{-}s\text{-}min}= - 0.85f_{sw}(171C_wL^2B(C_B+0.7)10^{-3}+M_{wv\text{-}s\text{-}mid})$$

where:

$M_{wv\text{-}h\text{-}mid}$: Vertical wave bending moment for strength assessment in hogging condition, as defined in [3.1.1] using f_p and f_m equal to 1.0.

$M_{wv\text{-}s\text{-}mid}$: Vertical wave bending moment for strength assessment in sagging condition, as defined in [3.1.1] using f_p and f_m equal to 1.0.

f_{sw} : Distribution factor along the ship length. To be taken as, see Figure 1:

$f_{sw} = 0.0$ for $x \leq 0$

$f_{sw} = 0.15$ at $x = 0.1\ L$

$f_{sw} = 1.0$ for $0.3\ L \leq x \leq 0.7\ L$

$f_{sw} = 0.15$ at $x = 0.9\ L$

$f_{sw} = 0.0$ for $x \geq L$

Intermediate values of f_{sw} are to be obtained by linear interpolation.

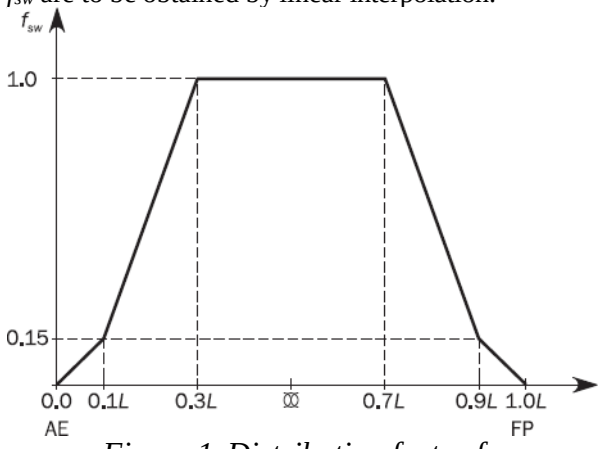

Figure 1 Distribution factor f_{sw}

2.2.2 Permissible vertical still water bending moment in seagoing condition

The permissible vertical still water bending moments, $M_{sw\text{-}h}$ and $M_{sw\text{-}s}$ in seagoing condition at any longitudinal position are to envelop:

- The most severe still water bending moments calculated, in hogging and sagging conditions, respectively, for the seagoing loading conditions defined in Ch 4, Sec 8.
- The most severe still water bending moments for the seagoing loading conditions defined in the loading manual.
- The minimum still water bending moment defined in [2.2.1]

2.2.3 *Permissible vertical still water bending moment in harbour/sheltered water and tank testing condition*

The permissible vertical still water bending moments in the harbour/sheltered water and tank testing condition $M_{sw\text{-}p\text{-}h}$ and $M_{sw\text{-}p\text{-}s}$ at any longitudinal position are to envelop:

- The most severe still water bending moments, in hogging and sagging conditions, respectively, for the harbour/sheltered water loading conditions defined in Ch 4, Sec 8.
- The most severe still water bending moments for the harbour/sheltered water loading conditions defined in the loading manual.
- The permissible still water bending moment defined in [2.2.2].
- The minimum still water bending moment defined in [2.2.1] increased by 25%.

2.2.4 *Permissible vertical still water bending moment in flooded condition at sea*

The permissible vertical still water bending moments in flooded condition $M_{sw\text{-}f}$ at any longitudinal position are to envelop:

- The most severe still water bending moments, in hogging and sagging conditions, respectively, for the intact and flooded seagoing loading conditions defined in Ch 4, Sec 8. Loading conditions encountered during ballast water exchange need not to be considered for the flooded condition.
- The most severe still water bending moments for the intact and flooded seagoing loading conditions defined in the loading manual.
- The permissible still water bending moment defined in [2.2.2] increased by 10%.

2.3 *Vertical still water shear force*

2.3.1 Minimum still water shear force in seagoing conditions for oil tankers

The minimum hull girder positive and negative vertical still water shear force, $Q_{sw\text{-}min}$ in kN, in way of transverse bulkheads between cargo tanks in the seagoing condition is to be taken as:

a) For oil tankers with three cargo tanks across the breadth of the ship:

$$Q_{sw-min} = \pm \max \begin{cases} 0.225\rho g B_{local} l_{tk} T_{SC} \\ 0.5\rho g[0.98(V_{CT} + 2V_{ST}) - 0.7 B_{local} l_{tk} T_{SC}] \end{cases}$$

and is to be taken as the maximum value of $Qsw\text{-}min$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

b) For oil tankers with two cargo tanks across the breadth of the ship:
$Q_{sw\text{-}min} = \pm 0.4\rho g B_{local} l_{tk} T_{SC}$
and is to be taken as maximum value of $Qsw\text{-}min$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

where:

B_{local} : Local breadth, in m, at T_{SC} at the middle length of the tank under consideration.

l_{tk} : Length of cargo tank under consideration, in m, taken at the forward or aft side of the transverse bulkhead under consideration, in m.

V_{CT} : Volume of centre cargo tank, in m_3, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration.

V_{ST} : Volume of side cargo tank, in m^3, taken for the cargo tank on the forward or aft side of the transverse bulkhead under consideration.

2.3.2 Minimum still water shear force in harbour/sheltered water conditions for oil tankers

The minimum hull girder positive and negative vertical still water shear force, $Q_{sw\text{-}p\text{-}min}$ in kN in the harbour/sheltered water condition in way of transverse bulkheads between cargo tanks are to be taken as:

a) For oil tankers with three cargo tanks across the breadth of the ship:

$$Q_{sw-min} = \pm \max \begin{cases} 0.275\rho g B_{local} l_{tk} T_{SC} \\ 0.5\rho g[0.98(V_{CT} + 2V_{ST}) - 0.6 B_{local} l_{tk} T_{SC}] \end{cases}$$

and is to be taken as the maximum value of $Q_{sw\text{-}p\text{-}min}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

b) For oil tankers with two cargo tanks across the breadth of the ship:
$Q_{sw\text{-}p\text{-}min} = \pm 0.45\rho g B_{local} l_{tk} T_{SC}$

and is to be taken as maximum value of $Q_{sw\text{-}p\text{-}min}$ calculated for cargo/ballast tanks forward and aft of the transverse bulkhead.

2.3.3 *Permissible still water shear force in seagoing condition*

The permissible vertical still water shear forces, Q_{sw} for oil tankers and bulk carriers, in seagoing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the seagoing loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier.
- The most severe still water shear forces for the seagoing loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- For oil tankers, the minimum still water shear forces for seagoing conditions defined in [2.3.1].

2.3.4 *Permissible still water shear force in harbour/sheltered water and tank testing condition*

The permissible vertical still water shear forces, *Qsw-p* for oil tankers and bulk carriers, in the harbour/sheltered water and tank testing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the harbour/sheltered water loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier.
- The most severe still water shear forces for the harbour/sheltered water loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- The permissible vertical still water shear force defined in [2.3.3].
- For oil tankers, the minimum still water shear forced for harbour/sheltered water conditions defined in [2.3.2].

The following value may be used as guidance at preliminary design stage:

$Q_{sw\text{-}p} = Q_{sw} + 0.6Q_{wv}$

where:

Q_{sw} : Permissible still water shear force Q_{sw}, as defined in [2.3.3].

Q_{wv} : Vertical wave shear force for strength assessment $Q_{wv\text{-}pos}$ and $Q_{wv\text{-}neg}$, as defined in [3.2.1] using f_p equal to 1.0.

2.3.5 *Permissible still water shear force in flooded condition at sea*

The permissible vertical still water shear forces, *Qsw-f* for oil tankers and bulk carriers, in flooded condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the flooded seagoing loading conditions defined in Ch 4, Sec 8 after shear force correction in case of bulk carrier. Loading conditions encountered during ballast water exchange need not be considered for the flooded condition.
- The most severe still water shear forces for the flooded seagoing loading conditions defined in the loading manual after shear force correction in case of bulk carrier.
- The permissible still water shear force is defined in [2.3.3].

3 *DYNAMIC HULL GIRDER LOADS*

3.1 Vertical wave bending moment

3.1.1

The vertical wave bending moments at any longitudinal position, in kNm, are to be taken as:

Hogging condition:

$M_{wv\text{-}h} = 0.19 f_{nl\text{-}vh} f_m f_p C_w L^2 B C_B$

Sagging condition:

$M_{wv\text{-}s} = -0.19 f_{nl\text{-}vs} f_m f_p C_w L^2 B C_B$

where:

$f_{nl\text{-}vh}$: Coefficient considering nonlinear effects applied to hogging, to be taken as:

$f_{nl\text{-}vh}$ =1.0 for strength and fatigue assessment.

$f_{nl\text{-}vs}$: Coefficient considering nonlinear effects applied to sagging, to be taken as:

$$f_{nl-s} = 0.58\frac{(C_B + 0.7)}{C_B}, \text{ for strength assessment.}$$

$f_{nl\text{-}s}$ = 1.0, for fatigue assessment.

f_p : Coefficient to be taken as:

$f_p = f_{ps}$, for strength assessment.

$f_p = 0.9[0.27-(6+4f_T)L\times10^{-5}]$, for fatigue assessment.

f_m : Distribution factor for vertical wave bending moment along the ship's length, to be taken as:

$f_m = 0.0$ for $x \le 0$

$f_m = 1.0$ for $0.4\,L \le x \le 0.65\,L$ f_m

$= 0.0$ for $x \ge L$

Intermediate values of *fm* are to be obtained by linear interpolation (see Figure 2).

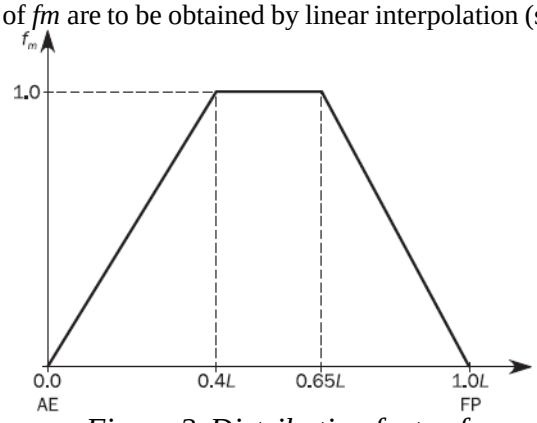

Figure 2 Distribution factor f_m

3.2 Vertical wave shear force

3.2.1

The vertical wave shear forces at any longitudinal position, in kN, are to be taken as:

$Q_{wv\text{-}pos}=0.52f_{q\text{-}pos}f_pC_wLBC_B$

$Q_{wv\text{-}neg}=-0.52f_{q\text{-}neg}f_pC_wLBC_B$

where:

f_p : Coefficient to be taken as:

$f_p = f_{ps}$,for strength assessment.

$f_p = 0.9[0.27-(17-8f_T)L\times10^{-5}]$, for fatigue assessment.

$f_{q\text{-}pos}$: Distribution factor along the ship length for positive wave shear force, to be taken as:

$f_{q\text{-}pos}$ = 0.0 for $x \le 0$

$f_{q\text{-}pos}$ = 0.92 f_{nl-vh} for 0.2 $L \le$ x $\le$ 0.3 L $f_{q\text{-}pos}$ = 0.7 for 0.4 $L \le x \le$ 0.6 L $f_{q\text{-}pos}$ = 1.0$f_{nl\text{-}vs}$ for 0.7 $L \le x \le$ 0.85 L $f_{q\text{-}pos}$ = 0.0 for $x \ge L$

Intermediate values of $f_{q\text{-}pos}$ are to be obtained by linear interpolation (see Figure 3).

$f_{q\text{-}neg}$: Distribution factor along the ship length for negative wave shear force, to be taken as:

$f_{q\text{-}neg}$ = 0.0 for $x \le 0$

$f_{q\text{-}neg}$ = 0.92f_{nl-vs} for 0.2$L \le$ x $\le$ 0.3 L $f_{q\text{-}neg}$ = 0.7 for 0.4$L \le$ x $\le$ 0.6 L $f_{q\text{-}neg}$ = 1.0f_{nl-vh} for 0.7$L \le$ x $\le$ 0.85 L $f_{q\text{-}neg}$

= 0.0 for x $\ge$ L

Intermediate values of $f_{q\text{-}neg}$ are to be obtained by linear interpolation, see Figure 4.

$f_{nl\text{-}vh}$, $f_{nl\text{-}vs}$: Coefficient considering nonlinear effects defined in [3.1.1].

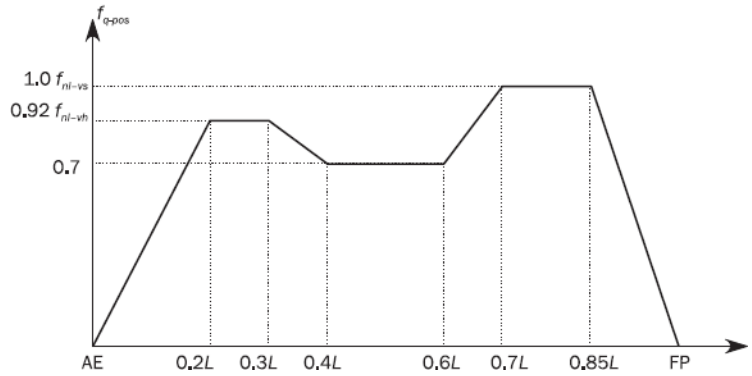

Figure 3 Distribution factor of positive vertical shear force $f_{q\text{-}pos}$

3.3 Horizontal wave bending moment

3.3.1

The horizontal wave bending moment at any longitudinal position, in kNm, is to be taken as:

$$M_{wh} = f_{nlh} f_p \left(0.31 + \frac{L}{2800}\right) f_m C_w L^2 T_{LC} C_B$$

where:

f_{nlh} : Coefficient considering nonlinear effect to be taken as:

f_{nlh} = 0.9 for strength assessment

f_{nlh} = 1.0 for fatigue assessment

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9[(0.2+0.04 f_T)+(11-8f_T)L\times10^{-5}]$ for fatigue assessment.

f_m : Distribution factor defined in [3.1.1].

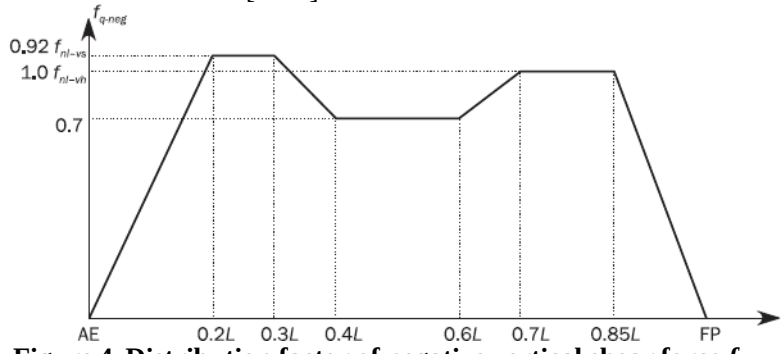

Figure 4 Distribution factor of negative vertical shear force $f_{q\text{-}neg}$

3.4 Wave torsional moment

3.4.1

The wave torsional moment at any longitudinal position with respect to the ship baseline, in kNm, is to be taken as:

$M_{wt}=f_p(M_{wt1}+M_{wt2})$

where:

$$M_{wt1} = 0.4 f_{t1} C_w \sqrt{\frac{L}{T_{LC}}} B^2 D C_B$$

$M_{wt2}=0.22 f_{t2} C_w L B^2 C_B$

f_{t1}, f_{t2} : Distribution factors, taken as:

$f_{t1}=0$ for $x<0$

$$f_{t1} = \left|\sin\left(\frac{2\pi x}{L}\right)\right| \text{ for } 0 \leqslant x \leqslant L$$

$f_{t1}=0$ for $x>L$

$f_{t2}=0$ for $x<0$

$$f_{t2} = \sin^2\left(\frac{\pi x}{L}\right) \quad \text{for } 0 \leqslant x \leqslant L$$

$f_{t2}=0$ for $x>L$

f_p : Coefficient to be taken as:

$f_p = f_{ps}$ for strength assessment.

$f_p = 0.9[0.2+(5\, f_T - 4.25)B\times 10^{-4}]$ for fatigue assessment

3.5 Hull girder loads for dynamic load cases

3.5.1 General

The dynamic hull girder loads to be applied for the dynamic load cases defined in Ch 4, Sec 2, are given in [3.5.2] to [3.5.5].

3.5.2 Vertical wave bending moment

The vertical wave bending moment, $M_{wv\text{-}LC}$, in kNm, to be used for each dynamic load case in Ch 4, Sec2, is defined in Table 1.

Vertical wave bending moment for dynamic load cases **Table 1**

Load combination factor	$M_{wv\text{-}LC}$
$C_{WV} \geqslant 0$	$f_\beta C_{WV} M_{wv-h}$
$C_{WV} < 0$	$f_\beta C_{WV} \lvert M_{wv-s} \rvert$

where:

C_{WV} : Load combination factor for vertical wave bending moment, to be taken as specified in Ch 4, Sec 2.

$M_{wv\text{-}h}$, $M_{wv\text{-}s}$: Hogging and sagging vertical wave bending moment taking account of the considered design load scenario, as defined in [3.1.1].

3.5.3 Vertical wave shear force

The vertical wave shear force, $Q_{wv\text{-}LC}$, in kN, to be used for each dynamic load case in Ch 4, Sec 2, is defined inTable 2.

Vertical wave shear force for dynamic load cases **Table 2**

Load combination factor	$Q_{wv\text{-}LC}$
$C_{QW} \geqslant 0$	$f_\beta C_{QW} Q_{wv-pos}$
$C_{QW} < 0$	$f_\beta C_{QW} \lvert Q_{wv-neg} \rvert$

where:

C_{QW} : Load combination factor for vertical wave shear force, to be taken as specified in Ch 4, Sec 2.

$Q_{wv\text{-}pos}$, $Q_{wv\text{-}neg}$: Positive and negative vertical wave shear force taking account of the considered design load scenario, as defined in [3.2.1].

3.5.4 Horizontal wave bending moment

The horizontal wave bending moment, $M_{wh\text{-}LC}$, in kNm, to be used for each dynamic load case defined in Ch4, Sec 2, is to be taken as:

$M_{wh\text{-}LC}=f_\beta C_{WH} M_{wh}$

where:

C_{WH} : Load combination factor for horizontal wave bending moment, to be taken as specified in Ch 4, Sec 2.

M_{wh} : Horizontal wave bending moment taking account of the appropriate design load scenario, as defined in [3.3.1].

3.5.5 Wave torsional moment

The wave torsional moment, $M_{wt\text{-}LC}$, in kNm, to be used for each dynamic load case defined in Ch 4, Sec 2, is to be taken as:

$M_{wt\text{-}LC}=f_\beta C_{WT} M_{wt}$

where:

C_{WT} : Load combination factor for wave torsional moment, to be taken as specified in Ch 4, Sec 2.
M_{wt} : Wave torsional moment taking account of the appropriate design load scenario, as defined in [3.4.1].

Section 5 EXTERNAL LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

λ : Wave length, in m.

B_x : Moulded breadth at the waterline, in m, at the considered cross section.

x, y, z: X, Y and Z coordinates, in m, of the load point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

f_{xL} : Ratio as defined in Ch 4, Sec 2.

f_{yB} : Ratio between Y-coordinate of the load point and B_x, to be taken as:

$$f_{yB} = \frac{|2y|}{B_x}, \text{ but not greater than 1.0,}$$

f_{yB} = 1.0 when B_x =0.

f_{yB1} : Ratio between Y-coordinate of the load point and B, to be taken as:

$$f_{yB} = \frac{|2y|}{B}, \text{ but not greater than 1.0}$$

C_w : Wave coefficient defined in Ch 4, Sec 4.

f_T : Ratio as defined in Ch 4, Sec 3.

$P_{W,WL}$: Wave pressure at the waterline, kN/m^2, for the considered dynamic load case.

$P_{W,WL}=P_W$ for $y=B_x/2$ and $z = T_{LC}$

h_W : Water head equivalent to the pressure at waterline, in m, to be taken as:

$$h_W = \frac{P_{W,WL}}{\rho g}$$

f_{ps} : Coefficient for strength assessment, as defined in Ch 4, Sec 3.

θ : Roll angle, in deg, as defined in Ch 4, Sec 3, [2.1.1].

T : Roll period, in s, as defined in Ch 4, Sec 3, [2.1.1].

f_{fa} : Coefficient defined in Ch 4, Sec 3.

f : Coefficient defined in Ch 4, Sec 4.

z_{SD} : Z coordinate, in m, of the midpoint of stiffener span, or of the middle of the elementary plate panel.

1 SEA PRESSURE

1.1 Total pressure

1.1.1

The external pressure P_{ex} at any load point of the hull, in kN/m^2, for the static (S) design load scenarios, is to be taken as:

$P_{ex} = P_S$,but not less than 0.

The total pressure P_{ex} at any load point of the hull for the static plus dynamic (S+D) design load scenarios, is to be derived from each dynamic load case and is to be taken as:

$P_{ex} = P_S + P_W$, but not less than 0.

where:

P_S : Hydrostatic pressure, in kN/m^2, defined in [1.2].

P_W : Wave pressure, in kN/m^2, is defined in [1.3].

1.2 Hydrostatic pressure

1.2.1

The hydrostatic pressure, P_S at any load point, in kN/m^2, is obtained from Table 1. See also Figure 1.

Hydrostatic pressure, P_S **Table 1**

Location	Hydrostatic Pressure, P_S, in kN/m^2
$z \leqslant T_{LC}$	$\rho g(T_{LC}-z)$
$z > T_{LC}$	0

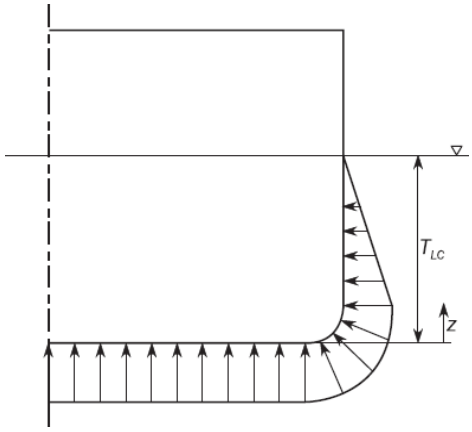

Figure 1 Hydrostatic pressure, P_S

1.3 External dynamic pressures for strength assessment

1.3.1 General

The hydrodynamic pressures for each dynamic load case defined in Ch4, Sec 2, [2] are defined in [1.3.2] to [1.3.8].

1.3.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, *PW*, for HSM-1 and HSM-2 load cases, at any load point, in kN/m2, are to be obtained from Table 2. See also Figure 2 and Figure 3.

Hydrodynamic pressures for HSM load cases **Table 2**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant h_W + T_{LC}$	$z > h_W + T_{LC}$
HSM-1	$P_W = \max(-P_{HS}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - g(z-T_{LC})$	$P_W = 0$
HSM-2	$P_W = \max(P_{HS}, \rho g(z-T_{LC}))$		

where:

$$P_{HS} = f_\beta f_{ps} f_{nl} f_h k_a k_p f_{yz} C_W \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as:

- For extreme sea loads design load scenario:
  f_{nl} = 0.7 at f_{XL}= 0.0
  f_{nl} = 0.9 at f_{XL}= 0.3
  f_{nl} = 0.9 at f_{XL}= 0.7
  f_{nl} = 0.6 at f_{XL}= 1.0
- For ballast water exchange design load scenario:
  f_{nl} = 0.85 at f_{XL}= 0.0
  f_{nl} = 0.95 at f_{XL}= 0.3
  f_{nl} = 0.95 at f_{XL}= 0.7
  f_{nl} = 0.80 at f_{XL}= 1.0
  Intermediate values are obtained by linear interpolation.

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:
f_h=3.0(1.21-0.66f_T)

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = (0.5 + f_T)\left\{(3 - 2\sqrt{f_{yB}}) - \frac{20}{9} f_{xL}(7 - 6\sqrt{f_{yB}})\right\} + \frac{2}{3}(1 - f_T) \quad \text{for} \quad f_{xL} < 0.15$$

k_a=1.0 for $0.15 \leqslant f_{xL} < 0.7$

$$k_a = 1 + (f_{xL} - 0.7)\left\{\left(\frac{40}{3} f_T - 5\right) + 2(1 - f_{yB})\left[\frac{18}{C_B} f_T (f_{xL} - 0.7) - 0.25(2 - f_T)\right]\right\} \text{ for } f_{xL} \geqslant 0.7$$

λ : Wave length of the dynamic load case, in m, to be taken as:
$\lambda = 0.6(1+f_T)L$

k_p : Phase coefficient to be obtained from Table 3. Intermediate values are to be interpolated.

k_p values for HSM load cases **Table 3**

f_{xL}	0	0.3 – 0.1 f_T	0.35 – 0.1 f_T	0.8 – 0.2 f_T	0.9 – 0.2f_T	1.0
k_p	–0.25 f_T (1 + f_{yB})	-1	1	1	-1	-1

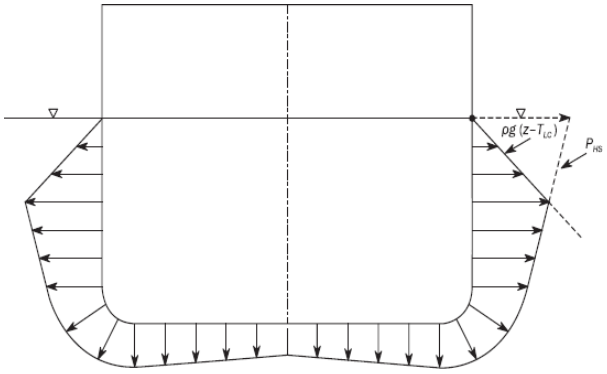

Figure 2 Transverse distribution amidships of dynamic pressure for HSM-1, HSA-1 and FSM-1 load cases

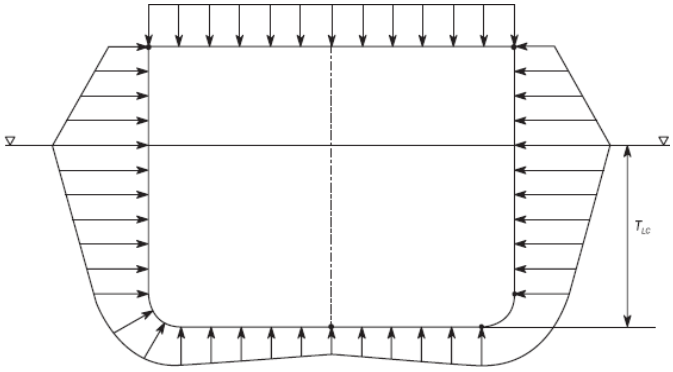

Figure 3 Transverse distribution amidships of dynamic pressure for HSM-2, HSA-2 and FSM-2 load cases

1.3.3 Hydrodynamic pressures for HSA load cases

The hydrodynamic pressures, P_W, for HSA-1 and HSA-2 load cases at any load point, in kN/m^2, are to be obtained from Table 4. See also Figure 2 and Figure 3.

Hydrodynamic pressures for HSA load cases **Table 4**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant h_W + T_{LC}$	$z > h_W + T_{LC}$
HSA-1	$P_W = \max(-P_{HS}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - g(z-T_{LC})$	$P_W = 0$
HSA-2	$P_W = \max(P_{HS}, \rho g(z-T_{LC}))$		

where:

$$P_{HS} = f_{ps} f_{nl} f_h k_a k_p f_{yz} C_W \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as defined in [1.3.2].

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

f_h=2.4(1.21-0.66f_T)

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as defined in [1.3.2].

λ : Wave length of the dynamic load case, in m, to be taken as:

λ=0.6(1+f_T)L

k_p : Phase coefficient to be obtained from Table 5. Intermediate values are to be interpolated.

k_p values for HSA load cases **Table 5**

f_{xL}	0	0.3 – 0.1 f_T	0.5 – 0.2 f_T	0.8 – 0.2 f_T	0.9 – 0.2 f_T	1.0
k_P	$1.5-f_T-0.5f_{yB}$	-1	1	1	-1	-1

1.3.4 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 6. See also Figure 2 and Figure 3.

Hydrodynamic pressures for FSM load cases **Table 6**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant h_W + T_{LC}$	$z > h_W + T_{LC}$
FSM-1	$P_W = \max(-P_{HS}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - g(z-T_{LC})$	$P_W = 0$
FSM-2	$P_W = \max(P_{HS}, \rho g(z-T_{LC}))$		

where:

$$P_{FS} = f_\beta f_{ps} f_{nl} f_h k_a k_p f_{yz} C_W \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} : Coefficient considering non-linear effects, to be taken as:

f_{nl} = 0.9 for extreme sea loads design load scenario.

f_{nl} = 0.95 for ballast water exchange design load scenarios.

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

f_h = 2.6

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

k_a = 1+(3.75-2f_T)(1-5f_{xL})(1-f_{yB}) for f_{xL}<0.2

k_a=1.0 for 0.2$\leqslant f_{xL}$<0.9

k_a = 1+20 (1-f_{yB}) (f_{xL}-0.9) for $f_{xL} \geqslant$0.9

λ : Wave length of the dynamic load case, in m, to be taken as:

λ=0.6(1+2/3f_T)L

k_p : Phase coefficient to be obtained from Table 7. Intermediate values are to be interpolated.

k_p values for FSM load cases **Table 7**

f_{xL}	0	0.35 – 0.1 f_T	0.5 – 0.2 f_T	0.75	0.8	1.0
k_p	$-0.75-0.25f_{yB}$	-1	1	1	-1	$-0.75-0.25f_{yB}$

1.3.5 Hydrodynamic pressures for BSR load cases

The wave pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 8. See also Figure 4 and Figure 5.

Hydrodynamic pressures for BSR load cases **Table 8**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant h_W + T_{LC}$	$z > h_W + T_{LC}$
BSR-1P	$P_W = \max(P_{BSR}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - \rho g(z-T_{LC})$	$P_W = 0$
BSR-2P	$P_W = \max(-P_{BSR}, \rho g(z-T_{LC}))$		
BSR-1S	$P_W = \max(P_{BSR}, \rho g(z-T_{LC}))$		
BSR-2S	$P_W = \max(-P_{BSR}, \rho g(z-T_{LC}))$		

where:

- For BSR-1P and BSR-2P load cases.

$$P_{BSR} = f_\beta f_{nl}\left(10y\sin\theta + 0.88 f_{ps} C_w \sqrt{\frac{L_0+\lambda-125}{L}}(f_{yB1}+1)\right)$$

- For BSR-1S and BSR-2S load cases.

$$P_{BSR} = f_\beta f_{nl}\left(-10y\sin\theta + 0.88 f_{ps} C_w \sqrt{\frac{L_0+\lambda-125}{L}}(f_{yB1}+1)\right)$$

f_{nl} : Coefficient considering non-linear effect, to be taken as:
f_{nl} = 1 for extreme sea loads design load scenario.
f_{nl} = 1 for ballast water exchange design load scenarios.

λ :Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = \frac{g}{2\pi} T_\beta^2$$

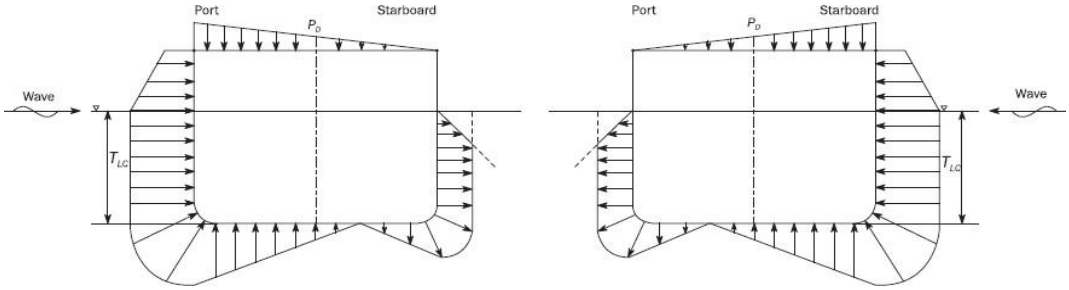

Figure 4 Transverse distribution of dynamic pressure for BSR-1P (left) and BSR-1S (right) load cases

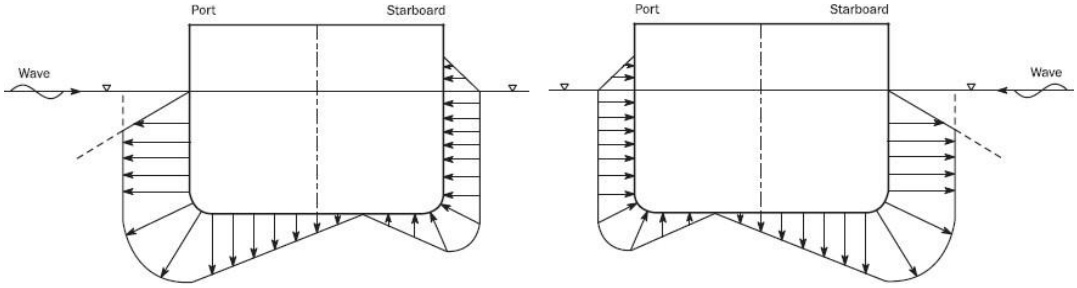

Figure 5 Transverse distribution of dynamic pressure for BSR-2P (left) and BSR-2S (right) load cases

1.3.6 Hydrodynamic pressures for BSP load cases

The wave pressures, *PW*, for BSP-1 and BSP-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 9. See also Figure 6 and Figure 7.

Hydrodynamic pressures for BSP load cases **Table 9**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$z \leqslant T_{LC}$	$z \leqslant T_{LC}$
BSP-1P	P_W = max (P_{BSP}, $\rho g(z-T_{LC})$)	$P_W = P_{W,WL} - \rho g(z-T_{LC})$	$P_W = 0$
BSP-2P	P_W = max (-P_{BSP}, $\rho g(z-T_{LC})$)		
BSP-1S	P_W = max (P_{BSP} , $\rho g(z-T_{LC})$)		
BSP-2S	P_W = max (-P_{BSP} , $\rho g(z-T_{LC})$)		

where:

$$P_{BSP} = 4.5 f_\beta f_{ps} f_{nl} f_{yz} C_w \sqrt{\frac{L_0+\lambda-125}{L}}$$

λ : Wave length of the dynamic load case, in m, to be taken as:
$\lambda = 0.2(1+2f_T)L$

f_{yz}: Girth distribution coefficient, to be obtained from Table 10.

Girth distribution coefficient, f_{yz} for BSP load cases **Table 10**

Transverse position	BSP-1P，BSP-2P	BSP-1S，BSP-2S
$y \geq 0$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5 f_{yB} + 0.5$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB} + 0.5$
$y < 0$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB} + 0.5$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5 f_{yB} + 0.5$

fnl : Coefficient considering non-linear effect, to be taken as:

- For extreme sea loads design load scenario:
  f_{nl} = 0.6 at f_{XL} = 0.0
  f_{nl} = 0.8 at f_{XL} = 0.3
  f_{nl} = 0.8 at f_{XL} = 0.7
  f_{nl} = 0.6 at f_{XL} = 1.0
- For ballast water exchange design load scenario:
  f_{nl} = 0.6 at f_{XL}= 0.0
  f_{nl} = 0.8 at f_{XL}= 0.3
  f_{nl} = 0.8 at f_{XL}= 0.7
  f_{nl} = 0.6 at f_{XL}= 1.0

Intermediate values are obtained by linear interpolation.

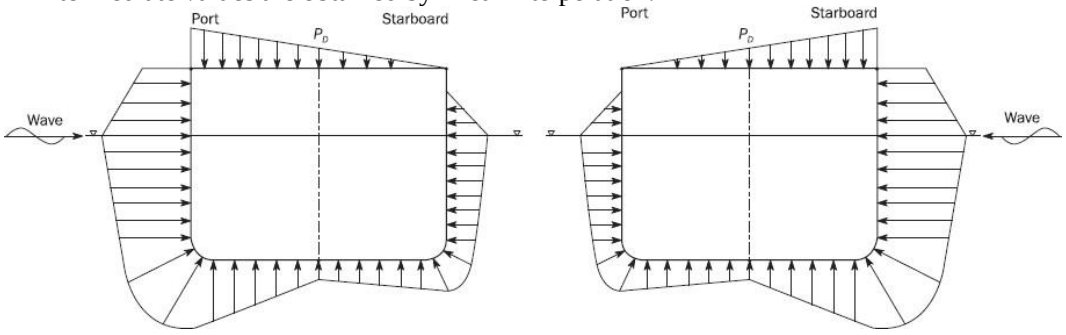

Figure 6 Transverse distribution of dynamic pressure for BSP-1P (left) and BSP-1S (right) load cases

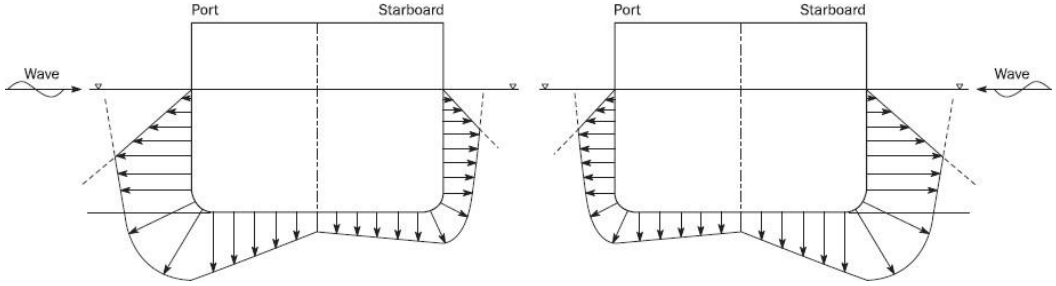

Figure 7 Transverse distribution of dynamic pressure for BSP-2P (left) and BSP-2S (right) load cases

1.3.7 Hydrodynamic pressures for OST load cases

The wave pressures, P_W, for OST-1 and OST-2 load cases, at any load point are to be obtained, in kN/m^2, from Table 11. See also Figure 8 and Figure 9.

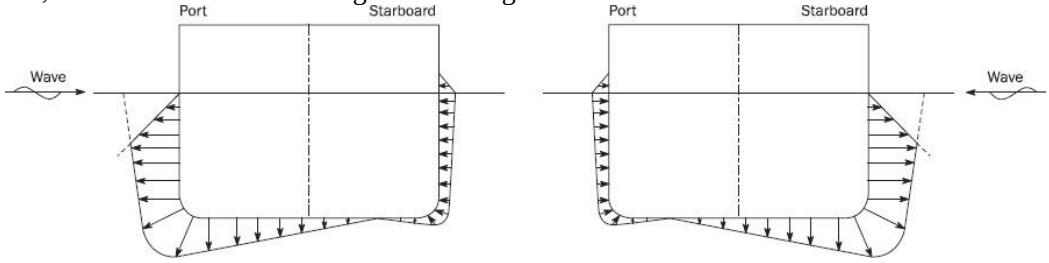

Figure 8 Transverse distribution of dynamic pressure amidships for OST-1P (left) and OST-1S (right) load cases

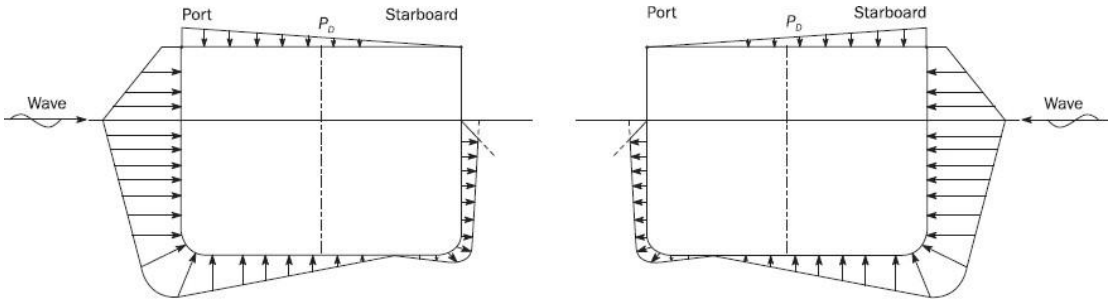

Figure 9 Transverse distribution of dynamic pressure amidships for OST-2P (left) and OST-2S (right) load cases

Hydrodynamic pressures for OST load cases **Table 11**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant h_W + T_{LC}$	$z > h_W + T_{LC}$
OST-1P	P_W = max (P_{OST}, $\rho g(z-T_{LC})$)	$P_W = P_{W,WL} - \rho g(z-T_{LC})$	$P_W = 0$
OST-2P	P_W = max (-P_{OST}, $\rho g(z-T_{LC})$)		
OST-1S	P_W = max (P_{OST} , $\rho g(z-T_{LC})$)		
OST-2S	P_W = max (-P_{OST} , $\rho g(z-T_{LC})$)		

where:

$$P_{OST} = 1.38 f_{ps} f_{nl} k_a k_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 12.

f_{nl} : Coefficient considering non-linear effect, to be taken as:

f_{nl} = 0.8 for extreme sea loads design load scenario.

f_{nl} = 0.9 for ballast water exchange design load scenarios.

λ : Wave length of the dynamic load case, in m, to be taken as:

λ= 0.45 L

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 13.

k_p : Phase coefficient to be obtained from Table 14. Intermediate values are to be interpolated.

Girth distribution coefficient, f_{yz} for OST load cases **Table 12**

Transverse position	OST-1P，OST-2P	OST -1S，OST -2S
$y \geq 0$	$5\frac{z}{T_{LC}} + 3.5 f_{yB} + 1.5$	$1.5\frac{z}{T_{LC}} + 1.5$
$y < 0$	$1.5\frac{z}{T_{LC}} + 1.5$	$5\frac{z}{T_{LC}} + 3.5 f_{yB} + 1.5$

	1.0	$-1.0+(0.5-0.5\ f_T)f_{yB}$	$-1.0+f_{yB}$

1.3.8 Hydrodynamic pressures for OSA load cases

The wave pressures, P_W, for OSA-1 and OSA-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 15. See also Figure 10 and Figure 11.

Hydrodynamic pressures for OSA load cases **Table 15**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC}<z \leqslant h_W+T_{LC}$	$z>h_W+T_{LC}$
OSA-1P	$P_W = \max(P_{OSA}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - \rho g(z-T_{LC})$	$P_W = 0$
OSA-2P	$P_W = \max(-P_{OSA}, \rho g(z-T_{LC}))$		
OSA-1S	$P_W = \max(P_{OSA}, \rho g(z-T_{LC}))$		
OSA-2S	$P_W = \max(-P_{OSA}, \rho g(z-T_{LC}))$		

where:

$$P_{OSA} = 0.8 f_{ps} f_{nl} k_a k_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}(1 + 0.5 f_T)$$

λ : Wave length of the dynamic load case, in m, to be taken as:
$\lambda = 0.7L$

f_{nl} : Coefficient considering non-linear effect, to be taken as:

- For extreme sea loads design load scenario:
  f_{nl} = 0.5 at f_{XL}= 0.0
  f_{nl} = 0.8 at f_{XL}= 0.3
  f_{nl} = 0.8 at f_{XL}= 0.7
  f_{nl} = 0.6 at f_{XL}= 1.0
- For ballast water exchange design load scenario:
  f_{nl} = 0.75 at f_{XL}= 0.0
  f_{nl} = 0.9 at f_{XL}= 0.3
  f_{nl} = 0.9 at f_{XL}= 0.7
  f_{nl} = 0.8 at f_{XL}= 1.0

  Intermediate values are obtained by linear interpolation.

fyz : Girth distribution coefficient, to be obtained from Table 16.

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 17.

k_p : Phase coefficient to be obtained from Table 18. Intermediate values are to be interpolated.

Girth distribution coefficient, f_{yz} for OSA load cases **Table 16**

Transverse position	OSA-1P, OSA-2P	OSA -1S, OSA -2S
$y \geqslant 0$	$5.5\frac{z}{T_{LC}} + 5.3f_{yB} + 2.2$	$0.9\frac{z}{T_{LC}} + 0.4f_{yB} + 2.2$
$y<0$	$0.9\frac{z}{T_{LC}} + 0.4f_{yB} + 2.2$	$5.5\frac{z}{T_{LC}} + 5.3f_{yB} + 2.2$

	1.0	$0.5f_T\text{-}1.25+(0.2\text{-}0.1f_T)f_{yB}$	$0.5f_T\text{-}1.25+(0.25\text{-}0.5f_T)f_{yB}$

1.3.9 Envelope of dynamic pressure

The envelope of dynamic pressure at any point, *Pex-max*, is to be taken as the greatest pressure obtained from any of the load cases determined by [1.3.2] to [1.3.8].

1.4 External dynamic pressures for fatigue assessments

1.4.1 General

The external pressure P_{ex} at any load point of the hull for the fatigue static plus dynamic (F:S+D) design load scenario, is to be derived for each fatigue dynamic load case and is to be taken as:

$P_{ex} = P_S + P_W$ but not less than 0.

where:

P_S : Hydrostatic pressure, in kN/m^2, defined in [1.2].

P_W : Hydrodynamic pressure, in kN/m^2, is defined in [1.4.2] to [1.4.6].

1.4.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, P_W, for load cases HSM-1 and HSM-2, at any load point, in kN/m^2, are to be obtained from Table 19.

Hydrodynamic pressures for HSM load cases **Table 19**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant 2h_W + T_{LC}$	$z > 2h_W + T_{LC}$
HSM-1	$P_W = \max(-P_{HS}, \rho g(z-T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z-T_{LC})$	$P_W = 0$
HSM-2	$P_W = \max(P_{HS}, \rho g(z-T_{LC}))$		

where:

$$P_{HS} = f_p f_h k_a k_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz}: Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{z}{T_{LC}} + f_{yB} + 1$$

f_h : Coefficient to be taken as:

$f_h = 2.75(1.21\text{-}0.66f_T)$

f_p: Coefficient to be taken as:

$f_p=f_{fa}[(0.21+0.02f_T)+(6-4f_T)L\times10^{-5}]$

k_a: Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$k_a=1+3f_T-(1+f_T)f_{yB}+[5(1+f_T)f_{yB}-15f_T]f_{xL}$ for $f_{xL}<0.2$

$k_a=1.0$ for $0.2\leqslant f_{xL}<0.6$

$k_a=1+(f_{xL}-0.6)[(13.5-3.5f_T)f_{yB}+(14.5f_T-17)+40(1-f_{yB})(f_{xL}-0.6)]$ for $f_{xL}\geqslant0.6$

λ: Wave length of the dynamic load case, in m, to be taken as:

$\lambda=0.6(1+f_T)L$

k_p : Phase coefficient to be obtained from Table 20. Intermediate values are to be interpolated.

k_p values for HSM load cases **Table 20**

f_{xL}	k_P
0	$(1.0-f_T)+(0.5-f_T)f_{yB}$
$0.3-0.1f_T$	-1
$0.5-0.2f_T$	1
$0.9-0.4f_T$	1
$0.9-0.2f_T$	-1
1.0	-1

1.4.3 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 21.

Hydrodynamic pressures for FSM load cases **Table 21**

	Wave pressure, in kN/m^2		
Load case	$z\leqslant T_{LC}$	$T_{LC}<z\leqslant2h_W+T_{LC}$	$z>2h_W+T_{LC}$
FSM-1	$P_W=\max(-P_{FS},\rho g(z-T_{LC}))$	$P_W=P_{W,WL}-\frac{1}{2}\rho g(z-T_{LC})$	$P_W=0$
FSM-2	$P_W=\max(P_{FS},\rho g(z-T_{LC}))$		

where:

$$P_{FS}=f_p f_h k_a k_p f_{yz} C_w\sqrt{\frac{L_0+\lambda-125}{L}}$$

f_{yz} : Girth distribution coefficient, to be taken as:

$$f_{yz}=\frac{z}{T_{LC}}+f_{yB}+1$$

f_h : Coefficient to be taken as:

$f_h=2.6$

f_p : Coefficient to be taken as:

$f_p=f_{fa}[(0.21+0.02f_T)+(6-4f_T)L\times10^{-5}]$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$k_a=1+(3.5-2f_T)(1-5f_{xL})(1-f_{yB})$ for $f_{xL}<0.2$

$k_a=1.0$ for $0.2\leqslant f_{xL}<0.9$

$k_a=1+15(1-f_{yB})(f_{xL}-0.9)$ for $f_{xL}\geqslant0.9$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda=0.6\left(1+\frac{2}{3}f_T\right)L$$

k_p : Phase coefficient to be obtained from Table 22. Intermediate values are to be interpolated.

k_p values for FSM load cases **Table 22**

f_{xL}	k_P
0	$-0.75-0.25f_{yB}$
$0.35-0.1f_T$	-1

f_{xL}	k_P
$0.5 - 0.2f_T$	1
0.75	1
$0.9 - 0.1f_T$	-1
1.0	$-0.5 - 0.5\,f_{yB}$

1.4.4 Hydrodynamic pressures for BSR load cases

The hydrodynamic pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 23.

Hydrodynamic pressures for BSR load cases **Table 23**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant 2h_W + T_{LC}$	$z > 2h_W + T_{LC}$
BSR-1P	$P_W = \max(P_{BSR}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z - T_{LC})$	$P_W = 0$
BSR-2P	$P_W = \max(-P_{BSR}, \rho g(z - T_{LC}))$		
BSR-1S	$P_W = \max(P_{BSR}, \rho g(z - T_{LC}))$		
BSR-2S	$p_W = \max(-P_{BSR}, \rho g(z - T_{LC}))$		

where:

- For BSR-1P and BSR-2P load cases.

$$P_{BSR} = 10y\sin\theta + 0.88 f_p C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}(f_{yB} + 1)$$

- For BSR-1S and BSR-2S load cases.

$$P_{BSR} = -10y\sin\theta + 0.88 f_p C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}(f_{yB} + 1)$$

f_p : Coefficient to be taken as:
$f_p = f_{fa}[(0.21 + 0.04f_T) - (12f_T - 2)B \times 10^{-4}]$

λ : Wave length of the dynamic load case, in m, to be taken as:

$$\lambda = \frac{g}{2\pi} T_\theta^2$$

1.4.5 Hydrodynamic pressures for BSP load cases

The wave pressures, P_W, for BSP-1 and BSP-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 24.

Hydrodynamic pressures for BSP **Table 24**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant 2h_W + T_{LC}$	$z > 2h_W + T_{LC}$
BSP-1P	$P_W = \max(P_{BSP}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z - T_{LC})$	$P_W = 0$
BSP-2P	$P_W = \max(-P_{BSP}, \rho g(z - T_{LC}))$		
BSP-1S	$P_W = \max(P_{BSP}, \rho g(z - T_{LC}))$		
BSP-2S	$P_W = \max(-P_{BSP}, \rho g(z - T_{LC}))$		

where:

$$P_{BSP} = 0.45 f_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

λ : Wave length of the dynamic load case, in m, to be taken as:
$\lambda = 0.2(1 + 2f_T)L$

f_p : Coefficient to be taken as:
$f_p = f_{fa}[0.2 + (8 + 16f_T) \times 10^{-3}]$

f_{yz} : Girth distribution coefficient, to be obtained from Table 25.

Girth distribution coefficient, f_{yz} for BSP load case **Table25**

Transverse position	BSP-1P，BSP-2P	BSP-1S，BSP-2S
$y \geqslant 0$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5 f_{yB} + 0.5$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB} + 0.5$
$y<0$	$f_{yz} = \frac{2}{3}\frac{z}{T_{LC}} + \frac{1}{2} f_{yB} + 0.5$	$f_{yz} = 2\frac{z}{T_{LC}} + 2.5 f_{yB} + 0.5$

1.4.6 Hydrodynamic pressures for OST load cases

The wave pressures, P_W, for OST-1 and OST-2 load cases, at any load point, in kN/m^2, are to be obtained from Table 26.

Hydrodynamic pressures for OST load cases **Table 26**

	Wave pressure, in kN/m^2		
Load case	$z \leqslant T_{LC}$	$T_{LC} < z \leqslant 2h_W + T_{LC}$	$z > 2h_W + T_{LC}$
OST-1P	$P_W = \max(P_{OST}, \rho g(z - T_{LC}))$	$P_W = P_{W,WL} - \frac{1}{2}\rho g(z - T_{LC})$	$P_W = 0$
OST-2P	$P_W = \max(-P_{OST}, \rho g(z - T_{LC}))$		
OST-1S	$P_W = \max(P_{OST}, \rho g(z - T_{LC}))$		
OST-2S	$P_W = \max(-P_{OST}, \rho g(z - T_{LC}))$		

where:

$$P_{OST} = 1.38 f_p k_a k_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} : Girth distribution coefficient, to be obtained from Table 27.

Girth distribution coefficient, f_{yz} for OST load cases **Table 27**

Transverse position	OST-1P - OST-2P	OST-1S - OST-2S
$y \geqslant 0$	$5\frac{z}{T_{LC}} + 3.3 f_{yB} + 1.7$	$\frac{z}{T_{LC}} + 0.3 f_{yB} + 1.7$
$y<0$	$\frac{z}{T_{LC}} + 0.3 f_{yB} + 1.7$	$5\frac{z}{T_{LC}} + 3.3 f_{yB} + 1.7$

f_p : Coefficient to be taken as:

$f_p = f_{fa}[(0.25 - 0.02 f_T) + (12 f_T - 9) B \times 10^{-4}]$

λ : Wave length of the dynamic load case, in m, to be taken as:

$\lambda = 0.45L$

k_a : Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 28.

k_p : Phase coefficient to be obtained from Table 29. Intermediate values are to be interpolated.

k_a values for OST load cases **Table 28**

Transverse Position	Longitudinal Position	OST-1P - OST-2P	OST-1S - OST-2S
$y \geqslant 0$	$f_{xL} \leqslant 0.2$	$1.0 + \{(3.5 - 2 f_T) + (10 f_T - 17.5)\} f_{xL}(1 - f_{yB})$	$1.0 + (3.5 - 2 f_T - 1.5 f_{yB}) + (10 f_T - 17.5 + 7.5 f_{yB}) f_{xL}$
	$0.2 < f_{xL} \leqslant 0.8$	1.0	1.0
	$f_{xL} > 0.8$	1.0	$1.0 + 2(1 - f_T)(5 f_{xL} - 4) f_{yB}$
$y<0$	$f_{xL} \leqslant 0.2$	$1.0 + (3.5 - 2 f_T - 1.5 f_{yB}) + (10 f_T - 17.5 + 7.5 f_{yB}) f_{xL}$	$1.0 + \{(3.5 - 2 f_T) + (10 f_T - 17.5)\} f_{xL}(1 - f_{yB})$
	$0.2 < f_{xL} \leqslant 0.8$	1.0	1.0
	$f_{xL} > 0.8$	$1.0 + 2(1 - f_T)(5 f_{xL} - 4) f_{yB}$	1.0

2 EXTERNAL PRESSURES ON EXPOSED DECKS

2.1 Application

2.1.1

The external pressures and forces on exposed decks are only to be applied for strength assessment.

2.1.2

The green sea pressures defined in [2.2] for exposed decks are to be considered independently of the pressures due to distributed cargo or other equipment loads and any concentrated forces due to cargo or other unit equipment loads, defined in [2.3.1] and [2.3.2] respectively.

2.2 Green sea loads

2.2.1 Pressure on exposed deck

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck, in kN/m^2, for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as defined in [2.2.3] to [2.2.4]

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck for the static (S) design load scenarios is zero.

2.2.2

If a breakwater is fitted on the exposed deck, no reduction in the green sea pressure is allowed for the area of the exposed deck located aft of the breakwater.

2.2.3 HSM, HSA and FSM load cases

The external pressure, P_D, for HSM, HSA and FSM load cases, at any load point of an exposed deck is to be obtained, in kN/m^2, from the following formula, see Figure 2 and Figure 3:

$P_D=\chi P_W$

where:

$P_W = P_{W,D}$, but not to be taken less than $P_{D\text{-}min}$.

$P_{W,D}$: Pressure, in kN/m^2, obtained at side of the exposed deck for HSM, HSA and FSM load cases as defined in [1.3].

$P_{D\text{-}min}$: Minimum exposed deck pressure, in kN/m^2, to be taken as:

- For cargo hold analysis according to Ch 7: $P_{D\text{-}min} = 0$.

- For other cases: $P_{D\text{-}min}$ as defined in Table 30.

χ : Coefficient defined in Table 31.

Minimum pressures on exposed decks for HSM, HSA, FSM load cases Table 30

Location	Minimum pressure on exposed deck, $P_{D\text{-}min}$, in kN/m^2	
	$L_{LL} \geq 100$m	$L_{LL} < 100$m
$x_{LL}/L_{LL} \leqslant 0.75$	34.3	$14.9 + 0.195\, L_{LL}$
$x_{LL}/L_{LL} > 0.75$	$34.3 + (14.8 + a(L_{LL} - 100))\left(4\frac{x_{LL}}{L_{LL}} - 3\right)$	$12.2 + \frac{L_{LL}}{9}\left(5\frac{x_{LL}}{L_{LL}} - 2\right) + 3.6\frac{x_{LL}}{L_{LL}}$

Where

a : Coefficient taken equal to:

$a = 0.356$ for Type A, Type B-60 and Type B-100 freeboard ships

$a = 0.0726$ for Type B freeboard ships.

x_{LL} : X-coordinate of the load point measured from the aft end of the freeboard length L_{LL}.

Coefficient for pressure on exposed decks Table 31

Exposed deck location	χ
Freeboard deck	1.00
Superstructure deck including forecastle deck	0.75
1st tier of deckhouse	0.56
2nd tier of deckhouse	0.42
3rd tier of deckhouse	0.32
4th tier of deckhouse	0.25
5th tier of deckhouse	0.20
6th tier of deckhouse	0.15
7th tier of deckhouse and above	0.10

2.2.4 BSR, BSP, OST and OSA load cases

The external pressure, P_D, for BSR, BSP, OST and OSA load cases at any load point of an exposed deck is to be obtained, in kN/m^2, by linear interpolation between the pressures at the port and starboard deck edges (see also Figure 4, Figure 6, Figure 9 and Figure 10):

$P_{D,stb} = \chi P_{W,D\text{-}stb}$

$P_{D,pt} = \chi P_{W,D\text{-}pt}$

where:

$P_{W,D\text{-}stb}$: Pressure obtained at starboard deck edge for BSR, BSP, OST or OSA load cases as defined in [1.3], as appropriate.

$P_{W,D\text{-}pt}$: Pressure obtained at port deck edge for BSR, BSP, OST and OSA load cases as defined in [1.3], as appropriate.

χ : Coefficient defined in Table 31.

2.2.5 Envelope of dynamic pressures on exposed deck

The envelope of dynamic pressure at any point of an exposed deck, $P_{D\text{-}max}$, is to be taken as the greatest pressure obtained from any of the load cases determined by [2.2.3] and [2.2.4].

2.3 Load carried on exposed deck

2.3.1 Pressure due to distributed load

If a distributed load is carried on an exposed deck, for example deck cargo or other equipment, the static and dynamic pressures due to this distributed load are to be considered.

The total pressure, P_{dl}, in kN/m^2, due to this distributed load for the static (S) design load scenario is to be taken as:

$P_{dl} = P_{dl\text{-}s}$

The pressure P_{dl}, in kN/m^2, due to this distributed load for the static plus dynamic (S+D) design load scenario is to be derived for each dynamic load case and is to be taken as:

$P_{dl}=P_{dl\text{-}s}+P_{dl\text{-}d}$

where:

$P_{dl\text{-}s}$: Static pressure, in kN/m^2, due to the distributed load, to be defined by the Designer and, in general, but not less than 10kN/m^2.

$P_{dl\text{-}d}$: Dynamic pressure, in kN/m^2, due to the distributed load, in kN/m^2, to be taken as:

$$P_{dl-d} = f_\beta \frac{a_Z}{g} P_{dl-s}$$

a_Z : Vertical acceleration, in m/s^2, at the centre of gravity of the distributed load, for the considered load case, to be obtained according to Ch 4, Sec 3, [3.2.4].

2.3.2 Concentrated force due to unit load

If a unit load, for example deck cargo, is carried on an exposed deck, the static and dynamic forces due to the unit load carried are to be considered.

The force F_U, in kN, due to this concentrated load for the static (S) design load scenarios, is to be taken as:

$F_U=F_{U\text{-}s}$

The force F_U, in kN, due to this concentrated load for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as:

$F_U=F_{U\text{-}s}+F_{U\text{-}d}$

where:

$F_{U\text{-}s}$: Static force, in kN, due to the unit load to be taken equal to:

$F_U=m_U g$

$F_{U\text{-}d}$: Dynamic force, in kN, due to unit load to be taken equal to:

$F_{U\text{-}d}=m_U f_\beta a_Z$

m_U : Mass of the unit load carried, in t.

a_Z : Vertical acceleration, in m/s^2, at the centre of gravity of the unit load carried for the considered load case, to be obtained according to Ch 4, Sec 3, [3.2.4].

3 EXTERNAL IMPACT PRESSURES FOR THE BOW AREA

3.1 Application

3.1.1

The impact pressures for the bow area are only to be applied for strength assessment.

3.2 Bottom slamming pressure

3.2.1

The bottom slamming pressure P_{SL}, in kN/m^2, for the bottom slamming design load scenario is to be evaluated for the following two cases:

Case 1: An empty ballast tank or a void space in way of the bottom shell.

$$P_{SL} = 10g\sqrt{L} f_{SL} c_{SL-et} \quad \text{for } L < 170 \text{ m}$$

$$P_{SL} = 130 g f_{SL} c_{SL-et} e^{c1} \quad \text{for } L \geqslant 170 \text{ m}$$

Case 2: A full ballast tank in way of the bottom shell.

$$P_{SL} = 10g\sqrt{L} f_{SL} c_{SL-ft} - 1.25\rho g(z_{top} - z) \quad \text{for } L < 170 \text{ m}$$

$$P_{SL} = 130 g f_{SL} c_{SL-ft} e^{c1} - 1.25\rho g(z_{top} - z) \quad \text{for } L \geqslant 170 \text{ m}$$

where:

c_1 : Coefficient to be taken as:

$c_1=0$ for $L \leqslant 180$m

$c_1=-0.0125(L-180)^{0.705}$ for $L > 180$ m

$c_{SL\text{-}et}$: Slamming coefficient for case with an empty ballast tank or void space:

$$c_{SL-et} = 5.95 - 10.5\left(\frac{T_{F-e}}{L}\right)^{0.2}$$

$c_{SL\text{-}ft}$: Slamming coefficient for case with a full ballast tank:

$$c_{SL-ef} = 5.95 - 10.5\left(\frac{T_{F-f}}{L}\right)^{0.2}$$

f_{SL} : Longitudinal slamming distribution factor, to be taken as:

f_{SL}=0 for $x/L \leqslant 0.5$

f_{SL}=1.0 for x/L=0.5+c_2

f_{SL}=1.0 for x/L=0.65+c_2

f_{SL}=0.5 for $x/L \geqslant 1.0$

Intermediate values of f_{SL} are to be obtained by linear interpolation.

c_2 : Coefficient to be taken as:

$$c_2 = 0.33C_B + \frac{L}{2500} \text{ but not to be taken greater than 0.35}$$

$TF\text{-}e$: Design slamming draught at the FP to be provided by the Designer. $T_{F\text{-}e}$ is not to be greater than the minimum draught at the FP indicated in the loading manual for all seagoing conditions where any of the ballast tanks within the bottom slamming region are empty. This includes all loading conditions with tanks inside the bottom slamming region that use the 'sequential' ballast water exchange method, if relevant.

$T_{F\text{-}f}$: Design slamming draught at the FP to be provided by the Designer. $T_{F\text{-}f}$ is not to be greater than the minimum draught at the FP indicated in the loading manual for all seagoing conditions where all ballast tanks within the bottom slamming region are full. This includes all loading conditions with tanks inside the bottom slamming region that use the 'flow-through' ballast water exchange method, if relevant.

z_{top} : Z-coordinate of the highest point of the tank, excluding small hatchways, in m. For strength assessment of double bottom floors and girders, z_{top} is not to be taken greater than the double bottom height.

3.2.2 Loading manual information

The loading guidance information is to clearly state the design slamming draughts and the ballast water exchange method used for each ballast tank, if any.

3.3 Bow impact pressure

3.3.1 Design pressures

The bow impact pressure P_{FB}, in kN/m^2, to be considered for the bow impact design load scenario is to be taken as:

P_{FB}=1.025$f_{FB}c_{FB}V^2_{im}\sin\gamma wl$

where:

f_{FB} : Longitudinal bow flare impact pressure distribution factor. To be taken as:

f_{FB}=0.55 for $x/L \leqslant 0.9$

f_{FB}=4(x/L-0.9)+0.55 for 0.9< $x/L \leqslant 0.9875$

f_{FB}=8(x/L-0.9875)+0.9 for 0.9875< $x/L \leqslant 1.0$

f_{FB}=1.0 for x/L>1.0

V_{im} : Impact speed, in knots, to be taken as:

$$V_{im} = 0.514V_{ref}\sin\alpha_{wl} + \sqrt{L}$$

V_{ref} : Forward speed, in knots, to be taken as:

V_{ref} =0.75V, but not less than 10.

α_{wl} : Local waterline angle, in deg, at the considered position, but not less than 35 deg. See Figure 12.

γ_{wl} : Local bow impact angle, in deg, measured in a vertical plane containing the normal to the shell, from the horizontal to the tangent line at the considered position but not less than 50 deg, as shown in Figure 12. Where this value is not available, it may be taken as:

$$\gamma_{wl} = \tan^{-1}\left(\frac{\tan\beta_{pl}}{\cos\alpha_{wl}}\right)$$

For ships with bow impact angle less than 50 deg, the impact pressure is to be individually considered by the Society. The resulting scantling individually considered by the Society is in no case to be less than the scantling calculated in accordance with [3.3.1] for local bow impact angle equal to 50 deg.

β_{pl} : Local body plan angle, in deg, at the considered position from the horizontal to the tangent line, but not less than 35 deg.

c_{FB} : Coefficient to be taken as:

c_{FB}=1.0 for positions between draughts T_{BAL} and T_{SC}

$$c_{FB} = \sqrt{1.0 + \cos^2\left[90\frac{(h_{fb} - 2h_0)}{h_{fb}}\right]}$$ for positions above draughts T_{SC}

h_{fb} : Vertical distance, in m, from the waterline at the draught T_{SC} to the highest deck at side. See Figure12.

h_0 : Vertical distance, in m, from the waterline at the draught T_{SC} to the considered position. See Figure 12.

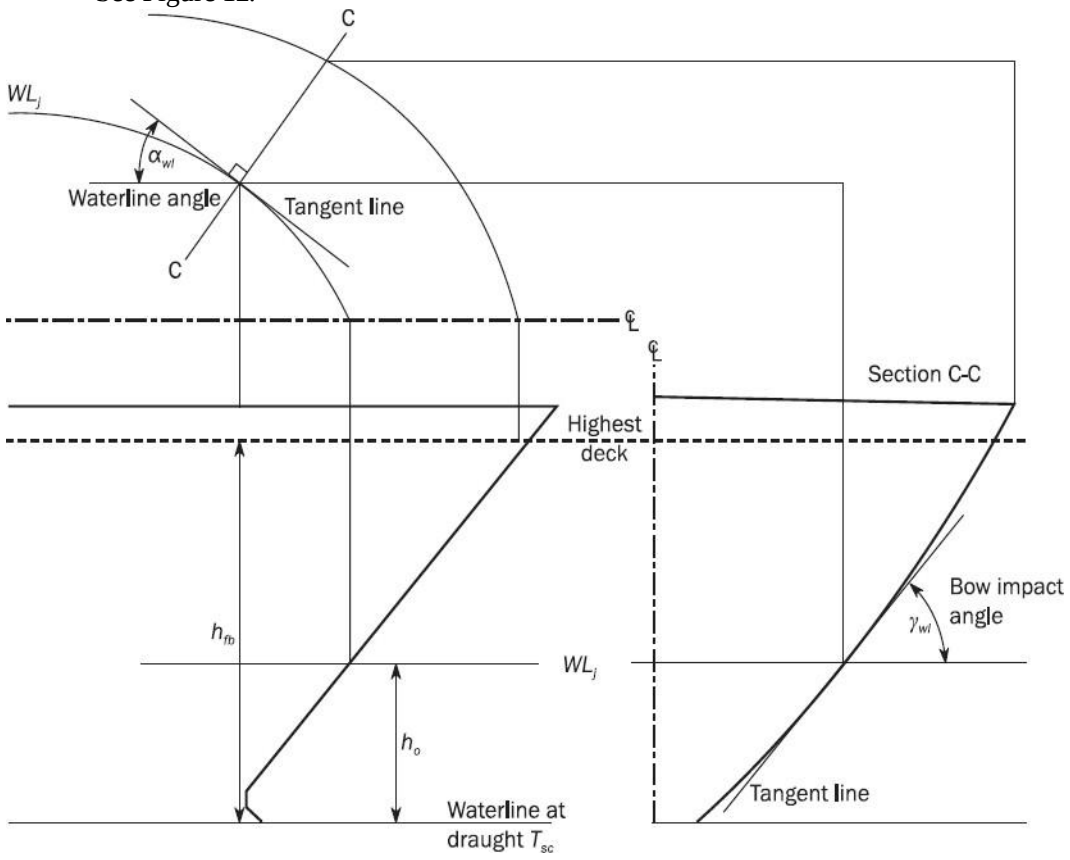

Figure 12 Definition of bow geometry

ISC 3.3.1a For ships with impact angle, γ_{wl}, less than 50 deg, in addition to [3.3.1], the requirements given in Ch 6, Sec 7, [3.3] of ISC Rules for Structures of Container Ships are to be complied also.

4 EXTERNAL PRESSURES ON SUPERSTRUCTURE AND DECKHOUSES

4.1 Application

4.1.1

The external pressures on superstructure and deckhouses are only to be applied for strength assessment. These pressures are to be considered as dynamic pressures and are to be applied to the appropriate structure without any static pressure load component.

4.1.2

The dynamic load case concept is not to be applied for external pressures on

superstructures and deckhouses.

4.2 Exposed wheel house tops

4.2.1

The lateral pressure for exposed wheel house tops, P_D, in kN/m^2, is to be taken as:

P_D=12.5

4.3 Sides of superstructures

4.3.1

The design pressure for the external sides of superstructures, P_{SI}, in kN/m^2, is to be taken as:

$$P_{SI} = 2.1 C_w c_F (C_B + 0.7) \frac{20}{10 + z_{SD} - T_{SC}}$$

where:

c_F : Distribution factor according to Table 32.

Distribution factor c_F **Table32**

Location	c_F
x/L < 0.2	$1.0 + \frac{5}{C_B}\left(0.2 - \frac{x}{L}\right)$ without taking x/L less than 0.1
$x/L \geqslant 0.2$	1.0

4.4 End bulkheads of superstructures and deckhouse walls

4.4.1

The external pressure for the aft and forward external bulkheads of superstructures and deckhouse walls, in kN/m^2, is to be taken as:

$P_A = f_n f_c [f_b f_d - (z_{SD} - T_{SC})]$

but is not to be less than $P_{A\text{-}min}$.

where:

f_n : Coefficient defined in Table 33.

f_c : Coefficient, to be taken as:

$$f_c = 0.3 + 0.7 \frac{b_1}{B_1}, \text{ but not less than } 0.475$$

For exposed parts of machinery casings, f_c is not to be taken less than 1.0.

f_d : Coefficient, to be taken as:

$$f_d = \frac{L}{10} e^{-(L/300)} - \left(1 - \left(\frac{L}{150}\right)^2\right) \text{ for } L < 150 \text{ m}$$

$$f_d = \frac{L}{10} e^{-(L/300)} \text{ for } 150 \text{ m} \leqslant L < 300 \text{ m}$$

f_d = 11.03 for $L \geqslant$ 300 m

b_1 : Breadth of deckhouse at the position considered.

B_1 : Actual breadth of ship on the exposed weather deck at the position considered.

f_b : Coefficient defined in Table 34.

$P_{A\text{-}min}$: Minimum lateral pressure, in kN/m^2, as defined in Table 35.

5 EXTERNAL PRESSURES ON HATCH COVERS

5.1 Application

5.1.1

The external pressures on hatch covers are only to be applied for strength assessment.

5.2 Green sea loads

5.2.1

The green sea loads at any load point of a hatch cover, *PHC*, in kN/mm2, is to be taken as follows:

- For cargo hold analysis according to Ch 7:
  $P_{HC} = P_D - \rho g (z_{HC} - D)$, without being less than 0

- For other cases: $P_{HC} = P_{D,min}$ as defined in Table 30.

P_D : Green sea pressure, in kN/mm^2, on the deck in way of the hatch cover obtained according to [2.2], considering χ equal to 1.0.

z_{HC} : z coordinate of the top of the hatch cover, in m.

5.3 Load carried on hatch covers

5.3.1

If a distributed load or a unit load is carried on a hatch cover, the pressure is to be obtained according to [2.3].

Coefficient f_n **Table33**

Type of bulkhead	Location	f_n
Unprotected front bulkhead (1)	Lowest tier (2)	$20+\frac{L_2}{12}$
	Second tier	$10+\frac{L_2}{12}$
	Third tier and above	$5+\frac{L_2}{15}$
Protected front bulkhead (1)	All tiers	$5+\frac{L_2}{15}$
Side bulkheads	All tiers	$5+\frac{L_2}{15}$
Aft end bulkheads	Abaft amidships	$7+\frac{L_2}{100}-8\frac{x}{L_2}$
	Forward of amidships	$5+\frac{L_2}{100}-4\frac{x}{L_2}$

(1) The front bulkhead of a superstructure or deckhouse may be considered as protected when it is located less than Bx behind another superstructure or deckhouse, and the width of the front bulkhead being considered is less than the width of the aft bulkhead of the superstructure or deckhouse forward of it. B_x is the local breadth of the ship at the front bulkhead.

(2) The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the moulded depth D is measured. However, when (D - T_{SC}) exceeds the minimum non-corrected tabular freeboard (according to ICLL as amended) by at least one standard superstructure height (as defined in Ch 1, Sec 4, [3.3]), then this tier may be defined as the 2nd tier and the tier above as the 3rd tier.

Coefficient f_b **Table 34**

Location of bulkhead (1)	f_b
$\frac{x}{L}<0.45$	$1.0+\left(\frac{x/L-0.45}{C_{B1}+0.2}\right)^2$
$\frac{x}{L}\geq 0.45$	$1.0+1.5\left(\frac{x/L-0.45}{C_{B1}+0.2}\right)^2$

where:

C_{B1} : Block coefficient, but not less than 0.60 nor greater than 0.80. For aft deckhouse bulkheads located forward of amidships, C_{B1} may be taken as 0.80.

(1) For deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding 0.15L each, and x is to be taken as the X-coordinate of the centre of each part considered.

Minimum lateral pressure, $P_{A\text{-}min}$ **Table 35**

	$P_{A\text{-}min}$, kN/m^2	
L	Lowest tier of unprotected fronts	Elsewhere (1)
$90 < L \leq 250$	$25+\frac{L}{10}$	$12.5+\frac{L}{20}$
L>250	50	25

(1) For the 4th tier and above, $P_{A\text{-}min}$ is to be taken equal to 12.5 kN/m^2.

Section 6 INTERNAL LOADS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4

a_X, a_Y, a_Z: Longitudinal, transverse and vertical accelerations, in m/s^2, at x_G, y_G, z_G, as defined in Ch 4, Sec 3, [3.2].

B_H : Breadth of the cargo hold, in m, measured at mid-length of the cargo hold and at the mid height between the top of hopper tank and the bottom of topside tank, see Figure 2.

B_{IB} : Breadth of inner bottom, in m, measured at mid-length of the cargo hold, see Figure 2.

D_1 : Distance, in m, from the baseline to the freeboard deck at side amidships.

d_{sc} : Diameter, in m, of a steel coil.

f_{cd} : Factor for joint probability of occurrence of liquid cargo density and maximum sea state in 25 years design life, to be taken as:

- For strength assessment with FE analysis of cargo tanks filled with liquid cargo:
  f_{cd} = 1.0 for ρ_L > 1.025 t/m^3.
  f_{cd} = 0.88 for ρ_L = 1.025t/m^3.
- For other cases:
  f_{cd} = 1.0.

f_{dc} : Dry cargo factor taken as:
f_{dc} = 1.0 for strength assessment,
f_{dc} = 0.5 for fatigue assessment.

f_β : Coefficient defined in Ch 4, Sec 4.

h_{air} : Height of air pipe or overflow pipe above the top of the tank, in m.

h_C : Height of bulk cargo, in m, from the inner bottom to the upper surface of bulk cargo, as defined in[2.3.1] or [2.3.2].

h_{DB} : Height, in m, of the double bottom at the centreline, measured at mid-length of the cargo hold, see Figure 2.

h_{HPL} :Vertical distance, in m, from the inner bottom at centreline to the upper intersection of hopper tank and side shell or inner side for double side bulk carriers, determined at mid length of the considered cargo hold, as shown in Figure 2.
h_{HPL} = 0 if there is no hopper tank.

h_{HPU} : Vertical distance, in m, from the inner bottom at centreline to the lower intersection of topside tank and side shell or inner side for double side bulk carriers, determined at mid length of the cargo hold at midship, as shown in Figure 2.

h_{LS} : Mean height, in m, of the lower stool, measured from the inner bottom.

h_{max} : Maximum permissible filling level, in m, taken as:
For ballast tanks: maximum tank height,

- For cargo tanks with cargo density equal to ρ_L: maximum tank height
- For cargo tanks with heavy liquid cargo density equal to ρ_{part} associated with a partially filled cargo tank: hpart as defined in Ch 10, Sec 4, [1.2.1].

K_C : Coefficient taken equal to:

$K_C = \cos^2\alpha + (1-\sin\Psi)\sin^2\alpha$	for $\alpha \leqslant 90°$
$K_C = (1-\sin\Psi)\sin^2\alpha$	for $90° < \alpha \leqslant 120°$
$K_C = 0.75(1-\sin\Psi)[1-(\alpha-120)/(60-\Psi)]$	for $\alpha > 120°$ and $\alpha + \Psi < 180°$
$K_C = 0$	when $\alpha + \Psi \geqslant 180°$

$K_{C\text{-}f}$: Coefficient taken equal to:

$$K_{C-f} = \tan^2\left(45 - \frac{\Psi}{2}\right)$$

l : Distance, in m, between floors.

l_H : Length of the cargo hold, in m, at the centreline between the transverse bulkheads. This is to be measured to the mid-depth of the corrugated bulkhead(s) if fitted.

l_{lp} : Distance, in m, between outermost dunnage per EPP in the ship X direction, see Figure 11.

l_{st} : Length, in m, of a steel coil.

M : Mass, in t, of the bulk cargo being considered.

M_{Full} : Cargo mass, in t, in a cargo hold corresponding to the volume up to the top of the hatch

coaming with a density of the greater of M_H/V_{Full} or 1.0 t/m^3.

M_{Full}=1.0V_{Full} but not less than M_H.

M_H : Cargo mass, in t, in a cargo hold that corresponds to the homogeneously loaded condition at maximum draught with 50% consumables.

M_{HD} : Maximum allowable cargo mass, in t, in a cargo hold according to design loading conditions with specified holds empty at maximum draught with 50% consumables. and all ballast water tanks in cargo hold region empty.

$M_{sc\text{-}ib}$: Equivalent mass of a steel coil, in t, on inner bottom, as defined in [4.3.1]

$M_{sc\text{-}hs}$: Equivalent mass of a steel coil, in t, on hopper side, as defined in [4.3.2].

n_1 : Number of tiers of steel coils.

n_2 : Number of load points per EPP of the inner bottom, see [4.1.3].

n_3 : Number of dunnages supporting one row of steel coils.

P_{drop} : Overpressure, in kN/m^2, due to sustained liquid flow through air pipe or overflow pipe in case of overfilling or filling during flow through ballast water exchange. It is to be defined by the designer, but not to be less than 25 kN/m^2.

P_{PV} : Design vapour pressure, in kN/m^2, but not less than 25 kN/m^2.

perm : Permeability of cargo, to be taken as:

perm = 0.3 for iron ore, coal cargoes and cement.

perm = 0 for steel coils and steel packed products.

R : Vertical coordinate of the ship rotation centre, defined in Ch 4, Sec 3.

s_C : Spacing of corrugations, in m, as defined in Ch 3, Sec 6, [10.4.2].

T_θ : Roll period, in s, as defined in Ch 4, Sec 3, [2.1.1].

V_{Full} : Volume, in m^3, of cargo hold up to top of the hatch coaming, taken as:

$V_{Full} = V_H + V_{HC}$.

V_H :Volume, in m^3, of cargo hold up to level of the intersection of the main deck with the hatch coaming excluding the volume enclosed by hatch coaming, see Figure 2.

V_{HC} : Volume, in m^3, of the hatch coaming, from the level of the intersection of the main deck with the hatch side coaming to the top of the hatch coaming, determined for the cargo hold at midship, as shown in Figure 2.

V_{TS} : Total volume, in m^3, of the portion of the lower bulkhead stools within the cargo hold length l_H and inboard of the hopper tanks.

W : Mass, in t, of a steel coil.

x, y, z : X, Y and Z coordinates, in m, of the load point with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

x_G, y_G, z_G: X, Y and Z coordinates, in m, of the volumetric centre of gravity of the tank or fully filled cargo hold, i.e. V_{Full}, considered with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2].

In case of partially filled cargo hold, x_G, y_G, z_G to be taken as follows:

x_G, y_G: Volumetric centre of gravity of the cargo hold.

$z_G = h_{DB} + h_{C\text{-}cl} / 2$

z_{top} : Z coordinate of the highest point of tank, excluding small hatchways, in m.

z_C : Height of the upper surface of the cargo above the baseline in way of the load point, in m, to be taken as:

$z_C = h_{DB} + h_C$

α : Angle, in deg, between panel considered and the horizontal plane. The angle is to be measured inward and upward from horizontal plane outside cargo hold, between 0 and 180 deg, as shown in Figure 1.

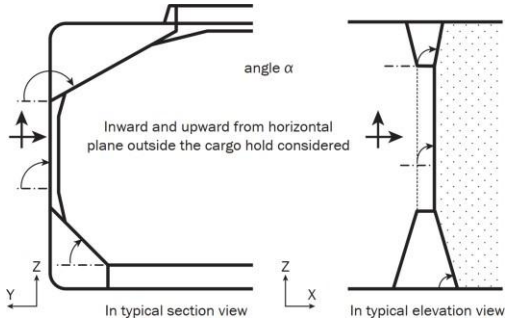

Figure 1 Measurement of angle α

φ : Pitch angle, in deg, defined in Ch 4, Sec 3, [2.1.2].

Ψ : Assumed angle of repose, in deg, of bulk cargo (considered drained and removed); to be taken as:

Ψ= 30°in general.

Ψ= 35°for iron ore.

Ψ= 25°for cement.

ρ_C : Density of bulk cargo, in t/m^3, as defined in [2.3.3].

ρ_L : Density of liquid in the tank and ballast hold, in t/m^3, but not less than:

- For strength assessment:

ρ_L = 1.025 for all liquids including oil cargoes. If a tank filled at 98% is intended to carry heavier liquid cargoes than 1.025 (i.e. $\rho_{max\text{-}LM} > 1.025$), then $\rho_L = \rho_{max\text{-}LM}$.

- For fatigue assessment:

ρ_L = 0.9 for liquid cargoes.

ρ_L= 1.025 for all other liquids.

$\rho_{max\text{-}LM}$: Maximum liquid cargo density in t/m^3, associated with a full tank at 98%, from any loading condition in the ship's loading manual or value specified by the designer.

ρ_{part} : Maximum permissible high liquid cargo density, in t/m^3, associated with a partially filled cargo tank but not taken less than ρ_L considered for strength assessment.

ρ_{slh} : Liquid density, in t/m^3, to be used for sloshing assessment, taken as:

$\rho_{slh}=\rho_{part}$, for heavy liquid cargo density associated with partial filling of cargo

$\rho_{slh}=\rho_L$, for all other cases

ρ_{ST} : Density of steel, in t/m^3, to be taken as 7.85.

Θ : Roll angle, in deg, defined in Ch 4, Sec 3, [2.1.1].

θ_h : Angle, in deg, between inner bottom plate and hopper sloping plate. in general θ_h is such that:

$$\tan\theta_h = \frac{2h_{HPL}}{B_H - B_{IB}}$$

1 PRESSURES DUE TO LIQUIDS

1.1 Application

1.1.1 Pressures for the strength and fatigue assessments of intact conditions

The internal pressure due to liquid acting on any load point of a tank and ballast hold boundary, in kN/m^2, for the static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$P_{in}=P_{ls}$ but not less than 0.

The internal pressure due to liquid acting on any load point of a tank and ballast hold boundary, in kN/m^2, for the static plus dynamic (S+D) design load scenarios is to be derived for each dynamic load case and is to be taken as:

$P_{in}=P_{ls}+P_{ld}$ but not less than 0.

where:

P_{ls} : Static pressure due to liquid in tanks and ballast holds, in kN/m^2, as defined in [1.2].

P_{ld} : Dynamic inertial pressure due to liquid in tanks and ballast holds, in kN/m^2, as defined in [1.3].

1.1.2 Pressures for the strength assessments of flooded conditions

The internal pressure in flooded condition, in kN/m^2, acting on any load point of the watertight boundary of a hold, tank or other space for the flooded static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:

$P_{in}=P_{fs}$ but not less than $\rho g d_0$

The internal pressure in flooded condition, in kN/m^2, acting on any load point of the watertight boundary of a hold, tank or other space for the flooded static plus dynamic (S+D) design load scenarios, is to be derived for each dynamic load case and is to be taken as:

$P_{in}=P_{fs}+P_{fd}$ but not less than $gd0$where:

P_{fs} : Static pressure of seawater in flooded condition in the compartment, in kN/m^2, as defined in [1.4].

P_{fd} : Dynamic inertial pressure of seawater in flooded condition in the compartment, in kN/m^2, as defined in [1.5].

d_0 : Distance, in m, to be taken as:

d_0=0.02L， form

d_0=2.4， for m

For corrugations of vertically corrugated bulkheads of bulk carrier cargo holds, the flooded pressures and forces specified in [3] for bulk cargoes are to be applied.

1.2 Static liquid pressure

1.2.1 Normal operations at sea

The static pressure due to liquid in tanks and ballast holds, P_{ls} during normal operations at sea, in kN/m^2, is to be taken as:

$P_{ls}=f_{cd}\rho_L g(z_{top}-z)+P_{PV}$, for cargo tanks filled with liquid cargo.

$P_{ls}=\rho_L g(z_{top}-z+0.5h_{air})$, for other cases

1.2.2 Harbour/sheltered water operations

The static pressure, P_{ls} due to liquid in tanks and ballast holds for harbour/sheltered water operations, in kN/m^2, is to be taken as:

$P_{ls}=\rho_L g(z_{top}-z+h_{air})+P_{drop}$ for ballast tanks

$P_{ls}=\rho_L g(z_{top}-z)+P_{PV}$ for cargo tanks filled with liquid cargo

$P_{ls}=\rho_L g(z_{top}-z+0.5h_{air})$ for ballast holds with h_{air} = 0 and for other cases

1.2.3 Sequential ballast water exchange

The static pressure, P_{ls} due to liquid in ballast tanks associated with sequential ballast water exchange operations, in kN/m^2, is to be taken as:

$P_{ls}=\rho Lg(z_{top}-z+0.5h_{air})$

1.2.4 Flow through ballast water exchange

The static pressure, P_{ls} due to liquid in ballast tanks associated with flow through ballast water exchange operations, in kN/m^2, is to be taken as:

$P_{ls}=\rho_L g(z_{top}-z+h_{air})+P_{drop}$

1.2.5 Ballasting using ballast water treatment system

The static pressure, P_{ls} due to liquid in tanks and ballast holds associated with ballasting operations using a ballast water treatment system is to be taken as defined for sequential ballast exchange in [1.2.3]. The ship designer has to inform the Society if the ballast water treatment system implies additional pressure to be considered as P_{drop}, etc in addition to the pressure defined in [1.2.3].

1.2.6 Static liquid pressure for the fatigue assessment

The static pressure due to liquid in tanks and ballast holds, P_{ls} to be used for the fatigue assessment, in kN/m^2, is to be taken as:

$P_{ls}=\rho_L g(z_{top}-z)$ for all tanks (cargo and water ballast tanks, ballast hold and other tanks).

1.3 Dynamic liquid pressure

1.3.1

The dynamic pressure, *Pld* due to liquid in tanks and ballast holds, in kN/m2 is to be taken as:

$P_{ld} = f_\beta f_{cd} \rho_L [a_Z (z_0 - z) + f_{ull\text{-}l}\, a_X (x_0 - x) + f_{ull\text{-}t}\, a_Y (y_0 - y)]$

where:

$f_{ull\text{-}l}$: Longitudinal acceleration correction factor for the ullage space above the liquid in tanks and ballast holds, taken as:

- For strength assessment:
  $f_{ull\text{-}l}$ = 0.62 for cargo tanks filled with any liquids including water ballast.
  $f_{ull\text{-}l}$ = 1.0 for other cases.
- For fatigue assessment

$$f_{ull-l} = 0.5 + \frac{|z_0 - z|}{l_{fs}} \frac{180}{\varphi\pi}$$ for cargo tanks and ballast holds

f_{ull-l} = 1.0 for other cases.

f_{ull-l} is not to be less than 0.0 nor greater than 1.0

l_{fs} : Cargo tank length at the top of the tank or length of the ballast hold hatch coaming, in m.

f_{ull-t} : Transverse acceleration correction factor to account for the ullage space above the liquid in tanks and ballast holds, taken as:

- For strength assessment:

  f_{ull-t} = 0.67 for cargo tanks filled with any liquids including water ballast.

  f_{ull-t} = 1.0 for other cases.

- For fatigue assessment

  $$f_{ull-t} = 0.5 + \frac{|z_0 - z|}{b_{top}} \frac{180}{\theta\pi}$$ for cargo tanks and ballast holds.

  f_{ull-t} = 1.0 for other cases.

  f_{ull-t} is not to be less than 0.0 nor greater than 1.0

b_{top} : Cargo tank breadth at the top of the tank or breadth of the ballast hold hatch coaming, in m, determined at mid length of the tank or ballast hold hatch coaming.

x_0 : X coordinate, in m, of the reference point.

y_0 : Y coordinate, in m, of the reference point.

z_0 : Z coordinate, in m, of the reference point.

The reference point is to be taken as the point with the highest value of V_j, calculated for all points that define the upper boundary of the tank or ballast hold as follows:

$V_j=a_X(x_j-x_G)+a_Y(y_j-y_G)+(a_z+g)(z_j-z_G)$

where:

x_j : X coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

y_j : Y coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

z_j : Z coordinate, in m, of the point j on the upper boundary of the tank or ballast hold.

1.4 Static pressure in flooded conditions

1.4.1 Static pressure in flooded compartments

The static pressure, P_{fs} in kN/m^2, for watertight boundaries of flooded compartments is to be taken as:

$P_{fs}=\rho g(z_{FD}-z)$ but not less than 0.

where:

z_{FD} : Z coordinate, in m, of the freeboard deck at side in way of the transverse section considered or the deepest equilibrium waterline in the damaged condition whichever is the greater.

1.5 Dynamic pressure in flooded conditions

1.5.1 Dynamic pressure in flooded compartments

The dynamic pressure, P_{fd}, in kN/m^2, for watertight boundaries of flooded compartments is to be taken as:

$P_{fd} = f_\beta \rho [a_Z (z_{0FD} - z) + f_{ull-l}\, a_X (x_0 - x) + f_{ull-t}\, a_Y (y_0 - y)]$

where:

z_{0FD} : Z coordinate of the effective reference point, in m, for a flooded compartment taken as:

When $z_{FD}>z_0$, $z_{0FD}=z_0$

When $z_{FD}\leqslant z_0$, $z_{0FD}=z_{FD}$

f_{ull-l}, f_{ull-t} : Longitudinal and transverse acceleration correction factors:

When $z_{FD}\leqslant z_0$, f_{ull-l} and f_{ull-t} are to be taken as defined in [1.3.1].

When $z_{FD}>z_0$, f_{ull-l} = 1.0 and f_{ull-t} = 1.0.

2 PRESSURES AND FORCES DUE TO DRY BULK CARGO

2.1 Application

2.1.1

The pressures and forces due to dry cargo in bulk in a cargo hold are to be determined both for fully and partially filled cargo holds according to [2.4] and [2.5].

2.2 Hold definitions

2.2.1 Geometrical characteristics

Figure 2 gives the main geometrical elements of a bulk carrier cargo hold.

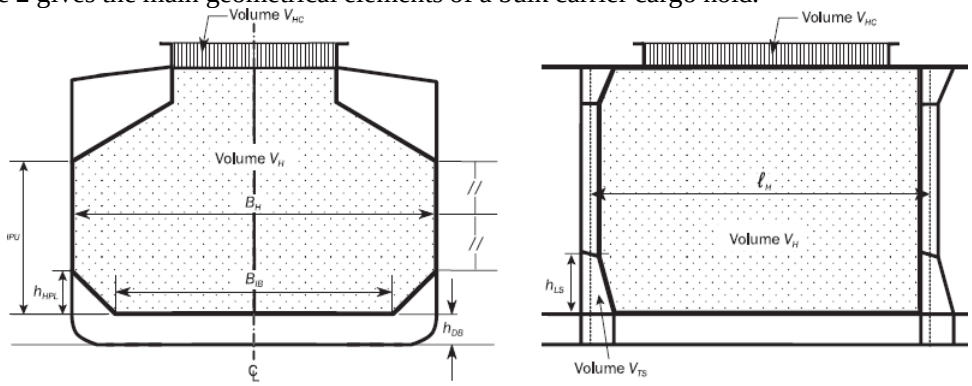

Figure 2 Definition of cargo hold parameters for bulk carrier

2.2.2 Fully and partially filled cargo holds

The definitions of a fully and partially filled dry bulk cargo holds are as follow:

a) Fully filled hold:
The dry bulk cargo density is such that the cargo hold is filled up to the top of the hatch coaming, as shown in Figure 3.
The upper surface of the cargo and its effective height in the hold h_C are to be determined in accordance with [2.3.1].

b) Partially filled hold:
The cargo density is such that the cargo hold is not filled up to the top of the hatch coaming, as shown in Figure 4 or Figure 5.
The upper surface of the cargo and its effective height in the hold h_C are to be determined in accordance with [2.3.2].

2.3 Dry cargo characteristics

2.3.1 Definition of the upper surface of dry bulk cargo for full cargo holds

For a fully filled cargo hold as defined in [2.2.2], including non-prismatic holds, the effective upper surface of the cargo is an equivalent horizontal surface at h_C, in m, above inner bottom at centreline as shown in Figure 3.

The value of h_C is to be calculated at mid length of the cargo hold at the midship, is to be kept constant over the cargo hold region area and is determined as follows:

$h_C = h_{HPU} + h_0$

where:

$$h_0 = \frac{S_A}{B_H}$$

$$S_A = S_0 + \frac{V_{HC}}{l_H}$$

S_0: Shaded area, in m^2, above the lower intersection of topside tank and side shell or inner side, as the case may be, and up to the level of the intersection of the main deck with the hatch coaming, determined for the cargo hold at the midship as shown in Figure 3.

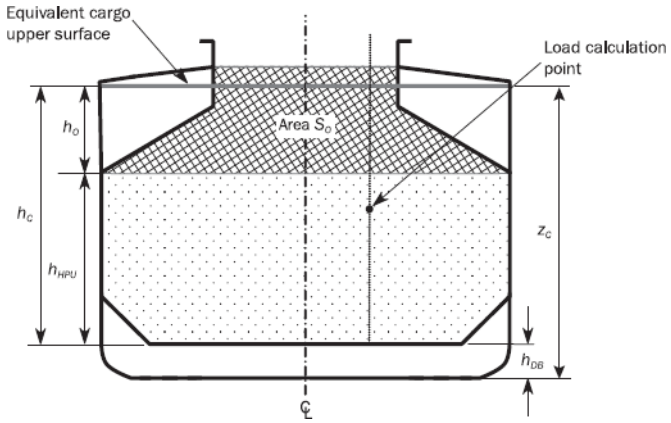

Figure 3 Definition of effective upper surface of cargo for a full cargo hold

2.3.2 Definition of upper surface of dry bulk cargo for partially filled cargo holds

For any partially filled cargo hold, as defined in [2.2.2], including non-prismatic holds, the effective upper surface of the cargo is to be made of three parts:

- One central horizontal surface of breadth $B_H/2$, in m, at a height $h_{C\text{-}CL}$, in m, above the inner bottom
- A sloped surface at each side with an angle $\psi/2$, in degrees, between the central horizontal surface, and the side shell or inner hull, as shown in Figure 4, or the hopper plating, as shown in Figure 5, as the case may be.

The height of cargo surface h_C, in m, is to be calculated at mid length of the considered cargo hold and is to be taken as constant over the length of the hold as follows:

For $|y| \le \frac{B_H}{4}$: $h_C = h_{C_CL}$

For $\frac{B_H}{4} < |y| \le \frac{B_2}{2}$: $h_C = h_{C_CL} - \left(|y| - \frac{B_H}{2}\right)\tan\left(\frac{\varphi}{2}\right)$

For $|y| > \frac{B_2}{2}$: $h_C = 0$

where:

h_1 : Height, in m, to be taken as:

$$h_1 = \frac{M}{\rho c \cdot B_H l_H} - \left(\frac{B_H + B_{IB}}{2B_H}\right)h_{HPL} - \frac{3}{16}B_H \tan\frac{\psi}{2} + \frac{V_{TS}}{B_H l_H}$$

- For $h_1 \geqslant 0$ as shown in Figure 4:

  $h_{C_CL} = h_{HPL} + h_1 + h_2$

  $$h_2 = \frac{B_H}{4}\tan\frac{\psi}{2}$$

  $B_2 = B_H$

- For $h_1 < 0$ as shown in Figure 5

  $h_{C_CL} = h_{11} + h_{22}$

  $$h_{11} = h_{HPL}\left(\frac{B_2 - B_{IB}}{B_H - B_{IB}}\right)$$

  $$h_{22} = \left(\frac{B_2}{2} - \frac{B_H}{4}\right)\tan\frac{\psi}{2}$$

  $$B_2 = \sqrt{\frac{\frac{1}{l_H}\left(\frac{M}{\rho_C} + V_{TS}\right) + \frac{1}{2}\left(\frac{h_{HPL} \cdot B_{IB}^2}{B_H - B_{IB}}\right) + \frac{B_H^2}{16}\tan\frac{\psi}{2}}{\frac{1}{2}\left[\left(\frac{h_{HPL}}{B_H - B_{IB}}\right) + \frac{1}{2}\tan\frac{\psi}{2}\right]}}$$

$h_{C\text{-}CL}$: Height, in m, of the cargo surface at the centreline, as shown in Figure 4 and Figure 5

B_2 : Maximum breadth of the cargo, in m, as shown in Figure 4 and Figure 5

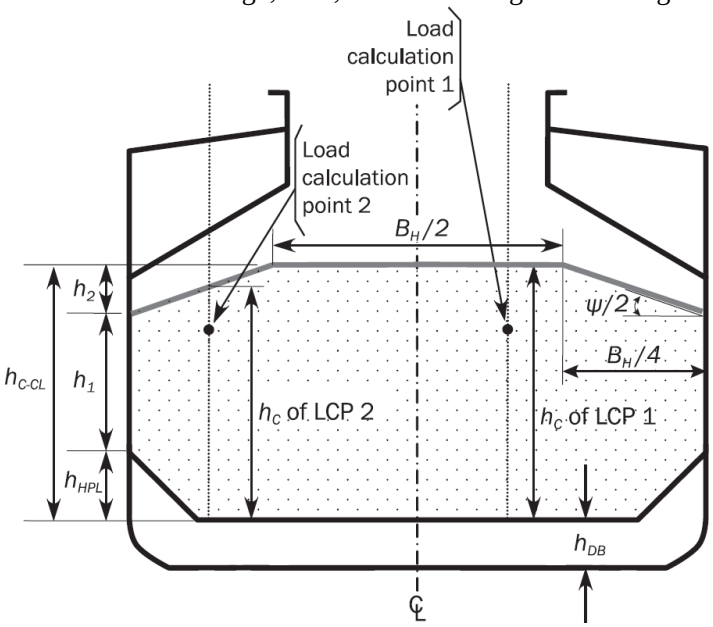

Figure 4 Definition of the effective upper surface of cargo for a partially filled cargo hold when $h_1 \geqslant 0$

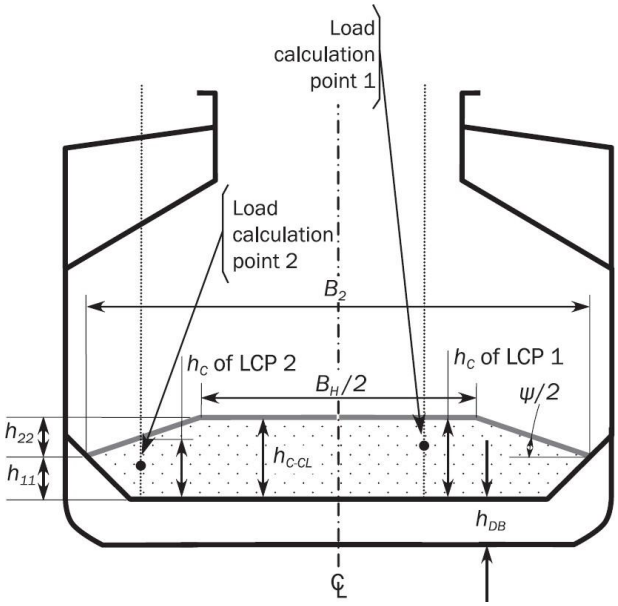

Figure 5 Definition of the effective upper surface of cargo for a partially filled cargo hold when $h_1 < 0$

2.3.3 Mass and density

The dry cargo mass and the density of the cargo are to be taken as follows:

- For strength assessment in intact condition: the values defined in Table 1
- For fatigue assessment: the values defined in Table 2
- For strength assessment in flooded condition: the values defined in Table 3

Dry bulk cargo mass and density for strength assessment in intact condition Table1

Ship type	Cargo mass Cargo density	Homogeneous loading condition		Alternate loading condition	
		Fully filled hold	Partially filled hold	Fully filled hold	Partially filled hold
No BC notation	M	$M = M_{Full}$	N/A	N/A	
	ρ_C	Maximum value specified in the loading manual			
BC-C	M	$M = M_{Full}$	N/A	N/A	
	ρ_C	$\rho_C = \left(\frac{M_{Full}}{V_{Full}}\right)$ but not less than			
BC-B	M	$M = M_{Full}$	$M = M_H$	N/A	
	ρ_C	$\rho_C = \left(\frac{M_{Full}}{V_{Full}}\right)$ but not less than	$\rho_C = 3.0$ (1)		
BC-A	M	$M = M_{Full}$	$M = M_H$	$M = M_{HD} + 0.1M_H$	$M = M_{HD} + 0.1M_H$
	ρ_C	$\rho_C = \left(\frac{M_{Full}}{V_{Full}}\right)$ but not less than	$\rho_C = 3.0$ (1)	$\rho_C = \frac{M_{HD} + 0.1M_H}{V_{Full}}$	$\rho_C = 3.0$ (1)
(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.					

Dry bulk cargo mass and density for fatigue assessment Table 2

Ship type	Cargo mass Cargo density	Homogeneous loading condition (Fully filled hold)	Alternate loading condition (Partially filled hold)
No BC notation	M	$M = M_H$	N/A
	ρ_C	ρ_C = maximum value specified in the loading manual	
BC-C	M	$M = M_H$	
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	
BC-B	M	$M = M_H$	
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	
BC-A	M	$M = M_H$	$M = M_{HD}$
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ (1)
(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.			

Dry bulk cargo mass and density for strength assessment in flooded condition Table 3

Ship type	Cargo mass Cargo density	Homogeneous loading condition		Alternate loading condition		
		Fully filled hold	Partially filled hold	Fully filled hold	Partially filled hold	Hold loaded with ρ_C=1.78 t/m^3 (2)
No BC notation	M	$M = M_H$		N/A		
	ρ_C	ρ_C = maximum value specified in the loading manual				
BC-C	M	$M = M_H$		N/A		
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$				
BC-B	M	$M = M_H$	$M = M_H$	N/A		
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ (1)			
BC-A	M	$M = M_H$	$M = M_H$	$M = M_{HD}$	$M = M_{HD}$	$M = M_{HD}$
	ρ_C	$\rho_C = \left(\frac{M_H}{V_{Full}}\right)$	$\rho_C = 3.0$ (1)	$\rho_C = \left(\frac{M_{HD}}{V_{Full}}\right)$	ρ_C=3.0 (1)	$\rho_C = 1.78$

(1) To be taken as 3.0 unless an alternative maximum cargo density is specified in the loading manual.
(2) To be applied for bulk carriers that are required to carry cargoes with a density less than or equal to 1.78 t/m^3.

2.3.4 FE application

The following process is to be applied for the bulk cargo pressure loads used in FE analysis:

a) Determine h_c according to [2.3.1] for fully filled cargo hold or [2.3.2] for partially filled cargo hold.

b) Determine the corresponding static pressure as defined in [2.4.2] and static shear pressure as defined in ρ_C [2.5.2] using and apply them in the FE model.

c) Calculate the actual mass of cargo, M_{actual}, in t.

d) Determine the effective cargo density, in t/m^3:

$$\rho_{eff} = \frac{M}{M_{actual}} \rho_C$$

e) Calculate the final pressure distribution and shear load using ρ_{eff} instead of ρ_C.

2.4 Dry bulk cargo pressures

2.4.1 Total pressure

The total pressure due to dry bulk cargo acting on any load point of a cargo hold boundary, in kN/m^2, is to be taken as:

$P_{in}=P_{bs}$ For strength assessment of intact conditions for static (S) design load scenarios, given in Ch 4, Sec 7

$P_{in}=P_{bs}+P_{bd}$ For strength assessment of intact conditions and fatigue assessment for static plus dynamic (S+D) design load scenarios, given in Ch 4, Sec 7

but not less than 0.

where:

P_{bs} : Static pressure due to dry bulk cargo, in kN/m^2, as defined in [2.4.2].

P_{bd} : Dynamic inertial pressure due to dry bulk cargo in cargo holds, in kN/m^2, as defined in [2.4.3].

Static and dynamic pressures as defined in [2.4.2] and [2.4.3] for FE analysis are to be determined using ρ_{eff} instead of ρ_C.

2.4.2 Static pressure

The dry bulk cargo static pressure P_{bs}, in kN/m^2, is to be taken as:

$P_{bs}=\rho_C g K_C(z_C-z)$ but not less than 0.

2.4.3 Dynamic pressure

The dry bulk cargo dynamic pressure P_{bd}, in kN/m^2, for each load case is to be taken as:

$P_{bd}=f_\beta\rho_C[0.25a_X(x_G-x)+ 0.25a_Y(y_G-y)+f_{dc}K_Ca_Z(z_C-z)]$ for $z\leqslant z_C$

$P_{bd}=0.0$ for $z>z_C$

2.5 Shear load

2.5.1 Application

For FE strength assessment and FE fatigue assessment, the following shear load pressures are to be considered in addition to the dry bulk cargo pressures defined in [2.4] when the load point elevation, z, is lower or equal to z_c:

- For static (S) design load scenarios, given in Ch 4, Sec 7: Static shear load, $P_{bs\text{-}s}$, due to gravitational forces acting on hopper tanks and lower stools plating, as defined in [2.5.2].
- For static plus dynamic (S+D) design load scenarios, given in Ch 4, Sec 7: The following dynamic shear load pressures:
  $P_{bs\text{-}s} + P_{bs\text{-}d}$ for the hopper tank and the lower stool plating, as defined in [2.5.3].
  $P_{bs\text{-}dx}$ for the inner bottom plating in the longitudinal direction, as defined in [2.5.4].
  $P_{bs\text{-}dy}$ for the inner bottom plating in the transverse direction, as defined in [2.5.4].

Shear loads as defined in [2.5.2] to [2.5.4] for FE analysis are to be determined using ρ_{eff} instead of ρ_c.

2.5.2 Static shear load on the hopper tank and lower stool plating

The static shear load pressure, $P_{bs\text{-}s}$ (positive downward to the plating) due to dry bulk cargo gravitational forces acting on hopper tank and lower stool plating, in kN/m^2, is to be taken as:

$$P_{bs-s} = \rho_C g \frac{(1-K_C)(z_C-z)}{\tan\alpha}$$

2.5.3 Dynamic shear load on the hopper tank and lower stool plating

The dynamic shear load pressure, $P_{bs\text{-}d}$ (positive downward to the plating) due to dry bulk cargo forces on the hopper tank and lower stool plating, in kN/m^2, for each dynamic load case is to be taken as:

$$P_{bs-d} = f_\beta \rho_C a_Z \frac{(1-K_C)(z_C-z)}{\tan\alpha}$$

2.5.4 Dynamic shear load along the inner bottom plating for FE analyses

The dynamic shear load pressures, $P_{bs\text{-}dx}$ in the longitudinal direction (positive to bow) due to dry bulk cargo forces acting along the inner bottom plating, in kN/m^2, for each dynamic load case is to be taken respectively as:

$P_{bs\text{-}dx}= -0.75f_\beta\rho_Ca_Xh_C$

The dynamic shear load pressures, $P_{bs\text{-}dy}$ in the transverse direction (positive to port) due to dry bulk cargo forces acting along the inner bottom plating, in kN/m^2, for each dynamic load case is to be taken respectively as

$P_{bs\text{-}dy}= -0.75f_\beta\rho_Ca_Yh_C$

The dynamic shear load pressures $P_{bs\text{-}dx}$ and $P_{bs\text{-}dy}$ are only used for FE strength assessment.

3 PRESSURES AND FORCES DUE TO DRY CARGOES IN FLOODED CONDITIONS

3.1 Vertically corrugated transverse watertight bulkheads

3.1.1 Application

The pressure defined in this sub-article applies to vertically corrugated transverse watertight bulkheads of the cargo holds of bulk carriers for the assessment in flooded conditions.

Each cargo hold is to be considered individually flooded, see Figure 6, Figure 7 and Figure 8.

3.1.2 General

The loads to be considered as acting on each bulkhead are those given by the combination of loads induced by cargo loads with those induced by the flooded loads of one hold adjacent to the bulkhead under examination. In any case, the pressure due to the flooded loads without cargo is also to be considered.

The most severe combinations of cargo induced loads and flooded loads are to be used for the check of the scantlings of each bulkhead, depending on the loading conditions included in the loading manual considering the individual flooded condition of both loaded and empty holds:

- Homogeneous loading conditions;
- Non-homogeneous loading conditions;

For the purpose of this article, the following items are defined as:

- Design load limits:
  The specified design load limits for the cargo holds are to be represented by loading conditions defined by the designer in the loading manual.
- Maximum cargo mass to consider:
  Unless the ship is intended to carry, in non-homogeneous conditions, only iron ore or cargo having bulk density equal to or greater than 1.78 t/m^3, the maximum mass of cargo which may be carried in the hold is also to be considered to fill that hold up to the top of the hatch coaming.
- Homogeneous loading conditions:
  Homogeneous loading condition means a loading condition in which the ratio between the highest and the lowest filling level, evaluated for each hold, does not exceed 1.20, to be corrected for different cargo densities.
- Packed cargoes:
  Holds carrying packed cargoes (such as steel mill products) are to be considered as empty.
- Unconsidered loading conditions:
  Non-homogeneous part loading conditions associated with multi-port loading and unloading operations for homogeneous loading conditions do not need to be considered for the verification of these requirements.

3.1.3 Flooded level

The flooded level z_F is the distance, in m, measured vertically from the baseline with the ship in the upright position, and obtained from Table 4.

Flooded level z_F, in m, for vertically corrugated transverse bulkheads Table 4

Bulk carrier type	Loading Condition	Vertically corrugated transverse bulkhead position	
		Foremost	Others
Bulk carriers less than 50,000 t deadweight with Type B freeboard	Non-homogeneous loading conditions with cargo density less than 1.78 t/m^3	$z_F=0.9D_1$	$z_F=0.8D_1$
	Other cases	$z_F = 0.95D_1$	$z_F = 0.85D_1$
Other bulk carriers	Non-homogeneous loading conditions with cargo density less than 1.78 t/m^3	$z_F=0.95D_1$	$z_F=0.85D_1$
	Other cases	$z_F =D_1$	$z_F=0.9D_1$

3.1.4 Flooded patterns

Three different flooded patterns are to be considered:

- The flooded level is below the upper surface of the cargo, (see Figure 6: $z_C > z_F$)
- The flooded level is above the upper surface of the cargo, (see Figure 7: $z_C \leqslant z_F$)
- The flooded hold is empty, (see Figure 8: $z_C = h_{DB}$)

3.1.5 Pressures and forces on vertically corrugated transverse bulkheads of flooded cargo holds

The static pressure $P_{bf\text{-}s}$, in kN/m^2, at any point of the vertically corrugated transverse bulkhead located at a level z from the baseline is given in Table 5 for each flooded pattern defined in [3.1.4]. The force $F_{bf\text{-}s}$, in kN, acting on a corrugation of a transverse bulkhead is given by Table 6 for each flooded pattern defined in [3.1.4].

where:

$P_{bf\text{-}s\text{-}LE}$: Static pressure calculated according to Table 5 for $z = h_{LS}+h_{DB}$

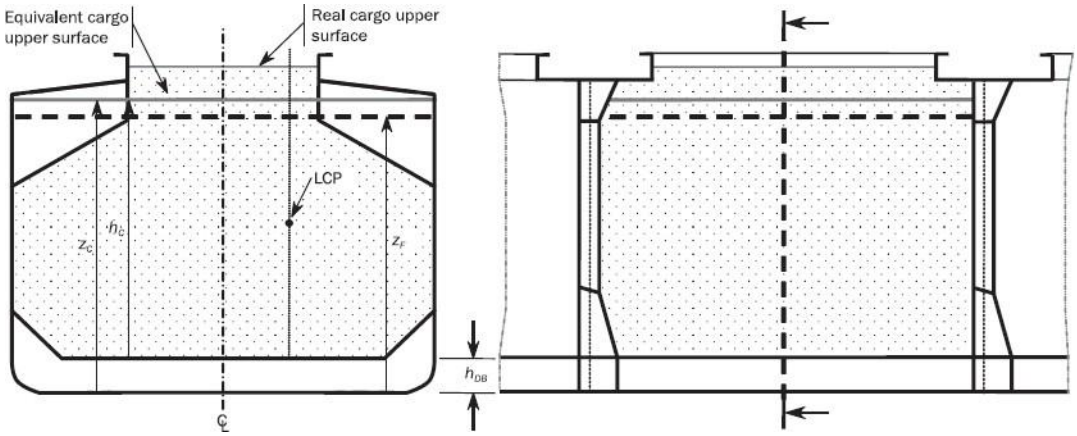

Figure 6 Flooded level below upper surface of bulk cargo

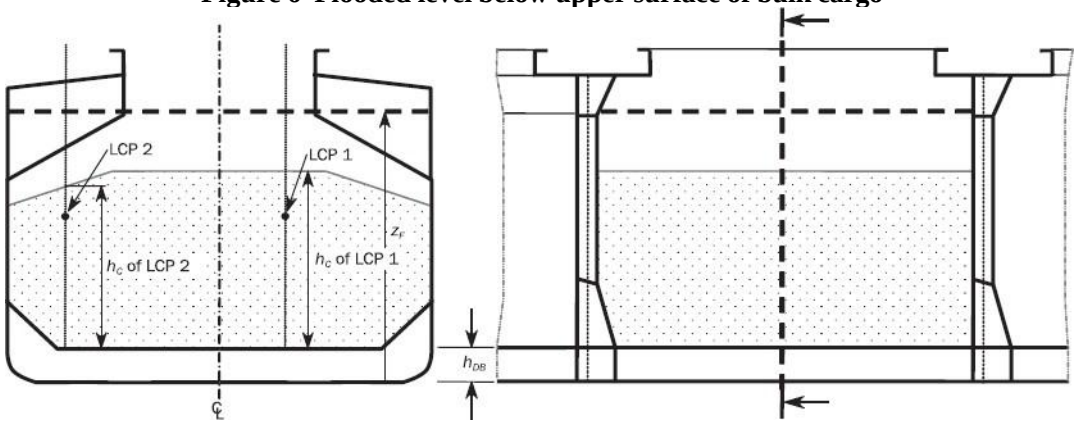

Figure 7 Flooded level above upper surface of bulk cargo

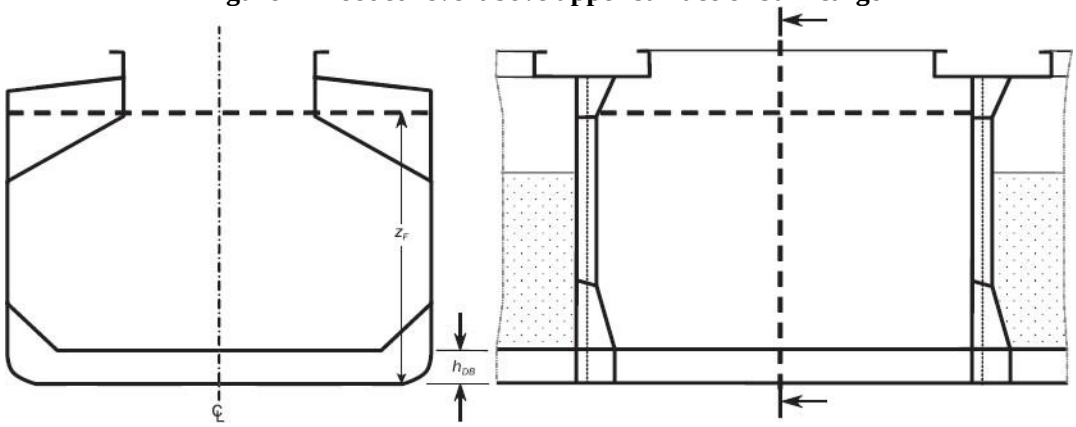

Figure 8 Flooded cargo hold without cargo

Static pressure on vertically corrugated transverse bulkhead of a flooded cargo hold $P_{bf\text{-}s}$

Table 5

Flooded case	Load point position	Pressure $p_{bf\text{-}s}$, in kN/m^2
$z_C > z_F$	$z > z_C$	$P_{bf\text{-}s}=0$
	$z_C \geqslant z \geqslant z_F$	$P_{bf\text{-}s}=\rho_C g(z_C-z)K_{C\text{-}f}$
	$z_F \geqslant z \geqslant h_{DB}$	$P_{bf\text{-}s}=\rho g(z_F-z)+[\rho_C(z_C-z)-\rho(1\text{-}perm)(z_F-z)]gK_{C\text{-}f}$
$h_{db} \leqslant z_C \leqslant z_F$	$z > z_F$	$P_{bf\text{-}s}=0$
	$z_F \geqslant z \geqslant z_C$	$P_{bf-s}=g(z_F-z)$
	$z_C \geqslant z \geqslant h_{DB}$	$P_{bf\text{-}s}=\rho g(z_F-z)+[\rho_C-\rho(1\text{-}perm)]g(z_C-z)K_{C\text{-}f}$

Force acting on a corrugation in the flooded cargo holds F_{bf-s} **Table 6**

Flooded case	Force F_{bf-s}, in kN
$z_C > z_F$	$F_{bf-s} = s_C \left\{ \rho_C g \frac{(z_C - z_F)^2}{2} K_{C-f} + \left[\frac{\rho_C g (z_C - z_F) K_{C-f} + p_{bf-s-LE}}{2} \right] (z_F - h_{DB} - h_{LS}) \right\}$
$z_F \geqslant z_C$	$F_{bf-s} = s_C \left\{ \rho g \frac{(z_C - z_F)^2}{2} + \left[\frac{\rho g (z_F - z_C) + p_{bf-s-LE}}{2} \right] (z_C - h_{DB} - h_{LS}) \right\}$

3.1.6 Pressures and forces on vertically corrugated transverse bulkheads of non-flooded cargo holds

The static pressure P_{bs}, in kN/m^2, at a point of the vertically corrugated transverse bulkhead located, located at the level z from the baseline, due to dry bulk cargo of a non-flooded cargo hold acting on the intact side of the transverse bulkhead which is flooded on the other side is to be taken as:
$P_{bs}=\rho_C g K_{C-f}(z_C - z)$, but not less than 0.
The resultant force F_{bs}, in kN, acting on a corrugation is to be taken as:

$$F_{bs} = \rho_C g s_C \frac{(z_C - h_{DB} - h_{LS})^2}{2} K_C$$

3.1.7 Resultant pressures and forces on vertically corrugated transverse bulkheads of flooded cargo holds

The resultant pressure P_R, in kN/m^2, at each point of the bulkhead, and the resultant force F_R, in kN, acting on a corrugation, given in Table 7, are to be considered for the assessment in flooded conditions of vertically corrugated transverse bulkhead structures, where:
P_{bf-s}: Pressure in the flooded cargo holds, in kN/m^2, as defined in [3.1.5].
P_{bs}: Pressure in the non-flooded cargo holds, in kN/m^2, as defined in [3.1.6].
F_{bf-s} : Force acting on a corrugation in the flooded cargo holds, in kN, as defined in [3.1.5].
F_{bs} : Force acting on a corrugation in the non-flooded cargo holds, in kN, as defined in [3.1.6].

Resultant pressure P_R and resultant force F_R on vertically corrugated transverse bulkhead in flooded condition **Table 7**

Loading condition	Resultant pressure P_R, in kN/m^2	Resultant force F_R, in kN	Application
Homogeneous	$P_R = P_{bf-s} - 0.8\, P_{bs}$	$F_R = F_{bf-s} - 0.8\, F_{bs}$	All bulk carriers
Alternate	$P_R = P_{bf-s}$	$F_R = F_{bf-s}$	BC-A bulk carriers

3.2 Double bottom in cargo hold region of bulk carrier in flooded conditions

3.2.1 Application

Each cargo hold is to be considered individually flooded.

3.2.2 General

The loads to be considered as acting on the double bottom are those given by the external sea pressures and the combination of the cargo loads with those induced by the flooding of the hold to which the double bottom belongs.
The most severe combinations of cargo induced loads and flooded loads are to be used, depending on the loading conditions included in the loading manual:

- Homogeneous loading conditions.
- Non-homogeneous loading conditions.
- Packed cargo conditions (such as in the case of steel mill products).

For each loading condition, the maximum dry bulk cargo density to be carried is to be considered in calculating the allowable hold loading.

3.2.3 Flooded level

The flooded level z_F is the distance, in m, measured vertically from the baseline with the ship in the upright position, and obtained from Table 8.

Flooded level z_F, for double bottom in cargo hold region of bulk carrier Table 8

Bulk carrier type	Cargo hold	
	Foremost	Others
Bulk carriers less than 50,000 t deadweight with Type-B freeboard	$z_F = 0.95\ D_1$	$z_F = 0.85\ D_1$
Other bulk carriers	$z_F = D_1$	$z_F = 0.9\ D_1$

4 STEEL COIL LOADS IN CARGO HOLDS OF BULK CARRIERS

4.1 General

4.1.1 Application

The provision is determined by assuming Figure 9 as the standard means of securing steel coils loaded on wooden dunnage.

It is assumed that all the steel coils have the same characteristics.

In cases where steel coils are lined up in two or more tiers, formulae in [4.1.3] and [4.2] can be applied assuming that only the lowest tier of steel coils is in contact with hopper sloping plate or inner side plate. In other cases, scantling requirements are to be determined on a case-by-case basis.

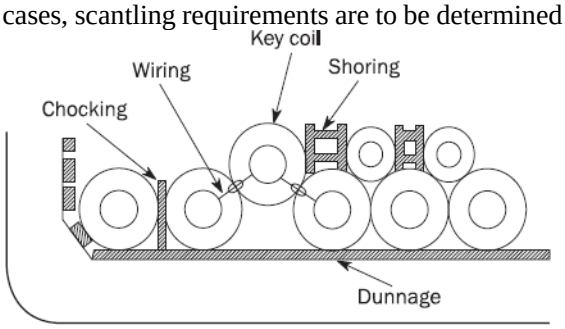

Figure 9 Inner bottom loaded by steel coils

4.1.2 Arrangement of steel coils on inner bottom

The two following arrangements of steel coils on the inner bottom are considered:

- The steel coils are positioned without respect to the location of the inner bottom floors, as shown in Figure 10.
- The steel coils are positioned with respect to the location of the inner bottom floors, as shown in Figure 11.

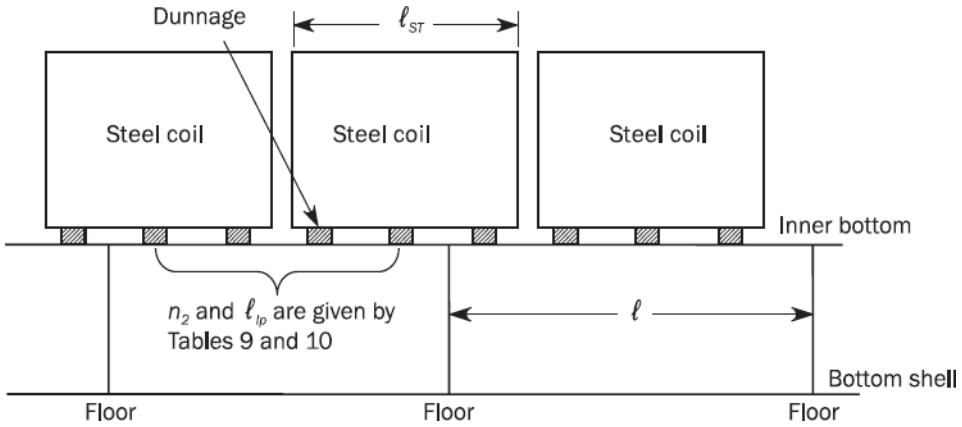

Figure 10 Steel coils loaded independently of inner bottom floors locations

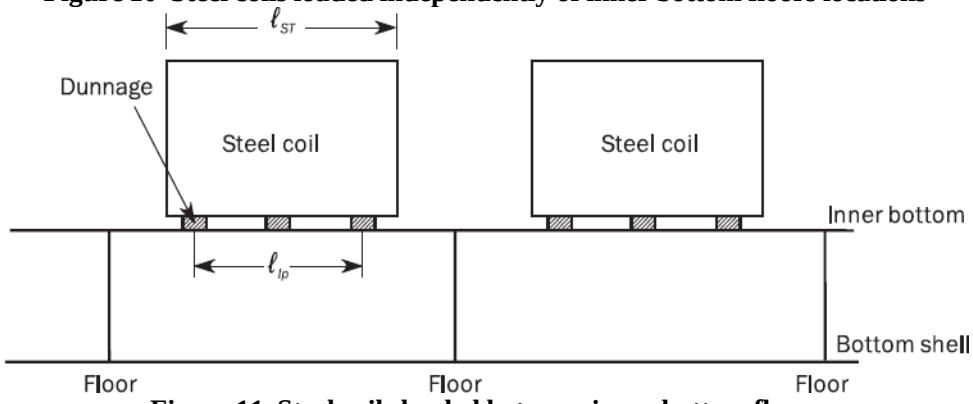

Figure 11 Steel coils loaded between inner bottom floors

4.1.3 Arrangement of steel coils independently of the floor locations

For steel coils loaded without respect to the location of floors in the inner bottom, see Figure 10:
The number n_2 of load point dunnages per elementary plate panels is to be found in comply with Table 9.
The distance l_{lp}, in m, between outermost load point dunnages per elementary plate panel is to be found in comply with Table 10.

Number n_2 of load point dunnages per elementary plate panel **Table 9**

n_2 (1) (2)	n_3 (3)				
	2	3	4	5	6
9	$4.8 < \frac{l}{l_{st}} \le 5.3$	$3.07 < \frac{l}{l_{st}} \le 3.6$	$2.4 < \frac{l}{l_{st}} \le 2.65$	$1.8 < \frac{l}{l_{st}} \le 2.0$	$1.53 < \frac{l}{l_{st}} \le 1.7$
10	$5.3 < \frac{l}{l_{st}} \le 6.0$	$3.6 < \frac{l}{l_{st}} \le 3.93$	$2.65 < \frac{l}{l_{st}} \le 2.9$	$2.0 < \frac{l}{l_{st}} \le 2.4$	$1.7 < \frac{l}{l_{st}} \le 1.87$

(1) In case l/l_{st} is greater than the value given in Table 9, n_2 is to be considered as greater than 10.
(2) For plating, n_2 is to be based on l. For stiffener, n_2 is to be derived with l replaced by l_{bdg}.
(3) The number of dunnages, n_3, considered at the design stage is to reflect the intended operation conditions. Unusual arrangements with 5 or more dunnages per row of steel coil need to be carefully considered by the designer and ship owner.

Distance between outermost load point dunnages per elementary plate panel, l_{lp}, in m

Table 10

n_2 (1)	n_3				
	2	3	4	5	6
1	Actual breadth of dunnages				
2	0.5 l_{st}	0.33 l_{st}	0.25 l_{st}	0.2 l_{st}	0.17 l_{st}
3	1.2 l_{st}	0.67 l_{st}	0.50 l_{st}	0.4 l_{st}	0.33 l_{st}
4	1.7 l_{st}	1.20 l_{st}	0.75 l_{st}	0.6 l_{st}	0.5 l_{st}
5	2.4 l_{st}	1.53 l_{st}	1.20 l_{st}	0.8 l_{st}	0.67 l_{st}
6	2.9 l_{st}	1.87 l_{st}	1.45 l_{st}	1.2 l_{st}	0.83 l_{st}
7	3.6 l_{st}	2.40 l_{st}	1.70 l_{st}	1.4 l_{st}	1.2 l_{st}
8	4.1 l_{st}	2.73 l_{st}	1.95 l_{st}	1.6 l_{st}	1.37 l_{st}
9	4.8 l_{st}	3.07 l_{st}	2.40 l_{st}	1.8 l_{st}	1.53 l_{st}
10	5.3 l_{st}	3.60 l_{st}	2.65 l_{st}	2.0 l_{st}	1.7 l_{st}

(1) When $n_2 > 10$, l_{lp} is to be taken equal to l.

4.1.4 Arrangement of steel coils between floors

For steel coils loaded with respect to the locations of floors in the inner bottom, see Figure 11:

- The number n_2 of load point dunnages per elementary plate panels is to be taken as: $n_2 = n_3$
- The distance l_{lp} between outermost load point dunnages per elementary plate panel is to be taken as the distance between the outermost dunnage supporting one row of steel coils.

4.1.5 Centre of gravity of steel coil cargo

The centre of gravity of the steel coil cargo of the considered cargo hold is to be taken at the following position:

a) Longitudinal position
x_{Gsc} is the X coordinate, in m, of the volumetric centre of gravity of the considered cargo hold with respect to the reference coordinate system defined in Ch 4, Sec 1, [1.2.1].

b) Transverse position

$$y_{Gsc} = \varepsilon \frac{B_H}{4}$$

c) Vertical position

$$z_{Gsc} = h_{DB} + \left\{1 + (n_1 - 1)\frac{\sqrt{3}}{2}\right\}\frac{d_{sc}}{2}$$

where:

ε : Coefficient to be taken as:

ε=1.0 when a port side structural member is assessed.

ε= -1.0 when a starboard side structural member is assessed.

4.2 Total loads

4.2.1 Total load on the inner bottom

The total load $F_{sc\text{-}ib}$, in kN, due to steel coil cargoes on the inner bottom is to be taken as:

$F_{sc\text{-}ib}$=cos ($C_{XG}\cdot\varphi$) ·cos ($C_{YG}\cdot\theta$) ·$F_{sc\text{-}ib\text{-}s}$ + $F_{sc\text{-}ib\text{-}d}$, but not less than 0

where:

$F_{sc\text{-}ib\text{-}s}$: Static load, in kN, on the inner bottom, given in [4.3.1].

$F_{sc\text{-}ib\text{-}d}$: Dynamic load, in kN, on the inner bottom, given in [4.4.2].

C_{XG}, C_{YG}: Load combination factors, as defined in Ch 4, Sec 2, [2.2].

4.2.2 Total load on the hopper side

The total load $F_{sc\text{-}hs}$, in kN, due to steel coil cargoes on the hopper side is to be taken as:

$$F_{sc-ib} = \frac{\cos(C_{XG}\cdot\varphi)\cdot\cos(C_{YG}\cdot\theta)}{\cos\theta_h}\cdot F_{sc-hs-s} + F_{sc-hs-d} \text{ but not less than 0}$$

where:

$F_{sc\text{-}hs\text{-}s}$: Static load, in kN, on the hopper side, given in [4.3.2].

$F_{sc\text{-}hs\text{-}d}$: Dynamic load, in kN, on the hopper, given in [4.4.3].

C_{XG}, C_{YG}: Load combination factors, as defined in Ch 4, Sec 2, [2.2].

4.3 Static loads

4.3.1 Static loads on the inner bottom

The static load $F_{sc\text{-}ib\text{-}s}$, in kN, on the inner bottom due to steel coils is to be taken as:

$F_{sc\text{-}ib\text{-}s} = M_{sc\text{-}ib}\cdot g$

where:

$M_{sc\text{-}ib}$: Equivalent mass of steel coils, in t, to be taken as:

$$M_{sc-ib} = K_S W \frac{n_1 n_2}{n_3} \quad \text{for } n_2 \leqslant 10$$

$$M_{sc-ib} = K_S W n_1 \frac{l}{l_{st}} \quad \text{for } n_2 > 10, \text{ for plating}$$

$$M_{sc-ib} = K_S W n_1 \frac{l_{bdg}}{l_{st}} \quad \text{for } n_2 > 10, \text{ for stiffener}$$

K_S : Coefficient to be taken as:

K_S = 1.4 when steel coils are lined up in one tier with a key coil.

K_S = 1.0 in other cases.

4.3.2 Static load on the hopper side

The static load $F_{sc\text{-}hs\text{-}s}$, in kN, on the hopper side due to steel coils is to be taken as:

$F_{sc\text{-}hs\text{-}s}$=cos$\theta_h$ $M_{sc\text{-}hs}\cdot g$

where:

$M_{sc\text{-}hs}$: Equivalent mass of steel coils, in t, to be taken as:

$$M_{sc-hs} = C_k W \frac{n_2}{n_3} \quad \text{for } n_2 \leqslant 10$$

$$M_{sc-hs} = C_k W \frac{l}{l_{st}} \qquad \text{for } n_2>10, \text{ for plating}$$

$$M_{sc-hs} = C_K W \frac{l_{bdg}}{l_{st}} \qquad \text{for } n_2>10, \text{ for stiffener}$$

C_k : Coefficient to be taken as:

C_k = 3.2 when steel coils are lined up two or more tiers, or when steel coils are lined up one tier and key coil is located second or 3rd from hopper sloping plate or inner hull plate.

C_k = 2.0 for other cases.

4.4 Dynamic loads

4.4.1 Tangential roll acceleration

The tangential roll acceleration a_R, in m/s^2, is to be taken as:

$$a_R = \theta \cdot \frac{\pi}{180} \cdot \left(\frac{2\pi}{T_\theta}\right)^2 \cdot \sqrt{y_{Gsc}^2 + (R - z_{Gsc})^2}$$

where:

y_{Gsc} : Y coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

z_{Gsc} : Z coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

4.4.2 Dynamic load on the inner bottom

The dynamic load $F_{sc\text{-}ib\text{-}d}$, in kN, on the inner bottom due to steel coils is to be taken as:

$F_{sc\text{-}ib\text{-}d} = M_{sc\text{-}ib} \cdot a_z$

where:

a_z : Vertical acceleration, in m/s^2, as defined in Ch 4, Sec 3, [3.2.4], calculated at the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

4.4.3 Dynamic load on the hopper side

The dynamic load $F_{sc\text{-}hs\text{-}d}$, in kN, on the hopper side due to steel coils is to be taken as:

$$F_{sc-hs-d} = \varepsilon M_{sc-hs} \left[C_{YR} a_R \sin\left(\tan^{-1} \left| \frac{y_{Gsc}}{R - z_{Gsc}} \right| - \theta_h \right) - C_{YS} a_{sway} \sin\theta_h \right]$$

where:

C_{YS}, C_{YR} : Load combination factors, defined in Ch 4, Sec 2, [2.2].

a_{sway} : Sway acceleration, in m/s^2, as defined in Ch 4, Sec 3, [2.2.2].

a_R : Tangential acceleration, in m/s^2, as defined in [4.4.1].

y_{Gsc} : Y coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

z_{Gsc} : Z coordinate, in m, of the centre of gravity of the steel coil cargo of the considered cargo hold, given in [4.1.5].

5 LOADS ON NON-EXPOSED DECKS AND PLATFORMS

5.1 Application

5.1.1 General

The loads defined in [5.2] and [5.3] are applicable to non-exposed decks, accommodation decks and platforms.

5.2 Pressure due to distributed load

5.2.1

If a distributed load is carried on a deck, the static and dynamic pressures due to this distributed load are to be considered.

The static distributed load is to be defined by the designer without being less than 3kN/m^2 for accommodation decks and 10kN/m^2 for other decks and platforms.

The pressure P_{dl}, in kN/m^2, due to this distributed load for the static (S) design load scenarios,

given in Ch 4, Sec 7, is to be taken as:
$P_{dl}=P_{dl-s}$
The pressure P_{dl}, in kN/m^2, due to this distributed load for the static plus dynamic (S+D) design load scenarios, is to be derived for the envelope of dynamic load cases and is to be taken as:
$P_{dl}=P_{dl-s}+P_{dl-d}$ but not less than 0.
where:
P_{dl-s} : Static pressure, in kN/m^2, due to the distributed load.
P_{dl-d} : Dynamic pressure, in kN/m^2, due to the distributed load, in kN/m^2, to be taken as:

$$P_{dl-d} = f_\beta \frac{a_{Z-env}}{g} P_{dl-s}$$

$a_{z\text{-}env}$: Envelope of vertical acceleration, in m/s^2, at the load position being considered, for the dynamic load cases, given in Ch 4, Sec 3, [3.3.3].

5.3 Concentrated force due to unit load

5.3.1

If a unit load is carried on an internal deck, the static and dynamic forces due to the unit load carried are to be considered when a direct analysis is applied for stiffeners or primary supporting members such as in Pt 1, Ch6, Sec 5, [1.2] or Pt 1, Ch 6, Sec 6, [3.3] respectively.
The force F_U, in kN, due to this concentrated load for the static (S) design load scenarios, given in Ch 4, Sec 7, is to be taken as:
$F_U=F_{U-s}$
The force F_U, in kN, due to this concentrated load for the static plus dynamic (S+D) design load scenarios, is to be derived for the envelope of dynamic load cases and is to be taken as:
$F_U=F_{U-s}+F_{U-d}$ but not less than 0.
where:
F_{U-s} : Static force, in kN, due to the unit load to be taken as:

$$F_{U-s} = m_U g$$

F_{U-d} : Dynamic force, in kN, due to unit load to be taken as:

$$F_{U-d} = m_U f_\beta a_{z-env}$$

m_U : Mass of the unit load carried, in t.
$a_{z\text{-}env}$: Envelope of vertical acceleration, in m/s^2, at the centre of gravity of the unit load carried for the dynamic load cases, given in Ch 4, Sec 3, [3.3.3].

6 SLOSHING PRESSURES IN TANKS

6.1 General

6.1.1 Application

This article applies to all liquid cargo, ballast tanks and other tanks with volume exceeding 100 m^3, but does not apply to the water ballast cargo hold of bulk carriers.

6.1.2

The sloshing pressures defined in this article do not include the effect of impact pressures due to high velocity impacts with tank boundaries or internal structures. For tanks with a maximum effective sloshing breadth, b_{slh}, see [6.4.2], greater than 0.56B or a maximum effective sloshing length, l_{slh}, see [6.3.2], greater than 0.13L at any filling level from 0.05h_{max} to 0.95h_{max}, see [6.3.3], a separate impact assessment is to be carried out in accordance with the Society procedures.

ISC 6.1.2a Where $l_s>0.13L$ or $b_s>0.56B$ for the tank, level 3 sloshing impact loads are to be calculated in accordance with relevant requirements of Section 2 of ISC Guidelines for Assessment of Sloshing Loads and Structural Scantlings of Tanks.

6.1.3 Sloshing pressure on tank boundaries and internal divisions

The sloshing pressure due to liquid motions in a tank P_{slh} acting on any load point of a tank boundary or internal divisions, in kN/m^2, for the sloshing design load scenario, given in Ch4, Sec 7, is to be taken as follows, without being less than $P_{slh-min}$, as given in [6.2]:

- $P_{slh} = P_{slh-lng}$ for transverse bulkheads, as defined in [6.3.3].
- $P_{slh} = P_{slh-wf}$ for web frames and transverse stringers, as defined in [6.3.4].
- $P_{slh} = P_{slh-t}$ for longitudinal bulkheads, as defined in [6.4.3].

- $P_{slh} = P_{slh\text{-}grd}$ for longitudinal girders and stringers, see [6.4.4].

6.2 Minimum sloshing pressure

6.2.1

The minimum sloshing pressure, $P_{slh\text{-}min}$, for tanks of cellular construction, i.e. double hull construction with internal structures restricting the fluid motion, is to be taken as 12 kN/m^2.

The minimum sloshing pressure, $P_{slh\text{-}min}$, for cargo and all other tanks is to be taken as 20 kN/m^2.

6.3 Sloshing pressure due to longitudinal liquid motion

6.3.1 Application

The sloshing pressure due to longitudinal liquid motion, $P_{slh\text{-}lng}$, is to be taken as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 h_{max} to 0.95h_{max}, in 0.05h_{max} increments.

6.3.2 Effective sloshing length

The effective sloshing length, l_{slh}, in m, is to be taken as defined in Table11.

Effective sloshing length l_{slh} **Table 11**

Type of transverse bulkhead	l_{zlh}
Transverse tight bulkheads	$l_{zlh} = \frac{(1+n_{WT}\alpha_{WT})(1+f_{wf}\alpha_{wf})l_{tk-h}}{(1+n_{WT})(1+f_{wf})}$
Transverse wash bulkheads	$l_{zlh} = \frac{[1+(n_{WT}-1)\alpha_{WT}](1+f_{wf}\alpha_{wf})l_{tk-h}}{(1+n_{WT})(1+f_{wf})}$

where:

n_{WT} : Number of transverse wash bulkheads in the tank.

α_{WT} : Transverse wash bulkhead coefficient, to be taken as (see Figure 12):

$$\alpha_{WT} = \frac{A_{OWT}}{A_{tk-t-h}}$$

For tanks with changing shape along the length and/or with wash bulkhead of different shape the transverse wash bulkhead coefficient, α_{WT}, may be taken as the weighted average of all wash bulkhead locations in the tank given as:

$$\alpha_{WT} = \frac{\sum_{i=1}^{n_{WT}} \frac{A_{OWT_i}}{A_{tk-t-h_i}}}{n_{WT}}$$

α_{wf} : Transverse web frame coefficient, to be taken as (see Figure 13):

$$\alpha_{wf} = \frac{A_{O-wf-h}}{A_{tk-t-h}}$$

For tanks with changing shape along the length and/or with web frames of different shape the transverse web frame coefficient, α_{wf}, may be taken as the weighted average of all web frame locations in the tank given as:

$$\alpha_{wf} = \frac{\sum_{i=1}^{n_{wf}} \frac{A_{o-wf-h_i}}{A_{tk-t-h_i}}}{n_{wf}}$$

A_{OWT} : Total area of openings, in m^2, in the transverse section in way of the wash bulkhead below the considered filling height.

A_{tk-t-h} : Total transverse cross sectional area, in m^2, of the tank below the considered filling height.

A_{O-wf-h} : Total area of openings, in m^2, in the transverse section in way of the web frame below the considered filling height.

f_{wf} : Factor to account for number of transverse web frames and transverse wash bulkheads in the tank, to be taken as:

$$f_{wf} = \frac{n_{wf}}{1+n_{WT}}$$

n_{wf} : Number of transverse web frames, excluding wash bulkheads, in the tank.

l_{tk-h} : Length of cargo tank, in m, at considered filling height.

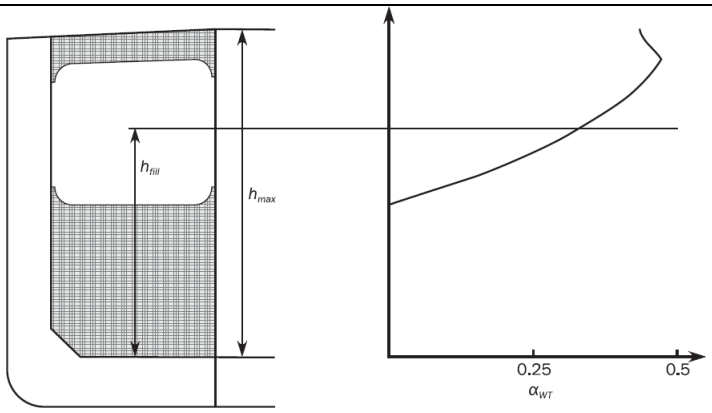

Figure 12 Transverse wash bulkhead coefficient

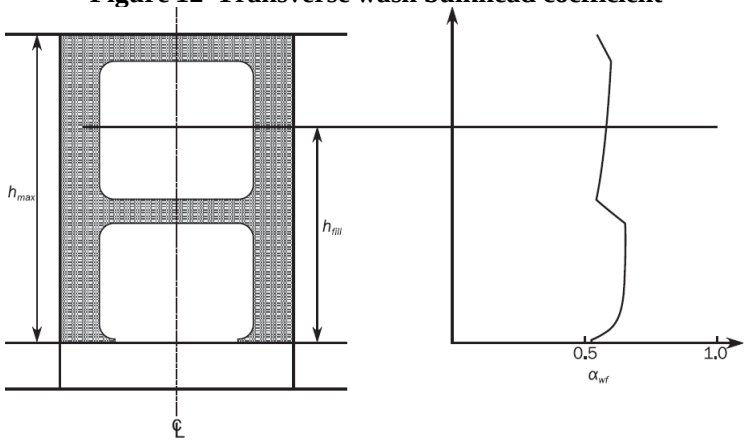

Figure 13 Transverse web frame coefficient

6.3.3 Sloshing pressure in way of transverse bulkheads

The sloshing pressure in way of transverse bulkheads including wash bulkheads due to longitudinal liquid motion, $P_{slh\text{-}lng}$, in kN/m^2, for a particular filling level, is to be taken as:

$$P_{slh-lng} = \rho_{slh} g l_{slh} \left[0.4 - \left(0.39 - \frac{1.7 l_{slh}}{L} \right) \frac{L}{350} \right]$$

where:

l_{slh} : Effective sloshing length, in m, as defined in [6.3.2].

f_{slh} : Coefficient taken as:

$$f_{slh} = 1 - 2\left(0.7 - \frac{h_{fill}}{h_{max}} \right)^2$$

h_{fill} : Filling height, measured from tank bottom, in m, see Figure 12.

6.3.4 Sloshing pressure on internal web frames or transverse stringers adjacent to a transverse bulkhead

For tanks with internal web frames the sloshing pressure acting on a web frame or transverse stringer adjacent to transverse bulkheads or transverse wash bulkheads due to longitudinal liquid motion, $P_{slh\text{-}wf}$, in kN/m^2, provided it is located within $0.25 l_{slh}$ from the bulkhead, is to be taken as:

$$P_{slh-wf} = P_{slh-lng} \left(1 - \frac{s_{wf}}{l_{slh}} \right)^2$$

where:

l_{slh} : Effective sloshing length, in m, as defined in [6.3.2].

$P_{slh\text{-}lng}$: Sloshing pressure due to longitudinal liquid motion acting on transverse bulkhead, as defined in [6.3.3].

s_{wf} : Distance from transverse bulkhead to web frame under consideration, in m.

The distribution of pressure across web frames and transverse stringers is given in Figure 14.

6.4 Sloshing pressure due to transverse liquid motion

6.4.1 Application

The sloshing pressure due to transverse liquid motion, *Pslh-t*, is to be taken constant as a constant value over the full tank depth and is to be taken as the greater of the sloshing pressures calculated for filling levels from 0.05 h_{max} to 0.95h_{max}, in 0.05h_{max} increments.

6.4.2 Effective sloshing breadth

The effective sloshing breadth, b_{slh}, in m, is to be taken as in Table 12, but not less than 0.3*B*.

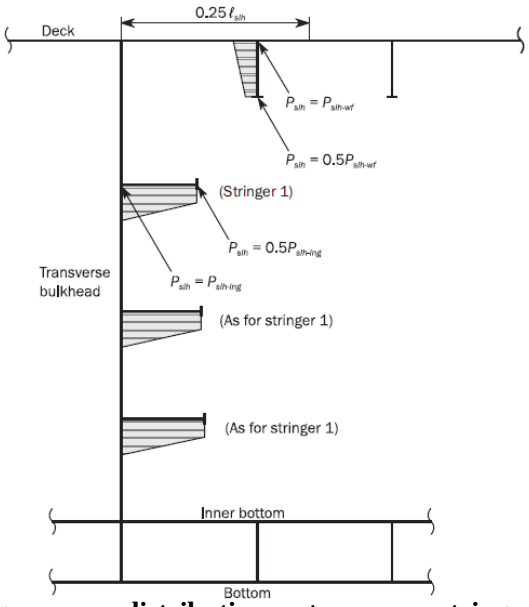

Figure 14 Sloshing pressure distribution on transverse stringers and web frames

Effective sloshing breadth b_{slh} **Table 12**

Type of longitudinal bulkhead	b_{slh}
Longitudinal tight bulkheads	$b_{slh} = \dfrac{(1+n_{WL}\alpha_{WL})(1+f_{grd}\alpha_{grd})b_{tk-h}}{(1+n_{WL})(1+f_{grd})}$
Longitudinal wash bulkheads	$b_{slh} = \dfrac{[1+(n_{WL}-1)\alpha_{WL}](1+f_{grd}\alpha_{grd})b_{tk-h}}{(1+n_{WL})(1+f_{grd})}$

where:

n_{WL} : Number of longitudinal wash bulkheads in the tank.

α_{WL} : Longitudinal wash bulkhead coefficient:

$$\alpha_{WL} = \frac{A_{OWL}}{A_{tk-L-h}}$$

For tanks with changing shape along the breadth and/or with wash bulkhead of different shape the longitudinal wash bulkhead coefficient, α_{WL}, may be taken as the weighted average of all wash bulkhead locations in the tank given as:

$$\alpha_{WT} = \frac{\sum_{i=1}^{n_{WL}} \frac{A_{OWL_i}}{A_{tk-L-h_i}}}{n_{WL}}$$

α_{grd} : Girder coefficient, to be taken as:

$$\alpha_{grd} = \frac{A_{O-grd-h}}{A_{tk-L-h}}$$

For tanks with changing shape along the breadth and/or with girder of different shape the girder coefficient, α_{grd}, may be taken as the weighted average of all girder locations in the tank given as:

$$\alpha_{grd} = \frac{\sum_{i=1}^{n_{grd}} \frac{A_{O-grd-h_i}}{A_{tk-L-h_i}}}{n_{grd}}$$

A_{OWL} : Total area of openings, in m^2, in the longitudinal section in way of the wash bulkhead below the considered filling height.

$A_{tk\text{-}L\text{-}h}$: Total longitudinal cross sectional area, in m^2, of the tank below the considered filling height.

$A_{O\text{-}grd\text{-}h}$: Total area of openings, in m^2, in the longitudinal section in way of the web frame below the considered filling height.

f_{grd} : Factor to account for number of longitudinal girders and longitudinal wash bulkheads in the tank, to be taken as:

$$f_{grd} = \frac{n_{grd}}{1 + n_{WL}}$$

n_{grd} : Number of longitudinal girders, excluding longitudinal wash bulkheads, in the tank.

$b_{tk\text{-}h}$: Breadth of cargo tank, in m, at considered filling height.

6.4.3 Sloshing pressure in way of longitudinal bulkheads

The sloshing pressure in way of longitudinal bulkheads including wash bulkheads due to transverse liquid motion, $P_{slh\text{-}t}$, in kN/m^2, for a particular filling level, is to be taken as:

$$P_{slh-t} = 7\rho_{slh} g f_{slh} \left(\frac{b_{slh}}{B} - 0.3 \right) GM^{0.75}$$

where:

b_{slh} : Effective sloshing breadth defined in [6.4.2].

GM : Metacentric height, given in Ch 4, Sec 3, [2.1.1].

For the calculation of sloshing pressure in ballast tanks the 'ballast condition' is to be used for oil tankers and the 'normal ballast condition' for bulk carriers.

For the calculations of sloshing pressure in cargo tanks of oil tankers, the 'partial load condition' is to be used.

f_{slh} : Coefficient defined in [6.3.3].

6.4.4 Sloshing pressure on internal girders or longitudinal stringers adjacent to longitudinal bulkheads

For tanks with internal girders or stringers, the sloshing pressure acting on the girder/web frame adjacent to longitudinal bulkheads and longitudinal wash bulkhead, $P_{slh\text{-}grd}$, in kN/m^2, provided it is located within 0.25 b_{slh} from the bulkhead, is to be taken as:

$$P_{slh-grd} = P_{slh-t} \left(1 - \frac{s_{grd}}{b_{slh}} \right)^2$$

where:

b_{slh} : Effective sloshing breadth defined in [6.4.2].

$P_{slh\text{-}t}$: Sloshing pressure due to transverse liquid motion acting on longitudinal bulkhead, as defined in [6.4.3].

s_{grd} : Distance from longitudinal bulkhead to girder under consideration, in m.

The distribution of pressure across stringers is given in Figure 15. The distribution of pressure across longitudinal girders is similar to the deck web frame shown in Figure 14.

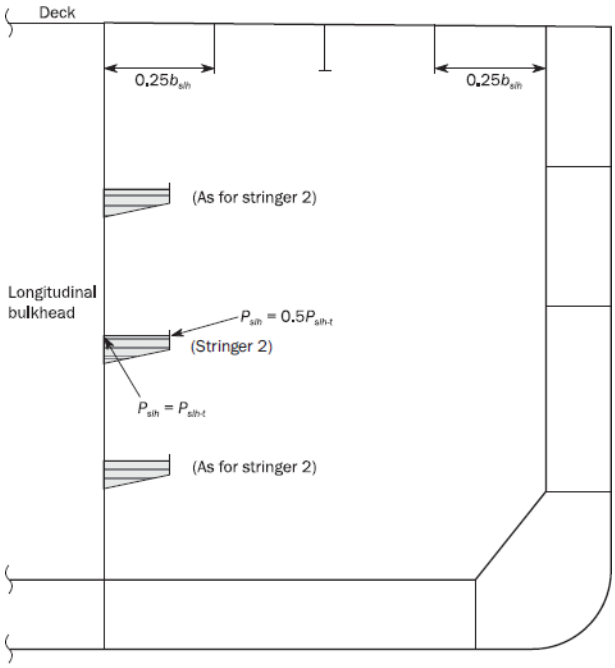

Figure 15 Sloshing pressure distribution on longitudinal stringers and girders

7 DESIGN PRESSURE FOR TANK TESTING

7.1 Definition

7.1.1

The actual strength testing is to be carried out in accordance with Ch1, Sec 2, [3.8.4]. In order to assess the structure, static design pressures are to be applied.

The design pressure for tank testing, P_{ST}, in kN/m^2, is to be taken as:

$P_{ST} = 10(z_{ST} - z)$

where:

z_{ST}: Design testing load height, in m, as defined in Table 13.

Design testing load height z_{ST} **Table 13**

Compartment	z_{ST}
Double bottom tanks (1)	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{bd}$
Hopper side tanks, topside tanks, double side tanks, fore and aft peaks used as tank	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 2.4$
Tank bulkheads, deep tanks, fuel oil bunkers	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 2.4$ $z_{ST} = z_{top} + 0.1P_{PV}$
Ballast hold	$z_{ST} = z_h + 0.9$
Chain locker	$z_{ST} = z_c$
Independent tanks	The greater of the following: $z_{ST} = z_{top} + h_{air}$ $z_{ST} = z_{top} + 0.9$
Ballast ducts	Testing load height corresponding to ballast pump maximum pressure

Compartment	z_{ST}
where: z_{bd} : Z coordinate, in m, of the bulkhead deck. z_h : Z coordinate, in m, of the top of hatch coaming. z_c : Z coordinate, in m, of the top of the chain pipe. (1) For double bottom tanks connected with hopper side tanks, topside tanks or double side tanks, z_{ST} corresponding to "Hopper side tanks, topside tanks, double side tanks, fore and aft peaks used as tank, cofferdams" is applicable.	

Section 7 DESIGN LOAD SCENARIOS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

V_{BM} : Design vertical bending moment, in kNm.

M_{sw} : Permissible hull girder hogging and sagging still water bending moment for seagoing operation, in kNm, as defined in Ch 4, Sec 4, [2.2.2].

$M_{sw\text{-}p}$: Permissible hull girder hogging and sagging still water bending moment for harbour/sheltered water operation, in kNm, as defined in Ch 4, Sec 4, [2.2.3].

$M_{sw\text{-}f}$: Permissible hull girder hogging or sagging still water bending moment $M_{sw\text{-}f}$ for seagoing operation in the flooded condition, in kNm, as defined in Ch 4, Sec 4, [2.2.4].

$M_{wv\text{-}LC}$: Vertical wave bending moment for a considered dynamic load case, in kNm, as defined in Ch 4, Sec4, [3.5.2].

HBM : Design horizontal bending moment, in kNm.

$M_{wh\text{-}LC}$: Horizontal wave bending moment for a considered dynamic load case, in kNm, as defined in Ch4, Sec 4, [3.5.4].

TM : Design torsional moment, in kNm.

$M_{wt\text{-}LC}$: Wave torsional moment for a considered dynamic load case, in kNm, as defined in Ch 4, Sec 4, [3.5.5].

VSF : Design vertical shear force, in kN.

Q_{sw} : Permissible hull girder positive and negative still water shear force limits for seagoing operation, in kN, as defined in Ch 4, Sec 4, [2.3.1] or Ch 4, Sec 4, [2.3.3].

$Q_{sw\text{-}p}$: Permissible hull girder positive and negative still water shear force limits for harbour/sheltered water operation, in kN, as defined in Ch 4, Sec 4, [2.3.2] or Ch 4, Sec 4, [2.3.4].

$Q_{sw\text{-}f}$: Permissible hull girder positive and negative still water shear force for seagoing operation in the flooded condition, in kN, as defined in Ch 4, Sec 4, [2.3.5].

$Q_{wv\text{-}LC}$: Vertical wave shear force for a considered dynamic load case, in kN, as defined in Ch 4, Sec 4, [3.5.3].

P_{ex} : Design external pressure, in kN/m^2.

P_S : Static sea pressure at considered draught, in kN/m^2, as defined in Ch 4, Sec 5, [1.2.1].

P_W : Dynamic pressure for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 5, [1.3.2] to Ch 4, Sec 5, [1.3.8].

P_D : Green sea load for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 5, [2.2.3] and Ch 4, Sec 5, [2.2.4].

P_{in} : Design internal pressure, in kN/m^2.

P_{ST} : Tank testing pressure, in kN/m^2, see Ch 4, Sec 6, [7.1.1].

P_{ls} : Static liquid pressure in tank, in kN/m^2, as defined in Ch 4, Sec 6, [1.2].

P_{ld} : Dynamic liquid pressure in tank for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [1.3].

P_{bs} : Dry bulk cargo static pressure, in kN/m^2, as defined in Ch 4, Sec 6, [2.5.2].

P_{bd} : Dry bulk cargo dynamic pressure for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [2.5.3].

P_{fs} : Static pressure in compartments and tanks in flooded condition, in kN/m^2, as defined in Ch 4, Sec 6, [1.4.1].

P_{fd} : Dynamic pressure in compartments and tanks in flooded condition, in kN/m^2, as defined in Ch 4, Sec 6, [1.5.1]

$P_{dl\text{-}s}$: Static pressure on non-exposed decks and platforms, in kN/m^2, as defined in Ch 4, Sec 6, [5.2.1].

$P_{dl\text{-}d}$: Dynamic pressure on non-exposed decks and platforms for a considered dynamic load case, in kN/m^2, as defined in Ch 4, Sec 6, [5.2.1]

$F_{U\text{-}s}$: Static load acting on supporting structures and securing systems for heavy units or cargo, equipment or structural components, in kN, as defined in Ch 4, Sec 5, [2.3.2].

$F_{U\text{-}d}$: Dynamic load acting on supporting structures and securing systems for heavy units of cargo equipment or structural components, in kN, as defined in Ch 4, Sec 5, [2.3.2].

P_{SL} : Bottom slamming pressure, in kN/m^2, as defined in Ch 4, Sec 5, [3.2]

P_{FB} : Bow impact pressure, in kN/m², as defined in Ch 4, Sec 5, [3.3].
P_{slh} : Sloshing pressure, in kN/m², as defined in Ch 4, Sec 6, [6].

1 GENERAL

1.1 Application

1.1.1

This section gives the design load scenarios that are to be used for:

- Strength assessment by prescriptive and direct analysis (Finite Element Method, FEM) methods, as given in [2].
- Fatigue assessment by prescriptive and direct analysis (FEM) methods, as given in [3].

1.1.2

For the strength assessment, the principal design load scenarios consist of either S (Static) loads or S+D (Static + Dynamic) loads. In some cases, the letter 'A' prefixes the S or S+D to denote that this is an accidental design load scenario. There are some additional design load scenarios to be considered which relate to impact (I) loads, sloshing (SL) loads and fatigue (F) load.

2 DESIGN LOAD SCENARIOS FOR STRENGTH ASSESSMENT

2.1 Principal design load scenarios

2.1.1

The principal design load scenarios are given in Table 1.

Principal design load scenarios **Table 1**

Design load scenario			Harbour and sheltered water and testing	Seagoing conditions With extreme sea loads	Ballast water exchange (4)	Accidental flooded conditions (4)	
Load components			Static (S)	Static +Dynamic (S+D)	Static + Dynamic (S+D)	Static (S)	Static + Dynamic (A : S+D)
Hull Girder	*VBM*		$M_{sw\text{-}p}$	$M_{sw} + M_{wv\text{-}LC}$	$M_{sw} + M_{wv\text{-}LC}$	$M_{sw\text{-}f}$ (2)	$M_{sw\text{-}f} + M_{wv\text{-}LC}$ (3)
	HBM		-	$M_{wh\text{-}LC}$	$M_{wh\text{-}LC}$	-	$M_{wh\text{-}LC}$ (3)
	VSF		$Q_{sw\text{-}p}$	$Q_{sw} + Q_{wv\text{-}LC}$	$Q_{sw} + Q_{wv\text{-}LC}$	-	$Q_{sw\text{-}f} + Q_{wv\text{-}LC}$ (3)
	TM		-	$M_{wt\text{-}LC}$	$M_{wt\text{-}LC}$	-	-
Local Loads	P_{ex}	External deck for green sea	-	P_D	-	-	-
		Hull envelope	P_S	$P_S + P_W$	$P_S + P_W$	-	-
	P_{in}	Ballast tanks (1)	$Max(P_{ls}, P_{ST})$	$P_{ls} + P_{ld}$	$P_{ls} + P_{ld}$	-	-
		Liquid cargo tanks			-	-	
		Other tanks			-	-	
		Watertight boundaries	-	-	-	P_{fs}	$P_{fs} + P_{fd}$
		Cargo holds	P_{bs}	$P_{bs} + P_{bd}$	-		
	P_{dk}	Internal decks for dry spaces	$P_{dl\text{-}s}$	$P_{dl\text{-}s} + P_{dl\text{-}d}$	-	-	-
		External deck for distributed loads	$P_{dl\text{-}s}$	$P_{dl\text{-}s} + P_{dl\text{-}d}$	-	-	-
		External deck for heavy units	$F_{U\text{-}s}$	$F_{U\text{-}s} + F_{U\text{-}d}$	-	-	-

Design load scenario	Harbour and sheltered water and testing	Seagoing conditions With extreme sea loads	Ballast water exchange (4)	Accidental flooded conditions (4)	
Load components	Static (S)	Static +Dynamic (S+D)	Static + Dynamic (S+D)	Static (S)	Static + Dynamic (A : S+D)

(1) WB cargo hold is considered as ballast tank except for design load scenario 'ballast water exchange'.
(2) M_{swf} used for hull local scantling of watertight bulkhead
(3) Hull girder strength check is performed according to Ch 5, Sec 1 for bulk carriers having a freeboard length L_{LL} of 150 m or above
(4) Applicable to prescriptive assessment only

2.2 Additional design load scenarios

2.2.1

The design load scenarios to be considered for sloshing, bottom slamming and bow impact are given in Table 2.

Design load scenarios for impact and sloshing conditions **Table 2**

Design load scenario / Load components			Bow impact Impact (I)	Bottom Slamming Impact (I)	Sloshing Sloshing (SL)
Hull Girder		VBM	-	-	M_{sw}
		HBM	-	-	-
		VSF	-	-	-
		TM	-	-	-
Local Loads	P_{ex}	External deck for green sea	-	-	-
		Hull envelope	P_{FB}	P_{SL}	-
	P_{in}	Ballast tanks	-	-	P_{slh}
		Liquid cargo tanks			
		Other tanks			
		Watertight boundaries		-	-
		Cargo holds(1)	-	-	-
	P_{dk}	Internal decks for dry spaces	-	-	-
		External deck for distributed loads	-	-	-
		External deck for heavy units	-	-	-

(1) Sloshing assessment is not to be considered for water ballast cargo holds of bulk carriers.

3 DESIGN LOAD SCENARIOS FOR FATIGUE ASSESSMENT

3.1 Design load scenarios

3.1.1

The design load scenarios for fatigue assessment are given in Table 3.

Design load scenarios for fatigue assessment **Table 3**

Design load scenario / Load components		Fatigue: Static + Dynamic (F: S+D)
Hull Girder	VBM	$M_{sw} + M_{wv\text{-}LC}$
	HBM	$M_{wh\text{-}LC}$
	VSF	$Q_{sw} + Q_{wv\text{-}LC}$

Design load scenario			Fatigue: Static + Dynamic (F: S+D)
Load components			
	TM		$M_{wt\text{-}LC}$
Local Loads	P_{ex}	External deck for green sea	-
		Hull envelope	$P_S + P_W$
	P_{in}	Ballast tanks (1)	$P_{ls} + P_{ld}$
		Liquid cargo tanks	
		Other tanks	
		Watertight boundaries	-
		Cargo holds	$P_{bs} + P_{bd}$
	P_{dk}	Internal decks for dry spaces	-
		External deck for distributed loads	-
		External deck for heavy units	-
(1) WB cargo hold is considered as ballast tank except for design load scenario ‘ballast water exchange’.			

Section 8 LOADING CONDITIONS

SYMBOLS

For symbols not defined in this section, refer to Ch1, Sec 4.

l : Distance from propeller centreline to the waterline, in m.

D_p : Propeller diameter, in m.

M_{Full} : Cargo mass, in t, as defined in Ch4, Sec 6.

M_H : Cargo mass, in t, as defined in Ch4, Sec 6.

M_{HD} : Cargo mass, in t, as defined in Ch4, Sec 6.

M_{BLK} : Maximum cargo mass in cargo holds in block loading conditions, in t, as defined in Ch4, App 1.

$C_{BM\text{-}LC}$: Coefficient taken as the percentage of permissible SWBM, defined in Table 2 to Table 9 and Table 12 to Table 21.

$C_{SF\text{-}LC}$: Coefficient taken as the percentage of permissible SWSF, defined in Table 2 to Table 9 and Table 12 to Table 21.

$x_{b\text{-}aft}$, $x_{b\text{-}fwd}$:Longitudinal position, in m, of respectively the aft and forward bulkhead of the mid-hold of the FE model.

EA : Empty hold in alternate loading condition.

FA : Full hold in alternate loading condition.

T_{H1}, T_{H2}, T_{H3}, T_{H4}: Minimum permissible draught, in m, in harbour condition as defined in Ch 4, App 1.

1 APPLICATION

1.1 Ships having a freeboard length L_{LL} of 150m or above

1.1.1

The requirements in [2] to [5] are applicable to ships having a freeboard length L_{LL} of 150 m or above.

1.1.2 Design loading conditions for strength assessment

Design loading conditions for strength assessment are given in [2] to [4]. The design loading conditions common to both oil tankers and bulk carriers are given in [2]. Specific design loading conditions for oil tankers and bulk carriers are given in [3] and [4] respectively.

Unless otherwise specified, each of the design seagoing conditions is to be investigated for the arrival and departure conditions.

1.1.3

These requirements are not intended to prevent conditions to be included in the loading manual for which calculations are to be submitted. It is not intended to replace in any way the required loading manual/instrument.

1.1.4

Loading conditions from the loading manual, which are not covered in [2] to [4], if any, are to be considered.

1.1.5 Standard design load conditions for fatigue assessment

The standard design loading conditions for fatigue assessment are given in [5].

1.2 Bulk carriers having a freeboard length L_{LL} less than 150 m

1.2.1

The severest loading condition from the loading manual, midship section drawing or otherwise specified by the Designer are to be considered for the longitudinal strength given in Ch5 and for local strength check of plating, ordinary stiffeners and primary supporting members given in Ch6 and Pt 2, Ch1, Sec 3 and Pt 2, Ch1, Sec 4.

The requirements in [2] are applicable to ships having a freeboard length L_{LL} less than 150 m.

1.3 Dynamic load cases

1.3.1 Seagoing conditions

Unless otherwise specified, each of the design seagoing conditions are to be investigated for all dynamic load cases.

1.3.2 Beam and oblique sea dynamic load cases

For FE load analysis, the beam sea and oblique sea dynamic load cases calculated for port and starboard sides are to be applied on the model to obtain the results for both model sides.

For ship with structure symmetrical about the centreline, the beam sea and oblique sea dynamic load cases calculated for portside may be applied only to the model (i.e. dynamic load cases on starboard side may be omitted) provided the results (yield and buckling) are mirrored.

2 COMMON DESIGN LOADING CONDITIONS

2.1 Definitions

2.1.1

In general, the design cargo and ballast loading conditions, based on the amount of bunker, fresh water and stores at departure and arrival, are to be considered for the still water bending moment and shear force calculations. Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting are to be submitted and included in the loading manual.

2.1.2 Departure conditions

The departure conditions are to be based on bunker tanks not taken less than 95% full and other consumables taken at 100% capacity. In case of liquefied gas fuel tank, the filling level is to be based on the definition in International Code of Safety for Ships Using Gases or other Low-Flashpoint Fuels (IGF code) 6.8.

2.1.3 Arrival conditions

The arrival conditions are to be based on 10% of the maximum capacity of bunker, fresh water and stores.

2.2 Partially filled ballast tanks

2.2.1 Partially filled ballast tanks in ballast loading conditions

Ballast loading conditions involving partially filled peak and/or other ballast tanks in any departure, arrival or intermediate condition are not permitted to be used as design loading conditions unless:

- Longitudinal strength of hull girder given in Ch 5, Sec 1 and Ch 8, Sec 3 is to comply with loading conditions with the considered tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition.
- For bulk carriers having a freeboard length L_{LL} of 150 m or above, longitudinal strength of hull girder in flooded condition given in Ch 5, Sec 1 is to comply with loading conditions with the considered tanks full, empty and partially filled at intended level in any departure, arrival or intermediate condition.

The corresponding full, empty and partially filled tank conditions are to be considered as design conditions for calculation of the still water bending moment and shear force, but these do not need to comply with propeller immersion and trim requirements as specified in [2.3.1], [3.1.1] or [4.1.1]. Where multiple tanks are intended to be partially filled, all combinations of empty, full and partially filled at intended levels for those tanks are to be investigated. These requirements are not applicable to ballast water exchange using the sequential method.

2.2.2 Partially filled ballast tanks in cargo loading conditions

In cargo loading conditions, the requirement in [2.2] applies to peak ballast tanks only.

2.3 Seagoing conditions

2.3.1

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Homogeneous cargo loading condition including a condition at the scantling draught. Homogeneous loading conditions are to not include filling of ballast tanks in departure conditions.

b) Ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. All cargo tanks/holds are to be empty including cargo tanks/holds suitable for the carriage of water ballast at sea. The propeller is to be fully immersed. The trim is to be by the stern and is not to exceed 0.015 L_{LL}.

c) Conditions covering ballast water exchange procedures, if any, with the calculations of intermediate conditions just before and just after ballasting and/or deballasting any ballast tank.

2.4 Harbour and sheltered water conditions

2.4.1

The following harbour and sheltered water conditions are to be included in the loading manual:

a) Conditions representing typical complete loading and unloading operations.

b) Docking condition afloat.

c) Propellers inspection afloat condition, in which the propeller shaft centreline is at least $D_p/4$ above the waterline in way of the propeller. Ships with podded propulsion system arrangements are to be individually considered by the Society.

ISC 2.4.1a The afloat condition for podded propulsion system inspection is to be included in the loading manual. Consideration may be given to inspection requirements of equipment supplier for the system.

2.5 Loading conditions

2.5.1 Alternative design

For structural arrangement not covered by this section, the loading conditions, including loading pattern, corresponding draught, still water bending moment and shear forces are to be agreed by the Society.

ISC 2.5.1a Where the hull structural arrangement is different from that covered by the Rules, for load conditions used for FE analysis, they are to be determined according to ISC Appendix B of this PART.

3 OIL TANKERS

3.1 Specific design loading conditions

3.1.1 Seagoing conditions

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Heavy ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. The fore peak water ballast tank is to be full, if fitted. If upper and lower fore peak tanks are fitted, the lower is required to be full and the upper tank may be full, partially full or empty. All the cargo tanks are to be empty including cargo tanks suitable for the carriage of water ballast at sea. The draught at the forward perpendicular is not to be less than that for the normal ballast condition. The propeller is to be fully immersed. The trim is to be by the stern and is not to exceed 0.015 L_{LL}.

b) Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions.

c) Any specified non-uniform distribution of loading.

d) Conditions with high density cargo including the maximum design cargo density, when applicable.

e) Design ballast condition in which all segregated ballast tanks in the cargo tank region are full and all other tanks are empty including fuel oil and fresh water tanks. This design condition is for assessment of hull strength and is not intended for ship operation.

3.1.2 Additional loading conditions

The following additional loading conditions are to be included in the loading manual if the ship is specifically approved and intended to be operated in such conditions:

a) Seagoing ballast conditions including water ballast carried in one or more cargo tanks which are intended for use in emergency situations as allowed by MARPOL Reg. 18.
b) Seagoing loading conditions where the net static upward load on the double bottom exceeds that given with the combination of an empty cargo tank and a mean ship's draught of 0.9 T_{SC}.
c) Seagoing loading conditions with cargo tanks less than 25% full with the combination of mean ship's draught greater than 0.9 T_{SC}.
d) Seagoing loading conditions where the net static downward load on the double bottom exceeds that given with the combination of a full cargo tank at a cargo density of 1.025 t/m^3 or greater and a mean ship's draught of 0.6T_{SC}.
e) For ships arranged with cross ties in the centre cargo tank, seagoing loading conditions showing a non-symmetric loading pattern where the difference in filling level between corresponding port an starboard wing cargo tanks exceeds 25% of the filling height in the wing cargo tank.

3.2 Design load combinations for direct strength analysis

3.2.1

The design load combinations for FE analysis are given in Table 1 as follows:

Design load combination for oil tankers **Table 1**

	Midship cargo hold region	Outside midship cargo hold region	Foremost cargo tanks	Aftmost cargo tanks
Tankers with two oil-tight bulkheads	Table 2	Table 4	Table 6	Table 8
Tankers with one centreline oil-tight bulkhead	Table 3	Table 5	Table 7	Table 9
Note 1: Outside midship cargo hold region means the forward or aft cargo hold region except the foremost and aftmost cargo holds				

3.2.2

For tankers with two oil-tight longitudinal bulkheads, where the cargo tank length is less than 0.15 *L*, the draughts given in Table 2, Table 4, Table 6 and Table 8 are subject to special consideration by the Society.

ISC 3.2.2a For tankers with two oil-tight longitudinal bulkheads, where the cargo tank length is less than 0.15L, the draughts corresponding to the load conditions are determined according to ISC Appendix B of this PART.

3.2.3

For tankers with one centreline oil-tight longitudinal bulkhead, where the cargo tank length is less than 0.11 *L*, the draughts given in Table 3, Table 5, Table 7 and Table 9 are subject to special consideration by the Society.

ISC 3.2.3a For tankers with one oil-tight longitudinal bulkheads, where the cargo tank length is less than 0.11L, the draughts corresponding to the load conditions are determined according to ISC Appendix B of PART9-1.

3.2.4

For seagoing conditions, the dynamic load cases required to be investigated for each loading pattern are indicated in Table 2 to Table 9. Dynamic load cases are defined in Ch 4, Sec 2.

3.2.5 Ships with structure symmetrical about centreline

For ships with structure symmetrical about the centreline, the loading pattern mirrored about centreline of another pattern may be omitted provided the results (yield and buckling) are mirrored, e.g. Table 2 A7b, A12b.

3.2.6 Tankers with two oil-tight longitudinal bulkheads except with a cross tie arrangement in the wing cargo tanks

For tankers with two oil-tight longitudinal bulkheads except with a cross tie arrangement in the wing cargo tanks, loading patterns A7 in Table 2, Table 4, Table 6 and Table 8 is to be examined for the possibility that unequal filling levels in transversely paired wing cargo tanks would result in a more onerous stress response. Loading pattern A7 is required to be analysed only if such a non-symmetric seagoing loading condition is included in the ship loading manual. The actual loading pattern, draught, GM and k_r from the loading manual are to be used in the FE analysis. Where the GM and k_r are not given in the ship's loading manual, GM and k_r are to be determined in accordance with Ch4, Sec 3.

If loading pattern A7 is not considered, an operational restriction describing that the difference in filling level between corresponding port and starboard wing cargo tanks is not to exceed 25% of the filling height in the wing cargo tank, is to be added in the loading manual.

Loading pattern A7 needs not be examined for tankers with a cross tie arrangement in the wing cargo tanks.

3.2.7

For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A3 and harbour loading pattern A13, with all cargo tanks abreast empty, in Table 2, Table 4, Table 6 and Table 8 are to be analysed with a ship draught of $0.65T_{SC}$ and $0.7T_{SC}$ respectively. If conditions in the ship loading manual specify greater draughts for loading pattern A3 or A13, then the maximum specified draught in the ship's loading manual for the loading pattern is to be used.

3.2.8

For tankers with two oil-tight longitudinal bulkheads, seagoing loading pattern A5 and harbour loading pattern A11, with all cargo tanks abreast fully loaded, in Table 2, Table 4, Table 6 and Table 8 are to be analysed with a ship draught of $0.65T_{SC}$ and $0.6T_{SC}$ respectively. If conditions in the ship loading manual specify lesser draughts for loading pattern A5 or A11, then the minimum specified draught in the ship's loading manual for the loading pattern is to be used.

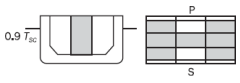
3.2.9

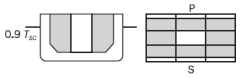
For loading patterns A1, A2, B1, B2 and B3, with cargo tank(s) empty, in Table 2 to Table 9, a minimum ship draught of $0.9T_{SC}$ is to be used in the analysis. If conditions in the ship loading manual specify greater draughts for loading patterns with empty cargo tank(s), then the maximum specified draught for the actual condition is to be used.

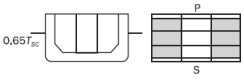
3.2.10 Ballast conditions

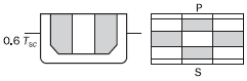
Where a ballast condition is specified in the ship loading manual with ballast water filled in one or more cargo tanks, loading patterns A8 or B7 in Table 2 or Table 3 are to be examined.

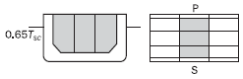
If the actual loading pattern as specified in the loading manual is different from load pattern A8 or B7 then:

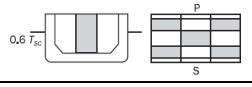


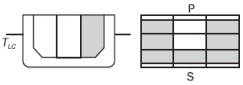




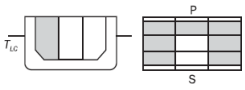


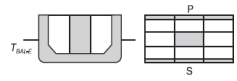


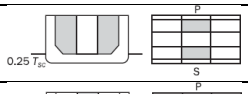


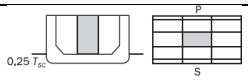


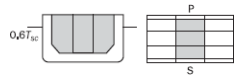
a) The actual loading patterns are to be substituted for the loading pattern A8 or B7 with the following calculation conditions:
   - Draught to be taken as $T_{BAL\text{-}E}$,
   - $C_{BM\text{-}LC}$ = 100% (sag.),
   - $C_{SF\text{-}LC}$ = 100%,
   - 100% filling of the considered tanks carrying ballast water.

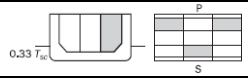


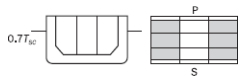


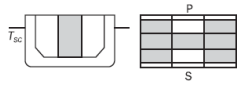












b) The strength assessment is to be carried out for all the dynamic load cases as defined in Ch 4, Sec 2.

c) An operational restriction corresponding to the analysed condition is to be added in the loading manual.

The actual loading pattern, draught, GM and k_r from the loading manual are to be used in the FE analysis. Where the GM and k_r are not given in the ship's loading manual, GM and k_r are to be determined in accordance with Ch 4, Sec 3.

(1) 100% filling of fuel and water ballast tanks in engine room, with tank boundaries at the forward engine room bulkhead.
(2) The required adjustment in shear force at aft bulkhead of the considered hold is to be done at forward slop tank bulkhead.
(3) The required adjustment in shear force at aft bulkhead of the considered hold is to be done at forward machinery space bulkhead.
(4) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(5) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

4 BULK CARRIERS

4.1 Specific design loading condition

4.1.1 Seagoing conditions

The following seagoing loading conditions are to be included, as a minimum, in the loading manual:

a) Cargo loading conditions as defined in [4.1.2] to [4.1.4].

b) Heavy ballast condition where the ballast tanks may be full, partially full or empty. Where ballast tanks are partially full, the conditions in [2.2.1] are to be complied with. The propeller immersion l/D_p is to be at least 60%. The trim is to be by the stern and is not to exceed 0.01 5 L_{LL}. The moulded forward draught is not to be taken less than the smaller of 0.03 L_{LL} or 8 m.

4.1.2 Cargo loading condition for BC-C

Homogeneous cargo loaded condition is to be included in the loading manual where the cargo density corresponds to all cargo holds, including hatchways, being 100% full at scantling draught with all ballast tanks empty.

4.1.3 Cargo loading condition for BC-B

As required for BC-C, plus:

Homogeneous cargo loaded condition is to be included in the loading manual where the cargo density is taken equal to 3.0 t/m^3, and all cargo holds are taken with the same filling ratio (cargo mass/hold cubic capacity) in all cargo holds at scantling draught with all ballast tanks empty.

In cases where the cargo density applied for this design loading condition is different from 3.0t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated in the loading manual. If the maximum density is less than 3.0t/m^3 then the additional service feature {maximum cargo density *x.y* t/m^3} is to be indicated as defined in Ch 1, Sec 1, [3.2.1].

4.1.4 Cargo loading condition for BC-A

As required for BC-B, plus:

At least one cargo loaded condition with specified holds empty, with cargo density 3.0t/m^3, and the same filling ratio (cargo mass/hold cubic capacity) in all loaded cargo holds at scantling draught with all ballast tanks empty.

The combination of specified empty holds is to be indicated with the additional service feature {Holds *a, b,* …may be empty}.

In such cases where the design cargo density applied is different from 3.0t/m^3, the maximum density of the cargo that the ship is allowed to carry is to be indicated in the loading manual. If the maximum density is less than 3.0 t/m^3 then the additional service feature {Holds *a, b,* … may be empty with maximum cargo density *x.y* t/m^3} is to be indicated as defined in Ch1, Sec 1, [3.2.1].

4.1.5 Additional ballast conditions

The following ballast conditions are to be included in the loading manual for longitudinal strength assessment:

- Ballast conditions with all ballast tanks 100% full,
- Heavy ballast conditions with all ballast tanks 100% full and one cargo hold adapted and designated for the carriage of water ballast at sea, where provided, 100% full.
  Where more than one hold is adapted and designated for the carriage of water ballast at sea, it is not required that two or more holds be assumed 100% full simultaneously in the longitudinal strength assessment, unless such conditions are expected in the heavy ballast condition. Unless each hold is individually investigated, the designated heavy ballast hold and any/all restrictions for the use of other ballast hold(s) are to be indicated in the loading manual.

4.1.6 Steel coils or heavy cargoes

The following note is to be included in the loading manual:

"Where the ship engages in a service carrying such cargoes as steel coils or heavy cargoes that may have an adverse effect on the local strength of the double bottom and which is not described as cargo in the loading manual, the maximum permissible and the minimum required mass of cargo are to be considered specially."

4.2 Design load combinations for direct strength analysis

4.2.1 Applicable general loading patterns

The following loading patterns are to be applied:

a) Any cargo hold carrying M_{Full} with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at scantling draught.

b) Any cargo hold carrying minimum 50% of M_H, with all double bottom tanks and all fuel oil tanks in way of the cargo hold being empty, at scantling draught.

c) Any cargo hold taken empty, with all double bottom tanks and all fuel oil tanks in way of the cargo hold being empty, at the deepest ballast draught. Where a topside and double bottom tank are permanently connected as a common tank, the following conditions are to be considered:
   - The topside and double bottom tank empty,
   - The topside and double bottom tank full.

4.2.2 Multiport conditions

The following multiport conditions are applicable to all types of bulk carriers except when the service feature {no MP} is assigned:

a) Any cargo hold carrying M_{Full} with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of scantling draught.
b) Any cargo hold taken empty with all double bottom tanks and all fuel oil tanks in way of the cargo hold being empty, at 83% of scantling draught.
c) Any two adjacent cargo holds carrying M_{Full} with the next holds being empty, with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of the scantling draught. This requirement to the mass of the cargo and fuel oil tanks in way of the cargo hold applies also to the condition where the adjacent hold is filled with ballast.
d) Any two adjacent cargo holds being empty with the next holds being full, with all double bottom tanks and fuel oil tank in way of the cargo hold being empty, at 75% of scantling draught.

4.2.3 Alternate conditions

The following alternate conditions are applicable to BC-A only:

a) Cargo holds which are intended to be empty at scantling draught, being empty with all double bottom tanks and fuel oil tanks in way of the cargo hold also being empty.
b) Cargo holds which are intended to be loaded with high density cargo, carrying M_{HD} plus 10% of M_H, in the partially filled condition with highest density according to Ch 4, Sec 6, Table 1. The fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at scantling draught.
c) Cargo holds which are intended to be loaded with high density cargo, carrying M_{HD} plus 10% of M_H in the full condition with lowest density according to Ch 4, Sec 6, Table 1. The fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom being empty in way of the cargo hold, at scantling draught.
d) If the ship is intended to operate in alternate block load condition, any two adjacent cargo holds are to be loaded with the next holds being empty, carrying 10% of M_H in each hold in addition to the maximum cargo load according to that design loading condition, with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at scantling draught. In operation the maximum allowable mass is to be limited to the maximum cargo load according to the design loading conditions.

4.2.4 Heavy ballast condition

The following condition applies to ballast holds only:

- Cargo holds which are designed as ballast water holds, being 100% full of ballast water including hatchways, with all double bottom tanks and fuel oil tanks in way of the cargo hold being 100% full, at any heavy ballast draught. For ballast holds adjacent to topside wing, hopper and double bottom tanks, it shall be strengthwise acceptable that the ballast holds are filled when the topside wing, hopper, stool, and double bottom tanks are empty

4.2.5 Additional harbour condition for all bulk carriers

The following additional harbour conditions apply to all bulk carriers:

a) At reduced draught during loading and unloading in harbour, the maximum allowable mass in a cargo hold may be increased by 15% of the maximum mass allowed at the scantling draught in seagoing condition, but is not to exceed the mass allowed at scantling draught in the seagoing condition. The minimum required mass may be reduced by the same amount.

b) Any single cargo hold holding the maximum allowable seagoing mass at 67% of scantling draught, in harbour condition with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty.

c) Any two adjacent cargo holds carrying M_{Full} with the next holds being empty, with fuel oil tanks in way of the cargo hold, if any, being 100% full and ballast water tanks in the double bottom in way of the cargo hold being empty, at 67% of scantling draught, in harbour condition.

4.2.6 Design load combinations for direct strength analysis

The loading patterns to be considered in the direct strength analysis of bulk carriers are summarised in Table 10. Load combinations providing the calculations details for each loading pattern are given in Table 12 to Table 21.

Applicable loading patterns according to additional service features Table 10

Loading pattern	Requirement	BC-			BC- {no MP}		
		A	B	C	A	B	C
Full load in homogeneous condition	[4.2.1] item a	×	×	×	×	×	×
Slack load	[4.2.1] item b	×	×	×	×	×	×

Multiport-4	[4.2.2] item d	×	×	×			
Alternate load partial	[4.2.3] items a & b	×			×		
Alternate load full	[4.2.3] items a & c	×			×		
Alternate block load	[4.2.3] item d	×			×		
Heavy ballast	[4.2.4]	×	×	×	×	×	×
Harbour condition	[4.2.5]	×	×	×	×	×	×

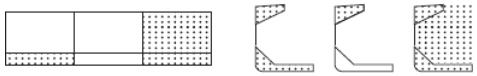
4.2.7

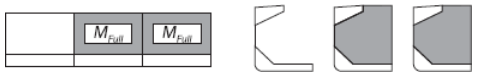
The design load combinations for FE analysis are given as follows:

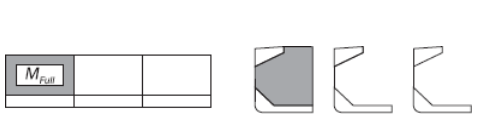
Design load combinations for Bulk Carriers Table 11

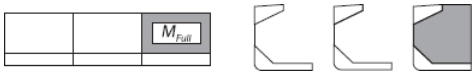
	Midship cargo hold region	Outside midship cargo hold region	Aftmost cargo hold	Foremost cargo hold
BC-A – EA	Table 12	Table 15	N/A	N/A
BC-A – FA	Table 13	Table 16	Table 18	Table 20
BC- B & BC-C	Table 14	Table 17	Table 19	Table 21
Note 1: Outside midship cargo hold region means the forward or aft cargo hold region except the foremost and aftmost cargo holds				

4.3 Hold mass curves

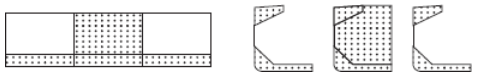


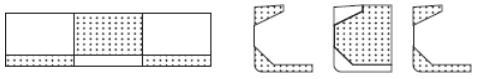


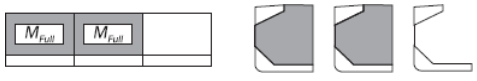




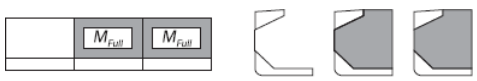
4.3.1

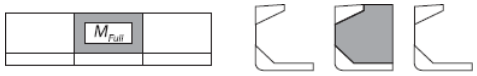






Based on the design loading criteria, as given in [4.2.1] to [4.2.5] except [4.2.4], hold mass curves for each single hold, as well as for any two adjacent holds are to be included in the loading manual and the loading instrument. The maximum allowable or minimum required cargo mass in a cargo





hold, or in two adjacent loaded holds is related to the net load on the double bottom. The net load on the double bottom is a function of draught, cargo mass in the cargo hold, as well as the mass of fuel oil and ballast water contained in double bottom tanks.

4.3.2
Hold mass curves are to be calculated according to Ch 4, App 1 showing maximum allowable and minimum required masses as a function of draught in seagoing condition as well as during loading and unloading in harbour.

(1) Loading pattern No. 1 with the cargo mass MFull and the maximum cargo density as defined in [4.1.4] can be analysed in lieu of this loading pattern.
(2) Maximum cargo density as defined in [4.1.4] is to be used for calculation of dry cargo pressure.
(3) In case of no ballast hold, normal ballast condition with assuming MSW = 100% (hog.) is to be analysed.
(4) Position of ballast hold is to be adjusted as appropriate.
(5) This condition is only required when this loading condition is included in the loading manual.
(6) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.
(7) This condition is to be considered for the empty hold which is assigned as ballast hold, if any.
(8) For the mid-hold where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(9) For the mid-hold where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at forward bulkhead of the midhold.
(10) This load combination is to be considered only for the mid-hold where $x_{b\text{-}aft} > 0.5L$ or $x_{b\text{-}fwd} < 0.5L$.
(11) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(12) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(13) This condition is only required when block loading condition is included in the loading manual.

(4) Position of ballast hold is to be adjusted as appropriate.
(5) This condition is only required when block loading condition is included in the loading manual.
(6) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.
(7) This condition is to be considered for the heavy cargo hold which is assigned as ballast hold, if any.
(8) For the mid-hold where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(9) For the mid-hold, where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at forward bulkhead of the mid- hold.
(10) This load combination is to be considered only for the mid-hold, where $x_{b\text{-}aft} > 0.5L$ or $x_{b\text{-}fwd} < 0.5L$.
(11) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(12) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(13) This condition is only required when block loading condition is included in the loading manual.

(1) Applicable to BC-B only.
(2) For BC-B ships, the loading pattern no. 1 with the cargo mass M_{Full} and the maximum cargo density as defined in [4.1.3] can be analysed in lieu of this loading pattern.
(3) Maximum cargo density as defined in [4.1.3] is to be used for calculation of dry cargo pressure.
(4) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.
(5) Position of ballast hold is to be adjusted as appropriate.
(6) This condition is to be considered for the cargo hold which is assigned as ballast hold, if any.
(7) For the mid-hold where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(8) For the mid-hold where $x_{b\text{-}aft} \leq 0.5L$ and $x_{b\text{-}fwd} \geq 0.5L$, the shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(9) This load combination is to be considered only for the mid-hold where $x_{b\text{-}aft} > 0.5L$ or $x_{b\text{-}fwd} < 0.5L$.
(10) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(11) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(1) Loading pattern no. 1 with the cargo mass M_{Full} and the maximum cargo density as defined in [4.1.4] can be analysed in lieu of this loading pattern.
(2) Maximum cargo density as defined in [4.1.4] is to be used for calculation of dry cargo pressure.
(3) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.
(4) Position of ballast hold is to be adjusted as appropriate.
(5) This condition is not required when {no MP} notation is assigned.
(6) This condition is only required when this loading condition is included in the loading manual.
(7) Actual still water vertical bending moment, as given in the loading manual, may be used instead of design value.
(8) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(9) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.
(10) This loading condition is required only when the ballast hold is located inside the cargo hold model.
(11) This condition is only required when block loading condition is included in the loading manual.

(1) Applicable to BC-B only.
(2) For BC-B ships, the loading pattern no. 1 with the cargo mass M_{Full} and the maximum cargo density as defined in [4.1.3] can be analysed in lieu of this loading pattern.
(3) Maximum cargo density as defined in [4.1.3] is to be used for calculation of dry cargo pressure.
(4) In case of no ballast hold, normal ballast condition with assuming M_{SW} = 100% (hog.) is to be analysed.
(5) Position of ballast hold is to be adjusted as appropriate.
(6) The shear force is to be adjusted to target value at aft bulkhead of the mid-hold.
(7) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

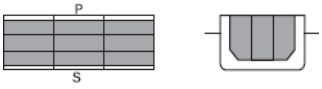
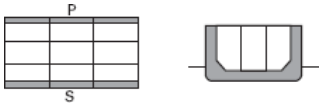
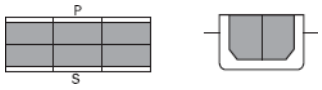
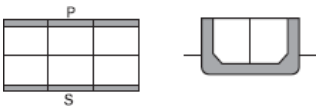
(7) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.



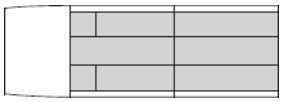


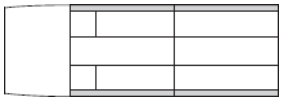


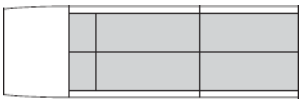


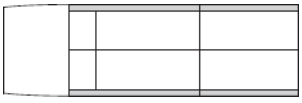
5 STANDARD LOADING CONDITIONS FOR FATIGUE ASSESSMENT

5.1 Oil tanker



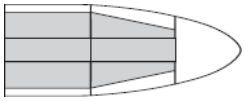


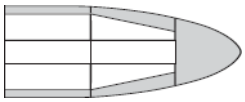


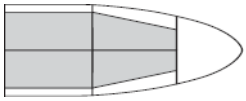


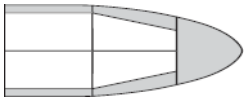
5.1.1

The standard loading conditions to be applied to oil tankers for fatigue assessment as required in Ch 9, Sec 1, [6.2], are defined in Table 22 to Table 24. Where fuel oil tanks, other oil tanks or fresh water tanks are arranged in way of the cargo hold region, the filling level of them are to be taken as full for both simplified stress analysis according to Ch 9, Sec 4 and direct strength analysis according to Ch 7 and Ch 9, Sec 5.









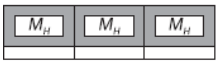
Standard design FE loading conditions for fatigue assessment of oil tankers except for foremost and aftmost cargo holds **Table 22**

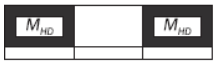
No.	Description	Loading pattern	Still water loads			Dynamic load cases
			Draught	C_{BM-LC}:% of perm. SWBM	C_{SF-LC}:% of perm. SWSF	
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All
(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.						

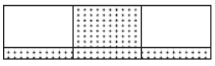
Standard design FE loading conditions for fatigue assessment of oil tankers for aftmost cargo hold **Table 23**

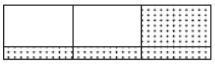
No.	Description	Loading pattern	Still water loads			Dynamic load cases
			Draught	C_{BM-LC}: % of perm. SWBM	C_{SF-LC} :% of perm. SWSF	
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All
(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.						

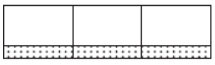
Standard design FE loading conditions for fatigue assessment of oil tankers for foremost cargo hold **Table 24**







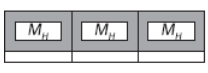




No.	Description	Loading pattern	Still water loads			Dynamic load cases
			Draught	$C_{BM\text{-}LC}$: % of perm. SWBM	$C_{SF\text{-}LC}$: % of perm. SWSF (1)	
Oil tankers with two oil-tight bulkheads						
A1-F	Full load		T_{SC}	60% (sag.)		All
A2-F	Normal ballast		T_{BAL}	80% (hog.)		All
Oil tankers with centreline oil-tight bulkhead						
B1-F	Full load		T_{SC}	60% (sag.)		All
B2-F	Normal ballast		T_{BAL}	80% (hog.)		All
(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.						

5.2 Bulk carriers

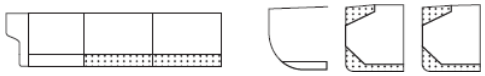
5.2.1



The standard loading conditions to be applied to bulk carriers for fatigue assessment as required in Ch 9, Sec 1, [6.3] are defined in Table 25, to Table 31 according to their additional service feature notations and the location of the assessed details. Where fuel oil tanks, other oil tanks or fresh water tanks are arranged in way of the cargo hold region, the filling level of them are to be taken as full for both simplified stress analysis according to Ch 9, Sec 4 and direct strength analysis according to Ch 7 and Ch 9, Sec 5.

Standard design FE Load combinations for fatigue assessment applicable to empty hold of BC-A in alternate condition (EA) - cargo hold region except aftmost and foremost cargo Holds **Table 25**

No.	Description Req^t ref	Loading pattern	Aft	Mid	Fore	Draught	$C_{BM\text{-}LC}$:% of perm. SWBM	$C_{SF\text{-}LC}$:% of perm. SWSF	Dynamic load case
1-F(1)	Full load homogeneous					T_{SC}	40% (sag.)		All
2-F(2)	Full load alternate					T_{SC}	75% (hog.)	100%	All
3-F(1)	Normal ballast					T_{BAL}	80% (hog.)		All
4-F (2) (3)	Heavy ballast					$T_{BAL\text{-}H}$	75% (sag.)	100%	All
5-F (2) (4)						$T_{BAL\text{-}H}$	45% (hog.)	100%	All
6-F (1) (5)						$T_{BAL\text{-}H}$	45% (hog.)		All



(1) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used.
(2) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used.
Where this shear force exceeds the target value, the correction of vertical loads is to be applied to adjust the shear force down to the target value.
(3) This condition is to be considered for empty cargo hold which is assigned as ballast hold, if any
(4) This condition is applicable when the WB hold corresponds to the forward or aft hold of the 3 hold model.
(5) This condition is applicable when the WB hold is located outside the 3 cargo hold model

Standard design FE Load combinations for fatigue assessment applicable to loaded hold of BC-A in alternate condition (FA) - cargo hold region except aftmost and foremost cargo Holds **Table 26**

No.	Description Reqt ref	Loading pattern	Aft	Mid	Fore	Draught	$C_{BM\text{-}LC}$:% of perm. SWBM	$C_{SF\text{-}LC}$:% of perm. SWSF	Dynamic load case
1-F(1)	Full load homogeneous					T_{SC}	40% （sag.）		All

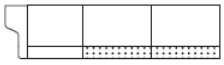
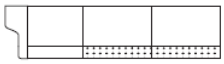
3-F(1)	Normal ballast		T_{BAL}	80% （hog.）		All
4-F(1)(3)	Heavy ballast		$T_{BAL\text{-}H}$	45% （hog.）		All



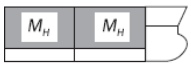


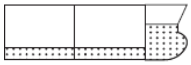
(1) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used.
(2) The actual shear force that results from the application of static and dynamic local loads to the FE model are to be used. Where this shear force exceeds the target value, the correction of vertical loads is to be applied to adjust the shear force down to the target value.
(3) This condition is applicable when the WB hold is located outside the 3 cargo hold model.

Standard design FE load combinations for fatigue assessment of BC-B, BC-C bulk carriers – cargo hold region except aftmost and foremost cargo holds **Table 29**

No.	Description	Loading pattern	Aft	Mid	Fore	Draught	$C_{BM\text{-}LC}$:% of perm. SWBM	$C_{SF\text{-}LC}$:% of perm. SWSF	Dynamic load case
1-F(1)	Full load homogeneous					T_{SC}	40% （sag.）		All
2-F(2)	Normal ballast					T_{BAL}	80% （hog.）		All
-F(2)(3)	Heavy ballast					$T_{BAL\text{-}H}$	75% （sag.）	100%	All
4-F(2)(4)						$T_{BAL\text{-}H}$	45% （hog.）	100%	All
5-F(1)(2)						$T_{BAL\text{-}H}$	45% （hog.）		All

(1) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used.
(2) The actual shear force curve that results from the application of static and dynamic local loads to the FE model are to be used.
Where this shear force exceeds the target value, the correction of vertical loads is to be applied to adjust the shear force down to the target value.
(3) This condition is to be considered for cargo hold which is assigned as ballast hold, if any.
(4) This condition is applicable when the WB hold corresponds to the forward or aft hold of the 3 hold model.
(5) This condition is applicable when the WB hold is located outside the 3 cargo hold model.





Standard design FE load combinations for fatigue assessment of BC-B, BC-C bulk carriers – Aftmost cargo hold **Table 30**

No.	Description	Loading pattern	Aft	Mid	Fore	Draught	$C_{BM\text{-}LC}$:% of perm. SWBM	$C_{SF\text{-}LC}$:% of perm. SWSF	Dynamic load case

Appendix 1 HOLD MASS CURVES

SYMBOLS

h : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline, in m.

h_a : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the aft cargo hold of two adjacent cargo holds, in m.

h_f : Vertical distance from the top of inner bottom plating to the lowest point of the upper deck plating at the ship's centreline of the fore cargo hold of two adjacent cargo holds, in m.

M_H : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{Full} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{HD} : Cargo mass, in t, as defined in Ch 4, Sec 6.

M_{BLK} : The maximum cargo mass in a cargo hold of two adjacent cargo holds according to the block loading condition in the loading manual, in t.

T_i : In loading condition No. i, draught, in m, at mid-hold position of single cargo hold length or at mid- length of the two adjacent cargo holds considered.

T_{min} : $0.75T_{SC}$ or draught in ballast conditions with the two adjacent cargo holds empty, whichever is greater, in m.

T_{H1} : Minimum permissible draught, in m, in harbour condition with M_{Full} in each of the two adjacent holds to be taken as:

- For ships having {No MP} notation assigned:

$$T_{H1} = \min \begin{cases} 0.67T_{SC} \\ T_{SC} - \dfrac{0.15\sum M_{Full}}{1.025\left(\dfrac{V_f}{h_f} + \dfrac{V_a}{h_a}\right)} \end{cases}$$

- For ships not having {No MP} notation assigned:

$$T_{H1} = 0.67T_{SC} - \frac{0.15\sum M_{Full}}{1.025\left(\dfrac{V_f}{h_f} + \dfrac{V_a}{h_a}\right)}$$

T_{H2} : Minimum permissible draught, in m, in harbour condition with M_{Full} in EA holds of BC-A ships or with M_{Full} in any holds of BC-B and BC-C ships to be taken as:

- For ships having {No MP} notation assigned:

$$T_{H2} = \min \begin{cases} 0.67T_{SC} \\ T_{SC} - \dfrac{0.15M_{Full}}{1.025\dfrac{V_H}{h}} \end{cases}$$

- For ships not having {No MP} notation assigned:

$$T_{H2} = 0.67T_{SC} - \frac{0.15M_{Full}}{1.025\dfrac{V_H}{h}}$$

T_{H3} : Minimum permissible draught, in m, in harbour condition in case of block loading with M_{BLK} in each of the two adjacent holds of BC-A ships to be taken as:

$$T_{H3} = T_{SC} - \frac{\sum(0.15M_{BLK} + 0.1M_H)}{1.025\left(\dfrac{V_f}{h_f} + \dfrac{V_a}{h_a}\right)}$$

T_{H4} : Minimum permissible draught, in m, in harbour condition with M_{HD} in FA holds of BC-A ships to be taken as:

$$T_{H4} = \min \begin{cases} 0.67 T_{SC} \\ T_{SC} - \dfrac{0.15 M_{HD} + 0.1 M_H}{1.025 \dfrac{V_H}{h}} \end{cases}$$

V_H : Volume in m^3, as defined in Ch 4, Sec 6.

V_a : Volume of the after cargo hold of two adjacent cargo holds excluding volume of the hatchway part, in m^3.

V_f : Volume of the forward cargo hold of two adjacent cargo holds excluding volume of the hatchway part, in m^3.

Σ : The sum of masses of two adjacent cargo holds.

E_A : Empty hold in alternate loading condition.

F_A : Full hold in alternate loading condition.

1 GENERAL

1.1 Application

1.1.1

The requirements of this appendix apply to bulk carriers having a freeboard length L_{LL} of 150 m or above.

1.1.2

This appendix describes the procedure to be used for determination of:

- The maximum and minimum mass of cargo in each cargo hold as a function of the draught at mid-hold position of cargo hold.
- The maximum and minimum mass of cargo in any two adjacent holds as a function of the draught at mid-length of these two adjacent cargo holds.

1.1.3 General

The cargo mass curves of single cargo hold or of two adjacent cargo holds in seagoing and harbour conditions as defined in [2] and [3] are based on the loading conditions considered in Ch 4, Sec 8, [4.2]. However if the ship structure is checked for more severe loading conditions than the ones considered in Ch 4, Sec 8, [4.2.7], the minimum required cargo mass and the maximum allowable cargo mass can be based on those corresponding loading conditions.

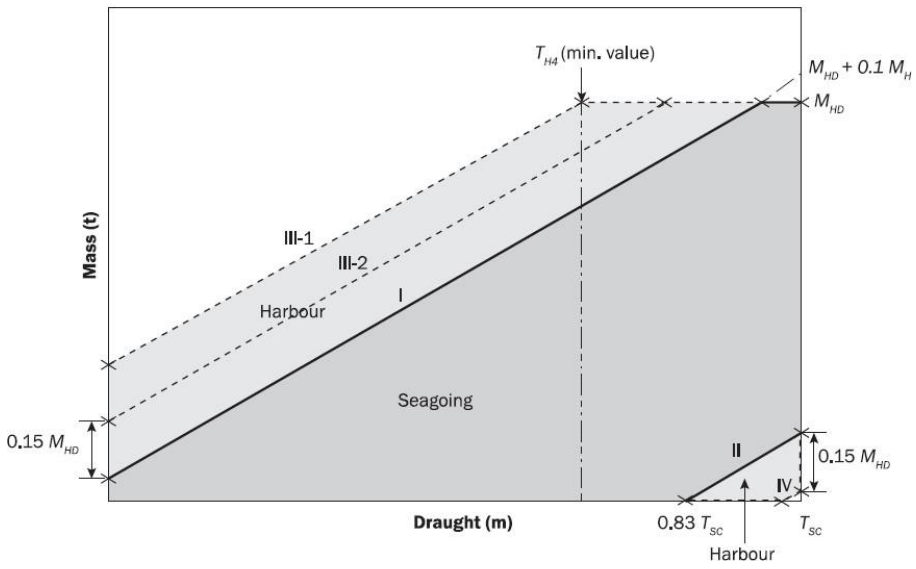
1.1.4 Loading/unloading conditions in harbour

For any bulk carrier, the maximum permissible cargo mass and the minimum required cargo mass of single cargo hold or of two adjacent cargo holds, corresponding to draught for loading/unloading conditions in harbour may be increased or decreased by 15% of the maximum permissible mass at the maximum draught for the cargo hold in seagoing condition. However, maximum permissible mass is in no case to be greater than the maximum permissible cargo mass at designed maximum load draught for each cargo hold.

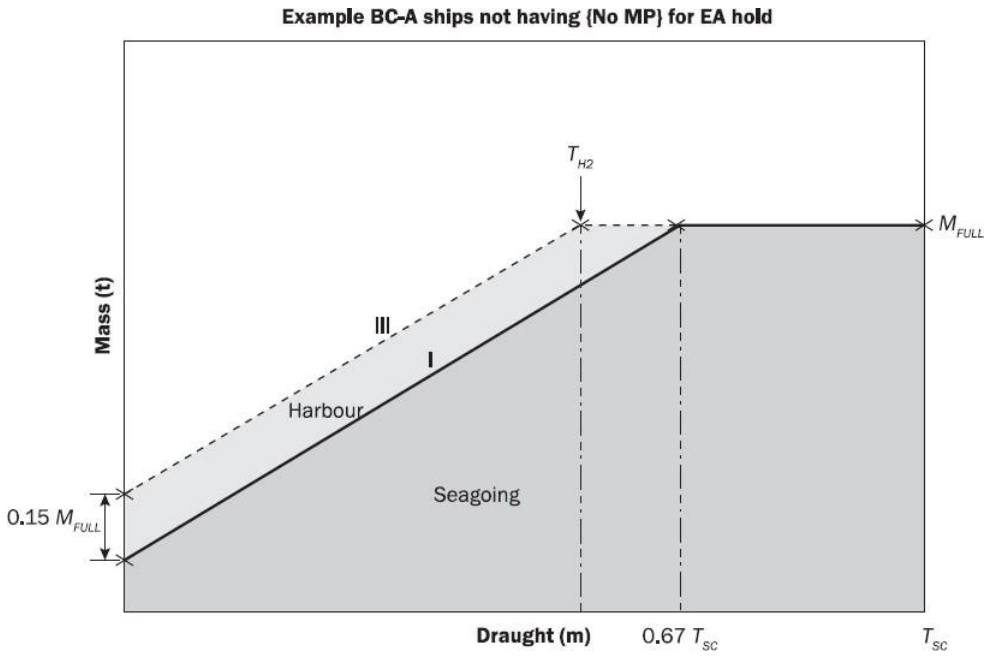
1.1.5 Maximum and minimum permissible mass expression

The maximum and minimum permissible mass in seagoing conditions, ($W_{maxS}(T_i)$, $W_{minS}(T_i)$) and in harbour condition (($W_{maxH}(T_i)$, $W_{minH}(T_i)$) at various draughts (T_i) is obtained, in t, by the following formulae given in tables of [2] and [3] for the followings:

- BC-A ship not having {No MP} notation assigned,
- BC-A ship having {No MP} notation assigned,
- BC-B and BC-C ships not having {No MP} notation assigned,
- BC-B and BC-C ships having {No MP} notation assigned,



Examples for mass curve of loaded cargo holds and cargo hold which can be empty at the maximum draught for BC-A ships not having {No MP} assigned are shown in figures of the above mentioned tables.



2 MAXIMUM AND MINIMUM MASSES OF CARGO IN EACH HOLD

Chapter 5 HULL GIRDER STRENGTH

Section 1 HULL GIRDER YIELDING STRENGTH

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

M_{sw} : Permissible hogging and sagging vertical still water bending moment in intact seagoing condition, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [2.2.2].

$M_{sw\text{-}p}$: Permissible hogging and sagging vertical still water bending moment for harbour/sheltered water operation, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.3].

$M_{sw\text{-}f}$: Permissible hogging and sagging vertical still water bending moment in flooded condition at sea, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.4].

M_{wv} : Vertical wave bending moment in seagoing condition, in kNm, in intact or flooded conditions at the hull transverse section considered, defined in Ch 4, Sec 4, [3.1.1].

M_{wh} : Horizontal wave bending moment, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [3.3.1].

Q_{sw} : Permissible positive or negative still water shear force for seagoing operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.3].

$Q_{sw\text{-}p}$: Permissible positive or negative still water shear force for harbour/sheltered operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.4].

$Q_{sw\text{-}f}$: Permissible positive or negative still water shear force for in flooded condition at sea, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.5].

Q_{wv} : Vertical wave shear force in seagoing condition, in kN, in intact or flooded conditions at the hull transverse section considered, defined in Ch 4, Sec 4, [3.2.1].

$Q_{sw\text{-}Lcd}$: Vertical still water shear force for the considered loading condition in seagoing operation, in kN, at the hull transverse section considered.

$Q_{sw\text{-}Lcd\text{-}p}$: Vertical still water shear force for the considered loading condition in harbour/sheltered operation, in kN, at the hull transverse section considered.

$Q_{sw\text{-}Lcd\text{-}f}$: Vertical still water shear force for the considered flooded condition in seagoing operation, in kN, at the hull transverse section considered.

x : X coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch1, Sec 4, [3.6].

V_D : Vertical distance to the equivalent deck line, in m, as defined in [1.4.3].

z : Z coordinate, in m, of the calculation point with respect to the reference coordinate system defined in Ch1, Sec 4, [3.6].

z_n : Z coordinate, in m, of horizontal neutral axis of the hull transverse section with net scantling defined in [1.2], with respect to the reference coordinate system defined in Ch 1, Sec 4, [3.6].

$I_{y\text{-}n50}$: Net moment of inertia, in m^4, of the hull transverse section about its horizontal neutral axis, to be calculated according to [1.5].

$I_{z\text{-}n50}$: Net moment of inertia, in m^4, of the hull transverse section about its vertical neutral axis, to be calculated according to [1.5].

$Z_{A\text{-}n50}$: Net section modulus, in m^3, at any point of the hull transverse section, to be calculated according [1.4.1].

$Z_{B\text{-}n50}$, $Z_{D\text{-}n50}$: Net section moduli, in m3, at bottom and deck, respectively, to be calculated according to [1.4.2] and [1.4.3].

z_{VD} : Z coordinate, in m, taken equal to $V_D + z_n$.

C_w : Wave parameter defined in Ch 4, Sec 4.

ρ : Seawater density, taken equal to 1.025 t/m^3.

f_β : Heading correction factor, to be taken as:

f_β = 1.05 for seagoing conditions.

f_β =1.0 for ballast water exchange at sea, harbour/sheltered water and accidental flooded design load scenarios.

1 STRENGTH CHARACTERISTICS OF HULL GIRDER TRANSVERSE SECTIONS

1.1 General

1.1.1

This section specifies the criteria for calculating the hull girder strength characteristics to be used for the checks in [2] to [3], in association with the hull girder loads specified in Ch 4, Sec 4.

1.2 Hull girder transverse sections

1.2.1 General

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder longitudinal strength, i.e. all continuous longitudinal members below and including the strength deck defined in [1.3], taking into account the requirements in [1.2.2] to [1.2.13].

1.2.2 Net scantling

The members contributing to the hull girder longitudinal strength are to be considered using the net offered scantlings based on gross offered thickness reduced by $0.5t_c$, as defined in Ch3, Sec3, when the hull girder strength characteristics are used for the hull girder yielding check according to [2] to [3].

1.2.3 Structural members not contributing to hull girder sectional area

The following members are not to be considered in the calculation as they are considered not contributing to the hull girder sectional area:

- Superstructures which do not form a strength deck.
- Deckhouses.
- Vertically corrugated bulkheads, according to [1.2.7].
- Bulwarks and gutter plates.
- Bilge keels.
- Sniped or non-continuous longitudinal stiffeners.
- Non-continuous hatch coaming.

1.2.4 Continuous trunks and longitudinal continuous hatch coamings

Continuous trunks and longitudinal continuous hatch coamings may be included in the hull girder transverse sections, provided that they are effectively supported by longitudinal bulkheads or primary supporting members.

1.2.5 Longitudinal stiffeners or girders welded above the strength deck

Longitudinal stiffeners or girders welded above the strength deck, including the deck of any trunk fitted as specified in [1.2.4], are to be included in the hull girder transverse sections.

1.2.6 Longitudinal girders between hatchways, supported by longitudinal bulkheads

Where longitudinal girders, effectively supported by longitudinal bulkheads, are fitted between hatchways, the sectional area of these longitudinal girders are to be included in the hull girder transverse section.

1.2.7 Longitudinal bulkheads with vertical corrugations

For longitudinal bulkheads with vertical corrugations, the vertical corrugations are not to be included in the hull girder transverse section. Longitudinal bulkheads with vertical corrugations are not effective for hull girder bending, but they are effective for hull girder shear force.

1.2.8 Members in materials other than steel

Where a member contributing to the longitudinal strength is made in material other than steel with a Young's modulus, E equal to 2.06×10^5 N/mm^2, the steel equivalent sectional area that may be included in hull girder transverse section is obtained, in m^2, from the following formula:

$$A_{SE-n50} = \frac{E}{2.06\times10^5} A_{M-n50}$$

where:

$A_{M\text{-}n50}$: Sectional area, in m^2, of the member under consideration.

1.2.9 Definitions of openings

The following definitions of opening are to be applied:

a) Large openings are:
   - Elliptical openings exceeding 2.5 m in length or 1.2 m in breadth.
   - Circular openings exceeding 0.9 m in diameter.

b) Small openings (i.e. drain holes, etc) are openings that are not large ones.

c) Manholes

d) solated openings are openings spaced not less than 1 m apart in the ship's transverse/vertical direction.

1.2.10 Large openings, manholes and nearby small openings

Large openings and manholes are to be deducted from the sectional area used in hull girder moment of inertia and section modulus. When small openings are spaced less than 1 m apart in the ship's transverse/vertical direction to large openings or manholes, the total breadth of them is to be deducted from the sectional area.

Additionally, isolated small openings which do not comply with the arrangement requirements given in Ch 3, Sec 6, [6.3.2] are to be deducted from the sectional areas included in the hull girder transverse sections.

1.2.11 Isolated small openings

Isolated small openings in one transverse section in the strength deck or bottom area need not be deducted from the sectional areas included in the hull girder transverse sections, provided that:

$$\sum b_s \leq 0.06(B - \sum b)$$

Σb_S :Total breadth of isolated small openings, in m, in the strength deck or bottom area at the transverse section considered, determined as indicated in Figure 1, not deducted from the section area as per [1.2.10].

Σb :Total breadth of large openings, in m, at the transverse section considered, determined as indicated in Figure 1, deducted from the section area as defined in [1.2.10].

Where the total breadth of isolated small openings Σb_s does not fulfil the above criteria, only the excess of breadth is to be deducted from the sectional areas included in the hull girder transverse sections.

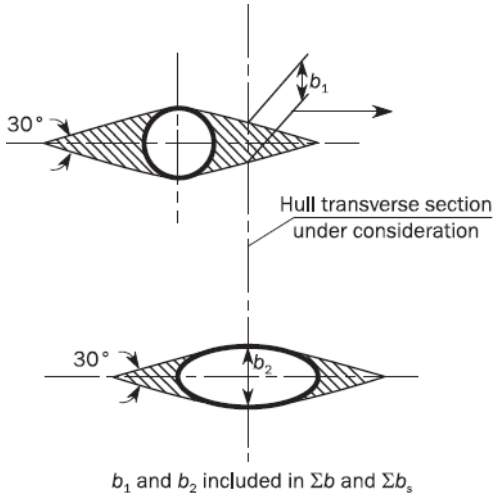

Figure 1 Calculation of Σb and Σb_s

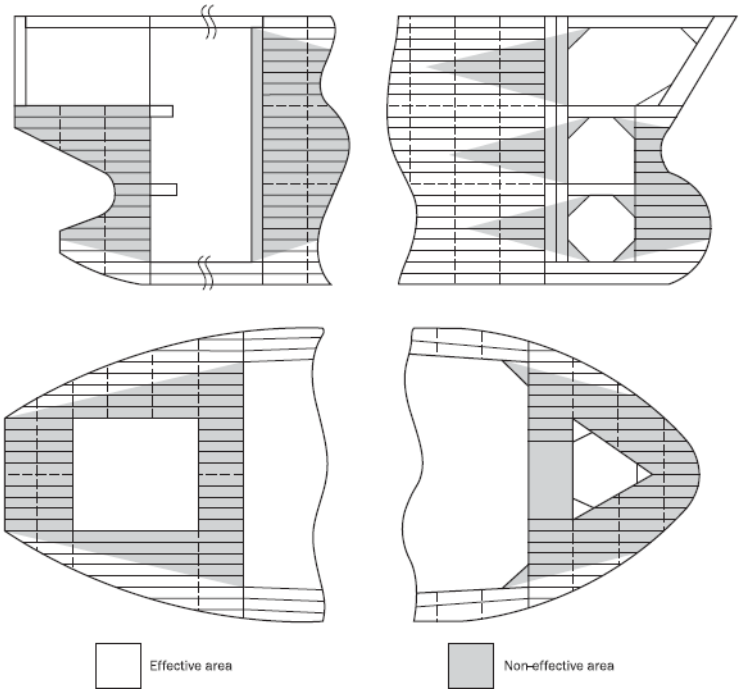

Figure 2 Effective area in way of non-continuous decks and bulkheads

1.2.12 Lightening holes, draining holes and single scallops

Lightening holes, draining holes and single scallops in longitudinals need not be deducted if their height is less than $0.25h_w$, where h_w is the web height of the longitudinals, in mm. Otherwise, the excess is to be deducted from the sectional area or compensated.

1.2.13 Non-continuous decks and longitudinal bulkheads

When calculating the effective area in way of non-continuous decks and longitudinal bulkheads, the effective area is to be taken as shown in Figure 2. The shadow area, which indicates the ineffective area, is obtained by drawing two tangent lines with an angle of 15 deg to the longitudinal axis of the ship.

1.3 Strength deck

1.3.1

The strength deck is, in general, the uppermost continuous deck. In the case of a superstructure or deckhouses contributing to the longitudinal strength, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse.

1.4 Section modulus

1.4.1 Section modulus at any point

The section modulus at any point of a hull transverse section is obtained, in m^3, from the following formula:

$$Z_{A-n50} = \frac{I_{y-n50}}{|Z - Z_n|}$$

1.4.2 Section modulus at bottom

The section modulus at bottom is obtained, in m^3, from the following formula:

$$Z_{B-n50} = \frac{I_{y-n50}}{Z_n}$$

1.4.3 Section modulus at deck

The section modulus at equivalent deck line is obtained, in m^3, from the following formula:

$$Z_{D-n50} = \frac{I_{y-n50}}{V_D}$$

where:

V_D : Vertical distance of the equivalent deck line, in m, taken equal to:

When no effective longitudinal members specified in [1.2.4] and [1.2.5] are positioned above a line extending from strength deck at side to a position $(z_D - z_n)/0.9$ from the neutral axis at the centreline

$V_D = z_D - z_n$

When effective longitudinal members as specified in [1.2.4] and [1.2.5] are positioned above a line extending from strength deck at side to a position $(z_D - z_n)/0.9$ from the neutral axis at the centreline

$$V_D = (z_T - z_n)\left(0.9 + 0.2\frac{y_T}{B}\right) \geq z_D - z_n$$

z_D : Z coordinate, in m, of strength deck at side, defined in [1.3].

y_T, z_T : Y and Z coordinates, in m, of the top of continuous trunk, hatch coaming, longitudinal stiffeners or girders, to be measured for the point which maximises the value of V_D.

1.5 Moments of inertia

1.5.1

The net moment of inertia, I_{y-n50} and I_{z-n50} in m^4, are those, calculated about the horizontal and vertical neutral axes, respectively, of the hull transverse sections defined in [1.2].

2 HULL GIRDER BENDING ASSESSMENT

2.1 General

2.1.1

Scantlings of all continuous longitudinal members of the hull girder based on moment of inertia and section modulus requirement in [2.3] are to be maintained within 0.4L amidships.

2.1.2

The k material factors are to be defined with respect to the materials used for the bottom and deck members contributing to the longitudinal strength according to [1]. When material factors for higher strength steels are used, the requirements in [2.4] apply.

2.2 Normal stresses

2.2.1

The normal stress, σ_L induced by vertical bending moments, is to be assessed for both hogging and sagging conditions, along the full length of the hull girder, from AE to FE.

The normal stress, σ_L at any point of the hull transverse section located below z_{VD} is to comply with the following formula:

$$\sigma_L \leq \sigma_{perm}$$

where:

σ_L : Normal stress, in N/mm^2, as defined in [2.2.2].

σ_{perm} : Permissible hull girder bending stress, in N/mm^2, as given in Table 1.

2.2.2

The normal stresses, σ_L in N/mm^2, induced by vertical bending moments are given in Table 2.

2.2.3

The normal stresses in a member made in material other than steel with a Young's modulus, E equal to 2.06×10^5 N/mm^2, included in the hull girder transverse sections as specified in [1.2.8], are obtained from the following formula:

$$\sigma_L = \frac{E}{2.06\times10^5}\sigma_{Ls}$$

where:

σ_{LS} : Normal stress, in N/mm^2, in the member under consideration, calculated according to [2.2.2] considering this member as having the steel equivalent sectional area A_{SE} defined in [1.2.8].

Permissible hull girder bending stress **Table 1**

Operation	Design load	Permissible hull girder bending stress, σ_{perm}				
		$\frac{x}{L} \le 0.1$	$0.1 < \frac{x}{L} < 0.3$	$0.3 < \frac{x}{L} < 0.7$	$0.7 < \frac{x}{L} < 0.9$	$\frac{x}{L} \ge 0.9$
Seagoing	(S+D)	140/*k*	Linear interpolation	190/*k*	Linear interpolation	140/*k*
Harbour/ sheltered water	(S)	105/*k*	Linear interpolation	143/*k*	Linear interpolation	105/*k*
Flooded condition at sea for bulk carriers having a freeboard length L_{LL} of 150 m or above	(A:S+D)	140/*k*	Linear interpolation	190/*k*	Linear interpolation	140/*k*

Normal stress, σ_L **Table 2**

Operation	Normal stress, σ_L		
	At any point located below Z_{VD}	At bottom (1)	At deck (1)
Seagoing	$\sigma_L = \frac{M_{sw} + f_\beta M_{wv}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw} + f_\beta M_{wv}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw} + f_\beta M_{wv}}{Z_{D-n50}} 10^{-3}$
Harbour/sheltered water	$\sigma_L = \frac{M_{sw-p}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-p}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-p}}{Z_{D-n50}} 10^{-3}$
Flooded condition at sea for bulk carriers having a freeboard length L_{LL} of 150 m or above	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{A-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{B-n50}} 10^{-3}$	$\sigma_L = \frac{M_{sw-f} + M_{wv}}{Z_{D-n50}} 10^{-3}$
(1) The σ_L values at bottom and deck, correspond to the application of formula given for any point, calculated at equivalent deck line and at baseline.			

2.3 Minimum net moment of inertia and net section modulus at midship section

2.3.1

At the transverse section in the midship part, the net moment of inertia about the horizontal axis, $I_{y\text{-}n50}$ is to be not less than the value obtained, in m^4, from the following formula:

$$I_{yR} = 2.7 C_w L^3 B (C_b + 0.7) 10^{-8}$$

2.3.2

At the transverse section in the midship part, the vertical hull girder net section modulus at the deck and the bottom, $Z_{D\text{-}n50}$ and $Z_{B\text{-}n50}$, are not to be less than the value obtained, in m3, from the following formula:

$$Z_R = 0.9 k C_w L^2 B (C_b + 0.7) 10^{-6}$$

2.4 Extent of high tensile steel

2.4.1 Vertical extent

The vertical extent of higher strength steel, $z_{hts,i}$ in m, used in the deck zone or bottom zone and

measured respectively from the moulded deck line at side or baseline is not to be taken less the value obtained from the following formula, see Figure 3:

$$z_{hts,i} = z_1\left(1 - \frac{\sigma_{perm,i}}{\sigma_L}\right)$$

where:

z_1 : Distance from horizontal neutral axis to moulded deck line or baseline respectively, in m.

$\sigma_{perm,i}$: Permissible hull girder bending stress of the considered steel, in N/mm^2, as given in Table 1 and Figure 3.

σ_L : Hull girder bending stress, σ_{dk} at moulded deck line or σ_{bl} at baseline respectively, in N/mm^2 given in Table 3.

Hull girder stresses at baseline and moulded deck line **Table 3**

Operation	At baseline	At moulded deck line
Seagoing	$\sigma_{bl} = \frac{\lvert M_{sw} + f_\beta M_{wv}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \frac{\lvert M_{sw} + f_\beta M_{wv}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
Harbour/sheltered water	$\sigma_{bl} = \frac{\lvert M_{sw-p}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \frac{\lvert M_{sw-p}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
Flooded condition at sea for bulk carriers having a freeboard length L_{LL} of 150 m or above	$\sigma_{bl} = \frac{\lvert M_{sw-f} + M_{wv}\rvert}{I_{y-n50}} z_n 10^{-3}$	$\sigma_{dk} = \frac{\lvert M_{sw-f} + M_{wv}\rvert}{I_{y-n50}} (z_{dk-s} - z_n) 10^{-3}$
z_{dk-s}: Distance from baseline to moulded deck line at side, in m.		

2.4.2 Longitudinal extent

Where used, the application of higher strength steel is to be continuous over the length of the ship to the location where the longitudinal stress levels are within the allowable range for mild steel structure, as shown in Figure 4.

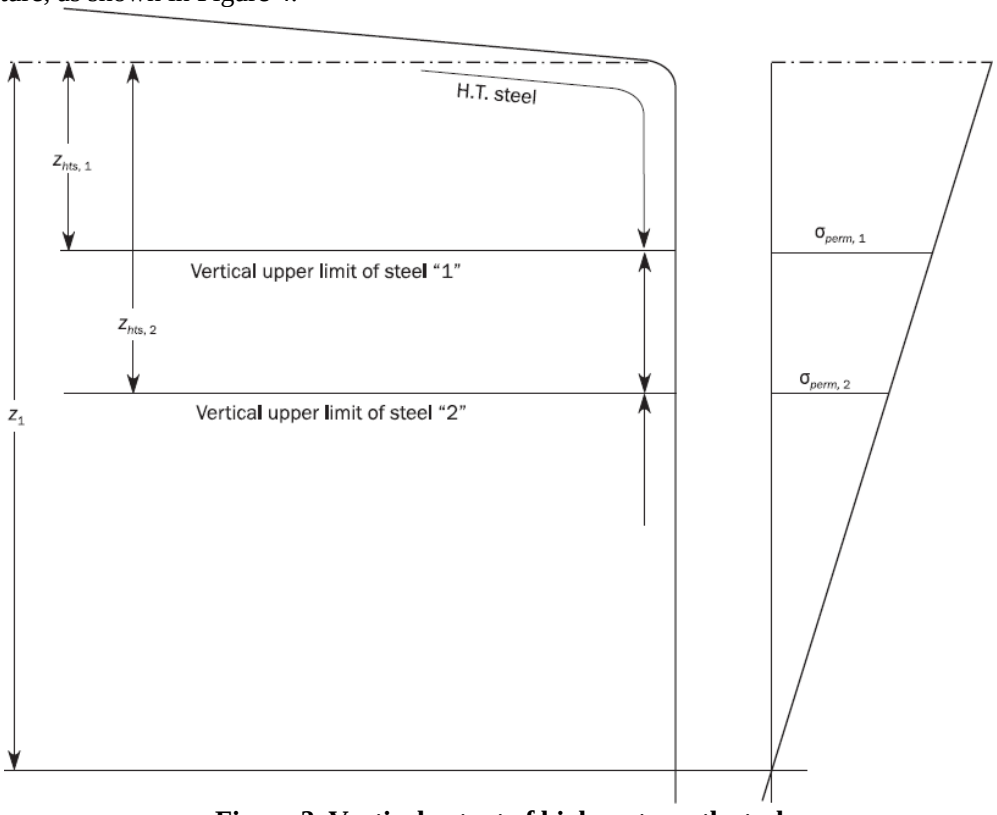

Figure 3 Vertical extent of higher strength steel

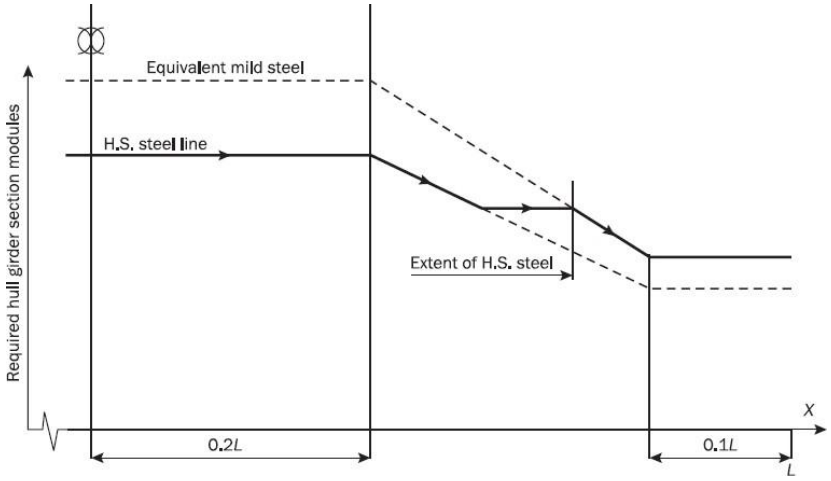

Figure 4 Longitudinal extent of higher strength steel

3 HULL GIRDER SHEAR STRENGTH ASSESSMENT

3.1 General

3.1.1

The hull girder shear strength requirements apply along the full length of the hull girder, from AE to FE.

3.2 Hull girder shear capacity

3.2.1

The total vertical hull girder shear capacity, Q_R in kN, is the minimum of the calculated values for all plates *i* contributing to the hull girder shear of the considered transverse section and is to be taken as:

$$Q_R = \min_i \left(\frac{\tau_{i-perm} \cdot t_{i-n50}}{q_{vi}} \cdot 10^{-3} \right)$$

where:

$t_{i\text{-}n50}$: Net thickness of plate *i*, in mm. For longitudinal bulkheads between cargo tanks of oil tankers, $t_{i\text{-}n50}$ is to be taken as $t_{sfi\text{-}n50}$ (see [3.4.1]) and $t_{sti\text{-}k\text{-}n50}$ (see [3.5.1]) as appropriate.

q_{vi} : Contribution ratio for hull girder shear force per mm, in mm^{-1}, for the plate *i* based on net scantlings with deduction of $0.5t_c$, which is equal to the unit shear flow per mm, in N/mm, obtained from a numerical calculation based on thin-walled beam theory according to Ch 5, App 1.

$\tau_{i\text{-}perm}$: Permissible shear stress, in N/mm^2, as given in Table 4, for plate *i*.

Permissible hull girder shear stress **Table 4**

Operation	Design load	Permissible hull girder shear, $\tau_{i\text{-}perm}$
Seagoing	(S+D)	120/k
Harbour/sheltered water	(S)	105/k
Flooded condition at sea of bulk carriers having a freeboard length L_{LL} of 150 m or above	(A:S+D)	120/k

3.3 Acceptance criteria

3.3.1 Permissible vertical shear force

The positive and negative permissible vertical shear forces are to comply with the following criteria:

- For seagoing operation:

$$|Q_{sw}| \le Q_R - |f_\beta Q_{wv}|$$

- For harbour/sheltered water operation:

$$|Q_{sw-p}| \le Q_R$$

- For flooded condition at sea of bulk carriers having a freeboard length L_{LL} of 150 m or above:

$$\left|Q_{sw-f}\right| \le Q_R - \left|Q_{wv}\right|$$

where:
Q_R : Total vertical hull girder shear capacity, in kN, as defined in [3.2.1].
The shear force Q_{wv}, used in 2 above criteria is to be taken with the same sign as the considered shear forces Q_{sw}, and Q_{sw-f} respectively.

3.3.2 Vertical still water shear force

The vertical still water shear forces, in kN, for all loading conditions are to comply with the following criteria:

- For seagoing operation:

$$\left|Q_{sw-Lcd} - \Delta Q_{mdf}\right| \le \left| Q_{sw}\right|$$

- For harbour/sheltered water operation:

$$\left|Q_{sw-Lcd-p} - \Delta Q_{mdf}\right| \le \left|Q_{sw-p}\right|$$

- For flooded condition at sea of bulk carriers having a freeboard length L_{LL} of 150 m or above:

$$\left|Q_{sw-Lcd-f} - \Delta Q_{mdf}\right| \le \left|Q_{sw-f}\right|$$

where:
ΔQ_{mdf} : Shear force correction at the transverse section considered, in kN, taken as:

- For bulk carriers, the value defined in [3.6.1].
- For oil tankers, $\Delta Q_{mdf} = 0$.

The permissible shear forces Q_{sw}, Q_{sw-p} and Q_{sw-f} are to be taken with the same sign as the considered shear forces Q_{sw-Lcd}, $Q_{sw-Lcd-p}$ and $Q_{sw-Lcd-f}$ respectively.

3.4 Effective net thickness for longitudinal bulkheads between cargo tanks of oil tankers

3.4.1

For longitudinal bulkheads between cargo tanks, the effective net thickness of the plating above the inner bottom, $t_{sfi-n50}$ for plate i, in mm, is given by:

$$t_{sfi-n50} = t_{i-n50} - t_{\Delta i}$$

where:
$t_{\Delta i}$: Thickness deduction for plate i, in mm, as defined in [3.4.2].

3.4.2

The vertical distribution of thickness reduction for shear force correction is to be triangular as indicated in Figure 5. The thickness deduction, $t_{\Delta i}$ in mm, to account for shear force correction on the plate i, is to be taken as:

$$t_{\Delta i} = \frac{\delta Q_3}{h_{blk}\tau_{i-perm}}\left(1 - \frac{x_{blk}}{0.5 l_{tk}}\right)\left(2 - \frac{2\left(z_p - h_{db}\right)}{h_{blk}}\right)$$

where:
δQ_3 : Shear force correction for longitudinal bulkhead as defined in [3.4.3] and [3.4.4] for ships with one or two longitudinal bulkheads respectively, in kN.
l_{tk} : Length of cargo tank, in m.
h_{blk} : Height of longitudinal bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead, as shown in Figure 5.
x_{blk} : Minimum longitudinal distance from section considered to the nearest cargo tank transverse bulkhead, in m. To be taken positive and not greater than $0.5 l_{tk}$.
z_p : Vertical distance from the lower edge of plate i to the base line, in m, but not taken less than h_{db}.
h_{db} : Height of double bottom, in m, as shown in Figure 5.
τ_{i-perm} : Permissible hull girder shear stress, in N/mm^2, for plate i:
$\tau_{i-perm} = 120/k$.

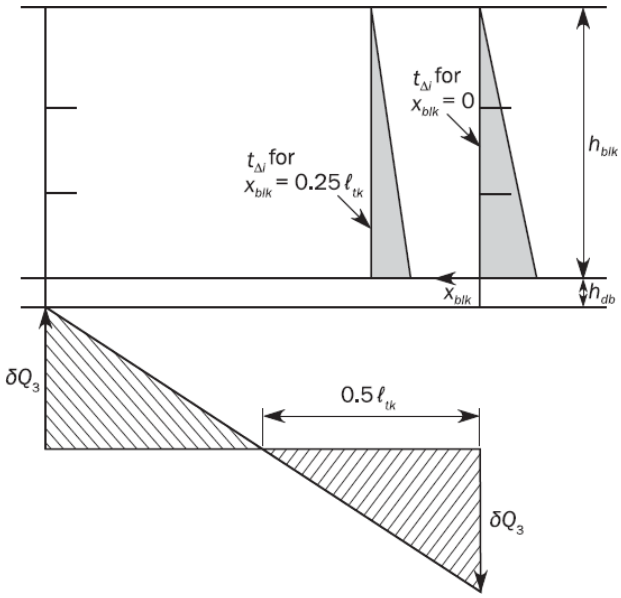

Figure 5 Shear force correction for longitudinal bulkheads

3.4.3 Shear force correction for a ship with a centreline longitudinal bulkhead

For ships with a centreline longitudinal bulkhead, the shear force correction in way of transverse bulkhead, δQ_3, in kN, is to be obtained from the following formula:

$$\delta Q_3 = 0.5 K_3 F_{db}$$

where:

F_{db} : Maximum resulting force on the double bottom in a tank, in kN, as defined in [3.4.5].

K_3 : Correction factor, to be taken equal to:

$$K_3 = 0.4 \cdot \left(1 - \frac{1}{1+n}\right) - f_3$$

n : Number of floors between transverse bulkheads.

f_3 : Shear force distribution factor, as defined in Table 7.

3.4.4 Shear force correction for a ship with two longitudinal bulkheads between the cargo tanks

For ships with two longitudinal bulkheads between the cargo tanks, the shear force correction, δQ_3 in kN, is to be obtained from the following formula:

$$\delta Q_3 = 0.5 K_3 F_{db}$$

where:

F_{db} : Maximum resulting force on the double bottom in a tank, in kN, as defined in [3.4.5].

K_3 : Correction factor, to be taken equal to:

$$K_3 = 0.5 \cdot \left(1 - \frac{1}{1+n}\right)\left(\frac{1}{r+1}\right) - f_3$$

where:

n : Number of floors between transverse bulkheads.

r : Ratio of the part load carried by the wash bulkheads and floors from longitudinal bulkhead to the double side taken as

$$r = \frac{1}{\left[\dfrac{A_{3-n50}}{A_{1-n50} + A_{2-n50}} + \dfrac{2 \times 10^4 b_{80}\left(n_s + 1\right) A_{3-n50}}{l_{tk}\left(n_s A_{T-n50} + R\right)}\right]}$$

l_{tk} : Length of cargo tank, between transverse bulkheads in the side cargo tank, in m.

b_{80} : 80% of the distance from longitudinal bulkhead to the inner hull longitudinal bulkhead, in m, at tank mid length.

$A_{T\text{-}n50}$: Net shear area of the transverse wash bulkhead, including the double bottom floor directly

below, in the side cargo tank, in cm^2, taken as the smallest area in a vertical section.

$A_{1\text{-}n50}$, $A_{2\text{-}n50}$, $A_{3\text{-}n50}$:Net areas, as defined in Table 7, in m^2.

f_3 : Shear force distribution factor, as defined in Table 7.

n_S : Number of wash bulkheads in the side cargo tank.

R : Total efficiency of the transverse primary supporting members in the side tank in cm^2.

$$R = \left(\frac{n - n_s}{2} - 1 \right) \frac{A_{Q-n50}}{\gamma}$$

$$\gamma = 1 + \frac{300 b_{80}{}^2 A_{Q-n50}}{I_{psm-n50}}$$

$A_{Q\text{-}n50}$: Net shear area, in cm^2, of a transverse primary supporting member in the wing cargo tank, taken as the sum of the net shear areas of floor, cross ties and deck transverse webs. The net shear area is to be calculated at the mid span of the members.

$I_{psm\text{-}n50}$: Net moment of inertia for transverse primary supporting members, in cm^4, in the wing cargo tank, taken as the sum of the moments of inertia of transverses and cross ties. The net moment of inertia is to be calculated at the mid span of the member including an attached plate width equal to the primary supporting member spacing.

3.4.5 Vertical force on double bottom

The maximum vertical resulting force on the double bottom in a tank, F_{db} is in no case to be less than that given by the minimum conditions given in Table 5.

The maximum resulting force on the double bottom in a tank, F_{db} in kN, is to be taken as:

$$F_{db} = g \left| W_{CT} + W_{CWBT} - \rho b_2 l_{lk} T_{mean} \right|$$

where:

W_{CT} : Weight of cargo, in tonnes, as defined in Table 6.

W_{CWBT} : Weight of ballast, in tonnes, as defined in Table 6.

b_2 : Breadth, in m, as defined in Table 6.

l_{tk} : Length of cargo tank, in m.

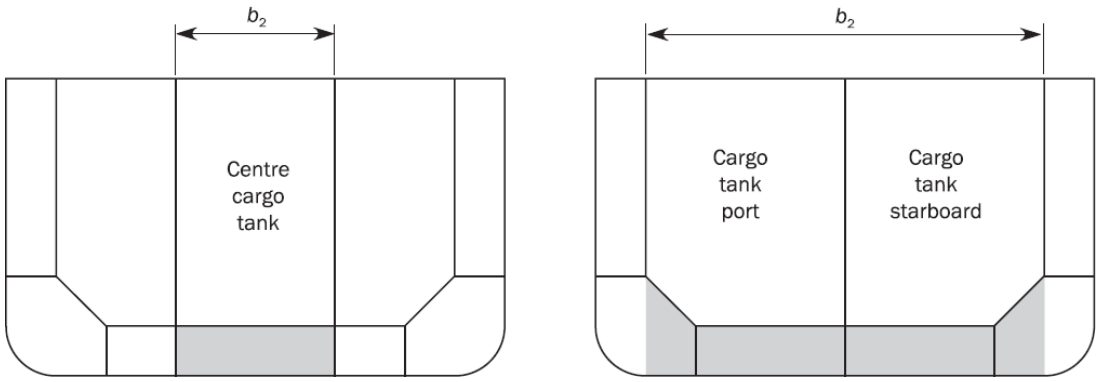
T_{mean} : Draught at the mid length of the tank for the loading condition considered, in m.

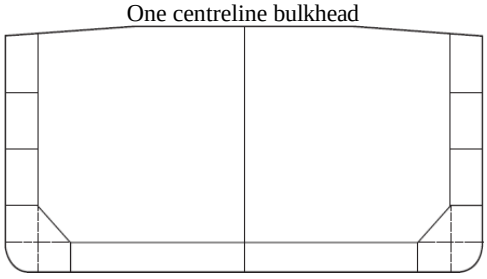
Minimum conditions for double bottom **Table 5**

Structural configuration	Positive/negative force, F_{db}	Minimum condition
Ships with centreline bulkhead	Max positive net vertical force, F_{db+}	0.9 *Tsc* and empty cargo tanks and ballast tanks
	Max negative net vertical force, F_{db-}	0.6 *Tsc* and full cargo tanks and empty ballast tanks
Ships with two longitudinal bulkheads	Max positive net vertical force, F_{db+}	0.9 *Tsc* and empty cargo tanks and ballast tanks
	Max negative net vertical force, F_{db-}	0.6 *Tsc* and full centre cargo tank and empty ballast tanks

Design conditions for double bottom **Table 6**

Structural configuration	W_{CT}	W_{CWBT}	b_2
Ships with centreline bulkhead	Weight of cargo in cargo tanks, in tonnes, using a minimum density of 1.025 t/m^3.	Weight of ballast between port and starboard inner sides, in t.	Maximum breadth between port and starboard inner sides at mid length of tank, in m, as shown in Figure 6.
Ships with two longitudinal bulkheads	Weight of cargo in the centre tank, in tonnes, using a minimum density of 1.025 t/m^3.	Weight of ballast below the centre cargo tank, in t.	Maximum breadth of the centre cargo tank at mid length of tank, in m, as shown in Figure 6.





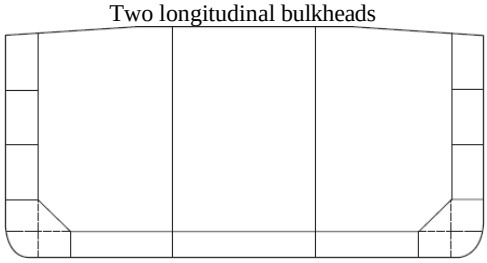


Figure 6 Tank breadth b_2

Shear force distribution factor for oil tanker **Table 7**

Hull configuration	f_3 factor
One centreline bulkhead 	$f_3 = 0.504 - 0.076\frac{A_{1-n50}}{A_{2-n50}} - 0.156\frac{A_{2-n50}}{A_{3-n50}}$
Two longitudinal bulkheads 	$f_3 = 0.353 - 0.049\frac{A_{1-n50}}{A_{2-n50}} - 0.095\frac{A_{2-n50}}{A_{3-n50}}$

where:

$A_{1\text{-}n50}$, $A_{2\text{-}n50}$, $A_{3\text{-}n50}$: Net projected area onto the vertical plane based on net thickness, t_{n50}, of the side shell, inner hull or the longitudinal bulkhead respectively, at one side of the section under consideration.

The area $A_{1\text{-}n50}$ includes the net plating area of the side shell, including the bilge.

The area $A_{2\text{-}n50}$ includes the net plating area of the inner hull, including the hopper side and the outboard girder under.

The Area $A_{3\text{-}n50}$ includes the net plating area of the longitudinal bulkheads, including the double bottom girders in line. The area $A_{3\text{-}n50}$ for the centreline bulkhead is not to be reduced for symmetry around the centreline. When the longitudinal bulkhead is made with corrugation, $A_{3\text{-}n50}$ is to consider the equivalent net thickness of the corrugation as defined in [3.4.6].

3.4.6 Equivalent net thickness of corrugation

The equivalent net thickness, in mm, of the corrugation of vertical and horizontal corrugated bulkheads, $t_{cor\text{-}n50}$, to be used for the calculation of the effective net shear area of $A_{3\text{-}n50}$ in Table 7 and for the unit shear flow, is given as follows:

$$t_{cor-n50} = \frac{t_{w-gr} + t_{f-gr}}{2} \cdot \frac{s_c}{c + a} - 0.5t_c$$

where:

$t_{w\text{-}gr}$: Gross corrugation web thickness, in mm.

$t_{f\text{-}gr}$: Gross corrugation flange thickness, in mm.

s_c : Projected length of one corrugation, in mm, as defined in Ch 3, Sec 6, Figure 21.

c : Breadth of corrugation web, in mm, as defined in Ch 3, Sec 6, Figure 21.
a : Breadth of corrugation flange, in mm, as defined in Ch 3, Sec 6, Figure 21.

3.5 Effective net thickness for longitudinal bulkheads between cargo tanks of oil tankers-Correction due to loads from transverse bulkhead stringers

3.5.1

In way of transverse bulkhead stringer connections, within areas as specified in Figure 8, the equivalent net thickness of plate, $t_{sti\text{-}k\text{-}n50}$ in mm, where the index k refers to the identification number of the stringer, is not to be taken greater than:

$$t_{sti-k-n50} = t_{sfi-n50}\left(1 - \frac{\tau_{sti-k}}{\tau_{i-perm}}\right)$$

where:

$\tau_{sti\text{-}k}$: Shear stress in plate i, in N/mm^2, in the longitudinal bulkhead due to the stringer force in way of stringer k, taken as:

$$\tau_{sti-k} = \frac{Q_{st-k}}{l_{st-k} t_{sfi-k-n50}}$$

$t_{sfi\text{-}k\text{-}n50}$: Effective net plating thickness as defined in [3.4.1], in mm, calculated at the transverse bulkhead for the height corresponding to the level of the stringer.

$t_{sfi\text{-}n50}$: Effective net plating thickness as defined in [3.4.1], calculated at the lower edge of plate i connecting to the stringer.

$\tau_{i\text{-}perm}$: permissible hull girder shear stress, in N/mm^2, for the plate i.

$\tau_{i\text{-}perm} = 120/k$

$l_{st\text{-}k}$: Connection length of stringer k, in m, as defined in Figure 7.

$Q_{st\text{-}k}$: Shear force on the longitudinal bulkhead from the stringer in loaded condition with tanks abreast full in kN, taken as:

$$Q_{st-k} = 0.8F_{st-k}\left(1 - \frac{Z_{st-k} - h_{db}}{h_{blk}}\right)$$

$F_{st\text{-}k}$: Total stringer supporting force in way of a longitudinal bulkhead, in kN, taken as:

h_{db} : Double bottom height, in m.

h_{blk} : Height of bulkhead, in m, defined as the distance from inner bottom to the deck at the top of the bulkhead.

$z_{st\text{-}k}$: Z coordinate of the stringer k, in m.

$P_{st\text{-}k}$: Pressure on stringer k, in kN/m^2, taken as:

$$P_{st-k} = g\rho_L \cdot h_{tt-k}$$

ρ_L : Density of the liquid in cargo tank, in t/m^3, ad defined in Ch 4, Sec 6.

$h_{tt\text{-}k}$: Height from the top of the tank to the midpoint of the load area between $h_k/2$ below and $h_{k\text{-}1}/2$ above the stringer k, in m.

h_k : Vertical distance from the considered stringer k to the stringer k+1 below. For the lowermost stringer, it is to be taken as 80% of the average vertical distance to the inner bottom, in m.

$h_{k\text{-}1}$: Vertical distance from the considered stringer k to the stringer k-1 above. For the uppermost stringer, it is to be taken as 80% of the average vertical distance to the upper deck, in m.

$b_{st\text{-}k}$: Load breadth acting on stringer k, in m, as defined in Figure 9 and Figure 10.

3.5.2

Where reinforcement is provided to meet the above requirement, the reinforced area based on the maximum value of $t_{sti\text{-}k\text{-}n50}$ is to extend longitudinally for the full length of the stringer connection and a minimum of one frame spacing forward and aft of the bulkhead. The reinforced area is to extend vertically from above the stringer level and down to 0.5 h_k below the stringer, where h_k, the vertical distance from the considered stringer to the stringer below is as defined in [3.5.1]. For the lowermost stringer the maximum plate thickness requirement, $t_{sti\text{-}k\text{-}n50}$ is to extend down to the inner bottom, see Figure 8.

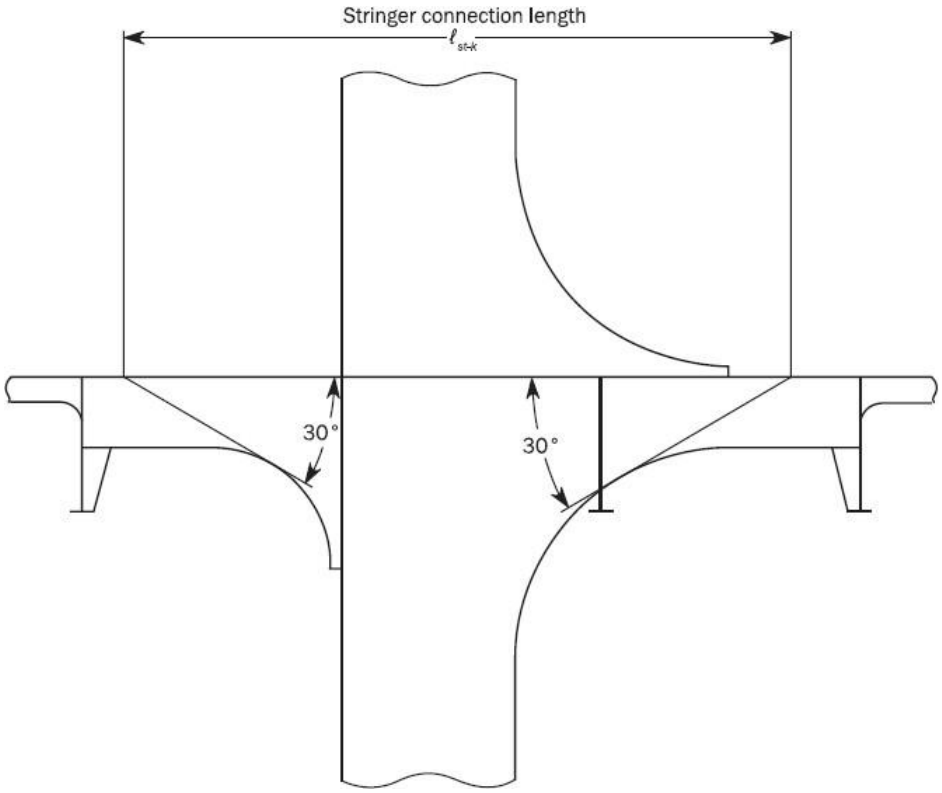

Figure 7 Effective connection length of stringer

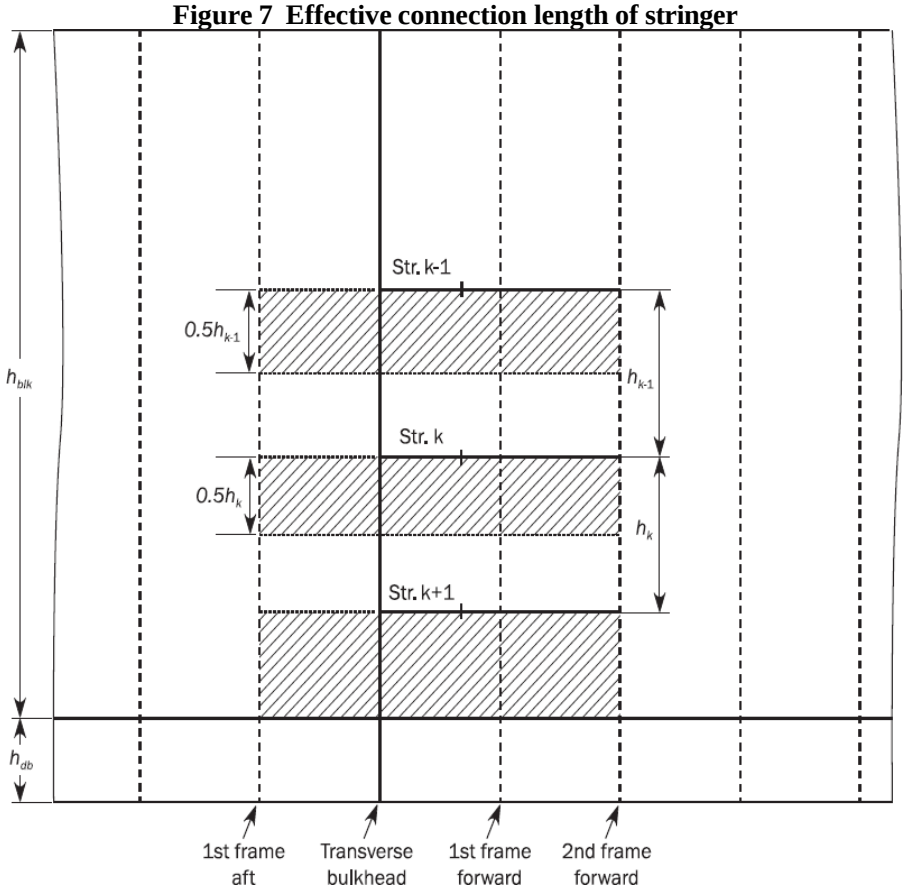

Figure 8 Region for stringer correction, t_i, for ships with 3 stringers

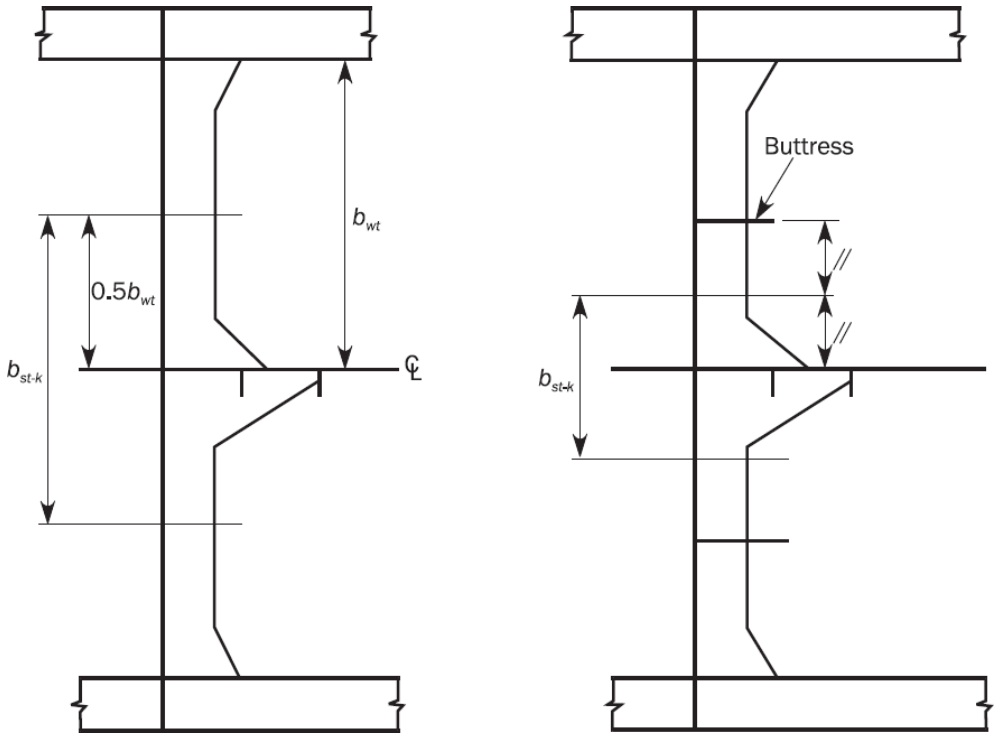

Figure 9 Load breadth of stringers for ships with a centreline bulkhead

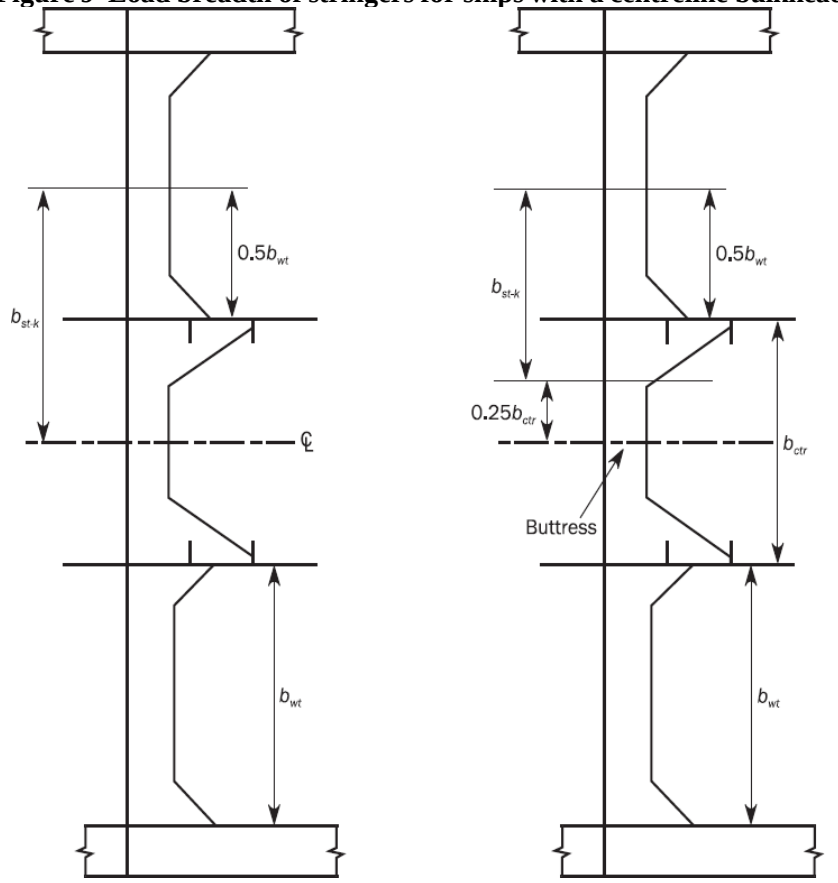

Figure 10 Load breadth of stringers for ships with 2 inner longitudinal bulkheads

In this figure:
b_{wt} is the breadth of wing cargo tank, in m.
b_{ctr} is the breadth of centre cargo tank, in m.

3.6 Shear force correction for bulk carriers

3.6.1

When hull girder shear strength assessment is performed in accordance with [3], shear force correction, which takes into account the portion of loads transmitted by the double bottom longitudinal girders to the transverse bulkheads, is to be considered.

For the considered cargo hold, the shear force correction at the considered transverse section is to be obtained, in kN, from the following formula:

$$\Delta Q_{mdf} = C_d \alpha \left(\frac{M}{B_H l_H} - \rho T_{LC,mh} \right)$$

where:

C_d : Distribution coefficient taken as:

- C_d = -1 at the aft end of the considered cargo hold except for aftmost cargo hold.
- C_d = 1 at the fore end of the considered cargo hold except for foremost cargo hold.
- C_d = 0 at mid-length of the cargo hold.
- C_d = 0 at the aft bulkhead of the aftmost cargo hold.
- C_d = 0 at the fore bulkhead of the foremost cargo hold.
- C_d: Linearly distributed at other locations.

α : Coefficient taken as:

$$\alpha = g \frac{l_0 b_0}{2 + \varphi \frac{l_0}{b_0}}$$

M : Mass, in t, in the hold in way of the considered transverse section for the considered loading condition. M is to include the mass of ballast water and fuel oil located directly below the flat portion of the inner bottom, if any, excluding the portion under the bulkhead stool.

B_H : Breadth of the cargo hold, in m, as defined in Ch 4, Sec 6.

l_H : Length of the cargo hold, in m, as defined in Ch 4, Sec 6.

l_0, b_0 : Length and breadth, respectively, in m, of the flat portion of the double bottom in way of the hold considered; b_0 is to be measured on the hull transverse section at the middle of the hold.

$\varphi = 1.38 + 1.55 g \frac{l_0}{b_0}$, but not greater than 3.7

$T_{LC,mh}$: Draught, in m, measured vertically on the hull transverse section at the middle of the hold considered, from the moulded baseline to the waterline in the loading condition considered.

ΔQ_{CF} : Shear force correction for the full hold.

ΔQ_{CE} : Shear force correction for the empty hold.

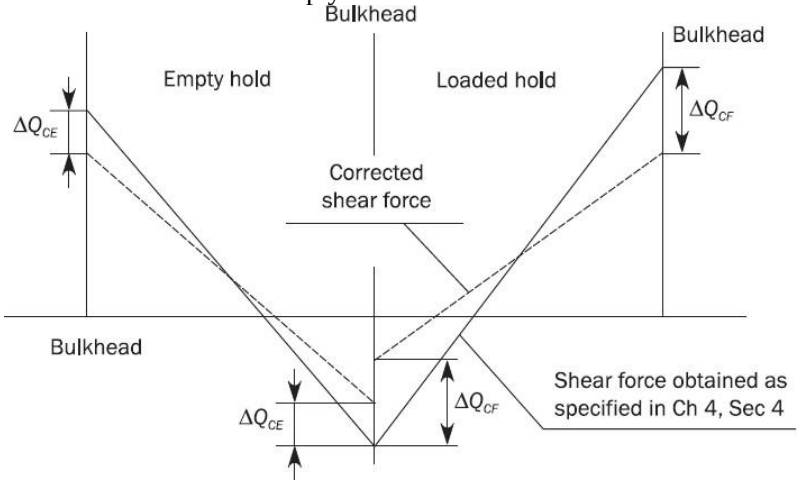

Figure 11 Shear force correction, ΔQ_C

Section 2 HULL GIRDER ULTIMATE STRENGTH

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4

$M_{sw\text{-}h}$, $M_{sw\text{-}s}$: Permissible hogging and sagging vertical still water bending moment in intact seagoing condition, in kNm, at the hull transverse section considered, defined in Ch 4, Sec 4, [2.2.2].

$M_{sw\text{-}p\text{-}h}$, $M_{sw\text{-}p\text{-}s}$: Permissible hogging and sagging vertical still water bending moment for harbour/sheltered water operation, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.3].

$M_{sw\text{-}f}$: Permissible hogging and sagging vertical still water bending moment in flooded condition at sea, in kNm, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.2.4].

1 APPLICATION

1.1 General

1.1.1

The requirements of this section apply to ships with freeboard length L_{LL} equal to or greater than 150 m.

1.1.2

The hull girder ultimate strength is to be assessed through the cargo hold region and machinery space.

1.1.3

The hull girder ultimate bending capacity is to be checked to ensure that it satisfies the checking criteria given in [2]. Such checking criteria are applicable to intact ship structures in the following conditions:

- For bulk carriers: seagoing, harbour/sheltered water and flooded conditions.
- For oil tankers: seagoing and harbour/sheltered water conditions.

2 CHECKING CRITERIA

2.1 General

2.1.1

The vertical hull girder ultimate bending capacity is to be checked for hogging and sagging conditions, for the following design load scenarios, as defined in Table 1:

- For bulk carriers: design load scenario A, for seagoing, harbour/sheltered water and flooded conditions.
- For oil tankers: design load scenario A, for seagoing and harbour/sheltered water conditions; and design load scenario B, for the operational seagoing homogeneous full load condition.

Design load scenarios **Table 1**

Design load scenarios		Permissible still water bending moment, $M_{sw\text{-}U}$
A	S+D	$M_{sw\text{-}h}$ or $M_{sw\text{-}s}$
	S	$M_{sw\text{-}p\text{-}h}$ or $M_{sw\text{-}p\text{-}s}$
	A: S+D	$M_{sw\text{-}f}$
B	S+D	Maximum sagging still water bending moment for operational seagoing homogeneous full load condition (1)

(1) The maximum still water bending moment is to be taken from the departure condition with the ship homogeneously loaded at maximum draught and corresponding arrival and any mid-voyage conditions.

2.1.2

The vertical hull girder ultimate bending capacity at any hull transverse section is to satisfy the following criteria:

$$M \leq \frac{M_U}{\gamma_R}$$

where:

M : Vertical bending moment, in kNm, to be obtained as specified in [2.2.1].

M_U : Vertical hull girder ultimate bending capacity, in kNm, to be obtained as specified in [2.3].

γ_R : Partial safety factor for the vertical hull girder ultimate bending capacity to be taken equal to:

$$\gamma_R = \gamma_M \gamma_{DB}$$

γ_M : Partial safety factor for the vertical hull girder ultimate bending capacity, covering material, geometric and strength prediction uncertainties; in general, to be taken equal to:

$\gamma_M = 1.1$

γ_{DB} : Partial safety factor for the vertical hull girder ultimate bending capacity, covering the effect of double bottom bending, to be taken equal to:

- For hogging condition, except flooded conditions:
  - $\gamma_{DB} = 1.25$ for empty cargo holds in alternate condition of BC-A bulk carriers,
  - $\gamma_{DB} = 1.10$ for oil tankers, for BC-B and BC-C bulk carriers and loaded cargo holds in alternate condition of BC-A bulk carriers,
- For sagging condition, except flooded condition: $\gamma_{DB} = 1.0$
- For hogging and sagging condition, for flooded condition: $\gamma_{DB} = 1.0$

2.2 Hull girder ultimate bending loads

2.2.1

The vertical hull girder bending moment, M in hogging and sagging conditions, to be considered in the ultimate strength check is to be taken as:

$$M = \gamma_s M_{sw-U} + \gamma_w f_\beta M_{wv}$$

where:

M_{sw-U}: Permissible still water bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered as defined in Table 1.

M_{wv} : Vertical wave bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered as defined in Ch 4, Sec 4, [3.1].

γ_S : Partial safety factor for the still water bending moment, as defined in Table 2.

γ_W : Partial safety factor for the vertical wave bending moment, as defined in Table 2.

f_β : Heading correction factor, as defined in Sec 1.

Partial safety factors **Table 2**

Design load scenarios	γ_S	γ_W
A	1.0	1.2
B	1.0	1.3

2.3 Hull girder ultimate bending capacity

2.3.1

The ultimate bending moment capacities of a hull girder transverse section, in hogging and sagging conditions, are defined as the maximum values of the curve of bending moment capacity versus the curvature χ of the transverse section considered (see Figure 1). The curvature χ is positive for hogging condition and negative for sagging condition.

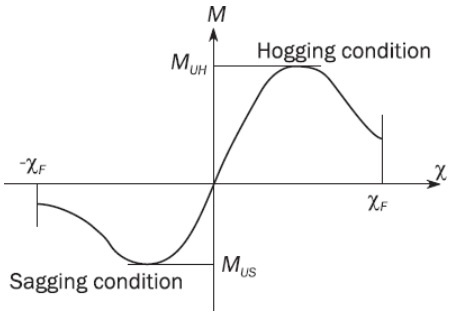

Figure 1 Bending moment capacity versus curvature χ

The hull girder ultimate bending capacity, M_U, is to be calculated according to Ch 5, App 2.

2.3.2
The effective area for the hull girder ultimate strength capacity assessment is specified in Ch 5, App 2.

Section 3 HULL GIRDER RESIDUAL STRENGTH

1 APPLICATION

1.1 General

1.1.1

The requirements of this section apply to ships with freeboard length L_{LL} equal to or greater than 150 m.

1.1.2

The hull girder ultimate bending capacity in the damaged condition is to be checked for the seagoing condition to ensure that it satisfies the residual strength checking criteria given in [2].

1.1.3

The hull girder residual strength is to be assessed through the cargo hold region and the machinery space.

2 CHECKING CRITERIA

2.1 General

2.1.1

The vertical hull girder ultimate bending capacity in the damaged condition is to be checked for the damage conditions specified in [2.2] in hogging and sagging conditions. For the damage conditions specified in [2.2], for the design load scenario A, as defined in Table 1:

Design load scenarios **Table 1**

	Design load scenario	Permissible still water bending moment in damage, $M_{sw\text{-}D}$
Collision	A: S+D	$M_{sw\text{-}h}$ or $M_{sw\text{-}s}$
Grounding	A: S+D	$M_{sw\text{-}h}$ or $M_{sw\text{-}s}$

2.1.2

The vertical hull girder ultimate bending capacity in the damaged condition at any hull transverse section is to satisfy the following criteria:

$$M_D \leq \frac{M_{UD}}{\gamma_{RD} \cdot C_{NA}}$$

where:

M_D : Vertical bending moment in the damaged condition, in kNm, to be obtained as specified in [2.3].

M_{UD} : Vertical hull girder ultimate bending capacity in the damaged condition, in kNm, to be obtained as specified in [2.4].

γ_{RD} : Partial safety factor for the vertical hull girder ultimate bending capacity in the damaged condition, to be taken equal to:

$\gamma_{RD} = 1.0$

C_{NA} : Neutral axis coefficient taken as:

- $C_{NA} = 1.0$ for grounding,
- $C_{NA} = 1.1$ for collision.

2.2 Damage conditions

2.2.1 General

The damage conditions specified for collision in [2.2.2] and for grounding in [2.2.3] are to be considered. The damage extents specified in [2.2.2] and [2.2.3] are to be measured from the moulded lines of the ship.

Stiffener element is to be considered intact unless the connection of stiffener with attached plate is included in the damaged extent.

Plates and stiffeners of inner bottom and inner hull longitudinal bulkhead are to be considered intact unless the damage extent exceeds the moulded distance from inner bottom and inner hull longitudinal bulkhead plate respectively, to the hull envelope plate.

2.2.2 Collision

For the collision assessment of the considered transverse damage cross section, the damage is to be considered on one side and inclusive of the freeboard deck.

The damage for collision extends from the point of intersection of the moulded lines of deck and side:

- vertically downward for a distance *h* and upward without limit,
- transversally inboard for a distance *d* and outward without limit,

where *h* and *d* are given in Table 2 according to the side shell arrangement in the considered damage transverse section.

On ships with a rounded gunwale, the point of intersection is to be taken from the continuation of the moulded lines of deck and side.

Damage extent for collision **Table 2**

Damage penetration, in m	Side shell arrangement	
	Single side	Double side
Height, *h*	0.75 *D*	0.6*D*
Depth, *d*	*B*/16	*B*/16

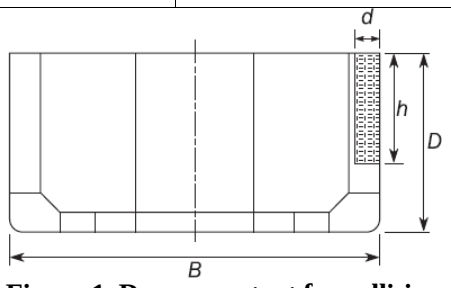

Figure 1 Damage extent for collision

The capacity of the damaged transverse cross section is calculated with the damage extent on one side, the ship kept in upright position.

2.2.3 Grounding

For the grounding assessment of the considered transverse damage cross section, the damage is to be considered on the bottom in the most unfavourable transversal position as regard to the structure considered by the damage.

The damage extent for grounding is given in Table 3.

Damage extent for grounding **Table 3**

Damage penetration, in m	Bulk carriers	Oil tankers
Height, *h*	Min (*B* /20, 2)	Min (*B* /15, 2)
Breadth, *b*	0.60 *B*	0.60 *B*

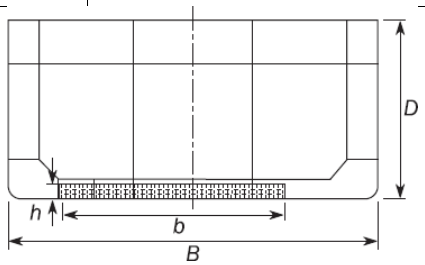

Figure 2 Damage extent for grounding

2.3 Hull girder ultimate bending loads in the damaged condition

2.3.1

The vertical bending moment, M_D in hogging and sagging conditions, to be considered in the ultimate strength check of the hull girder in the damaged condition, is to be obtained from the following formula:

$$M_D = \gamma_{SD} M_{sw-D} + \gamma_{WD} M_{wv}$$

where:

Ms_{w-D} : Permissible still water bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered, as defined in Table 1.

M_{wv} : Vertical wave bending moment, in kNm, in hogging and sagging conditions at the hull transverse section considered, as defined in Ch 4, Sec 4, [3.1].

γ_{SD} : Partial safety factor for the still water bending moment in the damaged condition, to be taken equal to:

$\gamma_{SD} = 1.1$

γ_{WD} : Partial safety factor for the vertical wave bending moment in the damaged condition, to be taken equal to:

$\gamma_{WD} = 0.67$

2.4 Hull girder ultimate bending capacity in the damaged condition

2.4.1

The hull girder ultimate bending capacity in the damaged condition is to be calculated according to Ch 5, App 2, with the damaged parts assumed not to contribute to the hull girder strength. When assessing the ultimate bending capacity, M_{UD} of the damaged hull sections, damaged area as defined in [2.2] carries no loads and is to be removed in the capacity model.

2.4.2

The effective area of the intact partsfor the hull girder ultimate strength capacity assessment is specified in Ch 5 App 2.

Appendix 1 DIRECT CALCULATION OF SHEAR FLOW

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 CALCULATION FORMULA

1.1 General

1.1.1

This appendix describes the procedures of direct calculation of shear flow which is working along a ship cross section due to hull girder vertical shear force. Shear flow q_v, at each location in the cross section, is calculated where considering the cross section is subjected to a unit vertical shear force, 1 N, in the direction of z coordinate.

The unit shear flow per mm, q_v in N/mm, can be considered equal to:

$q_v = q_D + q_l$

where:

q_D : Determinate shear flow, as defined in [1.2].

q_l : Indeterminate shear flow which circulates around the closed cells, as defined in [1.3].

In the calculation of the unit shear flow, q_v, the longitudinal stiffeners are to be taken into account.

1.2 Determinate shear flow

1.2.1

The determinate shear flow, q_D in N/mm, at each location in the cross section can be obtained from the following line integration:

$$q_D(s) = -\frac{1}{10^6 I_{y-n50}} \int_0^s (z - z_n) t_{n50} ds$$

where:

s : Coordinate value of running coordinate along the cross section, in m.

$I_{y\text{-}n50}$: Moment inertia of the cross section, in m^4.

t_{n50} : Net thickness of plating, in mm, or equivalent net thickness of corrugated plate as defined in Ch 5, Sec 1, [3.4.6].

1.2.2

Assuming the cross section is composed of line segments as shown in Figure 1, the determinate shear flow can be calculated by the following equation.

$$q_{Dk} = q_D(l) = -\frac{t_{n50} l}{2 \times 10^6 I_{y-n50}} (z_k + z_i - 2z_n) + q_{Di}$$

where:

q_{Dk}, q_{Di} : Determinate shear flow at node k and node i respectively, in N/mm.

l : Length of line segments, in m.

z_k, z_i : Z coordinate of the end point of line segment, in m, as defined in Figure 1.

1.2.3

Where the cross section includes closed cells, the closed cell are to be cut with virtual slits, as shown in Figure 2 in order to obtain the determinate shear flow.

However, the virtual slits must not be located at the walls by which the other closed cell is also bounded.

1.2.4

Calculations of the determinate shear flow at bifurcation points can be calculated such as water flow calculations as shown in Figure 2.

1.3 Indeterminate shear flow

1.3.1

The indeterminate shear flow is working around the closed cells and can be considered as a

constant value within the same closed cell. The following system of equation for determination of indeterminate shear flows can be developed. In the equations, contour integrations of several parameters around all closed cells are performed.

$$q_{Ik}\oint_k \frac{1}{t_{n50}}ds - \sum_i q_{Ii}\oint_{k,i}\frac{1}{t_{n50}}ds = -\oint_k \frac{q_D}{t_{n50}}ds$$

q_{Ik}, q_{Ii} : Indeterminate shear flow around the closed cell k and i respectively, in N/mm.

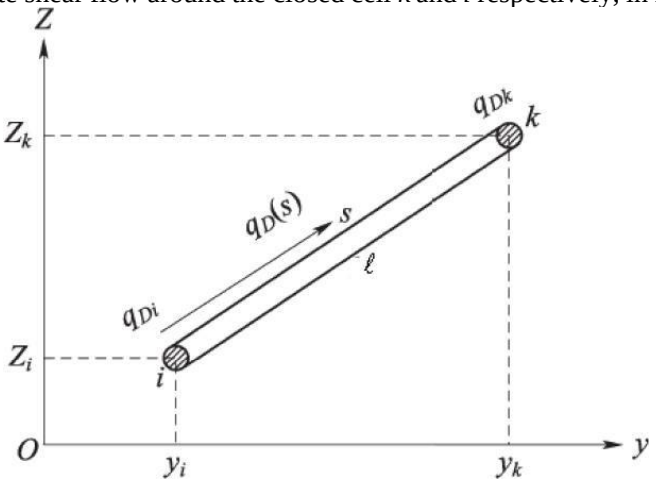

Figure 1 Definition of line segment

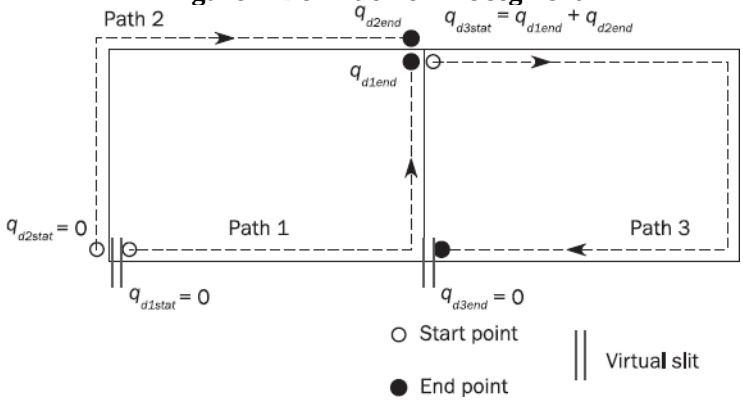

Figure 2 Calculation of determinate shear flow at bifurcation

1.3.2

With assuming assembly of line segments shown in Figure 1, the equations in [1.3.1] can be expressed as follows:

$$q_{Ik}\sum_{cell\ k}\frac{l}{t_{n50}} - \sum_i q_{Ii}\left(\frac{l}{t_{n50}}\right)\Bigg|_{common\ wall\ with\ cell\ k} = -\sum_{cell\ k}\phi$$

$$\phi = \int_0^l \frac{q_D(s)}{t_{n50}}ds = -\frac{l^2}{6\times10^3 I_{y-n50}}\left(z_k + 2z_i - 3z_G\right) + \frac{l}{t_{n50}}q_{Di}$$

q_{Di} : Determinate shear flow, in N/mm, calculated according to [1.2.2].

The difference in the directions of running coordinates specified in [1.2] and this sub-article is to be considered.

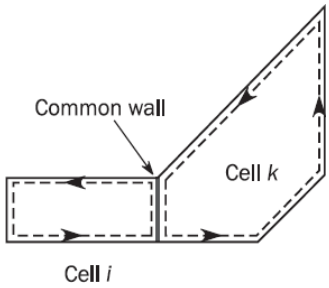

Figure 3 Closed cells and common wall

1.4 Computation of several properties of the cross section

1.4.1

Properties of the cross section can be obtained by the following formulae where the cross section is assumed as the assembly of line segments:

$$l = \sqrt{(y_k - y_i)^2 + (z_k - z_i)^2}$$

$$a_{n50} = 10^{-3} l t_{n50} \qquad A_{n50} = \sum a_{n50}$$

$$s_{y-n50} = \frac{a_{n50}}{2}(z_k + z_i) \qquad S_{y-n50} = \sum s_{y-n50}$$

$$i_{y0-n50} = \frac{a_{n50}}{3}(z_k^2 + z_k z_i + z_i^2) \qquad I_{y0-n50} = \sum i_{y0-n50}$$

where:

a_{n50}, A_{n50} : Area of the line segment and the cross section respectively, in m^2.
$s_{y\text{-}n50}$, $S_{y\text{-}n50}$: First moment of the line segment and the cross section about the baseline, in m^3.
$i_{y0\text{-}n50}$, $I_{y0\text{-}n50}$:Moment inertia of the line segment and the cross section about the baseline, in m^4.

1.4.2

The height of horizontal neutral axis, z_n in m, can be obtained as follows:

$$z_n = \frac{S_{y-n50}}{A_{n50}}$$

1.4.3

Inertia moment about the horizontal neutral axis, in m^4, can be calculated as follows:

$$I_{y-n50} = I_{y0-n50} - z_n^2 A_{n50}$$

2 EXAMPLE OF CALCULATIONS FOR A SINGLE SIDE HULL CROSS SECTION

2.1 Cross section data

2.1.1

The cross section is shown in Figure 4. The coordinates of the node points marked by filled black circles in Figure 4 are given in Table 1, where the plate thickness and the line segments (marked by circles in Figure 4) of the cross section are given in Table 2.

The sample calculations are performed taking advantage of symmetry of the cross section.

Node coordinates of cross section **Table 1**

Node number	*Y* coordinate (m)	*Z* coordinate (m)
0	0.00	0.00
1	5.80	0.00

14	2	6	15.0	1.68	0.025	0.021	0.02
15	1	7	15.0	1.68	0.025	0.021	0.02
				Total	1.416	11.686	185.138

2.1.2

The *Z* coordinate of horizontal neutral axis and the inertia moment about the neutral axis are calculated as follow:

$$z_n = \frac{\sum s_{y-n50}}{\sum a_{n50}} = \frac{11.686}{1.416} = 8.255$$

$$I_{y-n50} = 2\left(\sum i_{y0-n50} - z_n^2 \sum a_{n50}\right) = 2\left(185.138 - 8.255^2 \times 1.416\right) = 177.34$$

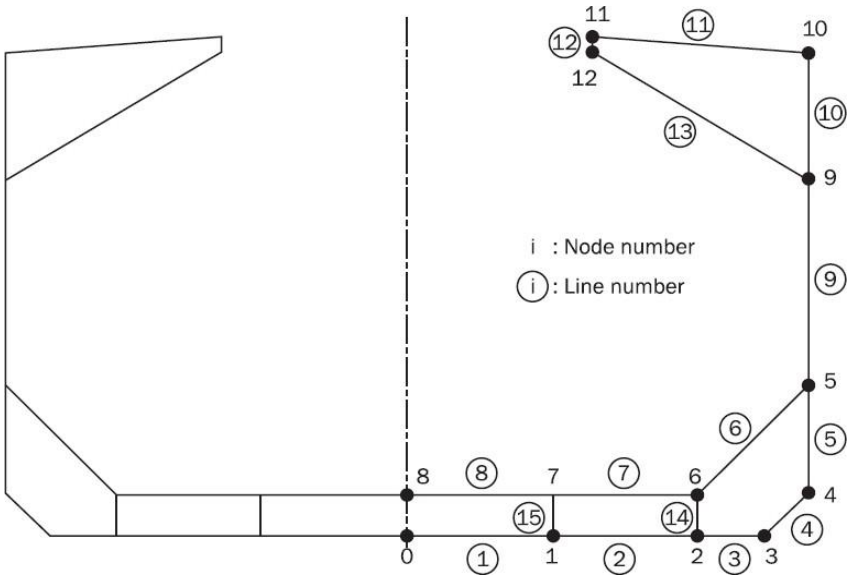

Figure 4 Numbering of nodes and lines

2.2 Calculations of the determinate shear flow

2.2.1

The virtual slits are added to cut the walls of the closed cells as shown in Figure 5. And then, the line integrations specified in [1.2.2] are performed to obtain determinate shear flow, q_D. The calculation results are shown in Table 3. The locations of the virtual slits and the paths of line integrations shown in Figure 5 are one such example. These definitions can be arbitrarily determined so as to calculate them easily.

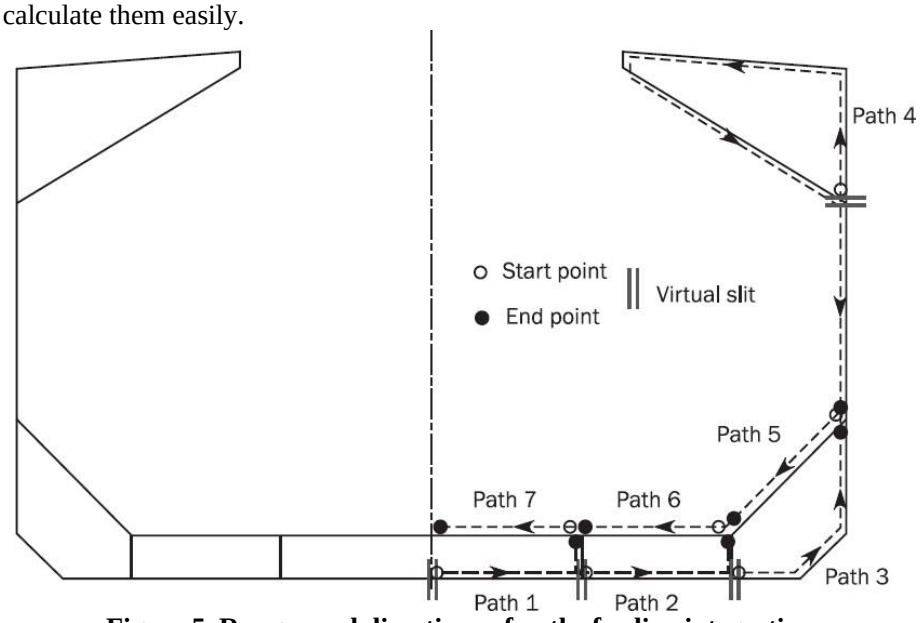

Figure 5 Ranges and directions of paths for line integrations

2.3 Calculations of the indeterminate shear flow

2.3.1

To obtain the system of equations for indeterminate shear flows, the contour integrations around 3 closed cells as defined in Figure 6 are performed. The closed cell at the centre of double bottom is considered as an open shape since the symmetrical condition of the cross section is considered. The calculation results of contour integrations around the closed cells are shown in Table 4 to Table 6.

11	10	11	-5.6	360.6	-4.45	-
12	11	12	-19.2	25.8	-0.51	-
13	12	9	-20.2	681.5	-16.59	-
			Total	1327.5	-22.19	-

2.3.2

The following system of equations can be developed by using the results of the contour integration around each closed cell:

- Cell 1: 852.0 q_{I1} – 112.0 q_{I2} = 2.68 ×10^{-3}
- Cell 2: -112.0 q_{I1} + 988.3 q_{I2} = 6.07 ×10^{-3}
- Cell 3: 1327.5 q_{I3} = 2.219×10^{-2}

The solution of this system gives indeterminate shear flows of the closed cell 1 to 3:
q_{I1} = 4.01 ×10^{-6}, q_{I2} = 6.60 ×10^{-6}, q_{I3} = 1.67 ×10^{-5}

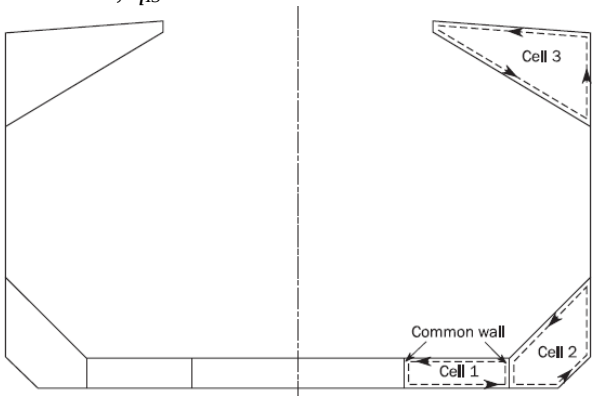

Figure 6 Numbering of closed cells

2.4 Summation

2.4.1

The shear flow q_v at all locations of the cross section can be obtained by the summation of determinate shear flow, q_D and indeterminate shear flow, q_I as shown in Figure 7.

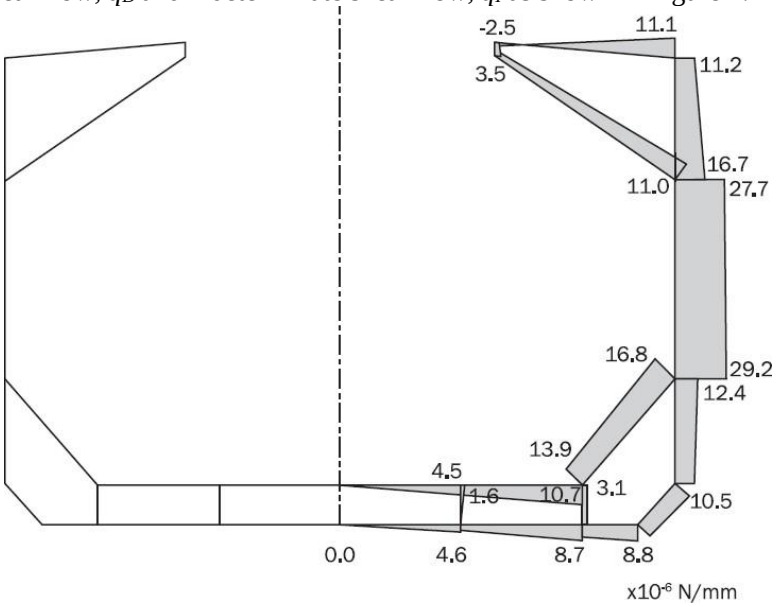

Figure 7 Calculation results of shear flow q_v, in 10^{-6} N/mm for vertical shear force with 1 N

Appendix 2 HULL GIRDER ULTIMATE CAPACITY

SYMBOLS

For symbols not defined in this article, refer to Ch 1, Sec 4.

$I_{y\text{-}n50}$: Moment of inertia, in m4, of the hull transverse section around its horizontal neutral axis, to be calculated according to Ch 5, Sec 1.

$Z_{B\text{-}n50}$, $Z_{D\text{-}n50}$: Section moduli, in m^3, at bottom and deck, respectively, defined in Ch 5, Sec 1.

R_{eHs} : Minimum yield stress, in N/mm^2, of the material of the considered stiffener.

R_{eHp} : Minimum yield stress, in N/mm^2, of the material of the considered plate.

$A_{s\text{-}n50}$: Net sectional area, in cm^2, of stiffener, without attached plating.

$A_{p\text{-}n50}$: Net sectional area, in cm^2, of attached plating.

z_i : z coordinate, in m, of centre of gravity of the i-th element.

1. GENERAL

1.1. Application

1.1.1

This appendix provides the criteria for obtaining the following ultimate longitudinal bending moment capacities:

1.1.1. M_U to be used in the hull girder ultimate capacity check according to Ch 5, Sec 2,

1.1.2. M_{UD} to be used in *the* hull girder residual strength capacity check according to Ch 5, Sec 3

1.1.2

The hull girder ultimate longitudinal bending moment capacity, M_U or M_{UD}, is defined as the maximum bending capacity of the hull girder beyond which the hull structure collapses. Hull girder failure is controlled by buckling, ultimate strength and yielding of longitudinal structural elements.

1.2. Methods

1.2.1. **Incremental-iterative method**

The hull girder ultimate bending capacity is to be assessed by the incremental-iterative method defined in [2].

1.2.2. **Alternative methods**

Principles for alternative methods for the calculation of the hull girder ultimate bending capacity; e.g. non- linear finite element analysis, are given in [3].

Application of alternative methods is to be agreed by the Society prior to commencement. Documentation of the analysis methodology and detailed comparison of its results are to be submitted for review and acceptance. The use of such methods may require the partial safety factors to be recalibrated.

1.3. Assumptions

1.3.1

The method for calculating the ultimate hull girder capacity is to identify the critical failure modes of all main longitudinal structural elements.

1.3.2

Structures compressed beyond their buckling limit have reduced load carrying capacity. All relevant failure modes for individual structural elements, such as plate buckling, torsional stiffener buckling, stiffener web buckling, lateral or global stiffener buckling; and their interactions, are to be considered in order to identify the weakest inter-frame failure mode.

1.3.3

Only vertical bending is considered. The effects of shear force, torsional loading, horizontal bending moment and lateral pressure are neglected.

1.3.4

For the calculation of the ultimate longitudinal bending moment capacity, M_{UD}, used in the hull girder residual strength check according to Ch 5, Sec 3, the structural members in way of the damage part are to be excluded from the members participating to the considered cross section strength.

2. INCREMENTAL-ITERATIVE METHOD

2.1. Assumptions

2.1.1

In applying the procedure described in [2.2], the following assumptions are generally to be made:

2.1.1. The ultimate strength is calculated at hull transverse sections between two adjacent transverse webs.

2.1.2. The hull girder transverse section remains plane during each curvature increment.

2.1.3. The hull material has an elasto-plastic behaviour.

2.1.4. The hull girder transverse section is divided into a set of elements, which are considered to act independently.

These elements are:

2.1.5. Transversely framed plating panels and/or stiffeners with attached plating, whose structural behaviour is described in [2.3.1].

2.1.6. Hard corners, constituted by plating crossing, whose structural behaviour is described in [2.3.2].

2.1.7. According to the iterative procedure, the bending moment M_i acting on the transverse section at each curvature value χ_i is obtained by summing the contribution given by the stress σ acting on each element. The stress σ corresponding to the element strain, ε is to be obtained for each curvature increment from the non-linear load-end shortening curves σ-ε of the element.

These curves are to be calculated, for the failure mechanisms of the element, from the formulae specified in [2.2]. The stress, σ is selected as the lowest among the values obtained from each of the considered load-end shortening curves σ-ε.

The procedure is to be repeated until the value of the imposed curvature reaches the value χ_F in m^{-1}, in hogging and sagging condition, obtained from the following formula:

$$\chi_F = \pm 0.003 \frac{M_Y}{EI_{y\text{-}n50}}$$

where:

M_Y : Lesser of the values M_{Y1} and M_{Y2}, in kNm.

$M_{Y1} = 10^3 R_{eH} Z_{B\text{-}n50}$

$M_{Y2} = 10^3 R_{eH} Z_{D\text{-}n50}$

If the value χ_F is not sufficient to evaluate the peaks of the curve M-χ, the procedure is to be repeated until the value of the imposed curvature permits the calculation of the maximum bending moments of the curve.

2.2. Procedure

2.2.1. General

The curve M-χ is to be obtained by means of an incremental-iterative approach, summarised in the flow chart in Figure 1.

In this procedure, the ultimate hull girder bending moment capacity, M_U is defined as the peak value of the curve with vertical bending moment M versus the curvature χ of the ship cross section as shown in Figure 1. The curve is to be obtained through an incremental-iterative approach.

Each step of the incremental procedure is represented by the calculation of the bending moment M_i which acts on the hull transverse section as the effect of an imposed curvature χ_i.

For each step, the value χ_i is to be obtained by summing an increment of curvature, $\Delta\chi$ to the value relevant to the previous step χ_{i-1}.This increment of curvature corresponds to an increment of the rotation angle of the hull girder transverse section around its horizontal neutral axis.

This rotation increment induces axial strains, ε in each hull structural element, whose value depends on the position of the element. In hogging condition, the structural elements above the neutral axis are lengthened, while the elements below the neutral axis are shortened, and vice-

versa in sagging condition.
The stress σ induced in each structural element by the strain ε is to be obtained from the load-end shortening curve σ-ε of the element, which takes into account the behaviour of the element in the non-linear elasto-plastic domain.
The distribution of the stresses induced in all the elements composing the hull transverse section determines, for each step, a variation of the neutral axis position, since the relationship σ-ε is non-linear. The new position of the neutral axis relevant to the step considered is to be obtained by means of an iterative process, imposing the equilibrium among the stresses acting in all the hull elements.
Once the position of the neutral axis is known and the relevant stress distribution in the section structural elements is obtained, the bending moment of the section M_i around the new position of the neutral axis, which corresponds to the curvature χ_i imposed in the step considered, is to be obtained by summing the contribution given by each element stress.
The main steps of the incremental-iterative approach described above are summarised as follows (see also Figure1):

a) Step 1 : Divide the transverse section of hull into stiffened plate elements.
b) Step 2 : Define stress-strain relationships for all elements as shown in Table 1.
c) Step 3: Initialise curvature χ_1 and neutral axis for the first incremental step with the value of incremental curvature (i.e. curvature that induces a stress equal to 1% of yield strength in strength deck) as:

$$\chi_1 = \Delta\chi = 0.01 \frac{R_{eH}}{E} \frac{1}{z_D - z_n}$$

where:

z_D : Z coordinate, in m, of strength deck at side, with respect to reference coordinate defined in Ch 1, Sec 4, [3.6]

d) Step 4: Calculate for each element the corresponding strain, $\varepsilon_i = \chi(z_i - z_n)$ and the corresponding stress σ_i .
e) Step 5: Determine the neutral axis z_{NA_cur} at each incremental step by establishing force equilibrium over the whole transverse section as:
$\sum A_{i\text{-}n50}\sigma_i = \sum A_{j\text{-}n50}\sigma_j$ (*i*-th element is under compression, *j*-th element under tension).
f) Step 6: Calculate the corresponding moment by summing the contributions of all elements as:

$$M_U = \sum \sigma_{Ui} A_{i-n50} \left| \left(z_i - z_{NA_cur} \right) \right|$$

g) Step7: Compare the moment in the current incremental step with the moment in the previous incremental step. If the slope in M-χ relationship is less than a negative fixed value, terminate the process and define the peak value of M_U Otherwise, increase the curvature by the amount of $\Delta\chi$ and go to Step 4.

2.2.2. Modelling of the hull girder cross section

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder ultimate strength.

Sniped stiffeners are also to be modelled, taking account that they do not contribute to the hull girder strength. The structural members are categorised into a stiffener element, a stiffened plate element or a hard corner element.
The plate panel including web plate of girder or side stringer is idealised into either a stiffened plate element, an attached plate of a stiffener element or a hard corner element.

The plate panel is categorised into the following two kinds:

2.2.2.1. Longitudinally stiffened panel of which the longer side is in the longitudinal direction, and
2.2.2.2. Transversely stiffened panel of which the longer side is in the perpendicular direction to the longitudinal direction.

2.2.2.2.1. Hard corner element:

Hard corner elements are sturdier elements composing the hull girder transverse section, which collapse mainly according to an elasto-plastic mode of failure (material yielding);

they are generally constituted by two plates not lying in the same plane.
The extent of a hard corner element from the point of intersection of the plates is taken equal to $20t_{n50}$ on transversely stiffened panel and to 0.5 s on a longitudinally stiffened panel, see Figure 2.
where:
t_{n50} : Net offered thickness of the plate, in mm.
s : Spacing of the adjacent longitudinal stiffener, in m.

Bilge, sheer strake-deck stringer elements, girder-deck connections and face plate-web connections on large girders are typical hard corners. Enlarged stiffeners, with or without web stiffening, used for Permanent Means of Access (PMA) are not to be considered as a large girder so the attached plate/web connection is only considered as a hard corner, see Figure 3.

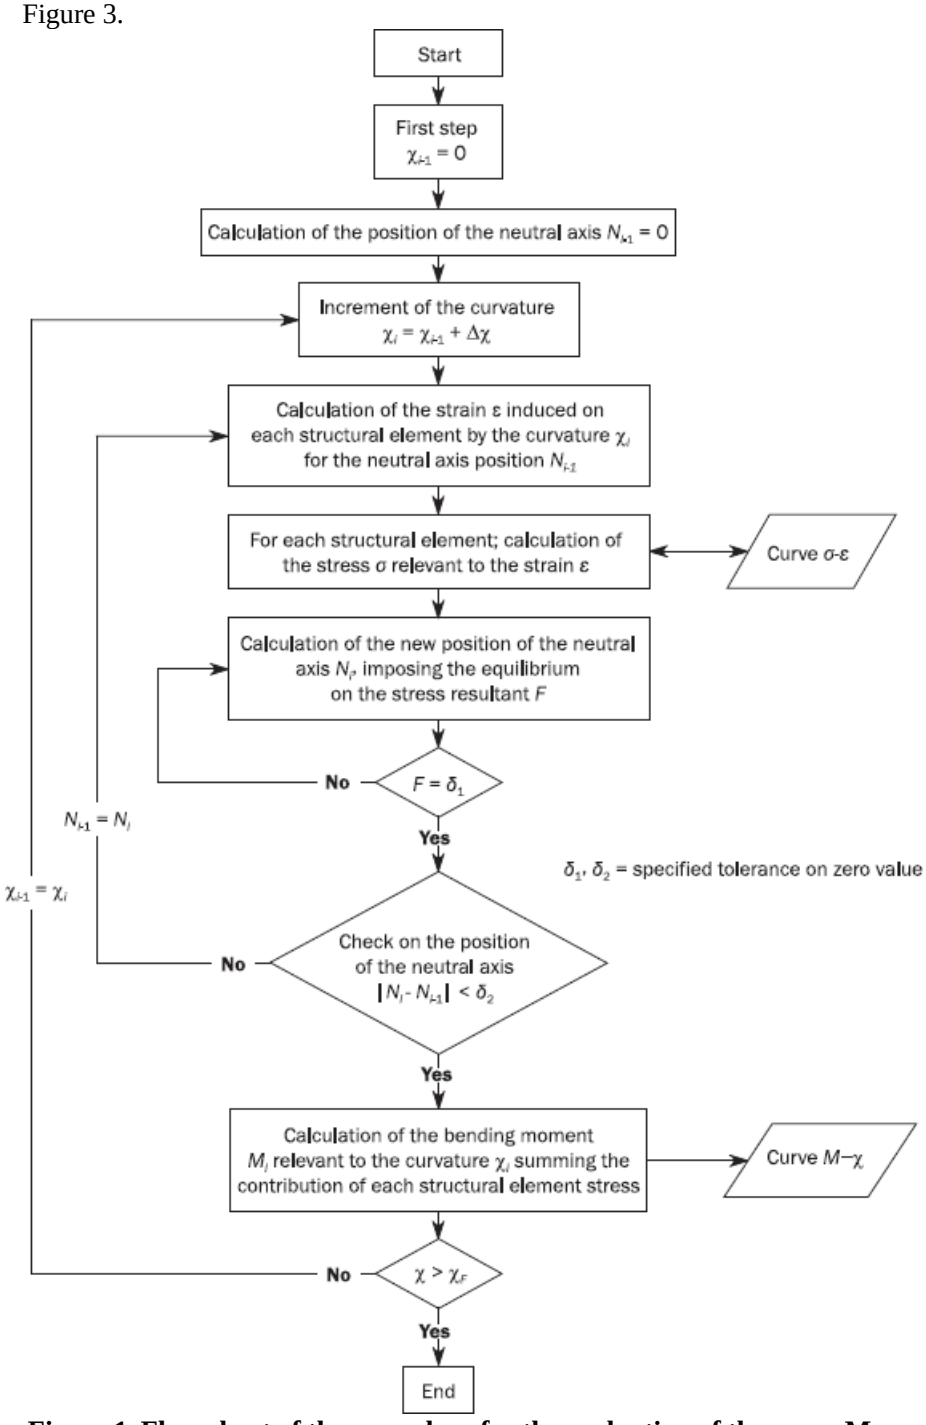

Figure 1 Flow chart of the procedure for the evaluation of the curve M-χ

2.2.2.2.2. Stiffener element:

The stiffener constitutes a stiffener element together with the attached plate. The attached plate width is in principle:

2.2.2.2.2.1. Equal to the mean spacing of the stiffener when the panels on both sides of the stiffener are longitudinally stiffened, or

2.2.2.2.2.2. Equal to the width of the longitudinally stiffened panel when the panel on one side of the stiffener is longitudinally stiffened and the other panel is of the transversely stiffened, see Figure 2.

2.2.2.2.3. Stiffened plate element:

The plate between stiffener elements, between a stiffener element and a hard corner element or between hard corner elements is to be treated as a stiffened plate element, see Figure 2.

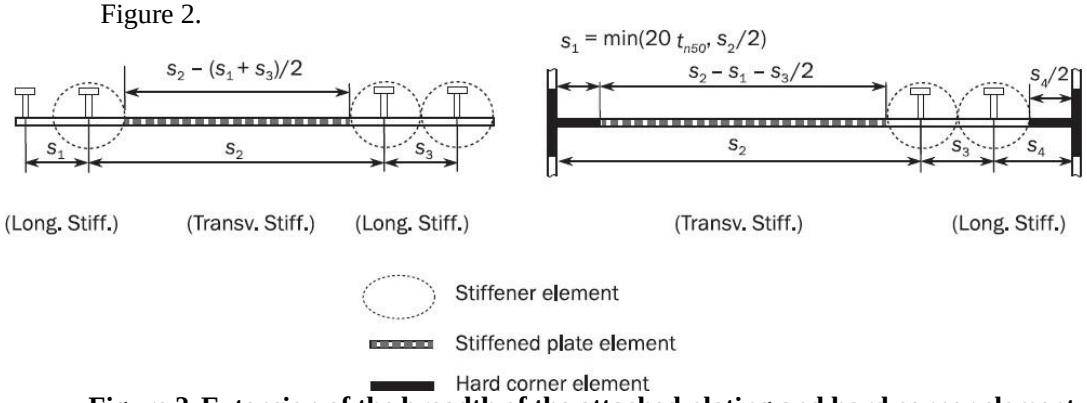

Figure 2 Extension of the breadth of the attached plating and hard corner element

The typical examples of modelling of hull girder section are illustrated in Figure 3 and Figure 4. Notwithstanding the foregoing principle, these figures are to be applied to the modelling in the vicinity of upper deck, sheer strake and hatch side girder.

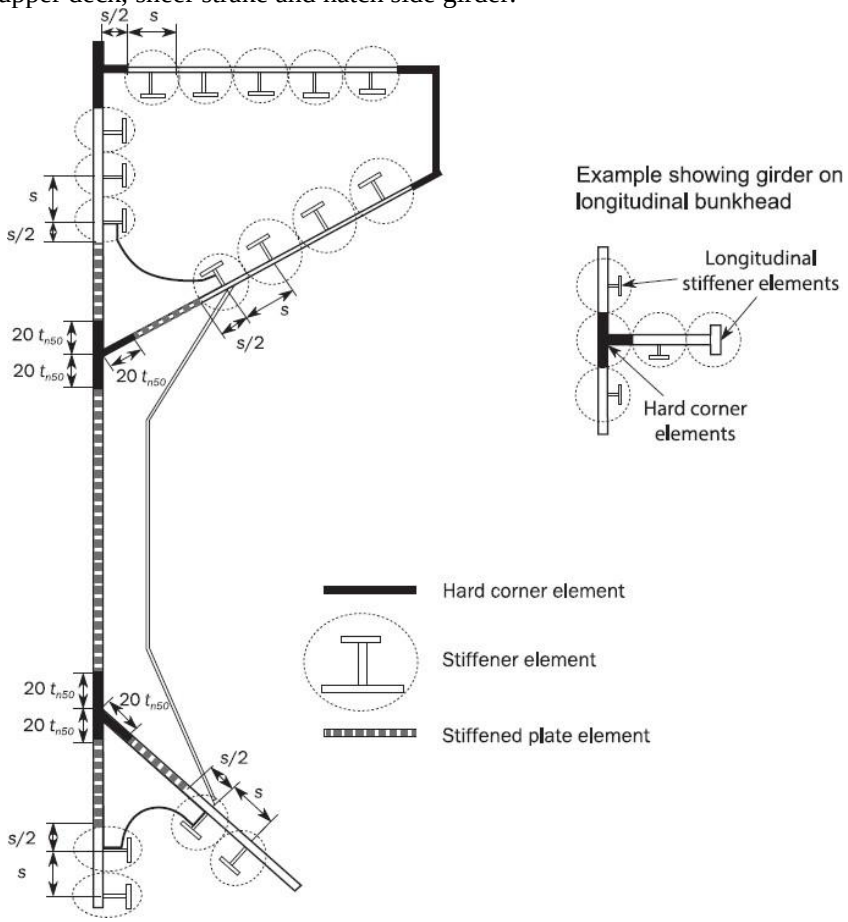

Figure 3 Examples of the configuration of stiffened plate elements, stiffener elements and hard corner elements on a hull section

- In case of the knuckle point as shown in Figure 5, the plating area adjacent to knuckles in the plating with an angle greater than30 deg is defined as a hard corner. The extent of one side of the corner is taken equal to $20t_{n50}$ on transversely framed panels and to 0.5 *s* on longitudinally framed panels from the knuckle point.
- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the non-continuous stiffeners are considered only as dividing a plate into various elementary plate panels.
- Where the opening is provided in the stiffened plate element, the openings are to be considered in accordance with Ch 5, Sec 1, [1.2.9].
- Where attached plating is made of steels having different thicknesses and/or yield stresses, an average thickness and/or average yield stress obtained from the following formula are to be used for the calculation.

$$t_{n50} = \frac{t_{1-n50}s_1 + t_{2-n50}s_2}{s} \quad R_{eHp} = \frac{R_{eHp1}t_{1-n50}s_1 + R_{eHp2}t_{2-n50}s_2}{t_{n50}s}$$

where R_{eHp1}, R_{eHp2}, $t_{1\text{-}n50}$, $t_{2\text{-}n50}$, s_1, s_2 and *s* are shown in Figure 6.

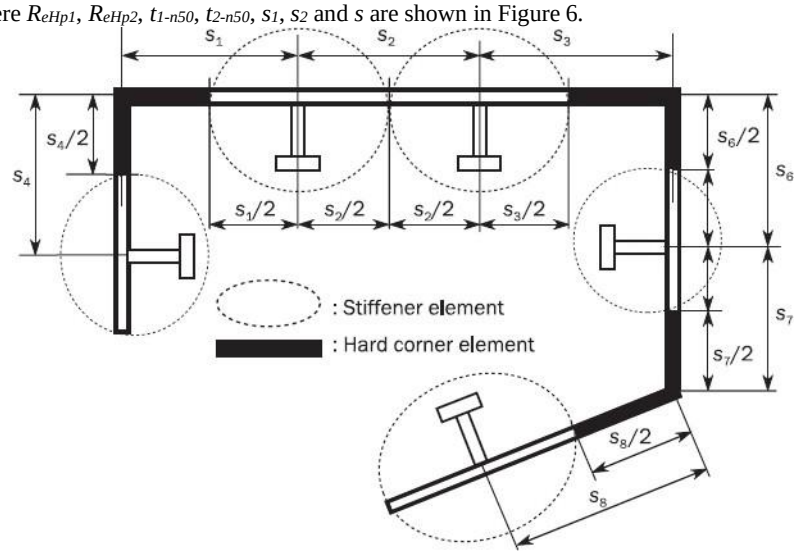

Figure 4 Extension of the breadth of the attached plating and hard corner element

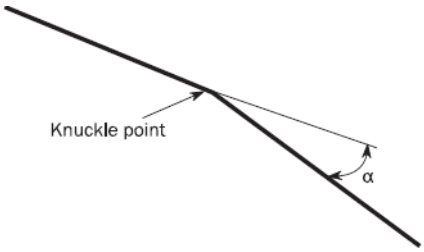

Figure 5 Plating with knuckle point

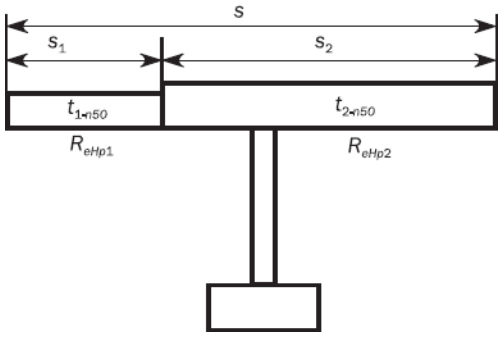

Figure 6 Element with different thickness and yield strength

2.3. Load-end shortening curves

2.3.1. Stiffened plate element and stiffener element

Stiffened plate element and stiffener element composing the hull girder transverse sections may

collapse following one of the modes of failure specified in Table 1.

- Where the plate members are stiffened by non-continuous longitudinal stiffeners, the stress of the element is to be obtained in accordance with [2.3.3] to [2.3.8], taking into account the non-continuous longitudinal stiffener. In calculating the total forces for checking the hull girder ultimate strength, the area of non-continuous longitudinal stiffener is to be assumed as zero.
- Where the opening is provided in the stiffened plate element, the considered area of the stiffened plate element is to be obtained by deducting the opening area from the plating in calculating the total forces for checking the hull girder ultimate strength. The consideration of the opening is in accordance with the requirement in Ch 5, Sec 1, [1.2.9] to Ch 5, Sec 1, [1.2.13].
- For stiffened plate element, the effective width of plate for the load shortening portion of the stress- strain curve is to be taken as full plate width, i.e. to the intersection of other plate or longitudinal stiffener – neither from the end of the hard corner element nor from the attached plating of stiffener element, if any. In calculating the total forces for checking the hull girder ultimate strength, the area of the stiffened plate element is to be taken between the hard corner element and the stiffener element or between the hard corner elements, as applicable.

Modes of failure of stiffened plate element and stiffener element Table 1

Element	Mode of failure	Curve σ-ε defined in
Lengthened stiffened plate element or stiffener element	Elasto-plastic collapse	[2.3.3]
Shortened stiffener element	Beam column buckling Torsional buckling Web local buckling of flanged profiles Web local buckling of flat bars	[2.3.4] [2.3.5] [2.3.6] [2.3.7]
Shortened stiffened plate element	Plate buckling	[2.3.8]

2.3.2. Hard corner element

The relevant load-end shortening curve σ-ε is to be obtained for lengthened and shortened hard corners according to [2.3.3].

2.3.3. Elasto-plastic collapse of structural elements

The equation describing the load-end shortening curve σ-ε for the elasto-plastic collapse of structural elements composing the hull girder transverse section is to be obtained from the following formula, valid for both positive (shortening) and negative (lengthening) strains, see Figure 7:

$$\sigma = \Phi R_{eHA}$$

where:

R_{eHA}: Equivalent minimum yield stress, in N/mm^2, of the considered element, obtained by the following formula:

$$R_{eHA} = \frac{R_{eHp} A_{p-50} + R_{eHs} A_{s-n50}}{A_{p-n50} + A_{s-n50}}$$

Φ : Edge function, equal to:

$\Phi = -1$ for $\varepsilon < -1$

$\Phi = \varepsilon$ for $-1 \leqslant \varepsilon \leqslant 1$

$\Phi = 1$ for $\varepsilon > 1$

ε : Relative strain, equal to:

$$\varepsilon = \frac{\varepsilon_E}{\varepsilon_Y}$$

ε_E : Element strain.

ε_Y : Strain at yield stress in the element, equal to:

$$\varepsilon_Y = \frac{R_{eHA}}{E}$$

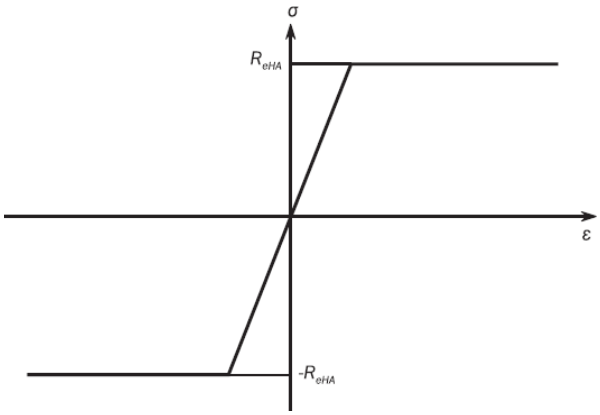

Figure 7 Load-end curve σ-ε for elasto plastic collapse

2.3.4. **Beam column buckling**

The equation describing the load-end shortening curve σ_{CR10}-ε for the beam column buckling of stiffeners composing the hull girder transverse section is to be obtained from the following formula, see Figure 8:

$$\sigma_{CR1} = \Phi \sigma_{C1} \frac{A_{s-n50} + A_{pE-n50}}{A_{s-n50} + A_{p-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

σ_{C1} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C1} = \frac{\sigma_{E1}}{\varepsilon} \qquad \text{for } \sigma_{E1} \le \frac{R_{eHB}}{2}\varepsilon$$

$$\sigma_{C1} = R_{eHB}\left(1 - \frac{R_{eHB}\varepsilon}{4\sigma_{E1}}\right) \quad \text{for } \sigma_{E1} > \frac{R_{eHB}}{2}\varepsilon$$

R_{eHB}: Equivalent minimum yield stress, in N/mm^2, of the considered element, obtained by the following formula:

$$R_{eHB} = \frac{R_{eHp}A_{pEI-n50}l_{pE} + R_{eHs}A_{s-n50}l_{sE}}{A_{pEI-n50}l_{pE} + A_{s-n50}l_{sE}}$$

$A_{pEl-n50}$: Effective area, in cm^2, equal to:

$A_{pEl-n50} = 10 b_{E1} t_{n50}$

l_{pE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plate of width b_{E1} to the bottom of the attached plate.

l_{sE} : Distance, in mm, measured from the neutral axis of the stiffener with attached plating of width b_{E1} to the top of the stiffener.

ε : Relative strain, as defined in [2.3.3].

σ_{E1} : Euler column buckling stress, in N/mm^2, equal to:

$$\sigma_{E1} = \pi^2 E \frac{I_{E-n50}}{A_{E-n50}l^2}10^{-4}$$

$I_{E\text{-}n50}$: Net moment of inertia of stiffeners, in cm^4, with attached plating of width b_{E1}.

$A_{E\text{-}n50}$: Net area, in cm^2, of stiffeners with attached plating of width b_E.

b_{E1} : Effective width corrected for relative strain, in m, of the attached plating, equal to:

$$b_{E1} = \frac{s}{\beta_E} \qquad \text{for } \beta_E > 1.0$$

$$b_{E1} = s \qquad \text{for } \beta_E \le 1.0$$

β_E : $\beta_E = 10^3 \dfrac{s}{t_{n50}} \sqrt{\dfrac{\varepsilon R_{eHp}}{E}}$

$A_{pE\text{-}n50}$: Net sectional area, in cm^2, of attached plating of width b_E, equal to:

$$A_{pE-n50} = 10 b_E t_{n50}$$

b_E : Effective width, in m, of the attached plating, equal to:

$$b_E = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2} \right) s \quad \text{for } \beta_E > 1.25$$

$$b_E = s \quad \text{for } \beta_E \le 1.25$$

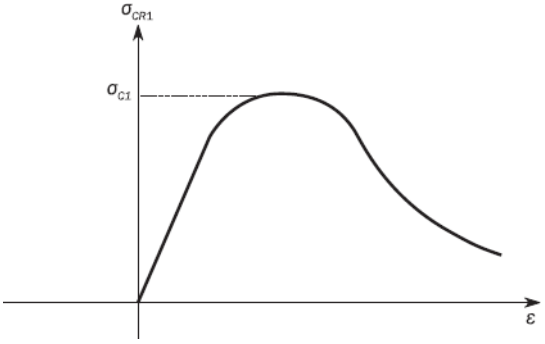

Figure 8 Load-end shortening curve σ_{CR1}-ε for beam column buckling

2.3.5 Torsional buckling

The equation describing the load-end shortening curve σ_{CR2}-ε for the flexural-torsional buckling of stiffeners composing the hull girder transverse section is to be obtained according to the following formula, see Figure 9.

$$\sigma_{CR2} = \Phi \frac{A_{s-n50}\sigma_{C2} + A_{p-n50}\sigma_{CP}}{A_{s-n50} + A_{p-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].

σ_{C2} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C2} = \frac{\sigma_{E2}}{\varepsilon} \quad \text{for } \sigma_{E2} \le \frac{R_{eHs}}{2}\varepsilon$$

$$\sigma_{C2} = R_{eHs}\left(1 - \frac{R_{eHs}\varepsilon}{4\sigma_{E2}}\right) \quad \text{for } \sigma_{E2} > \frac{R_{eHs}}{2}\varepsilon$$

σ_{E2} : Euler torsional buckling stress, in N/mm^2, taken as σ_{ET} in Ch 8, Sec 5, [2.3.4].

ε : Relative strain, as defined in [2.3.3].

σ_{CP} : Buckling stress of the attached plating, in N/mm^2, equal to:

$$\sigma_{CP} = \left(\frac{2.25}{\beta_E} - \frac{1.25}{\beta_E^2} \right) R_{eHp} \quad \text{for} \quad \beta_E > 1.25$$

$$\sigma_{CP} = R_{eHp} \quad \text{for} \quad \beta_E \le 1.25$$

β_E : Coefficient, as defined in [2.3.4].

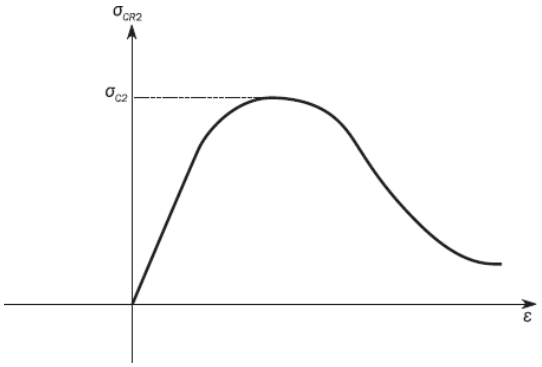

Figure 9 Load-end shortening curve σ_{CR2}-ε for flexural-torsional buckling

2.3.6 Web local buckling of stiffeners made of flanged profiles

The equation describing the load-end shortening curve σ_{CR3}-ε for the web local buckling of flanged stiffeners composing the hull girder transverse section is to be obtained from the following formula:

$$\sigma_{CR3} = \Phi \frac{10^3 b_E t_{n50} R_{eHp} + \left(h_{we} t_{w-n50} + b_f t_{f-n50}\right) R_{eHs}}{10^3 s t_{n50} + h_w t_{w-n50} + b_f t_{f-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].
b_E : Effective width, in m, of the attached shell plating, as defined in [2.3.4].
h_{we} : Effective height, in mm, of the web, equal to:

$$h_{we} = \left(\frac{2.25}{\beta_w} - \frac{1.25}{\beta_w^2}\right) h_w \quad \text{for} \quad \beta_w \geq 1.25$$
$$h_{we} = h_w \quad \text{for} \quad \beta_w < 1.25$$

ε : Relative strain, as defined in [2.3.3].

2.3.7 Web local buckling of stiffeners made of flat bars

The equation describing the load-end shortening curve σ_{CR4}-ε for the web local buckling of flat bar stiffeners composing the hull girder transverse section is to be obtained from the following formula, see Figure 10:

$$\sigma_{CR4} = \Phi \frac{A_{P-n50}\sigma_{CP} + A_{s-n50}\sigma_{C4}}{A_{p-n50} + A_{s-n50}}$$

where:

Φ : Edge function, as defined in [2.3.3].
σ_{CP} : Buckling stress of the attached plating, in N/mm^2, as defined in [2.3.5].
σ_{C4} : Critical stress, in N/mm^2, equal to:

$$\sigma_{C4} = \frac{\sigma_{E4}}{\varepsilon} \quad \text{for} \quad \sigma_{E4} \leq \frac{R_{eHs}}{2}\varepsilon$$
$$\sigma_{C4} = R_{eHs}\left(1 - \frac{R_{eHs}\varepsilon}{4\sigma_{E4}}\right) \quad \text{for} \quad \sigma_{E4} > \frac{R_{eHs}}{2}\varepsilon$$

σ_{E4} : Local Euler buckling stress, in N/mm^2, equal to:

$$\sigma_{E4} = 160000\left(\frac{t_{w-n50}}{h_w}\right)^2$$

ε : Relative strain, as defined in [2.3.3].

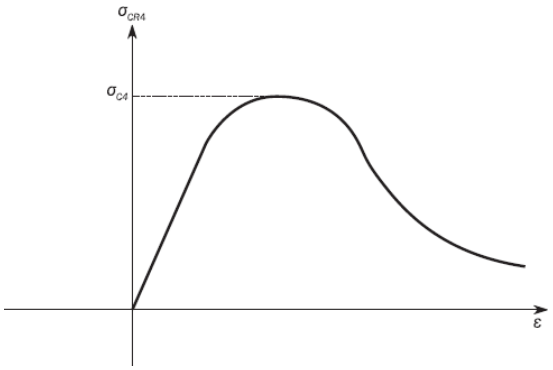

Figure 10 Load-end shortening curve σ_{CR4}-ε for web local buckling

2.3.8 Plate buckling

The equation describing the load-end shortening curve σ_{CR5}-ε for the buckling of transversely stiffened panels composing the hull girder transverse section is to be obtained from the following formula:

where:

$$\sigma_{CR5} = \min\left\{ \begin{array}{c} R_{eHp}\Phi \\ \Phi R_{eHp}\left[\frac{s}{l}\left(\frac{2.25}{\beta_E}-\frac{1.25}{\beta_E^2}\right)+0.1\left(1-\frac{s}{l}\right)\left(1+\frac{1}{\beta_E^2}\right)^2\right] \end{array}\right.$$

Φ : Edge function, as defined in [2.3.3].

$$\beta_E : \beta_E = 10^3 \frac{s}{t_{n50}}\sqrt{\frac{\varepsilon R_{eHp}}{E}}$$

s : Plate breadth, in m, taken as the spacing between the stiffeners.

l : Longer side of the plate, in m.

3. ALTERNATIVE METHODS

3.1. General

3.1.1

The bending moment-curvature relationship, M-χ, may be established by alternative methods. Such models are to consider all the relevant effects important to the non-linear response with due considerations of:

a) Non-linear geometrical behaviour.
b) Inelastic material behaviour.
c) Geometrical imperfections and residual stresses (geometrical out-of-flatness of plate and stiffeners).
d) Simultaneously acting loads:
   - Bi-axial compression.
   - Bi-axial tension.
   - Shear and lateral pressure.
e) Boundary conditions.
f) Interactions between buckling modes.
g) Interactions between structural elements such as plates, stiffeners, girders, etc.
h) Post-buckling capacity.
i) Overstressed elements on the compression side of hull girder cross section possibly leading to local permanent sets/buckle damages in plating, stiffeners etc (double bottom effects or similar).

3.2. Non-linear finite element analysis

3.2.1

Advanced non-linear finite element analyses models may be used for the assessment of the hull girder ultimate capacity. Such models are to consider the relevant effects important to the non-linear responses with due consideration of the items listed in [3.1.1].

ISC 3.2.1a The non-linear finite element analysis method used for the assessment of the ultimate strength of hull girders are given in ISC Appendix C of this PART.

3.2.2

Particular attention is to be given to modelling the shape and size of geometrical imperfections. It is to be ensured that the shape and size of geometrical imperfections trigger the most critical failure modes.

Chapter 6 HULL LOCAL SCANTLING

Section 1 GENERAL

1 APPLICATION

1.1 Application

1.1.1

This chapter applies to hull structure over the full length of the ship including fore end, cargo hold region, machinery space and aft end, the side shell above the freeboard deck, engine casing, exposed decks of superstructure and internal decks except those inside superstructure and deckhouse.

1.1.2

This chapter provides requirements for evaluation of plating, stiffeners and Primary Supporting Members (PSM) subject to lateral pressure, local loads and to hull girder loads, as applicable. Requirements are specified for:

- Load application in Ch 6, Sec 2.
- Minimum thickness of plates, stiffeners and PSM in Ch 6, Sec 3.
- Plating in Ch 6, Sec 4.
- Stiffeners in Ch 6, Sec 5.
- PSM and pillars in Ch 6, Sec 6.

In addition, other requirements not related to defined design load sets, are provided.

1.1.3 Required scantlings

The offered net scantling is to be greater than or equal to the required scantlings based on requirements provided in this chapter.

1.1.4 Additional local strength requirements

Additional local strength requirements are provided in Ch 10 considering bow impact loads, bottom slamming loads and sloshing loads, and for fore end, machinery space and aft end.

1.2 Acceptance criteria

1.2.1

Acceptance criteria set to be selected based on design load as follows:

1.2.1 AC-S for design load S; static loads.

1.2.2 AC-SD for design load S+D; combination of static and dynamic loads.

Section 2 LOAD APPLICATION

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

1 LOAD COMBINATION

1.1 Hull girder bending

1.1.1 Normal stresses

The normal stress σ_{hg} , in N/mm^2, induced by acting vertical and horizontal bending moments at the position being considered is given as follow. This stress is to be calculated for each design load set, as defined in [2] covering all dynamic load cases defined in Ch 4 in combination with M_{sw} both in hogging and in sagging.

$$\sigma_{hg} = \left(\frac{M_{sw} + M_{wv-LC}}{I_{y-n50}} (z - z_n) - \frac{M_{wh-LC}}{I_{z-n50}} y \right) 10^{-3}$$

where:

M_{sw} : Still water bending moment, in kNm, as defined in Ch 4, Sec 4, [2.2] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1.

$M_{wv\text{-}LC}$: Vertical wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, [3.5.2] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1, at the considered longitudinal position.

$M_{wh\text{-}LC}$: Horizontal wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, [3.5.4] in accordance with the considered design load scenario in Ch 4, Sec 7, Table 1, at the considered longitudinal position.

$I_{y\text{-}n50}$: Net vertical hull girder moment of inertia, at the longitudinal position being considered, in m^4.

$I_{z\text{-}n50}$: Net horizontal hull girder moment of inertia, at the longitudinal position being considered, in m^4.

y : Transverse coordinate of load calculation point, in m.

z : Vertical coordinate of the load calculation point under consideration, in m.

z_n : Distance from the baseline to the horizontal neutral axis, in m.

1.2 Lateral pressures

1.2.1 Static and dynamic pressures in intact conditions

The static and dynamic lateral pressures in intact condition induced by the sea and the various types of cargoes, ballast and other liquids are to be considered. Applied loads will depend on the location of the elements under consideration, and the adjacent type of compartments.

1.2.2 Lateral pressure in flooded conditions

Watertight boundaries of compartments not intended to carry liquids, excluding shell envelope, are to be subjected to lateral pressure in flooded conditions.

1.3 Pressure combination

1.3.1 Elements of the outer shell

If the compartment adjacent to the outer shell is intended to carry liquids, the static and dynamic lateral pressures to be considered are the differences between the internal pressures and the external sea pressures at the corresponding draught.

If the compartment adjacent to the outer shell is not intended to carry liquids, the internal pressures and external sea pressures are to be considered independently.

1.3.2 Elements other than those of the outer shell

Except as specified in [1.3.1], the static and dynamic lateral pressures on an element separating two adjacent compartments are those obtained considering the two compartments individually loaded.

2 DESIGN LOAD SETS

2.1 Application of load components

2.1.1 Application

These requirements apply to:

- Plating and stiffeners along the full length of the ship.
- PSM outside the cargo hold region.

2.1.2 Load components

The static and dynamic load components are to be determined in accordance with Ch 4, Sec 7, Table 1.

Radius of gyration, k_r, and metacentric height, GM, are to be in accordance with Ch 4, Sec 3, Table 1 and Ch 4, Sec 3, Table 2 for the considered loading conditions specified in the design load sets given in Table 1.

2.1.3 Design load sets for plating, stiffeners and PSM

Design load sets for plating, stiffeners and primary supporting members are given in Table 1.

In addition, the design load sets for primary supporting members of bulk carriers with freeboard length L_{LL} less than 150 m and of oil tankers within the cargo hold region are given respectively in Pt 2, Ch 1, Sec 4, [4.2] and in Pt 2, Ch 2, Sec 3, [1.2].

Design load sets **Table 1**

Item	Design load set	Load component	Draught	Design load	Loading condition
External shell and exposed deck	SEA-1	P_{ex}, P_D	T_{SC}	S+D	Full Load condition (1)
	SEA-2	P	T	S	Harbour condition (2)
Water ballast tank (oil tanker and bulk carrier)	WB-1	$P_{in} - P_{ex}$ (3)	T_{BAL}	S+D	Normal ballast condition
	WB-2	$P_{in} - P_{ex}$ (3)	T_{BAL}	S+D	Normal ballast condition Water ballast exchange
	WB-3	$P_{in} - P_{ex}$ (3)	$0.25T_{SC}$	S	Harbour/test condition
Water ballast tank (bulk carrier) and bulk cargo hold assigned as ballast hold	WB-4	$P_{in} - P_{ex}$ (3)	T_{BAL-H} (7)	S+D	Heavy ballast condition
	WB-5 (4)	$P_{in} - P_{ex}$ (3)	T_{BAL-H} (7)	S+D	Heavy ballast condition Water ballast exchange
	WB-6 (5)	P_{in}	-	S	Harbour/test condition
Cargo oil tank	OT-1	P_{in}	T_{SC}	S+D	Full Load condition
	OT-2	P_{in}	$0.6T_{SC}$	S+D	Partial load condition
	OT-3	P_{in}	-	S	Harbour/Test condition
Bulk cargo hold	BC-1	P_{in}	T_{SC}	S+D	Homogeneous loading, fully filled
	BC-2	P_{in}	-	S	
	BC-3	P_{in}	T_{SC}	S+D	Homogeneous heavy cargo, partially filled (BC-A, B ships)
	BC-4	P_{in}	-	S	
	BC-5	P_{in}	T_{SC}	S+D	Alternate light cargo, fully filled (BC-A ships)
	BC-6	P_{in}	-	S	
	BC-7	P_{in}	T_{SC}	S+D	Alternate heavy cargo, partially filled (BC-A ships.)
	BC-8	P_{in}	-	S	
Other tanks (fuel oil tank, fresh water tank)	TK-1	$P_{in} - P_{ex}$ (3)	T_{BAL}	S+D	Normal ballast condition
	TK-2	$P_{in} - P_{ex}$ (3)	$0.25T_{SC}$	S	Harbour/test condition
Compartments not carrying liquids	FD-1 (6)	P_{in}	T_{SC}	S+D	Flooded condition
	FD-2 (6)	P_{in}	-	S	Flooded condition
Exposed deck, internal decks or platforms	DL-1 (8)	P_{dl}, F_U	T_{SC}	S+D	Full Load condition
	DL-2 (8)	P_{dl}, F_U	-	S	Harbour condition

(1) For bulk carrier BC-A and BC-B, full load condition means 'homogeneous heavy cargo'.
(2) For external shell only.
(3) P_{ex} is to be considered for external shell only.
(4) Not to be applied to bulk cargo hold assigned as ballast hold.
(5) Bulk cargo hold only.
(6) FD-1 and FD-2 are not applicable to external shell and corrugations of transverse vertically corrugated bulkhead separating cargo holds. Requirement in flooded conditions of transverse corrugated bulkhead are given in Pt 2, Ch 1, Sec 3, [3]. FD-1 and FD-2 are to be considered for strength deck whenever applicable.
(7) Minimum draught among heavy ballast conditions is to be used.
(8) Distributed or concentrated loads only. Need not be combined with simultaneously occurring green sea pressure.

Section 3 MINIMUM THICKNESSES

SYMBOLS
For symbols not defined in this section, refer to Ch 1, Sec 4.

1 PLATING

1.1 Minimum thickness requirements

1.1.1
The net thickness of plating in mm, is to comply with the appropriate minimum thickness requirements given in Table 1.

Minimum net thickness for plating **Table 1**

Element	Location	Area	Net thickness
Shell	Keel	-	$7.5 + 0.03\,L_2$
	Bottom Side shell Bilge	Fore Part	$6.5 + 0.03\,L_2$
		Machinery space Aft part	$7.0 + 0.03\,L_2$
		Elsewhere	$5.5 + 0.03\,L_2$
Breasthook	Fore part	Breasthook	6.5
Deck	Weather deck, strength deck, internal tank boundary	-	$4.5 + 0.02\,L_2$
	Platform deck	Machinery space	$2.8 + 0.0067s$
		Elsewhere	6.5
Inner bottom (1)	-	Machinery space	$6.6 + 0.024\,L_2$
		Elsewhere	$5.5 + 0.03\,L_2$
Longitudinal bulkheads of bulk carriers	Inner side, hopper tank top, top wing tank longitudinal bulkhead	Cargo hold region	$0.7\,L_2$
Bulkheads	Internal tank boundary, Transverse/longitudinal watertight bulkhead	-	$4.5 + 0.02\,L_2$
	Non-tight bulkhead, Wash bulkhead, Bulkheads between dry spaces.	-	$4.5 + 0.01\,L_2$
	Pillar bulkheads in fore and aft peaks	-	7.5
Other members	Diaphragms in lower/upper stool	-	$5.0 + 0.015\,L_2$
	Engine casing (in the cargo hold region)	Cargo hold region	5.5
	Engine casing (in way of accommodation)	Accommodation	4.0
	Other plates in general	-	$4.5 + 0.01L_2$
(1) Applicable for both tight and non tight members			

2 STIFFENERS AND TRIPPING BRACKETS

2.1 Minimum thickness requirements

2.1.1
The net thickness of the web and face plate, if any, of stiffeners and tripping brackets in mm, is to comply with the minimum net thickness given in Table 2.

In addition, the net thickness of the web of stiffeners and tripping brackets, in mm, is to be:

- Not less than 40% of the net required thickness of the attached plating, to be determined

according to Ch 6, Sec 4.

- Less than twice the net offered thickness of the attached plating.

Minimum net thickness for stiffeners and tripping brackets **Table 2**

Element	Location	Net thickness
Stiffeners and attached end brackets	Watertight boundary	3.5 + 0.015 L_2
	Other structure	3.0 + 0.015 L_2
Cargo hold side frames webs of single side bulk carriers	Foremost hold (1)	6.0 + 0.026 L
	Other holds (1)	5.2 + 0.023 L
Tripping brackets		5.0+ 0.015 L_2
(1) L needs not to be taken greater than 200 m		

3 PRIMARY SUPPORTING MEMBERS

3.1 Minimum thickness requirements

3.1.1

The net thickness of web plating and flange of primary supporting members in mm, is to comply with the minimum net thickness given in Table 3.

Minimum net thickness for primary supporting members **Table 3**

Element	Location		Net thickness
Double bottom centreline girder	Machinery space		1.55 $L_2^{1/3}$+3.5
	Elsewhere		5.5 + 0.025 L_2
Other bottom girder	Machinery space		1.7 $L_2^{1/3}$+1.0
	Fore part of ships with $L \geqslant$ 150 m		0.7 $L_2^{1/2}$
	Elsewhere and fore part of ships with L < 150 m		5.5 + 0.02 L_2
Girders bounding a duct keel	Machinery space		0.8 $L_2^{1/2}$ + 2.5
Bottom floor	Machinery space		1.7 $L_2^{1/3}$ + 1.0
	Fore part		0.7 $L_2^{1/2}$
	Elsewhere		0.6 $L_2^{1/2}$
Aft peak floor	-		0.7 $L_2^{1/2}$
Other primary supporting member	Aft part / fore part		0.7 $L_2^{1/2}$
	Elsewhere	In oil cargo tanks	5.5+0.015L_2
		For other cases	0.6 $L_2^{1/2}$

Section 4 PLATING

SYMBOLS

For symbols not defined in this section, refer to Ch1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as follow but not to be taken greater than 1.0.

$$\alpha_p = 1.2 - \frac{b}{2.1a}$$

a : Length of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

P : Design pressure for the considered design load set, see Ch 6, Sec 2, [2], calculated at the load calculation point defined in Ch 3, Sec 7, [2.2], in kN/m^2.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1], calculated at the load calculation point as defined in Ch 3, Sec 7, [2.2].

χ : Coefficient taken equal to:

- In intact condition:
  - χ= 0.70 for inner bottom and bilge hopper tank plating in cargo holds of bulk carriers,
  - χ= 1.00 for other cases.
- In flooded condition:
  - χ= 1.00 for collision bulkheads for acceptance criteria set AC-S,
  - χ= 0.95 for collision bulkheads for acceptance criteria set AC-SD,
  - χ= 1.15 for other watertight boundaries of compartments.

1 PLATING SUBJECTED TO LATERAL PRESSURE

1.1 Yielding check

1.1.1 Plating

The net thickness, t in mm, is not to be taken less than the greatest value for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t = 0.0158\alpha_p b\sqrt{\frac{|P|}{\chi C_a R_{eH}}}$$

C_a : Permissible bending stress coefficient for plate taken equal to:

$$C_a = \beta - \alpha\frac{|\sigma_{hg}|}{R_{eH}} \text{ not to be taken greater than } C_{a\text{-}max}.$$

β : Coefficient as defined in Table 1.

α : Coefficient as defined in Table 1.

$C_{a\text{-}max}$: Maximum permissible bending stress coefficient as defined in Table 1.

Definition β, α and $C_{a\text{-}max}$ **Table 1**

Acceptance criteria set	Structural member		β	α	$C_{a\text{-}max}$
AC-S	Longitudinal strength members	Longitudinally stiffened plating	0.9	0.5	0.8
		Transversely stiffened plating	0.9	1.0	0.8
	Other members		0.8	0.8	0
AC-SD	Longitudinal strength members	Longitudinally stiffened plating	1.05	0.5	0.95
		Transversely stiffened plating	1.05	1.0	0.95
	Other members		1.0	1.0	0

1.2 Plating of corrugated bulkheads

1.2.1 Cold hot formed and built up corrugations

The net thicknesses, t in mm, of the web and flange plates of corrugated bulkheads are not to be

taken less than the greatest value calculated for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t = 0.0158 b_p \sqrt{\frac{|P|}{C_{CB} R_{eH}}}$$

where:

b_p : Breadth of plane corrugation plating:

$b_p = b_{f\text{-}cg}$ for flange plating, in mm, as defined in Ch 3, Sec 6, Figure 21.

$b_p = b_{w\text{-}cg}$ for web plating, in mm, as defined in Ch 3, Sec 6, Figure 21.

C_{CB} : Permissible bending stress coefficient for corrugated bulkhead plating taken equal to:

- For acceptance criteria set AC-S for transverse corrugated bulkheads and vertically corrugated longitudinal bulkheads.
  $C_{CB} = 0.75$
- For acceptance criteria set AC-SD for transverse corrugated bulkheads and vertically corrugated longitudinal bulkheads.
  $C_{CB} = 0.90$
- For horizontally corrugated longitudinal bulkheads, without being greater than $C_{CB\text{-}max}$.

$$C_{CB} = \beta_{CB} - \alpha_{CB} \frac{|\sigma_{hg}|}{R_{eH}}$$

β_{CB} : Coefficient as defined in Table 2.

α_{CB} : Coefficient as defined in Table 2.

$C_{CB\text{-}max}$: Maximum permissible bending stress coefficient as defined in Table 2.

Definition β_{CB}, α_{CB} and $C_{CB\text{-}max}$ **Table 2**

Acceptance criteria set	Structural member	β_{CB}	α_{CB}	$C_{CB\text{-}max}$
AC-S	Horizontally corrugated longitudinal bulkheads	0.90	0.50	0.75
AC-SD	Horizontally corrugated longitudinal bulkheads	1.05	0.50	0.90

1.2.2 Built-up corrugations

For built-up corrugations, with flange and web plate of different thickness, the net thickness, t_1 in mm, is to be taken as the greatest value calculated for all applicable design load sets, as defined in Ch 6, Sec 2, [2.1.3], given by:

$$t_1 = \sqrt{\frac{0.0005 b_p^2 |P|}{C_{CB} R_{eH}} - t_2^2}$$

where:

t_1 : Net thickness of the thicker plating, either flange or web, in mm.

t_2 : Net thickness of the thinner plating, either flange or web, in mm.

b_P : Breadth of thicker plate, either flange or web, in mm.

C_{CB} : Permissible bending stress coefficient as defined in [1.2.1].

2 SPECIAL REQUIREMENTS

2.1 Minimum thickness of keel plating

2.1.1

The net thickness of the keel plating is not to be taken less than the offered net thickness of the adjacent 2m width bottom plating, measured from the edge of the keel strake.

The width of the keel is defined in Ch 3, Sec 6, [7.2.1].

2.2 Bilge plating

2.2.1 Definition of bilge plating

The definition of bilge plating is given in Ch 1, Sec 4, [3.8.1].

2.2.2 Bilge plating thickness

a) The net thickness of transversely stiffened bilge plating is not to be taken less than the net required thickness for the adjacent bottom shell plating and adjacent side shell plating, by Ch 6 and Ch 8, Sec 2 and Sec 3, whichever is greater. When bilge plating is divided into two or more strakes, in accordance with this requirement, the net thicknesses of lower and upper strakes are to be determined in comparison with the net required thicknesses of adjacent bottom shell plating and side shell plating respectively.

b) The net thickness of rounded bilge plating, t, in mm, is not to be taken less than:

$$t_{net} = 6.45\times10^{-4}(P_{ex}s_b)^{0.4}R^{0.6}$$

where:

P_{ex} : Design sea pressure for the design load set SEA-1 as defined in Ch 6, Sec 2, [2.1.3] calculated at the lower turn of the bilge, in kN/m^2.

R : Effective bilge radius in mm.

$$R = R_0 + 0.5(\Delta s_1 + \Delta s_2)$$

R_0 : Radius of curvature, in mm. See Figure 1.

Δs_1 : Distance between the lower turn of bilge and the outermost bottom longitudinal, in mm, see Figure 1. Where the outermost bottom longitudinal is within the curvature, this distance is to be taken as zero.

Δs_2 : Distance between the upper turn of bilge and the lowest side longitudinal, in mm, see Figure 1. Where the lowest side longitudinal is within the curvature, this distance is to be taken as zero.

s_b : Distance between transverse stiffeners, webs or bilge brackets, in mm.

c) Longitudinally stiffened bilge plating is to be assessed as regular stiffened plating. The bilge thickness is not to be less than the lesser of the value obtained by [1.1.1] and [2.2.2] b). A bilge keel is not considered as an effective 'longitudinal stiffening' member.

2.2.3 Transverse extension of bilge minimum plate thickness

Where a plate seam is located in the straight plate just below the lowest stiffener on the side shell, any increased thickness required for the bilge plating does not have to be extended to the adjacent plate above the bilge provided the plate seam is not more than $s_2/4$ below the lowest side longitudinal. Similarly, for the flat part of adjacent bottom plating, any increased thickness for the bilge plating does not have to be extended to the adjacent plate provided that the plate seam is not more than $s_1/4$ beyond the outboard bottom longitudinal. For definition of s_1 and s_2, see Figure 1.

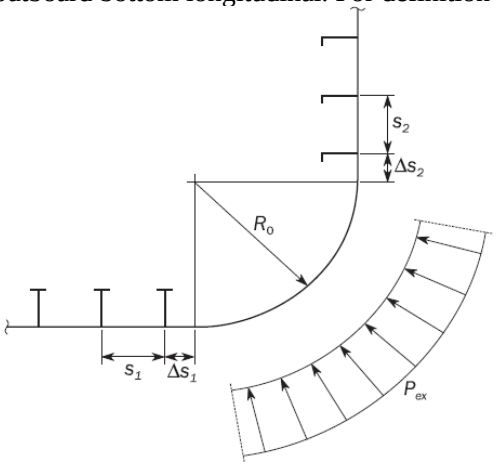

Figure 1 Transverse stiffened bilge plating

2.2.4 Hull envelope framing in bilge area

For transversely stiffened bilge plating, a longitudinal is to be fitted at the bottom and at the side close to the position where the curvature of the bilge plate starts. The scantling of those longitudinals are to be not less than the one of the closer adjacent stiffener. The distance between the lower turn of bilge and the outermost bottom longitudinal, Δs_1, is generally not to be greater than one-third of the spacing between the two outermost bottom longitudinals, s_1. Similarly, the distance between the upper turn of the bilge and the lowest side longitudinal, Δs_2, is generally not

to be greater than one-third of the spacing between the two lowest side longitudinals, s_2. See Figure 1.

2.3 Side shell plating

2.3.1 Fender contact zone

The net thickness, t in mm, of the side shell plating within the fender contact zone as specified in [2.3.2] is not to be taken less than:

$$t = 26\left(\frac{b}{1000} + 0.7\right)\left(\frac{BT_{SC}}{R_{eH}^{\ 2}}\right)^{0.25}$$

2.3.2 Application of fender contact zone requirement

The application extends within the cargo hold region as defined in Ch 1, Sec 1, [2.4.3], from the ballast draught T_{BAL} to $0.25T_{SC}$ (minimum 2.2 m) above T_{SC}.

2.4 Sheer strake

2.4.1 General

The minimum width of the sheer strake is defined in Ch 3, Sec 6, [8.2.4].

2.4.2 Welded sheer strake

The net thickness of a welded sheer strake is not to be less than the offered net thickness of the adjacent side plating, provided this adjacent side plating is located entirely within the top wing tank or double side tank as the case may be.

2.4.3 Rounded sheer strake

The net thickness of a rounded sheer strake is not to be less than:

- The offered net thickness of the adjacent 2 m width deck plating, or
- The offered net thickness of the adjacent 2 m width side plating, whichever is greater.

2.5 Deck stringer plating

2.5.1

The minimum width of deck stringer plating is defined in Ch 3, Sec 6, [9.1.2].

2.5.2

Within 0.6L of amidships, the net thickness of the deck stringer plate is not to be less than the offered net thickness of the adjacent deck plating.

2.6 Supporting structure in way of corrugated bulkheads

2.6.1 General

Requirements for the arrangement of bulkhead as given in Ch 3, Sec 6, [10.4] are to be considered together with [2.6.2] to [2.6.4].

2.6.2 Lower stool

a) The net thickness of the stool top plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation. The extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

b) The net thickness of the stool side plate, within the region of the corrugation depth from the stool top plate, is not to be less than the corrugated bulkhead flange net required thickness at the lower end and is to be of at least the same material yield strength. The net thickness may be reduced to 90% of corrugation flange thickness if continuity is provided between the corrugation web and supporting brackets inside the stool as defined in (c).

c) For oil tankers, continuity between corrugation web and lower stool supporting brackets is to be maintained inside the stool. Alternatively, lower stool supporting brackets inside the stool are to be aligned with every knuckle point of corrugation web.

d) The net thickness of supporting bracket is not to be less than 80% of the required net thickness of the corrugation webs and is to be of at least the same material yield strength.

e) The net thickness of supporting floors is not to be less than the net required thickness of the stool side plating (excluding the application of GRAB requirements as defined in Pt 2, Ch 1, Sec 6) connected to the inner bottom and is to be of at least the same material yield strength. If material of different yield strength is used, the required thickness is to be adjusted by the ratio of the two material factors *k*, as defined in Ch 3, Sec 1, [2.2.1].

f) Where a lower stool is fitted, particular attention is to be given to the through-thickness properties, and arrangements for continuity of strength, at the connection of the bulkhead stool to the inner bottom. For requirements for plates with specified through-thickness properties, see Ch 3, Sec 1, [2.5].

2.6.3 Upper stool

a) The net thickness of the stool bottom plate is not to be less than that required for the attached corrugated bulkhead and is to be of at least the same material yield strength as the attached corrugation. The extension of the top plate beyond the corrugation is not to be less than the as-built flange thickness of the corrugation.

b) The net thickness of the lower portion of stool side plating is not to be less than the greater of the following,

- The net thickness obtained from [1.1],
- 80% of the net thickness of the upper part of the bulkhead plating as required by
  - [1.2],
  - Pt 2, Ch 1, Sec 3, [3.1], or Pt 2, Ch 2, Sec 3, [2.2.1] as applicable,

  where the same material is used.

If materials of different yield strength are used, the required thickness is to be adjusted by the ratio of the two material factors k as defined in Ch 3, Sec 1, [2.2.1].

2.6.4 Local supporting structure in way of corrugated bulkheads without a lower stool

a) The net thickness of the supporting floors and pipe tunnel beams in way of a corrugated bulkhead are not to be less than the required net thickness of the corrugation flanges and are to be of at least the same material yield strength. The inner bottom and hopper tank in way of the corrugation is to be of at least the same material yield strength as the attached corrugation, and Z grade steel as defined in Ch 3, Sec 1, [2.5.1] is to be used unless through thickness properties are documented for approval.

b) Brackets/carlings arranged in line with the corrugation web are to have a depth of not less than 0.5 times the corrugation depth and a net thickness not less than 80% of the net thickness of the corrugation webs and are to be of at least the same material yield strength. Where support is provided by gussets with shedder plates instead of brackets/carlings, the height of the gusset plate, see h_G in Pt 2, Ch 1, Sec 3, Figure 5, is to be at least equal to the corrugation depth. The gusset plates are to be fitted in line with and between the corrugation flanges. The net thickness of the gusset and shedder plates is not to be less than 100% and 80%, respectively, of the net thickness of the corrugation flange and is to be of at least the same material yield strength.

2.7 Aft peak bulkhead

2.7.1

The net thickness of the aft peak bulkhead plating in way of the stern tube penetration is to be at least 1.6 times the required thickness for the bulkhead plating.

Section 5 STIFFENERS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

d_{shr} : Effective shear depth, in mm, as defined in Ch 3, Sec 7, [1.4.3].

l_{bdg} : Effective bending span, in m, as defined in Ch 3, Sec 7, [1.1.2].

l_{shr} : Effective shear span, in m, as defined in Ch 3, Sec 7, [1.1.3].

P : Design pressure for the design load set being defined in Ch 6, Sec 2 and calculated at the load calculation point defined in Ch 3, Sec 7, [3.2], in kN/m^2.

χ : Coefficient taken equal to:

- In intact condition:
  - χ= 0.90 for stiffeners attached to inner bottom or bilge hopper tank plating in cargo holds of bulk carriers,
  - χ= 1.00 for other cases.
- In flooded condition: χ as defined in Ch 6, Sec 4 for flooded condition.

1 STIFFENERS SUBJECT TO LATERAL PRESSURE

1.1 Yielding check

1.1.1 Web plating

The minimum net web thickness, *tw* in mm, is not to be taken less than the greatest value calculated for all applicable design load sets as defined in Ch 6, Sec 2, [2], given by:

$$t_w = \frac{f_{shr}|P|sl_{shr}}{d_{shr}\chi C_t \tau_{eH}} \quad \text{with } C_t \text{ not to be taken greater than 1.0.}$$

where:

f_{shr} : Shear force distribution factor taken as:

- For continuous stiffeners with fixed ends, f_{shr} is not to be taken less than:
  - f_{shr} = 0.5 for horizontal stiffeners and upper end of vertical stiffeners.
  - f_{shr} = 0.7 for lower end of vertical stiffeners.
- For stiffeners with reduced end fixity, variable load or being part of grillage, the requirement in [1.2] applies.

C_t : Permissible shear stress coefficient for the design load set being considered, taken as:

- C_t = 0.75 for acceptance criteria set AC-S.
- C_t = 0.90 for *acceptance* criteria set AC-SD.

1.1.2 Section modulus

The minimum net section modulus, *Z* in cm3, is not to be taken less than the greatest value calculated for all applicable design load sets as defined in Ch 6, Sec 2, [2.1.3], given by:

$$Z = \frac{|P|sl_{bdg}^2}{f_{bdg}\chi C_s R_{eH}} \quad \text{with } \chi\, C_s \text{ not to be taken greater than 1.0.}$$

where:

f_{bdg} : Bending moment factor taken as:

- For continuous stiffeners with fixed ends, f_{bdg} is not to be taken higher than:
  - f_{bdg} = 12 for horizontal stiffeners and upper end of vertical stiffeners.
  - f_{bdg} = 10 for lower end of vertical stiffeners.
- For stiffeners with reduced end fixity, variable load or being part of grillage, the requirement in [1.2] applies.

C_s : Permissible bending stress coefficient as defined in Table 1 for the design load set being considered.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1], calculated at the load calculation point as defined in Ch 3, Sec 7, [3.2].

β_s : Coefficient as defined in Table 2.

α_s : Coefficient as defined in Table 2.

$C_{s\text{-}max}$: Coefficient as defined in Table 2.

Definition of C_s **Table 1**

Sign of hull girder bending stress, σ_{hg}	Lateral pressure acting on	Coefficient C_s
Tension (positive)	Stiffener side	$C_s = \beta_s - \alpha_s \dfrac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
Compression	Compression	
Tension (positive)	Plate side	
Compression (negative)	Stiffener side	$C_s = C_{s\text{-}max}$

Definition of β_s , α_s and $C_{s\text{-}max}$ **Table 2**

Acceptance criteria set	Structural member	β_s	α_s	$C_{s\text{-}max}$
AC-S	Longitudinal strength member	0.85	1.0	0.75
	Transverse or vertical member	0.75	0	0.75
AC-SD	Longitudinal strength member	1.0	1.0	0.9
	Transverse or vertical member	0.9	0	0.9

1.1.3 Group of stiffeners

Scantlings of stiffeners based on requirements in [1.1.1] and [1.1.2] may be decided based on the concept of grouping designated sequentially placed stiffeners of equal scantlings on a single stiffened panel between primary supporting members. The scantling of the group is to be taken as the greater of the following:

- The average of the required scantling of all stiffeners within a group.
- 90% of the maximum scantling required for any one stiffener within the group.

1.1.4 Plate and stiffener of different materials

When the minimum specified yield stress of a stiffener exceeds the minimum specified yield stress of the attached plate by more than 35%, the following criterion is to be satisfied:

$$R_{eH-S} \le \left(R_{eH-P} - \frac{\alpha_S \lvert\sigma_{hg}\rvert}{\beta_S} \right) \frac{Z_P}{Z} + \frac{\alpha_S \lvert\sigma_{hg}\rvert}{\beta_S}$$

where:

$R_{eH\text{-}S}$: Minimum specified yield stress of the material of the stiffener, in N/mm^2.

$R_{eH\text{-}P}$: Minimum specified yield stress of the material of the attached plate, in N/mm^2.

σ_{hg} : Hull girder bending stress, in N/mm^2, as defined in Ch 6, Sec 2, [1.1] with $\lvert\sigma_{hg}\rvert$ not to be taken less than 0.4 $R_{eH\text{-}P}$.

Z : Net section modulus, in way of face plate/free edge of the stiffener, in cm^3.

Z_P : Net section modulus, in way of the attached plate of stiffener, in cm^3.

α_s, β_s : Coefficients defined in Table 2.

1.2 Beam analysis

1.2.1 Direct analysis

The maximum normal bending stress, σ and shear stress, τ in a stiffener using net properties with reduced end fixity, variable load or being part of grillage are to be determined by direct calculations taking into account:

- The distribution of static and dynamic pressures and forces, if any.
- The number and position of intermediate supports (e.g. decks, girders, etc).
- The condition of fixity at the ends of the stiffener and at intermediate supports.
- The geometrical characteristics of the stiffener on the intermediate spans.

1.2.2 Stress criteria

The stress is to comply with the following criteria where the coefficients C_t and C_s, are defined in [1.1.1] and [1.1.2].

$$\tau \le \chi C_t \tau_{eH}$$

$$\sigma \le \chi C_s R_{eH}$$

Section 6 PRIMARY SUPPORTING MEMBERS AND PILLARS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

P : Design pressure for the design load set being considered as defined in Ch 6, Sec 2 and calculated at the load calculation point as defined in Ch 3, Sec 7, [4.1.1], in kN/m^2.

l_{bdg} : Effective bending span, as defined in Ch 3, Sec 7, [1.1.6], in m.

l_{shr} : Effective shear span, as defined in Ch 3, Sec 7, [1.1.7], in m.

χ : Coefficient taken equal to:

- In intact condition:
  - χ= 0.90 for primary supporting members attached to inner bottom or bilge hopper tank plating in cargo holds of bulk carriers,
  - χ= 1.00 for other cases.
- In flooded condition: χ as defined in Ch 6, Sec 4 for flooded condition.

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to primary supporting members subjected to lateral pressure and concentrated loads and pillars subjected to compressive axial loads. The yielding check is to be carried out for such members subjected to specific loads.

2 PRIMARY SUPPORTING MEMBERS WITHIN CARGO HOLD REGION

2.1 Flooded condition

2.1.1

The requirements in this sub-article apply to the primary supporting members of watertight boundaries other than outer shell or tank boundaries, subject to lateral pressure in flooded condition.

2.1.2

The verification against flooded condition is to be made by using the pressure and hull girder loads for the appropriate design load set as defined in Ch 6, Sec 2 and the scantling requirements given in [3.2].

2.2 Bulk carriers

2.2.1 Bulk carriers having a freeboard length L_{LL} of 150m and above

The scantlings of primary supporting members within the cargo hold region are to be verified by FE structural analysis as defined in Ch 7.

2.2.2 Bulk carriers having a freeboard length L_{LL} less than 150m

The scantlings of primary supporting members within the cargo hold region are to comply with the requirements given in Pt 2, Ch 1, Sec 4, [4]. Alternatively, the scantlings of such members may be verified by direct strength assessment as deemed appropriate by the Society.

ISC 2.2.2a Alternatively, the scantlings of primary supporting members within the cargo area may be verified by direct strength assessment in accordance with the requirements of ISC 4.1.2a, Section 4, Chapter 1 of PART 9-2.

2.3 Oil tankers

2.3.1

Scantlings of primary supporting members within the cargo hold region are to comply with the requirements given in Pt 2, Ch 2, Sec 3, [1] and are to be verified by FE structural analysis, as defined in Ch 7.

3 PRIMARY SUPPORTING MEMBERS OUTSIDE CARGO HOLD REGION

3.1 Application

3.1.1
The requirements of this article apply to primary supporting members, subjected to lateral pressure within the fore part, aft part and machinery space.

3.2 Scantling requirements

3.2.1 Net section modulus

The net section modulus, Z_{n50} in cm^3, of primary supporting members subjected to lateral pressure is not to be taken less than the greatest value for all applicable design load sets defined in Ch 6, Sec 2, [2], given by:

$$Z_{n50} = 1000 \frac{|P| Sl_{bdg}{}^2}{\chi f_{bdg} C_s R_{eH}}$$

f_{bdg} : Bending moment distribution factor, as given in Table 2.
C_s : Permissible bending stress coefficient for the acceptance criteria set, as given in Table 1.

3.2.2 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of primary supporting members subjected to lateral pressure is not to be taken less than the greatest value for all applicable design load sets defined in Ch 6, Sec 2, [2], given by:

$$A_{shr-n50} = 10 \frac{f_{shr} |P| Sl_{shr}}{\chi C_t \tau_{eH}}$$

where:

f_{shr} : Shear force distribution factor, as given in Table
C_t : Permissible shear stress coefficient for the acceptance criteria set being considered, as given in Table 1.

Permissible bending and shear stress coefficients for primary supporting members Table 1

Acceptance criteria set	Structure attached to primary supporting member	C_s and C_t
AC-S	All boundaries, including decks and flats	0.70
AC-SD	All boundaries, including decks and flats	0.85

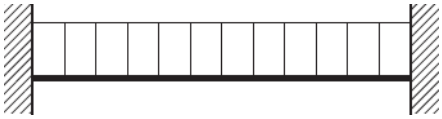
3.3 Advanced calculation methods

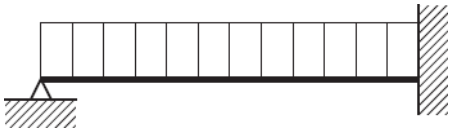
3.3.1 Direct analysis

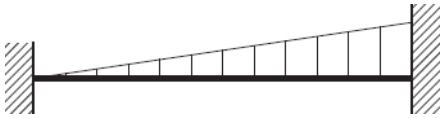
Where complex grillage structures are employed or cross ties are fitted in side shell primary supporting members, the scantlings are to be determined by direct calculation taking into account:

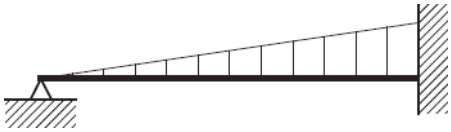
- The distribution of still water and wave pressure and forces, if any.
- The number and position of intermediate supports (e.g. decks, girders, etc).
- The condition of fixity at the ends of the primary supporting members and at intermediate supports.
- The geometrical characteristics of the primary supporting members on the intermediate spans.

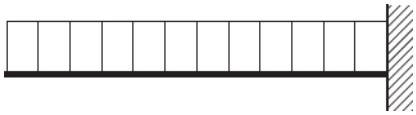
3.3.2 Analysis criteria











The calculated stresses are to comply with the following criteria where the coefficients C_t and C_s, are defined in [3.2]:

- $\sigma \leqslant \chi C_s R_{eH}$
- $\tau \leqslant \chi C_t \tau_{eH}$

where:

σ : Shear stress in member, in N/mm^2, based on t_{n50}.
τ : Normal stress in member, in N/mm^2, based on t_{n50}.

Bending moment and shear force factors, f_{bdg} and f_{shr} **Table 2**

Load and boundary condition				Bending moment and shear force distribution factors (based on load at mid span, where load varies)		
Position				1 f_{bdg1} f_{shr1}	2 f_{bdg2} -	3 f_{bdg3} f_{shr3}
Load model	1 Support	2 Field	3 Support			
A				12.0 0.50	24.0 -	12.0 0.50
B				- 0.38	14.2 -	8.0 0.63
C				- 0.50	8.0 -	- 0.50
D				15.0 0.30	23.3 -	10.0 0.70
E				- 0.20	16.8 -	7.5 0.80
F				- -	- -	2.0 1.0

Note1: The bending moment distribution factor, f_{bdg} for the support positions is applicable for a distance of $0.2l_{bdg}$ from the end of the effective bending span of the primary supporting member.

Note2: The shear force distribution factor, f_{shr} for the support positions is applicable for a distance of 0.2 l_{shr} from the end of the effective shear span of the primary supporting member.

Note3: Application of f_{bdg} and f_{shr}:
The section modulus requirement within $0.2l_{bdg}$ from the end of the effective span is to be determined using the applicable f_{bdg1} and f_{bdg3}, however f_{bdg} is not to be taken greater than 12.
The section modulus of mid-span area is to be determined using f_{bdg} = 24, or f_{bdg2} from the table if lesser.
The shear area requirement of end connections within $0.2l_{shr}$ from the end of the effective span is to be determined using f_{shr} = 0.5 or the applicable f_{shr1} or f_{shr3}, whichever is greater.
For models A through F, the value of f_{shr} may be gradually reduced outside of $0.2l_{shr}$ towards $0.5f_{shr}$ at mid-span, where f_{shr} is the greater value of f_{shr1} and f_{shr3}.

4 PILLARS

4.1 Pillars subjected to compressive axial load

4.1.1 Criteria

The maximum applied compressive axial load on a pillar, F_{pill}, in kN, is to be taken as the greatest value calculated for all applicable design load sets defined in Ch 6, Sec 2, [2], and is given by the following formula:

$F_{pill}=Pb_{a\text{-}sup}I_{a\text{-}sup}+F_{pill\text{-}upr}$

where:
$b_{a\text{-}sup}$: Mean breadth of area supported, in m.
$l_{a\text{-}sup}$: Mean length of area supported, in m.
$F_{pill\text{-}upr}$: Axial load from pillar including axial load from pillars above, in kN, if any.
$A_{pill\text{-}n50}$: Net cross section area of the pillar, in cm^2.
The buckling check of the pillar is to be performed according to Ch 8, Sec 4, [5.1], with σ_{av} in N/mm^2, as defined in Ch 8, Sec 5, [3.1] given by:

$$\sigma_{av} = 10\frac{F_{pill}}{A_{pill-n50}}$$

4.2 Pillars subject to tensile axial load

4.2.1 Criteria

Pillars and PSM members subjected to tensile axial load are to satisfy the criteria given in [3.3.2].

Chapter 7 DIRECT STRENGTH ANALYSIS

Section 1 STRENGTH ASSESSMENT

1 GENERAL

1.1 Application

1.1.1

This chapter provides requirements applicable to ships having rule a freeboard length L_{LL} of 150 m or above to assess the scantlings of the hull structure using finite element analysis.

1.1.2

The finite element analysis consists of three parts:

a) Cargo hold analysis to assess the strength of longitudinal hull girder structural members, primary supporting structural members and bulkheads.
b) Fine mesh analysis to assess detailed stress levels in local structural details.
c) Very fine mesh analysis to assess the fatigue capacity of the structural details according to Ch 9.

1.1.3

The strength assessment performed with finite element analysis is to verify that the scantlings comply with the acceptance criteria specified in this chapter for:

- Cargo hold structural analysis 6v-vvperformed in accordance with Ch 7, Sec 2.
- Local structural analysis performed in accordance with Ch 7, Sec 3.

1.1.4

Strength assessment based on finite element analysis is applicable for the entire cargo hold region.

1.1.5

The analysis is to verify the following:

a) Stress levels are within the acceptance criteria for yielding.
b) Buckling capability of plates and stiffened panels are within the acceptance criteria for bucking defined in Ch 8.
c) Fatigue capacity of structural details is within the acceptance criteria defined in Ch 9.

1.1.6

A flow diagram showing the minimum requirement of finite element analysis is shown in Figure 1.

2 NET SCANTLING

2.1 Net scantling application

2.1.1

FE models for cargo hold FE analyses, local fine mesh FE analysis and very fine mesh FE analyses, are to be based on the net scantling approach, applying a corrosion addition as defined in Ch 3, Sec 2, Table 1.

All buckling capacity assessment are to be based on corrosion addition, as defined in Ch 3, Sec 2, Table 1.

3 FINITE ELEMENT TYPES

3.1 Used finite element types

3.1.1

The structural assessment is to be based on linear finite element analysis of three dimensional structural models. The general types of finite elements to be used in the finite element analysis are given in Table 1.

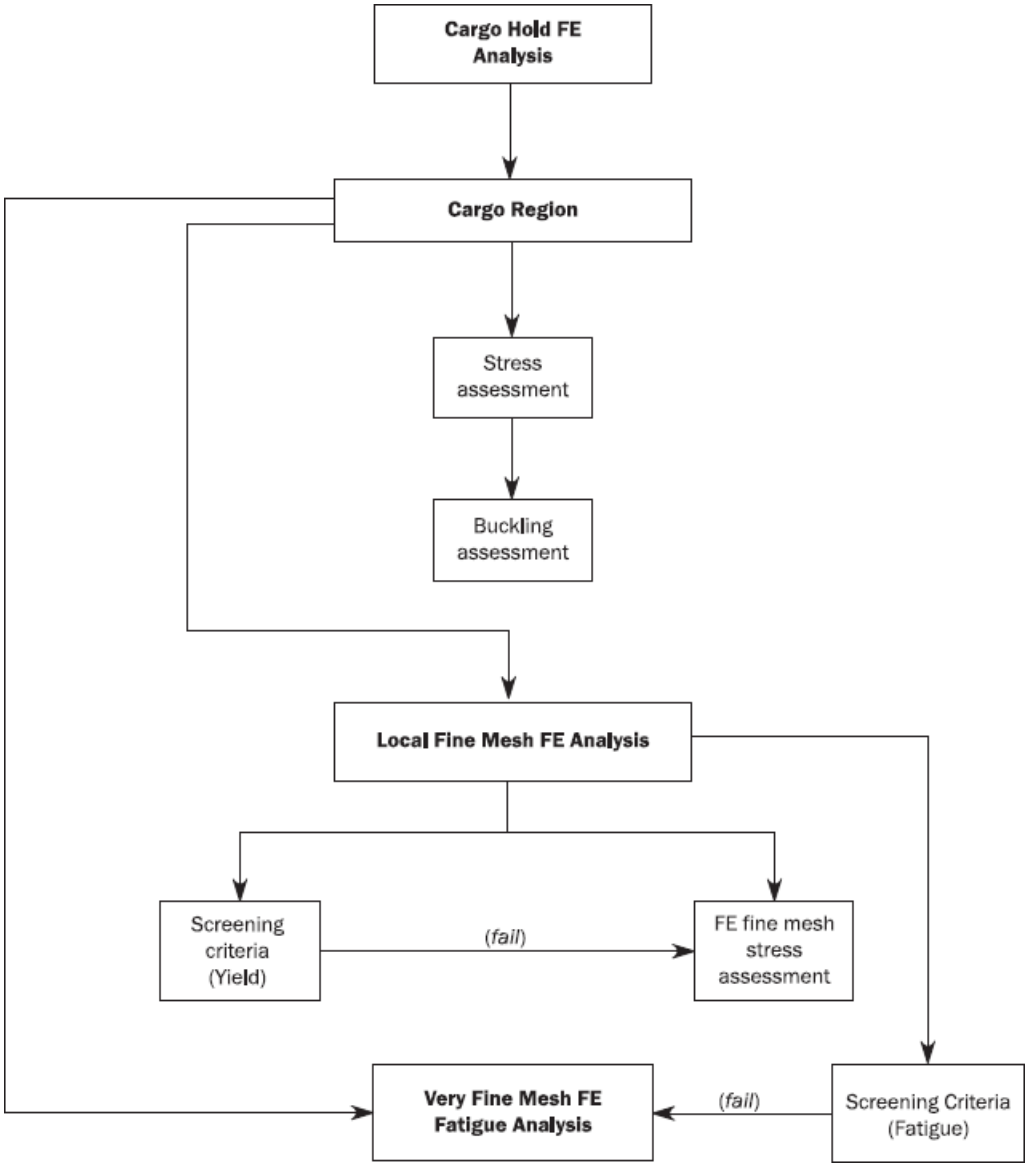


Figure 1 Flow diagram of finite element analysis

Types of finite element **Table 1**

Type of finite element	Description
Rod (or truss) element	Line element with axial stiffness only and constant cross sectional area along the length of the element.
Beam element	Line element with axial, torsional and bi-directional shear and bending stiffness and with constant properties along the length of the element.
Shell (or plate) element	Shell element with in-plane stiffness and out-of-plane bending stiffness with constant thickness.

3.1.2

Two node line elements and four node shell elements are, in general, considered sufficient for the representation of the hull structure. The mesh requirements given in this chapter are based on the assumption that these elements are used in the finite element models. However, higher order elements may also be used.

4 SUBMISSION OF RESULTS

4.1 Detailed report

4.1.1

A detailed report of the structural analysis is to be submitted by the designer/builder to demonstrate compliance with the specified structural design criteria. This report is to include the following information:

a) List of plans used including dates and versions.
b) Detailed description of structural modelling including all modelling assumptions and any deviations in geometry and arrangement of structure compared with plans.
c) Plots to demonstrate correct structural modelling and assigned properties.
d) Details of material properties, plate thickness, beam properties used in the model. e) Details of boundary conditions.
e) Details of all loading conditions reviewed with calculated hull girder shear force, bending moment and torsional moment distributions.
f) Details of applied loads and confirmation that individual and total applied loads are correct.
g) Plots and results that demonstrate the correct behaviour of the structural model under the applied loads.
h) Summaries and plots of global and local deflections.
i) Summaries and sufficient plots of stresses to demonstrate that the design criteria are not exceeded in any member.
j) Plate and stiffened panel buckling analysis and results.
k) Tabulated results showing compliance, or otherwise, with the design criteria.
l) Proposed amendments to structure where necessary, including revised assessment of stresses, buckling and fatigue properties showing compliance with design criteria.
m) Reference of the finite element computer program, including its version and date.

5 COMPUTER PROGRAMS

5.1 Use of computer programs

5.1.1

Any finite element computation program complying with Ch 1, Sec 3 may be employed to determine the stress and deflection of the hull structure, provided that the combined effects of bending, shear, axial and torsional deformations are considered.

Section 2 CARGO HOLD STRUCTURAL STRENGTH ANALYSIS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

M_{sw} : Permissible vertical still water bending moment, in kNm, as defined in Ch 4, Sec 4.

M_{wv} : Vertical wave bending moment, in kNm, in hogging or sagging condition, as defined in Ch 4, Sec 4.

M_{wh} : Horizontal wave bending moment, in kNm, as defined in Ch 4, Sec 4.

M_{wt} : Wave torsional moment in seagoing condition, in kNm, as defined in Ch 4, Sec 4.

Q_{sw} : Permissible still water shear force, in kN, at the considered bulkhead position, as provided in Ch 4, Sec 4.

Q_{wv} : Vertical wave shear force, in kN, as defined in Ch 4, Sec 4.

$x_{b\text{-}aft}$, $x_{b\text{-}fwd}$: X-coordinate, in m, of respectively the aft and forward bulkhead of the mid-hold.

x_{aft} : X-coordinate, in m, of the aft end support of the FE model.

x_{fore} : X-coordinate, in m, of the fore end support of the FE model.

x_i : X-coordinate, in m, of web frame station i.

Q_{aft} : Vertical shear force, in kN, at aft bulkhead of mid-hold as defined in [4.4.6].

Q_{fwd} : Vertical shear force, in kN, at fore bulkhead of mid-hold as defined in [4.4.6].

$Q_{targ\text{-}aft}$: Target shear force, in kN, at the aft bulkhead of mid-hold as defined in [4.3.3].

$Q_{targ\text{-}fwd}$: Target shear force, in kN, at the forward bulkhead of mid-hold as defined in [4.3.3].

1 OBJECTIVE AND SCOPE

1.1 General

1.1.1

The cargo hold structural strength analysis is used for the assessment of scantlings of longitudinal hull girder structural members, primary supporting members and bulkheads within the cargo hold region. This section gives the requirements for cargo hold structural strength analysis.

1.1.2

Cargo hold structural strength analysis is mandatory within the cargo hold region including the aft bulkhead of the aftmost cargo hold and the collision bulkhead. The evaluation areas are defined in [5.1].

1.1.3

For the purpose of FE structural assessment and load application, the cargo hold region contains the following cargo hold regions, which may vary depending on the ship length and cargo hold arrangement, as defined in Figure 1:

- Midship cargo hold region,
- Forward cargo hold region,
- After cargo hold region,
- Foremost cargo hold(s),
- Aftmost cargo hold(s).

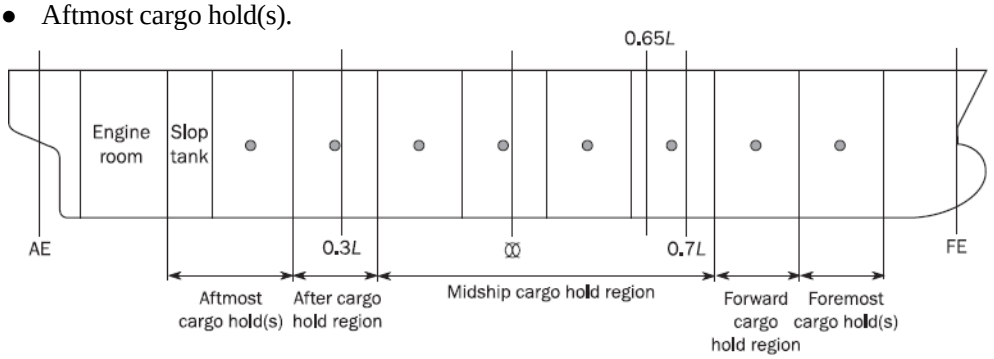

Figure 1 Definition of cargo hold regions for FE structural assessment

Holds in the forward cargo hold region are defined as holds with their longitudinal centre of gravity position forward of 0.7L from AE, except foremost cargo hold.

Holds in the midship cargo hold region are defined as holds with their longitudinal centre of

gravity position at or forward of 0.3*L* from AE and at or aft of 0.7*L* from AE.
Holds in the after cargo hold region are defined as holds with their longitudinal centre of gravity position aft of 0.3 *L* from AE, except aftmost cargo hold.
Foremost cargo hold(s) is (are) defined as hold(s) in the foremost location of the cargo hold region.
Aftmost cargo hold(s) is (are) defined as hold(s) in the aftmost location of the cargo hold region.

1.2 Cargo hold structural strength analysis procedure

1.2.1 Procedure description

The structural FE analysis is to be performed in accordance with the following:

- Model: Three cargo hold model with:
  - Extent as given in [2.2]
  - Finite element types as given in [2.3]
  - Structural modelling as defined in [2.4]
- Boundary conditions as defined in [2.5]
- FE load combinations as defined in [3]
- Load application as defined in [4]
- Evaluation area as defined in [5.1]
- Strength assessment as defined in [5.2] and [5.3]

1.2.2 Mid-hold definition

For the purpose of the FE analysis, the mid-hold is defined as the middle hold(s) of the three cargo hold length FE model.
In case of foremost and aftmost cargo hold assessment, the mid-hold represents the foremost and aftmost cargo hold including the slop tank if any, respectively.

1.2.3 Scantling assessment

The scantling assessment is carried out according to Ch 7, Sec 1 for each individual cargo hold using the FE load combinations defined in Ch 4, Sec 8 applicable to the considered cargo hold. The FE analysis results are applicable to the evaluation area as defined in [5.1.1], of the considered cargo hold.
The individual transverse bulkhead structural elements, inclusive plating, stiffeners and horizontal stringers, are to be assessed considering two cargo hold finite element analyses, i.e. the analysis for the hold forward and the one for the hold aft of the considered transverse bulkhead.

2 STRUCTURAL MODEL

2.1 Members to be modelled

2.1.1

All main longitudinal and transverse structural elements are to be modelled. These include:

- Inner and outer shell,
- Deck,
- Double bottom floors and girders,
- Transverse and vertical web frames,
- Hatch coamings,
- Stringers,
- Transverse and longitudinal bulkhead structures,
- Other primary supporting members,
- Other structural members which contribute to hull girder strength.

All plates and stiffeners on the structure, including web stiffeners, are to be modelled. Brackets which contribute to primary supporting member strength and the size of which is not less than the typical mesh size (*s*-by-*s*) described in [2.4.2], are to be modelled.

2.2 Extent of model

2.2.1 Longitudinal extent

Except the foremost and aftermost cargo hold models, the longitudinal extent of the cargo hold FE model is to cover three cargo hold lengths. The transverse bulkheads at the ends of the model are to be modelled. Where corrugated transverse bulkheads are fitted, the model is to include the extent of the bulkhead stool structure forward and aft of the tanks/holds at the model ends. The

web frames at the ends of the model are to be modelled. Typical finite element models representing the midship cargo hold region of different ship type configurations are shown in Figure 3 and Figure 4.

The foremost and the aftmost cargo holds are located at the middle of the FE models as follows:

- Foremost cargo hold: from the after bulkhead of the cargo hold no. 2 to the ship's foremost cross section where the reinforced ring or web frame remains continuous from the base line to the strength deck.
- Aftermost cargo hold: from the after bulkhead of the engine room to the forward bulkhead of no. N-1 cargo hold, where N is the number of holds or sets of holds numbered from forward to aft.

Examples of finite element models representing the foremost and aftermost cargo holds of different ship type configurations are shown in Figure 5 and Figure 6.

2.2.2 Hull form modelling

In general, the finite element model is to represent the geometry of the hull form. In the midship cargo hold region, the finite element model may be prismatic provided the mid-hold has a prismatic shape.

In the foremost cargo hold model, the hull form forward of the transverse section at the middle of the fore part up to the model end as defined in [2.2.1] may be modelled with a simplified geometry. The transverse section at the middle of the fore part up to the model end may be extruded out to the fore model end, as shown in Figure 2.

In the aftmost cargo hold model, the hull form aft of the middle of the machinery space may be modelled with a simplified geometry. The section at the middle of the machinery space may be extruded out to its aft bulkhead, as shown in Figure 2.

When the hull form is modelled by extrusion, the geometrical properties of the transverse section located at the middle of the considered space (fore or machinery space) are copied along the simplified model. The transverse web frames are to be considered along this extruded part with the same properties as the ones in the fore part or in the machinery space.

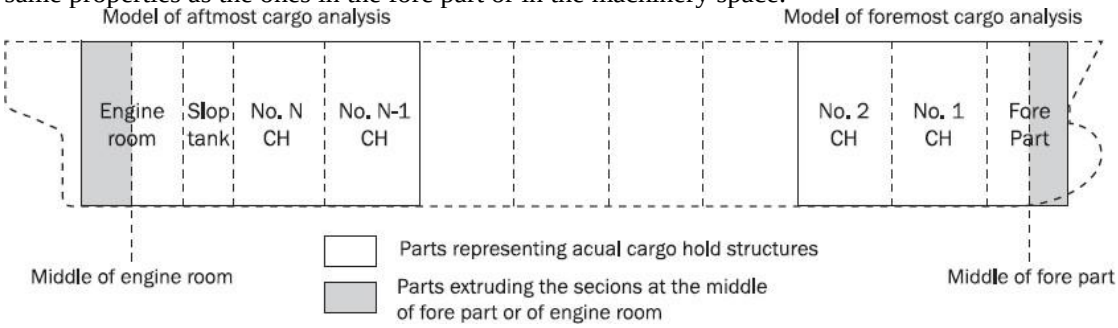

Figure 2 Hull form simplification for foremost and aftmost cargo hold model

2.2.3 Transverse extent

Both port and starboard sides of the ship are to be modelled.

2.2.4 Vertical extent

The full depth of the ship is to be modelled including primary supporting members above the upper deck, trunks, forecastle and/or cargo hatch coaming, if any.

The superstructure or deck house in way of the machinery space and the bulwark are not required to be included in the model.

2.3 Finite element types

2.3.1

Shell elements are to be used to represent plates.

2.3.2

All stiffeners are to be modelled with beam elements having axial, torsional, bi-directional shear and bending stiffness. The eccentricity of the neutral axis is to be modelled.

2.3.3

Face plates of primary supporting members and brackets are to be modelled using rod or beam elements.

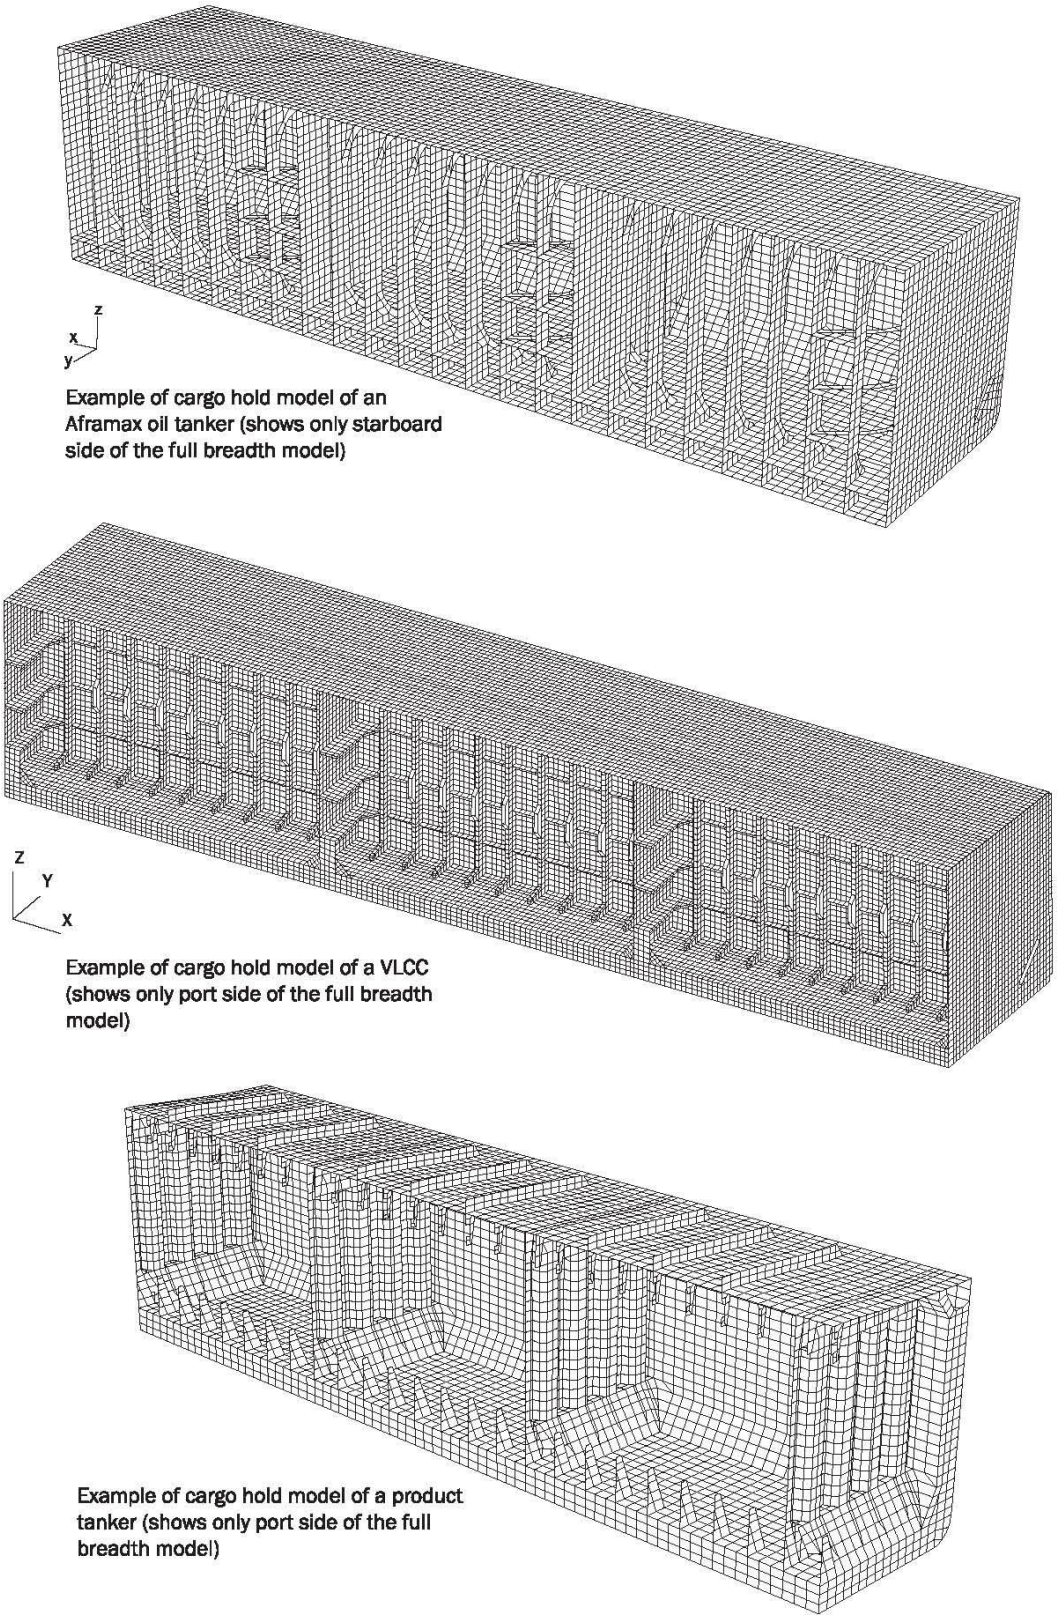

Figure 3 Example of 3 cargo hold model within midship region of oil tankers

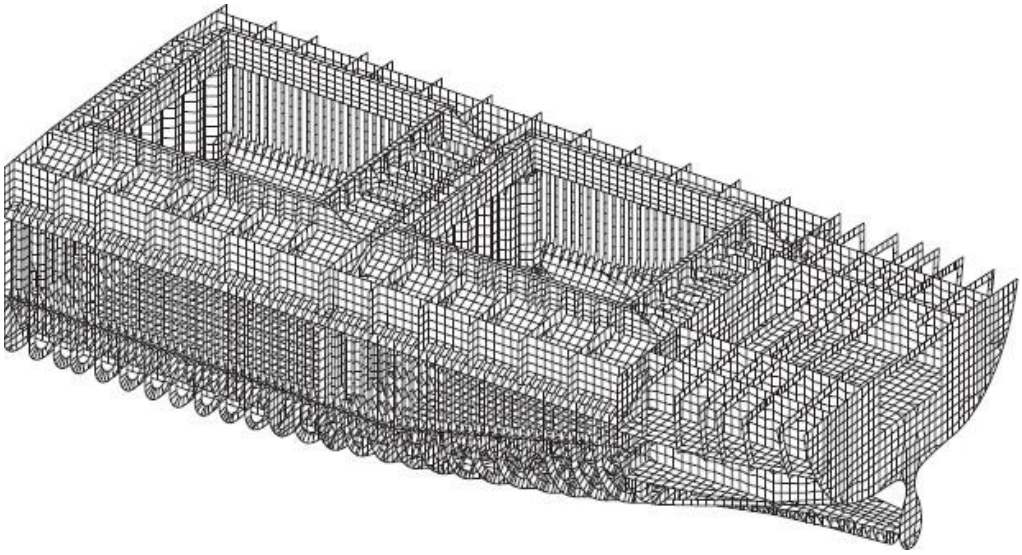

Figure 6 Example of FE model for the aftermost cargo hold structure of a bulk carrier

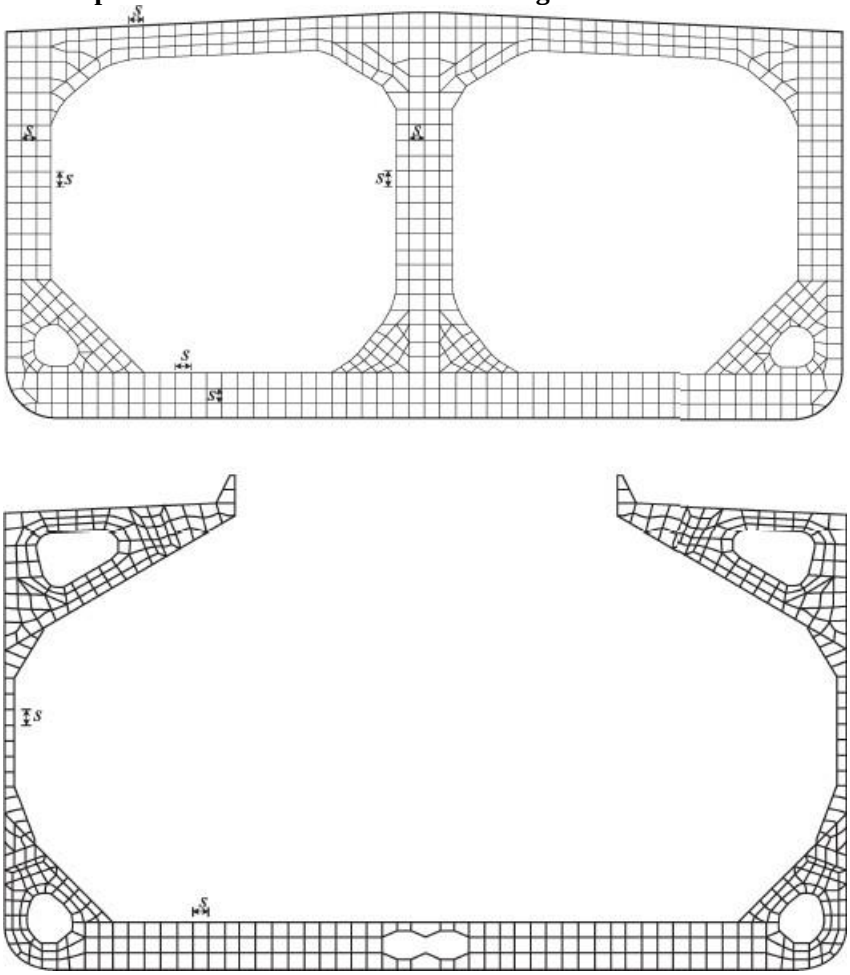

Figure 7 Typical finite element mesh on web frame

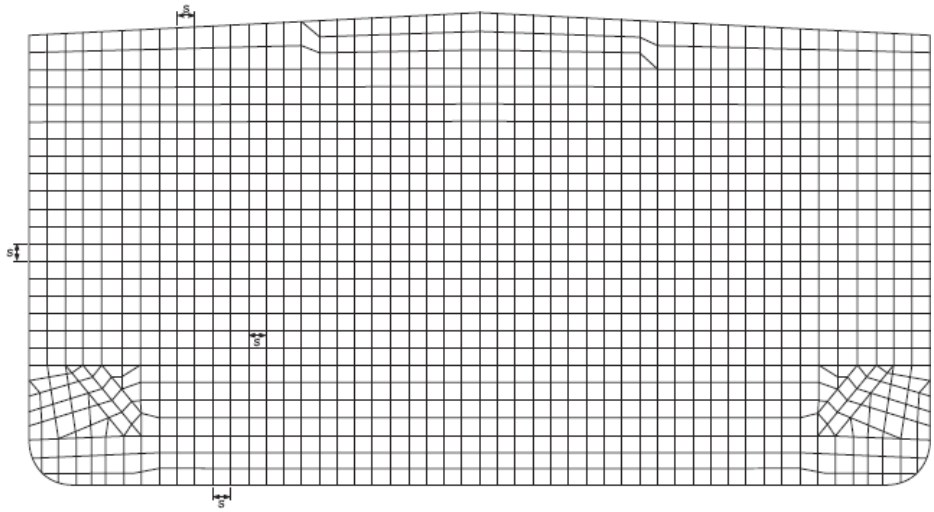

Figure 8 Typical finite element mesh on transverse bulkhead

s = Stiffener spacing

2.4 Structural modelling

2.4.1 Aspect ratio

The aspect ratio of the shell elements is in general not to exceed 3. The use of triangular shell elements is to be kept to a minimum. Where possible, the aspect ratio of shell elements in areas where there are likely to be high stresses or a high stress gradient is to be kept close to 1 and the use of triangular elements is to be avoided.

2.4.2 Mesh

The shell element mesh is to follow the stiffening system as far as practicable, hence representing the actual plate panels between stiffeners. In general, the shell element mesh is to satisfy the following requirements:

a) One element between every longitudinal stiffener, see Figure 7. Longitudinally, the element length is not to be greater than 2 longitudinal spaces with a minimum of three elements between primary supporting members.

b) One element between every stiffener on transverse bulkheads, see Figure 8.

c) One element between every web stiffener on transverse and vertical web frames, cross ties and stringers, see Figure 7 and Figure 9.

d) At least 3 elements over the depth of double bottom girders, floors, transverse web frames, vertical web frames and horizontal stringers on transverse bulkheads. For cross ties, deck transverse and horizontal stringers on transverse wash bulkheads and longitudinal bulkheads with a smaller web depth, modelling using 2 elements over the depth is acceptable provided that there is at least 1 element between every web stiffener. For a single side bulk carrier, 1 element over the depth of side frames is acceptable. The mesh size of adjacent structure is to be adjusted accordingly.

e) The mesh on the hopper tank web frame and the topside web frame is to be fine enough to represent the shape of the web ring opening, as shown in Figure 7.

f) The curvature of the free edge on large brackets of primary supporting members is to be modelled to avoid unrealistic high stress due to geometry discontinuities. In general, a mesh size equal to the stiffener spacing is acceptable. The bracket toe may be terminated at the nearest nodal point provided that the modelled length of the bracket arm does not exceed the actual bracket arm length. The bracket flange is not to be connected to the plating, as shown in Figure 10. The modelling of the tapering part of the flange is to be in accordance with [2.4.8]. An example of acceptable mesh is shown in Figure 10. A finer mesh is to be used for the determination of detailed stress at the bracket toe, as given in Ch 7, Sec 3.

2.4.3 Finer mesh

Where the geometry cannot be adequately represented in the cargo hold model and the stress exceeds the cargo hold mesh acceptance criteria, a finer mesh may be used for such geometry to

demonstrate satisfactory scantlings. The mesh size required for such analysis can be governed by the geometry. In such cases, the average stress within an area equivalent to that specified in [2.4] is to comply with the requirements given in [5.2].

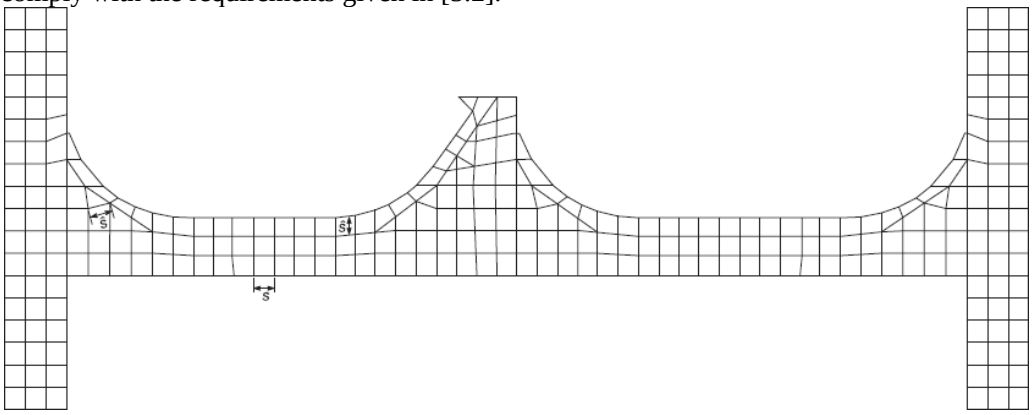

Figure 9 Typical finite element mesh on horizontal transverse stringer on transverse bulkhead

s = Stiffener spacing

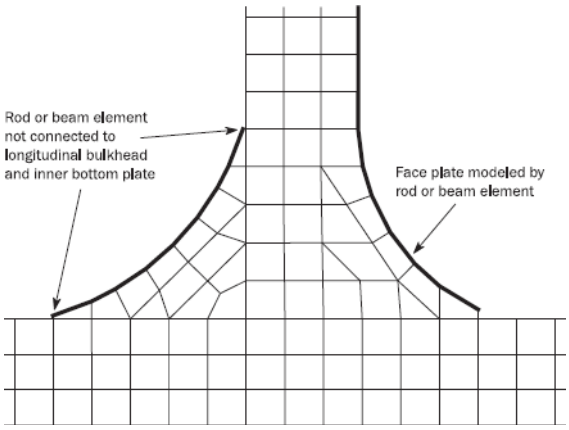

Figure 10 Typical finite element mesh on transverse web frame main bracket

2.4.4 Corrugated bulkhead

Diaphragms in the stools, supporting structure of corrugated bulkheads and internal longitudinal and vertical stiffeners on the stool plating are to be included in the model. Modelling is to be carried out as follows:

a) The corrugation is to be modelled with its geometric shape.
b) The mesh on the flange and web of the corrugation is in general to follow the stiffener spacing inside the bulkhead stool.
c) The mesh on the longitudinal corrugated bulkhead is to follow longitudinal positions of transverse web frames, where the corrections to hull girder vertical shear forces are applied in accordance with [4.4.7].
d) The aspect ratio of the mesh in the corrugation is not to exceed 2 with a minimum of 2 elements for the flange breadth and the web height.
e) Where difficulty occurs in matching the mesh on the corrugations directly with the mesh on the stool, it is acceptable to adjust the mesh on the stool in way of the corrugations.
f) For a corrugated bulkhead without an upper stool and/or lower stool, it may be necessary to adjust the geometry in the model. The adjustment is to be made such that the shape and position of the corrugations and primary supporting members are retained. Hence, the adjustment is to be made on stiffeners and plate seams if necessary.
g) When corrugated bulkhead is subjected to liquid cargo or ballast, dummy rod elements with a cross sectional area of 1 mm2 are to be modelled at the corrugation knuckle between the flange and the web. Dummy rod elements are to be used as minimum at the two corrugation knuckles closest to the intersection between:
   - Transverse and longitudinal bulkheads,
   - Transverse bulkhead and inner hull,

- Transverse bulkhead and side shell.

h) Manholes in diaphragms are to be modelled according to [2.4.9].

2.4.5

Example of mesh arrangements of the cargo hold structure are shown in Figure 11 to Figure 14.

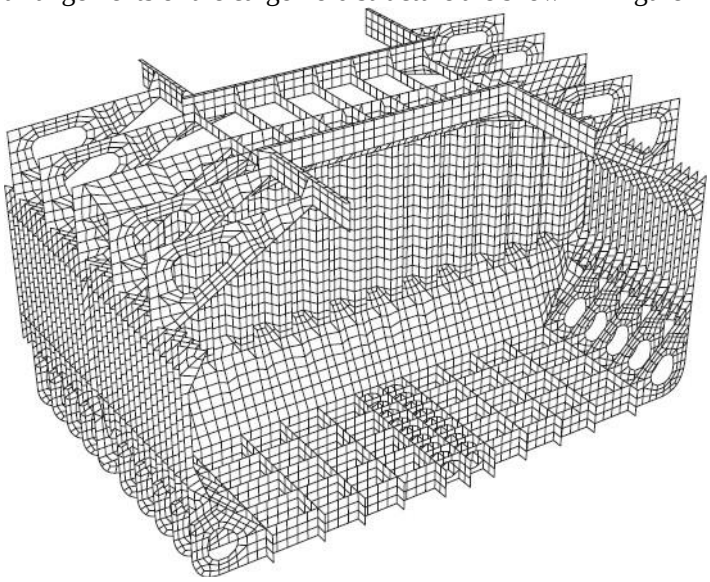

Figure 11 Example of FE mesh arrangements of cargo hold structure for a bulk carrier

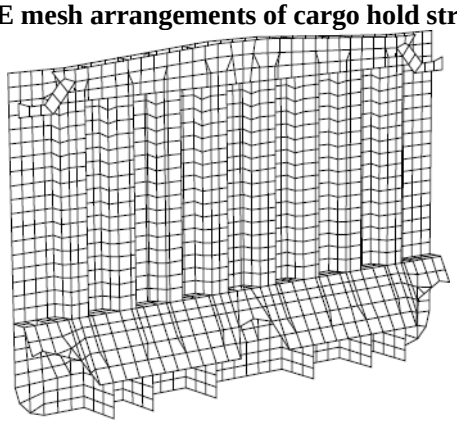

Figure 12 Example of FE mesh on transverse corrugated bulkhead structure for a product tanker

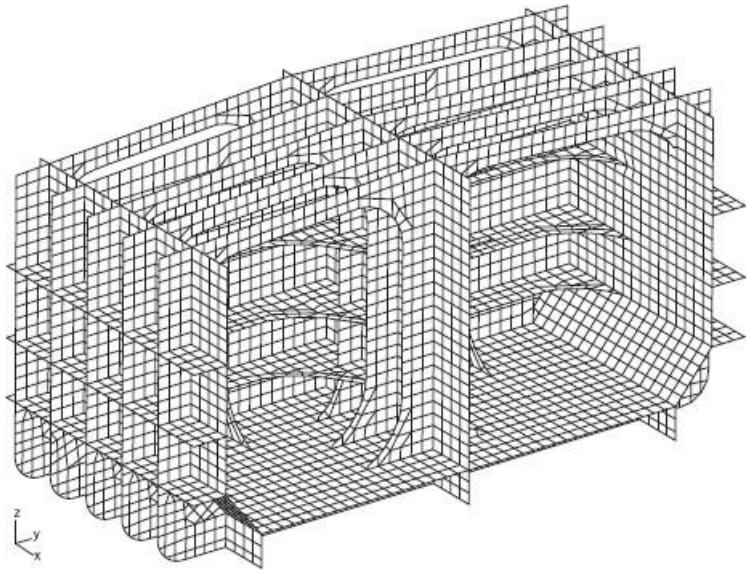

Figure 13 Example of FE mesh arrangements of cargo tank structure for an aframax tanker

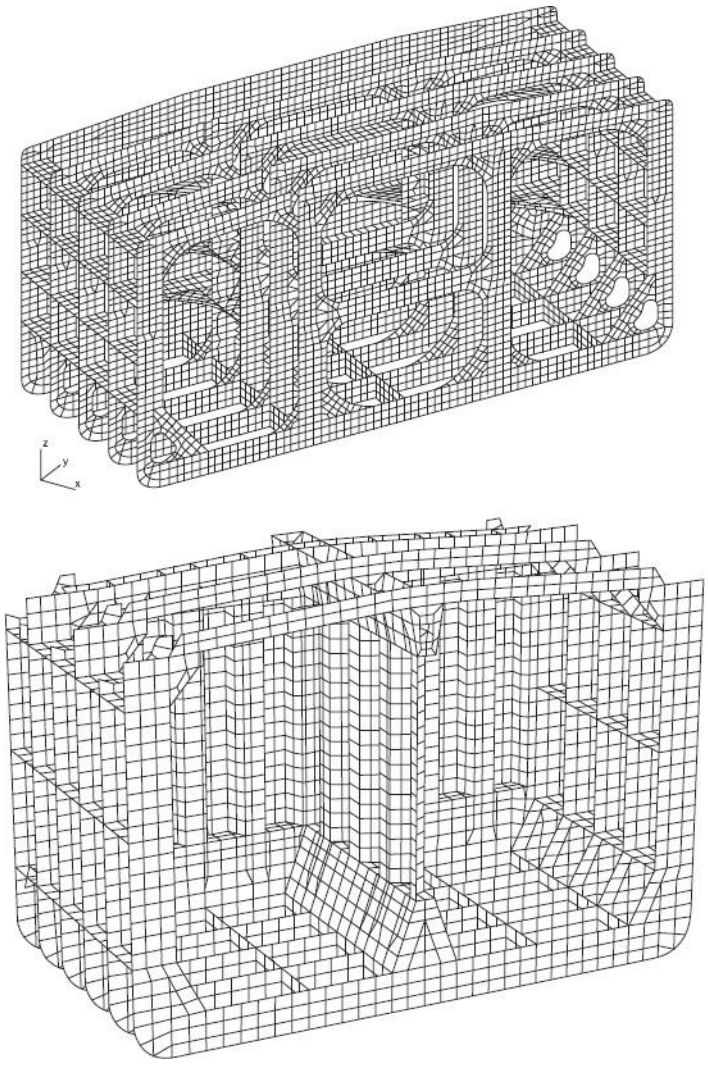

Figure 14 Examples of FE mesh arrangements of cargo tank structure for VLCC and product tanker

2.4.6 Sniped stiffener

Non continuous stiffeners are to be modelled as continuous stiffeners, i.e. the height web reduction in way of the snip ends are not to be modelled.

2.4.7 Web stiffeners of primary supporting members

Web stiffeners of primary supporting members are to be modelled. Where these stiffeners are not in line with the primary FE mesh, it is sufficient to place the line element along the nearby nodal points provided that the adjusted distance does not exceed 0.2 times the stiffener spacing under consideration. The stresses and buckling utilisation factors obtained need not be corrected for the adjustment. Buckling stiffeners on large brackets, deck transverses and stringers parallel to the flange are to be modelled. These stiffeners may be modelled using rod elements.

2.4.8 Face plate of primary supporting member

The effective cross sectional area at the curved part of the face plate of primary supporting members and brackets is to be calculated in accordance with Ch 3, Sec 7. The cross sectional area of a rod or beam element representing the tapering part of the face plate is to be based on the average cross sectional area of the face plate in way of the element length.

2.4.9 Openings

Methods of representing openings and manholes in webs of primary supporting members are to be in accordance with Table1. Regardless of size, manholes are to be modelled by removing the appropriate elements.

Representation of openings in primary supporting member webs **Table 1**

Criteria	Modelling decision	Analysis
$h_o / h < 0.5$ and $g_o < 2.0$	Openings do not need to be modelled	To be evaluated by the screening procedure as given in Ch 7, Sec 3, 3.1.1
manholes	The geometry of the opening is to be modelled by removing the adequate elements	To be evaluated by the screening procedure as given in Ch 7, Sec 3, 3.1.1
$h_o / h \geqslant 0.5$ or $g_o \geqslant 2.0$	The geometry of the opening is to be modelled	To be evaluated by fine mesh as given in Ch 7, Sec 3, 2.1.1

where:

$$g_0 = \left(1 + \frac{l_0^2}{2.6(h - h_0)^2}\right)$$

l_0 : Length of opening parallel to primary supporting member web direction, in m, see Figure 15.
For sequential openings where the distance, d_o between openings is less than 0.25 h, the length l_0 is to be taken as the length across openings as shown in Figure 16.

h_o : Height of opening parallel to depth of web, in m, see Figure 15 and Figure 16.

h : Height of web of primary supporting member in way of opening, in m, see Figure 15 and Figure 16.

2.5 Boundary conditions

2.5.1 General

All boundary conditions described in this section are in accordance with the global coordinate system defined in Ch 4, Sec 1.

2.5.2 Application

The boundary conditions given [2.5.3] are applicable to cargo hold finite element model analyses in cargo hold region.

2.5.3 Boundary conditions

The boundary conditions consist of the rigid links at model ends, point constraints and end-beams. The rigid links connect the nodes on the longitudinal members at the model ends to an independent point at neutral axis in centreline. The boundary conditions to be applied at the ends of the cargo hold FE model, except for the foremost cargo hold, are given in Table 2. For the foremost cargo hold analysis, the boundary conditions to be applied at the ends of the cargo hold FE model are given in Table 3.

Note 3: Boundary constraints in fore end are to be located at the most forward reinforced ring or web frame which remains continuous from the base line to the strength deck.

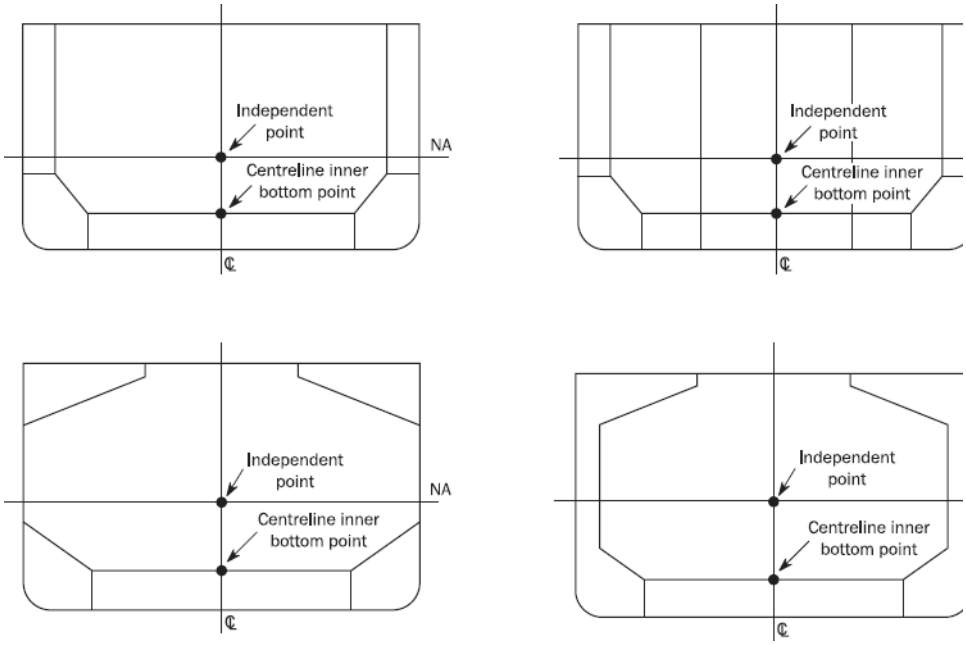

Figure 17 Boundary conditions applied at the model end sections

2.5.4 End constraint beams

End constraint beams are to be modelled at the both end sections of the model along all longitudinally continuous structural members and along the cross deck plating of bulk carriers. An example of end beams at one end for a double hull bulk carrier is shown in Figure 18.

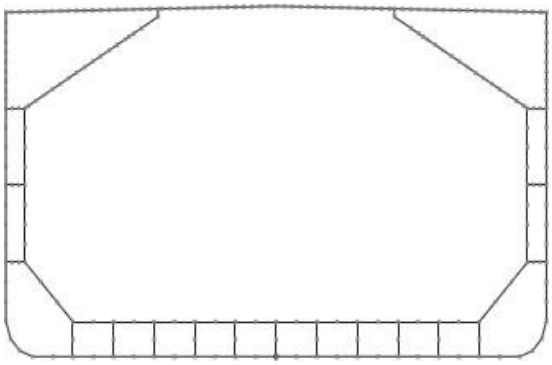

Figure 18 End constraint beams for a bulk carrier

The properties of beams are calculated at fore and after sections separately and all beams at each end section have identical properties as follows:

- Net moment of inertia: $I_{yy\text{-}n50} = I_{zz\text{-}n50} = I_{xx\text{-}n50}(J) = 1/25$ of the vertical hull girder moment of inertia of fore/aft end cross sections based on the net FE model.
- Net cross sectional area: $A_{y\text{-}n50}$ and $A_{z\text{-}n50} = 1/80$ of the fore/aft end cross sectional areas based on the net FE model.

where:

$I_{yy\text{-}n50}$: Moment of inertia about local beam *Y* axial, in m^4.
$I_{zz\text{-}n50}$: Moment of inertia about local beam *Z* axial, in m^4.
$I_{xx\text{-}n50}(J)$: Torsional inertia, in m^4.
$A_{y\text{-}n50}$: Shear area in local beam *Y* direction, in m^2.
$A_{z\text{-}n50}$: Shear area in local beam *Z* direction, in m^2.

3 FE LOAD COMBINATIONS

3.1 Design Load combinations

3.1.1 FE load combination definition

A FE load combination is defined as a loading pattern, a draught, a value of still water bending and shear force, associated with a given dynamic load case.

3.1.2 Mandatory load combinations

For cargo hold structural strength analysis, the design load combinations specified in Ch4, Sec 8 are to be used for considered ship type and considered cargo hold regions.

Each design load combination given in Ch 4, Sec 8 consists of a loading pattern and dynamic load cases as given in Ch4, Sec 2. Each load combination requires the application of the structural weight, internal and external pressures and hull girder loads. For seagoing condition, both static and dynamic load components (S+D) are applied. For harbour and tank testing condition, only static load components (S) are applied.

3.1.3 Additional loading conditions

Where the loading conditions specified by the designer are not covered by the load combinations given in Ch4, Sec 8, these additional loading conditions are to be examined according to the procedure in [4].

4 LOAD APPLICATION

4.1 General

4.1.1 Structural weight

Effect of the weight of hull structure is to be included in static loads, but is not to be included in dynamic loads. Density of steel is to be taken as given in Ch 4, Sec 6.

4.1.2 Sign convention

Unless otherwise mentioned in this Section, the sign of moments and shear force is to be in accordance with the sign convention defined in Ch 4, Sec 1.

4.2 External and internal loads

4.2.1 External pressure

External pressure is to be calculated for each load case in accordance with Ch 4, Sec 5. External pressures include static sea pressure, wave pressure and green sea pressure.

The forces applied on the hatch cover by the green sea pressure are to be distributed along the top of the corresponding hatch coamings. The total force acting on the hatch cover is determined by integrating the hatch cover green sea pressure as defined in Ch 4, Sec 5, [5]. Then the total force is to be distributed to the total length of the hatch coamings using the average line load. The effect of the hatch cover self weight is to be ignored in the loads applied to the ship structure.

4.2.2 Internal pressure

Internal pressure is to be calculated for each load case in accordance with Ch 4, Sec 6 for design load scenarios given in Ch 4, Sec 7, Table 1. Internal pressures include static dry and liquid cargo, ballast and other liquid pressure, setting pressure on relief valve and dynamic pressure of dry and liquid cargo, ballast and other liquid pressure due to acceleration.

4.2.3 Pressure application on FE element

Constant pressure, calculated at the element's centroid, is applied to the shell element of the loaded surfaces, e.g. outer shell and deck for external pressure and tank/hold boundaries for internal pressure. Alternately, pressure can be calculated at element nodes applying linear pressure distribution within elements.

4.3 Hull girder loads

4.3.1 General

Each loading condition is to be associated with its corresponding hull girder loads which is to be applied to the model according to the procedure described in [4.4] for shear force and bending moment and in [4.5] for torsional moment. The hull girder loads are the combinations of still water hull girder loads and wave induced hull girder loads as specified in Ch 4, Sec 8. For each required FE load combination, the wave induced hull girder loads are to be calculated with the Load Combination Factors (LCFs), specified in Ch 4, Sec 2.

4.3.2 Target hull girder vertical bending moment

The target hull girder vertical bending moment, $M_{v\text{-}targ}$, in kNm, at a longitudinal position for a

given FE load combination is taken as:

$M_{v\text{-}targ}=C_{BM\text{-}LC}M_{sw}+M_{wv\text{-}LC}$

where:

C_{BM-LC} : Percentage of permissible still water bending moment applied for the load combination under consideration as given in Ch 4, Sec 8,

M_{sw} : Permissible still water bending moments in kNm, at the considered longitudinal position for seagoing and harbour conditions as defined in Ch 4, Sec 4, [2.2.2] and Ch 4, Sec 4, [2.2.3] respectively.

M_{wv-LC}: Vertical wave bending moment in kNm, for the dynamic load case under consideration, calculated in accordance with Ch 4, Sec 4, [3.5.2].

The values of $M_{v\text{-}targ}$ are taken as:

Midship cargo hold region: the maximum hull girder bending moment within the mid-hold(s) for each individual cargo hold for each given FE load combination as defined in Ch 4, Sec 8.

Outside midship cargo hold region: the values at all web frame and transverse bulkhead positions of the FE model under consideration.

Both $C_{BM\text{-}LC}M_{sw}$ *and* $M_{wv\text{-}LC}$ are either in sagging or in hogging condition according to the FE load combinations given in the tables of Ch 4, Sec 8.

4.3.3 Target hull girder shear force

The target hull girder vertical shear force at the aft and forward transverse bulkheads of the mid-hold, $Q_{targ\text{-}aft}$ and $Q_{targ\text{-}fwd}$, in kN, for a given FE load combination is taken as:

- $Q_{fwd} \geqslant Q_{aft}$:

$$Q_{targ\text{-}aft} = C_{SF-LC} \cdot Q_{sw-neg} - \Delta Q_{swa} + f_{\beta} \left| C_{QW} \right| Q_{wv-neg}$$

$$Q_{targ\text{-}fwd} = C_{SF-LC} \cdot Q_{sw-pos} + \Delta Q_{swf} + f_{\beta} \left| C_{QW} \right| Q_{wv-pos}$$

- $Q_{fwd} < Q_{aft}$:

$$Q_{targ\text{-}aft} = C_{SF-LC} \cdot Q_{sw-pos} - \Delta Q_{swa} + f_{\beta} \left| C_{QW} \right| Q_{wv-pos}$$

$$Q_{targ\text{-}fwd} = C_{SF-LC} \cdot Q_{sw-neg} + \Delta Q_{swf} + f_{\beta} \left| C_{QW} \right| Q_{wv-neg}$$

where:

Q_{fwd}, Q_{aft} :Vertical shear forces, in kN, due to the local loads respectively at the forward and aft bulkhead position of the mid-hold, as defined in [4.4.6].

$C_{SF\text{-}LC}$: Percentage of permissible still water shear force as given in Ch 4, Sec 8, for the FE load combination under consideration.

$Q_{sw\text{-}pos}$, $Q_{sw\text{-}neg}$: Positive and negative permissible still water shear forces, in kN, at any longitudinal position for seagoing and harbour conditions as defined in Ch 4, Sec 4, [2.3.3] and Ch 4, Sec 4, [2.3.4] respectively.

ΔQ_{swf} : Shear force correction, in kN, for the considered FE loading pattern at the forward bulkhead taken as:

- For bulk carriers:

Minimum of the absolute values of ΔQ_{mdf} as defined in Ch 5, Sec 1, [3.6.1] calculated at forward bulkhead for the mid-hold and the value calculated at aft bulkhead of the forward cargo hold taken as:

$$\Delta Q_{swf} = \text{Min}(\left|\Delta Q_{mdf}\right|_{Mid}, \left|\Delta Q_{mdf}\right|_{Fwd})$$

- For oil tankers:

$\Delta Q_{swf} = 0$

ΔQ_{swa} : Shear force correction, in kN, for the considered FE loading pattern at the aft bulkhead taken as:

- For bulk carriers:

Minimum of the absolute values of ΔQ_{mdf} as defined in Ch 5, Sec 1, [3.6.1] calculated at aft bulkhead for the mid-hold and the value calculated at forward bulkhead of the aft cargo hold taken as:

$$\Delta Q_{swa} = \text{Min}(\left|\Delta Q_{mdf}\right|_{Mid}, \left|\Delta Q_{mdf}\right|_{Aft})$$

- For oil tankers:

$\Delta Q_{swa}=0$

f_β : Wave heading factor, as given in Ch 4, Sec 4.
C_{QW} : Load combination factor for vertical wave shear force, as given in Ch 4, Sec 2.
$Q_{wv\text{-}pos}$, Q_{wv_neg} : Positive and negative vertical wave shear force, in kN, as defined in Ch 4, Sec 4, [3.2.1].
The values of $Q_{targ\text{-}aft}$ and $Q_{targ\text{-}fwd}$ are to be taken at after and forward transverse bulkheads of the mid-hold under consideration.

4.3.4 Target hull girder horizontal bending moment

The target hull girder horizontal bending moment, $M_{h\text{-}targ}$, in kNm, for a given FE load combination is taken as:

$$M_{h-targ} = M_{wh-LC}$$

where:

M_{wh-LC}: Horizontal wave bending moment, in kNm, for the dynamic load case under consideration, calculated in accordance with Ch 4, Sec 4, [3.5.4].

The values of $M_{wh\text{-}LC}$ are taken as:

- Midship cargo hold region: the value calculated for the middle of the individual cargo hold under consideration.
- Outside midship cargo hold region: the values calculated at all web frame and transverse bulkhead positions of the FE model under consideration.

4.3.5 Target hull girder torsional moment

For bulk carriers only, the target hull girder torsional moment, $M_{wt\text{-}targ}$, in kNm, for the dynamic load cases OST and OSA is the value at the target location taken as:

$$M_{wt-targ} = M_{wt-LC}\,(x_{targ})$$

where:

$M_{wt\text{-}LC\,(x)}$: Wave torsional moment, in kNm, for the dynamic load case OST and OSA, defined in Ch 4, Sec 4, [3.5.5], calculated at x position.

x_{targ} : Target location for hull girder torsional moment taken as:

- For midship cargo hold region:
  - If $x_{mid} \leqslant 0.531\,L$: after bulkhead of the mid-hold.
  - If $x_{mid} > 0.531\,L$: forward bulkhead of the mid-hold.
- Outside midship cargo hold region:
  The transverse bulkhead of mid-hold where the following formula is minimum:

$$\frac{M_{wt-LC}(x_{bhd})}{\left|M_{wt-LC}(x_{bhd})\right|}\cdot\left[M_{wt-LC}(x_{bhd}) - M_{T-FEM}(x_{bhd})\right]$$

x_{mid} : X-coordinate, in m, of the mid-hold centre.

x_{bhd} : X-coordinate, in m, of the after or forward transverse bulkhead of mid-hold.

For dynamic load cases of bulk carriers other than OST and OSA and for all dynamic load cases of oil tankers, hull girder torsional moment $M_{wt\text{-}targ}$, at middle of mid-hold is to be adjusted to zero.

4.4 Procedure to adjust hull girder shear forces and bending moments

4.4.1 General

The procedure given in this sub-article [4.4] describes how to adjust the hull girder horizontal bending moment, vertical force and vertical bending moment distribution on the three cargo hold FE model to achieve the required target values at required locations. The hull girder load target values are specified in [4.3].

The target locations for hull girder shear force are at the transverse bulkheads of the mid-hold. The final adjusted hull girder shear force at the target location should not exceed the target hull girder shear force.

The target location for hull girder bending moment is, in general, located at the centre of the mid-hold. If the maximum value of bending moment is not located at the centre of the mid-hold, the final adjusted maximum bending moment within the mid-hold is not to exceed the target hull girder bending moment.

4.4.2 Local load distribution

The following local loads are to be applied for the calculation of hull girder shear and bending

moments:

a) Ship structural steel weight distribution over the length of the cargo hold model (static loads). The structural steel weight is to be calculated based on the FE model with a net thickness of 0.5 *tc* deduction, as used in the cargo hold FE model.
b) Weight of cargo and ballast (static loads).
c) Static sea pressure, dynamic wave pressure and, where applicable, green sea load. For the harbour/tank testing load cases, only static sea pressure needs to be applied.
d) Dynamic cargo and ballast loads for seagoing load cases.

With the above local loads applied to the FE model, the FE nodal forces are obtained through FE loading procedure. The 3D nodal forces will then be lumped to each longitudinal station to generate the one dimension local load distribution. The longitudinal stations are located at transverse bulkheads/frames and typical longitudinal FE model nodal locations in between the frames according to the cargo hold model mesh size requirement. Any intermediate nodes created for modelling structural details are not treated as the longitudinal stations for the purpose of local load distribution. The nodal forces within half of forward and half of afterward of longitudinal station spacing are lumped to that station. The lumping process will be done for vertical and horizontal nodal forces separately to obtain the lumped vertical and horizontal local loads, f_{vi} and f_{hi}, at the longitudinal station *i*.

4.4.3 Hull girder forces and bending moment due to local loads

With the local load distribution, the hull girder load longitudinal distributions are obtained by assuming the model is simply supported at model ends. The reaction forces at both ends of the model and longitudinal distributions of hull girder shear forces and bending moments induced by local loads at any longitudinal station are determined by the following formulae:

$$R_{V_fore} = -\frac{\sum_j (x_i - x_{aft}) f_{vi}}{x_{fore} - x_{aft}} \qquad R_{V_aft} = \sum_i f_{vi} + R_{V_fore}$$

$$R_{H_fore} = -\frac{\sum_j (x_i - x_{aft}) f_{hi}}{x_{fore} - x_{aft}} \qquad R_{V_aft} = \sum_i f_{vi} + R_{H_fore}$$

$$F_l = \sum_i f_{li}$$

$$Q_{V_FEM}(x_j) = R_{V_aft} - \sum_i f_{hi} \qquad \text{when} x_i < x_j$$

$$Q_{H_FEM}(x_j) = R_{H_aft} + \sum_i f_{hi} \qquad \text{when} x_i < x_j$$

$$M_{V_FEM}(x_j) = R_{V_aft} - \sum_i (x_j - x_i) f_{vi} \quad \text{when} \quad x_i < x_j$$

$$M_{H_FEM}(x_j) = R_{H_aft} + \sum_i (x_j - x_i) f_{hi} \quad \text{when} \quad x_i < x_j$$

Where:

R_{V_aft}, R_{V_fore}, R_{H_aft}, R_{H_fore} : Vertical and horizontal reaction forces at the aft and fore ends, in kN.

x_{aft} : *X*-coordinate of the aft end support, in m.

x_{fore} : *X*-coordinate of the fore end support, in m.

f_{vi} :Lumped vertical local load at longitudinal station *i* as defined in [4.4.2], in kN.

f_{hi} :Lumped horizontal local load at longitudinal station *i* as defined in [4.4.2], in kN.

F_l : Total net longitudinal force of the model, in kN.

f_{li} : Lumped longitudinal local load at longitudinal station *i* as defined in [4.4.2], in kN.

x_j : *X*-coordinate, in m, of considered longitudinal station *j*.

x_i : *X*-coordinate, in m, of longitudinal station *i*.

$Q_{V_FEM}(x_j)$, $Q_{H_FEM}(x_j)$, $M_{V_FEM}(x_j)$, $M_{H_FEM}(x_j)$: Vertical and horizontal shear forces, in kN, and bending moments, in kNm, at longitudinal station x_j created by the local loads applied on the FE model. The sign convention for reaction forces is that a positive creates a positive shear force.

4.4.4 Longitudinal unbalanced force

In case total net longitudinal force of the model, F_l, is not equal to zero, the counter longitudinal force, $(F_x)_j$, is to be applied at one end of the model, where the translation on X-direction, δ_x, is fixed, by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements, as follows:

$$(F_x)_j = \frac{F_l}{A_{x-n50}} \frac{A_{j-n50}}{n_j}$$

where:

$(F_x)_j$: Axial force applied to a node of the j-th element, in kN.

F_l : Total net longitudinal force of the model, as defined in [4.4.3], in kN.

$A_{j\text{-}n50}$: Net cross sectional area of the j-th element, in m^2.

$A_{x\text{-}n50}$: Net cross sectional area of fore end section, in m^2,

$$A_{x-n50} = \sum_j A_{j-n50}$$

n_j : Number of nodal points of j-th element on the cross section, $n_j = 1$ for beam element, $n_j = 2$ for 4- node shell element.

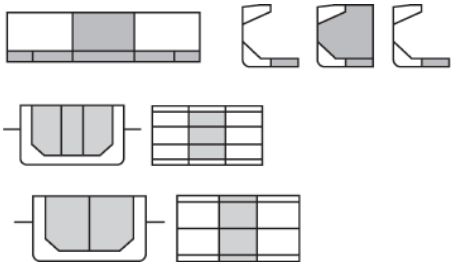
4.4.5 Hull girder shear force adjustment procedure

The hull girder shear force adjustment procedure defined in this requirement applies to all FE load combinations given in Ch 4, Sec 8. The FE load combinations not directly covered by the load combination tables of Ch 4, Sec 8 are to be considered on a case by case basis.

The two following methods are to be used for the shear force adjustment:

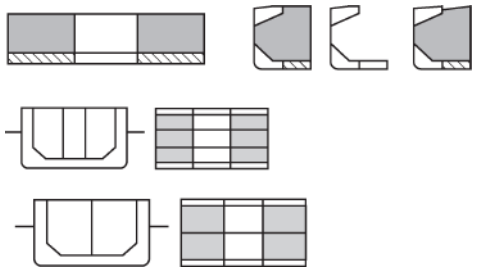
- Method 1 (M1): for shear force adjustment at one bulkhead of the mid-hold as given in [4.4.6],
- Method 2 (M2): for shear force adjustment at both bulkheads of the mid-hold as given in [4.4.7].

For the considered FE load combination, the method to be applied is to be selected as follows:



- For maximum shear force load combination (Max SFLC), the method 1 applies at the bulkhead mentioned in Table 4 if the shear force after the adjustment with method 1 at the other bulkhead does not exceed the target value. Otherwise, the method 2 applies.
- For other shear force load combination:
  - The shear force adjustment is not requested when the shear forces at both bulkheads are lower or equal to the target values. This applies to cargo hold analysis in whole cargo area except for aft most and foremost cargo hold.
    For aft most and foremost cargo hold analyses, the shear force adjustment is to be applied with method 1. The target hull girder vertical shear force at the aft and forward transverse bulkheads, $Q_{targ\text{-}aft}$ and $Q_{targ\text{-}fwd}$, are to be set to values of vertical shear force due to local loads Q_{aft} and Q_{fwd} accordingly:
    $$Q_{targ-fwd} = Q_{fwd}$$
    $$Q_{targ-aft} = Q_{aft}$$
  - The method 1 applies when the shear force exceeds the target at one bulkhead and the shear force at the other bulkhead after the adjustment with method 1 does not exceed the target value. Otherwise the method 2 applies,
  - The method 2 applies when the shear forces at both bulkheads exceed the target values,

ISC 4.4.5a For the considered conditions not included in the tables of loading conditions in Section 8, Chapter 4, the hull girder shear force is to be adjusted as follows:

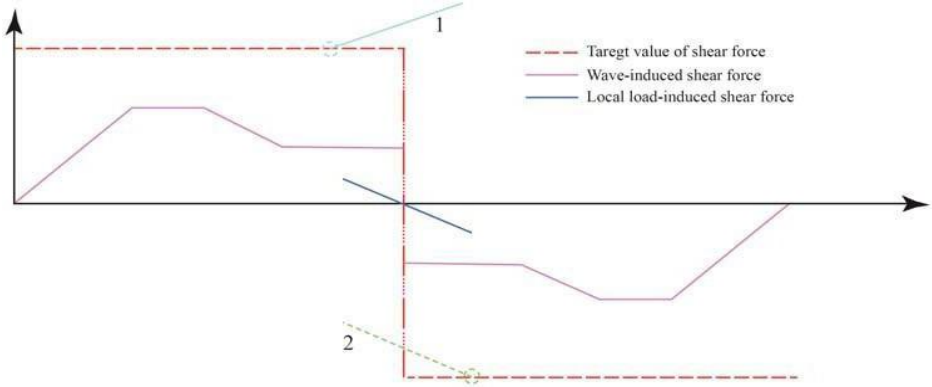


(1) The shear force of hull girders is to be adjusted for the following load combinations:

① Loading pattern: alternate loading of holds in longitudinal direction.

(a) All middle holds are loaded while end holds are empty, as shown in the figure below.

(b) All middle holds are empty while end holds are loaded, as shown in the figure below.



② Dynamic load cases: head sea model (HSM) or following sea model (FSM) or harbor condition.

③ Target bulkheads:

(a) For the model of a mid-hold of which both fore and aft bulkheads are located fore or aft of 0.5L amidships, the shear force adjustment is to be made at the bulkhead location defined in Table 4, Section 2, Chapter 7.

(b) For the model of a mid-hold situated amidships, of which the fore bulkhead is located fore of 0.5L amidships and the aft bulkhead aft of 0.5L amidships, the shear force adjustment is to be made at the bulkhead location where the absolute target value is greater. E.g.: where the absolute target value at the aft bulkhead is greater than that at the fore bulkhead, the shear force adjustment is to be made at the aft bulkhead location according to 1 as shown in the figure below, otherwise according to 2.

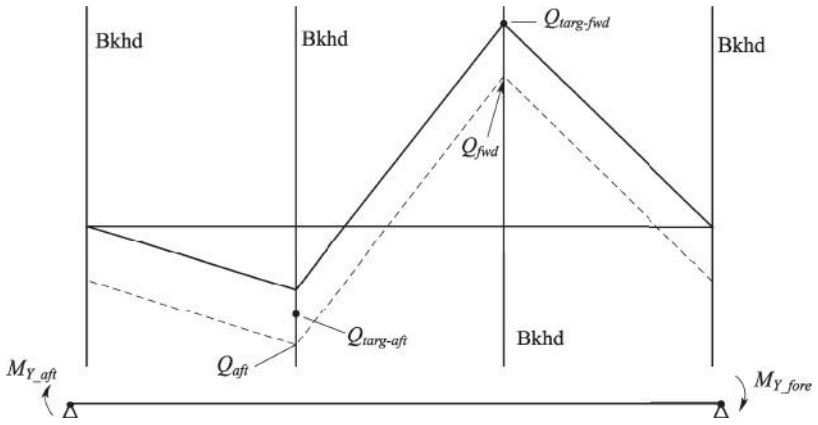
④ Method of hull girder shear force adjustment:

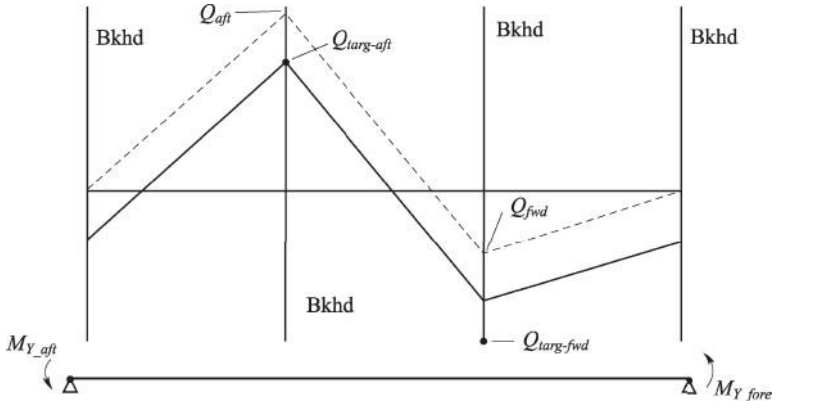
The method of hull girder shear force adjustment is to be in accordance with 4.4.5 Section 2 Chapter 7.

(2) For other load combinations:

The hull girder shear force adjustment is to be in accordance with 4 .4.5 Section 2 Chapter 7.

(3) The tart hull girder shear force are to be taken in accordance with 4.3 Section 2 Chapter 7 and the shear force adjustment procedure is to be in accordance with the relevant requirements of 4.4 Section 2 Chapter 7.





Mid-hold bulkhead location for shear force adjustment **Table 4**

Design loading conditions	Bulkhead location	$M_{wv\text{-}LC}$	Condition on Q_{fwd}	Mid-hold bulkhead for SF adjustment

Vertical shear force adjustment by application of vertical bending moments M_{Y_aft} and M_{Y_fore} for method 1 **Table 5**

Vertical shear force diagram	Target position in mid-hold
	Forward bulkhead
	Aft bulkhead
Vertical shear force after adjustment Vertical shear due to local adjustment	

4.4.6 Method 1 for vertical shear force adjustment at one bulkhead

The required adjustments in shear force at aft or forward transverse bulkhead of the mid-hold are to be made by applying vertical bending moments, M_{Y_aft}, M_{Y_fore} at model ends. For aft most cargo and foremost cargo hold models, the following additional vertical loads are to be applied at the transverse frame positions as shown in Table 7:

- $\delta w'_1$ - for aft most cargo hold model
- $\delta w'_3$ - for foremost cargo hold model

The required adjustments in shear force at following transverse bulkheads of the mid-hold are given by:

- Aft bulkhead:

$$M_{Y_aft} = M_{Y_fore} = \frac{(X_{fore} - X_{aft})}{2}(Q_{targ-aft} - Q_{aft}) - M'_{1-aft}$$

$$\Delta Q_{aft} = \Delta Q_{fwd} = 0$$

$$\delta w'_1 = \frac{Q_{targ-aft} - Q_{aft} + R_{v_aft}}{(n_1 - 1)} \quad \text{for aftmost cargo hold model only}$$

$$\delta w'_3 = \frac{Q_{targ-aft} - Q_{aft} + R_{v_fore}}{(n_3 - 1)} \quad \text{for foremost cargo hold model only}$$

- Forward bulkhead:

$$M_{Y_aft} = M_{Y_fore} = \frac{(X_{fore} - X_{aft})}{2}(Q_{targ-fwd} - Q_{fwd}) - M'_{1-fwd}$$

$$\Delta Q_{aft} = \Delta Q_{fwd} = 0$$

$$\delta w'_1 = \frac{Q_{targ-fwd} - Q_{fwd} + R_{v_aft}}{(n_1 - 1)} \quad \text{for aftmost cargo hold model only}$$

$$\delta w'_3 = \frac{Q_{targ-fwd} - Q_{fwd} + R_{v_fore}}{(n_3 - 1)} \quad \text{for foremost cargo hold model only}$$

where:

M_{Y_aft}, M_{Y_fore}: Vertical bending moment, in kNm, to be applied at the aft and fore ends in accordance with [4.4.10], to enforce the hull girder vertical shear force adjustment as shown in Table 5. The sign convention is that of the FE model axis.

Q_{aft} : Vertical shear force, in kN, due to local loads at aft bulkhead location of mid-hold, x_{b_aft}, resulting from the local loads calculated according to [4.4.3].Since the vertical shear force is discontinued at the transverse bulkhead location, Q_{aft} is the maximum absolute shear force between the stations located right after and right forward of the aft bulkhead of mid-hold.

Q_{fwd} : Vertical shear force, in kN, due to local loads at the forward bulkhead location of mid-hold, $x_{b\text{-}_fwd}$, resulting from the local loads calculated according to [4.4.3].Since the vertical shear force is discontinued at the transverse bulkhead location, Q_{fwd} is the maximum absolute shear force between the stations located right after and right forward of the forward bulkhead of mid-hold.

$M'_{1\text{-}aft}$,$M'_{1\text{-}fwd}$: Additional vertical bending moment, in kNm, applicable for aftmost and foremost cargo hold analysis only, taken as:

- Aft most cargo hold model

$$M'_{1-aft} = \frac{l_1}{4}(Q_{targ-aft} - Q_{aft} + R_{v-aft})$$

$$M'_{1-fwd} = \frac{l_1}{4}(Q_{targ-fwd} - Q_{fwd} + R_{v-aft})$$

- Foremost cargo hold model

$$M'_{1-aft} = \frac{l_3}{4}(Q_{targ-aft} - Q_{aft} + R_{v-fore})$$

$$M'_{1-fwd} = \frac{l_3}{4}(Q_{targ-fwd} - Q_{fwd} + R_{v-fore})$$

$\delta w'_1$: Distributed load, in kN, at frame in the modelled engine room of aftmost cargo hold model, see also Table 8.

$\delta w'_3$: Distributed load, in kN, at frame in the modelled forepeak of foremost cargo hold model, see also Table 8.

ΔQ_{aft} ,ΔQ_{fwd} : Shear force adjustments, as given in Table 8

R_{v_aft}, M_{v_fore} : Reaction forces at the aft and fore ends, in kN, as defined in [4.4.3].

l_1 : Length of the modelled engine room in aftmost cargo hold model, in m. See also

Table 8.

l_3 : Length of the modelled forepeak in foremost cargo hold model, in m. See also Table 8.

n_1, n_3 :Number of frame spaces, see Table 8.

4.4.7 Method 2 for vertical shear force adjustment at both bulkheads

The required adjustments in shear force at both transverse bulkheads of the mid-hold are to be made by applying:

- Vertical bending moments, M_{Y_aft}, M_{Y_fore} at model ends and,
- Vertical loads at the transverse frame positions as shown in Table 7 in order to generate vertical shear forces, ΔQ_{aft} and ΔQ_{fwd}, at the transverse bulkhead positions.
- For aft most cargo and foremost cargo hold models, the following additional vertical loads are to be applied at the transverse frame positions as shown in Table 7:
  - $\delta w'_1$: for aft most cargo hold model
  - $\delta w'_3$: for foremost cargo hold model

Table 6 shows examples of the shear adjustment application due to the vertical bending moments and to vertical loads.

$$M_{Y_aft} = M_{Y_fore} = \frac{(X_{fore} - X_{aft})}{2}(Q_{targ-fwd} - Q_{fwd})$$

$$M_{Y_aft} = \frac{X_{fore} - X_{aft}}{2} \cdot \frac{Q_{targ-fwd} - Q_{fwd} + Q_{targ-aft} - Q_{aft}}{2}$$

$$M_{Y_fore} = M_{Y_aft}$$

$$\Delta Q_{fwd} = \frac{Q_{targ-fwd} - Q_{fwd} - (Q_{targ-aft} - Q_{aft})}{2}$$

$$\Delta Q_{aft} = -\Delta Q_{fwd}$$

- Aft most cargo hold model

$$\delta w'_1 = \left(\frac{(Q_{targ-aft} - Q_{aft})(l - l_2 - l_1) + (Q_{targ-fwd} - Q_{fwd})(l - l_2 - l_3)}{(2l - l_1 - 2l_2 - l_3)} + R_{v_aft} \right) \frac{1}{(n_1 - 1)}$$

- Foremost cargo hold model

$$\delta w'_3 = \left(\frac{(Q_{targ-fwd} - Q_{fwd})(l - l_2 - l_3) + (Q_{targ-aft} - Q_{aft})(l - l_2 - l_1)}{(2l - l_1 - 2l_2 - l_3)} + R_{v_fore} \right) \frac{1}{(n_3 - 1)}$$

where:

M_{Y_aft}, M_{Y_fore}: Vertical bending moment, in kNm, to be applied at the aft and fore ends in accordance with [4.4.10], to enforce the hull girder vertical shear force adjustment. The sign convention is that of the FE model axis.

ΔQ_{aft} : Adjustment of shear force, in kN, at aft bulkhead of mid-hold.

ΔQ_{fwd} : Adjustment of shear force, in kN, at fore bulkhead of mid-hold.

M'_2 : Additional vertical bending moment, in kNm, applicable for aftmost and foremost cargo hold analysis only, taken as:

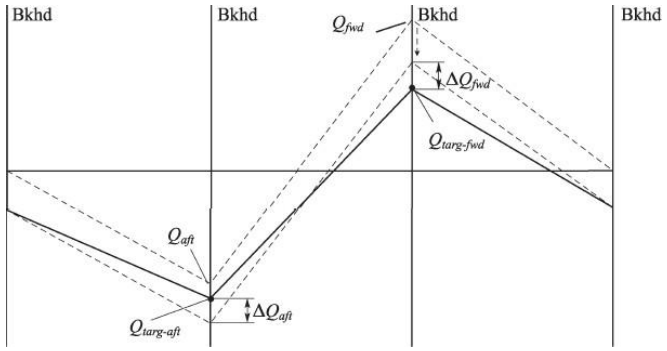
- Aftmost cargo hold model $M'_2 = \frac{l_1 (n_1 - 1) \delta w'_1}{4}$
- Foremost cargo hold model $M'_2 = \frac{l_3 (n_3 - 1) \delta w'_3}{4}$

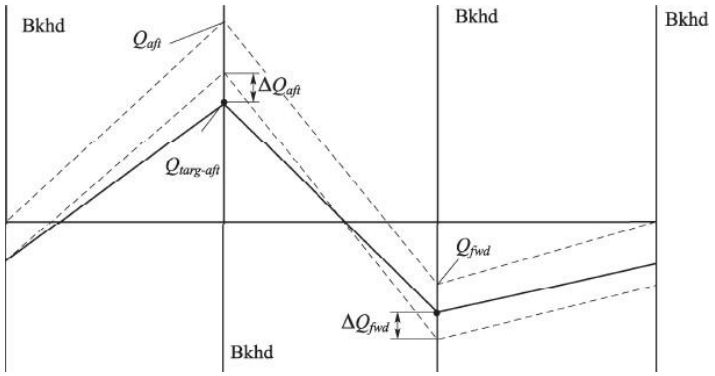
$\delta w'_1$: Distributed load, in kN, at frame in the modelled engine room of aftmost cargo hold model, see also Table 8.

$\delta w'_3$: Distributed load, in kN, at frame in the the modelled forepeak of foremost cargo hold model, see also Table 8.

R_{v_aft}, M_{v_fore}: Reaction forces at the aft and fore ends, in kN, as defined in [4.4.3].

l_1 : Length of the modelled engine room in aftmost cargo hold model, in m. See also Table 8.





l_3 : Length of the modelled forepeak in foremost cargo hold model, in m. See also Table 8.

$n_{1,3}$: Number of frame spaces, see Table 8.

The above adjustments in shear forces, ΔQ_{aft} and ΔQ_{fwd}, at the transverse bulkhead positions are to be generated by applying vertical loads at the transverse frame positions as shown in Table 7. For bulk carriers, the transverse frame positions correspond to the floors. Vertical correction loads are not to be applied to any transverse tight bulkheads, any frames forward of the forward cargo hold and any frames aft of the aft cargo hold of the FE model.

The vertical loads to be applied to each transverse frame to generate the increase/decrease in shear force at the bulkheads may be calculated as shown in Table 7. In case of uniform frame spacing, the amount of vertical force to be distributed at each transverse frame may be calculated in accordance with Table 8.

Target and required shear force adjustment by applying vertical forces Table 6

Note: F=0 if l_1=l_3 and l_{fore}=l_{end}, and loads are symmetrical about mid-length of model.

Note1: For definition of symbols, see Table 8.

Formulae for calculation of vertical loads for adjusting vertical shear forces Table 8

$$\delta w_1 = \frac{\Delta Q_{aft}(2l - l_2 - l_3) + \Delta Q_{fwd}(l_2 + l_3)}{(n_1 - 1)(2l - l_1 - 2l_2 - l_3)} + \delta w'_1$$

$$\delta w_2 = \frac{(W1 + W3)}{(n_2 - 1)} = \frac{(\Delta Q_{aft} - \Delta Q_{fwd})}{(n_2 - 1)}$$

$$\delta w_3 = \frac{-\Delta Q_{fwd}(2l - l_1 - l_2) - \Delta Q_{aft}(l_1 + l_2)}{(n_3 - 1)(2l - l_1 - 2l_2 - l_3)} - \delta w'_3$$

In general

$$F = F_{aft} = F_{fwd} = 0.5\left[\frac{W1(l_2 + l_1) - W3(l_2 + l_3)}{l}\right]$$

For aftmost and foremost cargo hold FE model

$$F = F_{aft} = \left(\frac{W1(\Delta l_{fore} + l_3 + l_2 + 0.5l_1) + W2(\Delta l_{fore} + l_3 + 0.5l_2) + W3(\Delta l_{fore} + 0.5l_3)}{l}\right)$$

where:

l_1 : Length of aft cargo hold of model, in m.
l_2 : Length of mid-hold of model, in m.
l_3 : Length of forward cargo hold of model, in m.
ΔQ_{aft} : Required adjustment in shear force, in kN, at aft bulkhead of middle hold, see [4.4.7].
ΔQ_{fwd} : Required adjustment in shear force, in kN, at fore bulkhead of middle hold, see [4.4.7].
F : End reactions, in kN, due to application of vertical loads to frames.
$W1$: Total evenly distributed vertical load, in kN, applied to aft hold of FE model, $(n_1 - 1)\ \delta w_1$.
$W2$: Total evenly distributed vertical load, in kN, applied to mid-hold of FE model, $(n_2 - 1)\ \delta w_2$.
$W3$: Total evenly distributed vertical load, in kN, applied to forward hold of FE model, $(n_3 - 1)\ \delta w_3$.
n_1 : Number of frame spaces in aft cargo hold of FE model.
n_2 : Number of frame spaces in mid-hold of FE model.
n_3 : Number of frame spaces in forward cargo hold of FE model.
δw_1 : Distributed load, in kN, at frame in aft cargo hold of FE model.
δw_2 : Distributed load, in kN, at frame in mid-hold of FE model.
δw_3 : Distributed load, in kN, at frame in forward cargo hold of FE model.
$\delta w'_1$: Additional distributed load, in kN, at frame in the modelled engine room of aftmost cargo hold model. Formulae of $\delta w'_1$ are given in [4.4.6] and [4.4.7] for shear force adjustment method 1 and method 2 accordingly.
$\delta w'_3$: Additional distributed load, in kN, at frame in the modelled forepeak of foremost cargo hold model. Formulae of $\delta w'_3$ are given in [4.4.6] and [4.4.7] for shear force adjustment method 1 and method 2 accordingly.
Δl_{end} : Distance, in m, between end bulkhead of aft cargo hold to aft end of FE model.
$\Delta l_{end} = 0$ in the aftmost cargo hold model
Δl_{fore} : Distance, in m, between fore bulkhead of forward cargo hold to forward end of FE model.
$\Delta l_{fore} = 0$ in the foremost cargo hold model
l : Total length, in m, of FE model including portions beyond end bulkheads:
$= l_1 + l_2 + l_3 + l_4 + \Delta l_{end} + \Delta l_{fore}$

Note1: Positive direction of loads, shear forces and adjusting vertical forces in the formulae is in accordance with Table 6 and Table 7.
Note2: $W1 + W3 = W2$. (not applicable for aftmost and foremost cargo FE model).
Note3: The above formulae are only applicable if uniform frame spacing is used within each hold. The length and frame spacing of individual cargo holds may be different.

If non-uniform frame spacing is used within each cargo hold, the average frame spacing $l_{av\text{-}i}$ is used to calculate the average distributed frame loads *wav-i,*, according to Table 8, where $i = 1, 2, 3$ for each hold.

Then $\delta w_{av\text{-}i}$ is redistributed to the non-uniform frame as follows:

$$\delta w_i^k = \delta w_{av-i} \frac{l_{av-i}^k}{l_{av-i}} \quad k=1, 2, \ldots, n_i - 1 \text{ for each frame in cargo hold i, i=1, 2, 3}$$

where:

$l_{av\text{-}i}$: Average frame spacing, in m, calculated as l_i / n_i, in cargo hold i with i = 1, 2, 3.
l_i : Length, in m, of the cargo hold i with i = 1, 2, 3 as defined in Table 8.
n_i : Number of frame spacing in cargo hold i with i = 1, 2, 3 as defined in Table 8.
$\delta w_{av\text{-}i}$: Average uniform frame spacing, in m, distributed force calculated according to Table 8 with the average frame spacing $l_{av\text{-}i}$ in cargo hold i with i = 1, 2, 3.
δw_i^k : Distributed load, in kN, for non-uniform frame k in cargo hold i.
$l^k_{av\text{-}i}$: Equivalent frame spacing, in m, for each frame k with k = 1, 2,..., ni - 1, in cargo hold i, taken as:

$$l^k_{av-i} = l^1_i - \frac{l_{av-i} l^1_i}{l^1_i + l^{n_i}_i} + \frac{l^2_i}{2} \quad \text{for } k = 1 \text{ (first frame), in cargo hold } i$$

$$l^k_{av-i} = \frac{l^k_i}{2} + \frac{l^{k+1}_i}{2} \quad \text{for } k = 2, 3, \ldots, n_1 - 2, \text{ in cargo } i$$

$$l^k_{av-i} = l^{n_i}_i - \frac{l_{av-i} l^{n_i}_i}{l^1_i + l^{n_i}_i} + \frac{l^{n_i-1}_i}{2} \quad \text{for } k = n_i - 1 \text{ (last frame), in cargo } i$$

l^k_i: Frame spacing, in m, between the frame k - 1 and k in the cargo hold i:

The required vertical load δw_i for a uniform frame spacing or $\delta_{wi}{}^k$ for non-uniform frame spacing, are to be applied by following the shear flow distribution at the considered cross section, as described in Ch 5, App 1. For a frame section under vertical load δw_i, the shear flow, q_f, at the middle point of the element is calculated as:

$$q_{f-k} = \frac{\delta w_i}{I_{y-n50}} Q_{k-n50}$$

where:
$q_{f\text{-}k}$: Shear flow calculated at the middle of the k-th element of the transverse frame, in N/mm.
δw_i : Distributed load at each transverse frame location for i-th cargo hold, i = 1, 2, 3, as defined in Table 8, in N.
$I_{y\text{-}n50}$: Moment of inertia of the hull girder cross section, in mm^4.
$Q_{k\text{-}n50}$: First moment about neutral axis of the accumulative section area starting from the open end (shear stress free end) of the cross section to the point sk for shear flow $q_{f\text{-}k}$ in mm^3, taken as;

$$Q_{k-n50} = \int_0^{S_k} z_{neu} t_{n50} \mathrm{d}s$$

z_{neu} : Vertical distance from the integral point, s, to the vertical neutral axis.
t_{n50} : Net thickness, in mm, of the plate at the integral point of the cross section.

The distributed shear force at j-th FE grid of the transverse frame, $F_{j\text{-}grid}$, is obtained from the shear flow of the connected elements as following:

$$F_{j-grid} = \sum_{k=1}^{n} q_{f-k} \frac{l_k}{2}$$

where:
l_k : Length of the k-th element of the transverse frame connected to the grid j, in mm.
n : Total number of elements connect to the grid j.

The shear flow has direction along the cross section and therefore the distributed force, $F_{j\text{-}grid}$, is a vector force. For vertical hull girder shear correction, the vertical and horizontal force components calculated with above mentioned shear flow method need to be applied to the cross section.

4.4.8 Procedure to adjust vertical and horizontal bending moments for midship cargo hold region

In case the target vertical bending moment needs to be reached, an additional vertical bending moment is to be applied at both ends of the cargo hold FE model to generate this target value in the mid-hold of the model. This end vertical bending moment is given as follows:

$M_{v\text{-}end} = M_{v\text{-}targ} - M_{v\text{-}peak}$

where:
$M_{v\text{-}end}$: Additional vertical bending moment, in kNm, to be applied to both ends of FE model in

accordance with [4.4.10].

$M_{v\text{-}targ}$: Hogging (positive) or sagging (negative) vertical bending moment, in kNm, as specified in [4.3.2].

$M_{v\text{-}peak}$:Maximum or minimum bending moment, in kNm, within the length of the mid-hold due to the local loads described in [4.4.3] and due to the shear force adjustment as defined in [4.4.5].

$M_{v\text{-}peak}$ is to be taken as the maximum bending moment if $M_{v\text{-}targ}$ is hogging (positive) and as the minimum bending moment if $M_{v\text{-}targ}$ is sagging (negative). $M_{v\text{-}peak}$ is to be calculated as follows based on a simply supported beam model:

$$M_{v-peak} = Extremum\left\{ M_{v_FEM}(x) + M_{lineload} + M_{Y_aft}\left(2\frac{x - x_{aft}}{x_{fore} - x_{aft}} - 1\right)\right\}$$

$M_{V_FEM(x)}$: Vertical bending moment, in kNm, at position x, due to the local loads as described in [4.4.3].

M_{Y_aft} : End bending moment, in kNm, to be taken as:

- When method 1 is applied: the value as defined in [4.4.6].
- When method 2 is applied: the value as defined in [4.4.7].
- Otherwise: $M_{Y_af} = 0$

$M_{lineload}$: Vertical bending moment, in kNm, at position x, due to application of vertical line loads at frames according to method 2, to be taken as:

$M_{lineload} = -(x - x_{aft})F - \sum_i (x - x_i)\,\delta w_i$ when $x_i < x$

F : Reaction force, in kN, at model ends due to application of vertical loads to frames as defined in Table 7.

x : X-coordinate, in m, of frame in way of the mid-hold.

δw_i : vertical load, in kN, at web frame station i applied to generate required shear force.

$\delta w_i = -\delta w_1$ when frame i is within after hold

$\delta w_i = \delta w_2$ when frame i is within mid-hold

$\delta w_i = -\delta w_3$ when frame i is within forward hold

In case the target horizontal bending moment needs to be reached, an additional horizontal bending moment is to be applied at the ends of the cargo tank FE model to generate this target value within the mid-hold. The additional horizontal bending moment is to be taken as:

$$M_{h-end} = M_{h\text{-}targ} - M_{h-peak}$$

where:

$M_{h\text{-}end}$: Additional horizontal bending moment, in kNm, to be applied to both ends of the FE model according to [4.4.10].

$M_{h\text{-}targ}$: Horizontal bending moment, as defined in [4.3.4].

$M_{h\text{-}peak}$: Maximum or minimum horizontal bending moment, in kNm, within the length of the mid-hold due to the local loads described in [4.4.3].

$M_{h\text{-}peak}$ is to be taken as the maximum horizontal bending moment if $M_{h\text{-}targ}$ is positive (starboard side in tension) and as the minimum horizontal bending moment if $M_{h\text{-}targ}$ is negative (port side in tension).

$M_{h\text{-}peak}$ is to be calculated as follows based on a simply supported beam model:

$$M_{h-peak} = Extremum\left\{ M_{H_FEM}(x)\right\}$$

$M_{H_FEM\ (x)}$: Horizontal bending moment, in kNm, at position x, due to the local loads as described in [4.4.3].

The vertical and horizontal bending moments are to be calculated over the length of the mid-hold to identify the position and value of each maximum/minimum bending moment.

4.4.9 Procedure to adjust vertical and horizontal bending moments outside midship cargo hold region

To reach the vertical hull girder target values at each frame and transverse bulkhead position, as defined in [4.3.2], the vertical bending moment adjustments, *mvi*, are to be applied at web frames and transverse bulkhead positions of the finite element model, as shown in Figure 19. The vertical bending moment adjustment at each longitudinal location, *i*, is to be calculated as follows:

$$f(i) = M_{v\text{-}targ}(i) - M_{v\text{-}FEM}(i) - M_{lineload}(i) - M_{Y_aft}\left(2 \cdot \frac{x_i - x_{aft}}{x_{fore} - x_{aft}} - 1\right)$$

$$m_{vi} = \frac{f(i) + f(i+1)}{2} - \sum_{j=0}^{i-1} m_{vj}$$

$$m_{v-end} = -\sum_{j=0}^{n_t} m_{vj}$$

where:

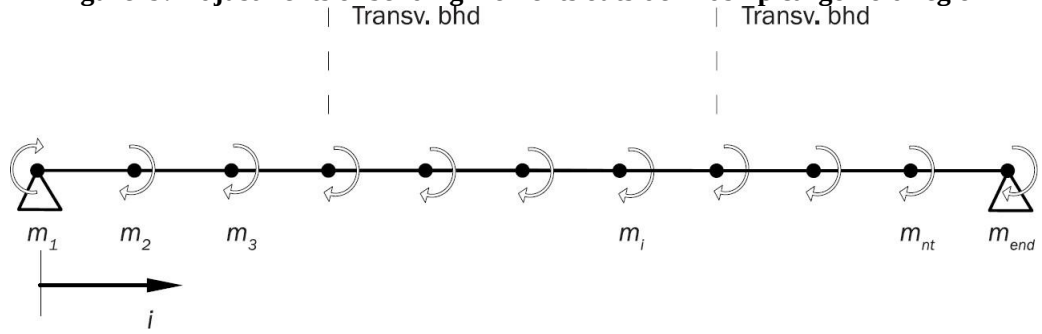
i : Index corresponding to the i-th station, starting from i =1 at the aft end section up to n_t

n_t : Total number of longitudinal stations where the vertical bending moment adjustment, m_{vi}, is applied.

m_{vi} : Vertical bending moment adjustment, in kNm, to be applied at transverse frame or bulkhead at station i.

m_{v_end} : Vertical bending moment adjustment, in kNm, to be applied, at the fore end section (n_t+1 station).

m_{vj} : Argument of summation to be taken as:



- m_{vo}= 0 when j=0
- m_{vj} = m_{vi} when j=i

$M_{v\text{-}targ(i)}$: Required target vertical bending moment, in kNm, at station i, calculated in accordance with [4.3.2].

$M_{V\text{-}FEM(i)}$: Vertical bending moment distribution, in kNm, at station i due to local loads as given in [4.4.3].

$M_{lineload(i)}$:Vertical bending moment, in kNm, at station i, due to the line load for the vertical shear force correction as required in [4.4.8].

Figure19: Adjustments of bending moments outside midship cargo hold region

m_{hi} can be substituted to m_{vi} in this figure and m_i is the positive bending moment in FE coordinate system.

To reach the horizontal hull girder target values at each frame and transverse bulkhead position as defined in [4.3.4], the horizontal bending moment adjustments, *mhi*, are to be applied at web frames and transverse bulkhead positions of the finite element model, as shown in Figure 19. The horizontal bending moment adjustment at each longitudinal location, i, is to be calculated as follows:

$$f(i) = M_{h\text{-}targ}(i) - M_{H-FEM}(i)$$

$$m_{hi} = \frac{f(i) + f(i+1)}{2} - \sum_{j=0}^{i-1} m_{hj}$$

$$n_t$$

$$m_{h-end} = -\sum_{j=0} m_{hj}$$

where:

i : Longitudinal location for bending moment adjustments, m_{hi}.

n_t : Total number of longitudinal stations where the horizontal bending moment adjustment, m_{hi}, is applied.

m_{hi} : Horizontal bending moment adjustment, in kNm, to be applied at transverse frame or bulkhead at station i.

m_{h_end} :Horizontal bending moment adjustment, in kNm, to be applied at the fore end section (nt+1 station).

m_{hj} :Argument of summation to be taken as:

- m_{ho} = 0 when $j=0$
- $m_{hj} = m_{hi}$ when $j=i$

$M_{h\text{-}targ(i)}$: Required target horizontal bending moment, in kNm, at station i, calculated in accordance with [4.3.4].

$M_{H\text{-}FEM(i)}$: Horizontal bending moment distribution, in kNm, at station i due to local loads as given in [4.4.3].

The vertical and horizontal bending moment adjustments, m_{vi} and m_{hi}, are to be applied at all web frames and bulkhead positions of the FE model. The adjustments are to be applied in FE model by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements in accordance with [4.4.10].

4.4.10 Application of bending moment adjustments on the FE model

The required vertical and horizontal bending moment adjustments are to be applied to the considered cross section of the cargo hold model by distributing longitudinal axial nodal forces to all hull girder bending effective longitudinal elements of the considered cross section according to Ch 5, Sec 1, [1.2] as follows:

- For *vertical* bending moment:

$$(F_x)_i = \frac{M_v}{I_{y-n50}} \frac{M_{i-n50}}{n_i} z_i$$

- For *horizontal* bending moment:

$$(F_x)_i = \frac{M_h}{I_{z-n50}} \frac{A_{i-n50}}{n_i} y_i$$

where:

M_v : Vertical bending moment adjustment, in kNm, to be applied to the considered cross section of the model.

M_h : Horizontal bending moment adjustment, in kNm, to be applied to the considered cross section the ends of the model.

$(F_x)_i$: Axial force, in kN, applied to a node of the i-th element.

$I_{y\text{-}n50}$: Hull girder vertical moment of inertia, in m^4, of the considered cross section about its horizontal neutral axis.

$I_{z\text{-}n50}$: Hull girder horizontal moment of inertia, in m^4, of the considered cross section about its vertical neutral axis.

Z_i : Vertical distance, in m, from the neutral axis to the centre of the cross sectional area of the i-th element.

Y_i : Horizontal distance, in m, from the neutral axis to the centre of the cross sectional area of the i-th element.

$A_{i\text{-}n50}$: Cross sectional area, in m^2, of the i-th element.

n_i : Number of nodal points of i-th element on the cross section, n_i = 1 for beam element, n_i = 2 for 4- node shell element.

For cross sections other than cross sections at the model end, the average area of the corresponding i-th elements forward and aft of the considered cross section is to be used.

4.5 Procedure to adjust hull girder torsional moments

4.5.1 General

The procedure in this sub-article describes how to adjust the hull girder torsional moment distribution on the cargo hold FE model to achieve the target torsional moment at the target location. The hull girder torsional moment target values are given in [4.3.5].

4.5.2 Torsional moment due to local loads

Torsional moment, in kNm, at longitudinal station i due to local loads, $M_{T\text{-}FEMi}$ in kNm, is

determined by the following formula (see Figure 20):

$$M_{T-FEM_i} = \sum_k \left[f_{hik}(z_{ik} - z_r) \right] - \sum_k (f_{vik} y_{ik})$$

where:

$M_{T\text{-}FEMi}$: Lumped torsional moment, in kNm, due to local load at longitudinal station *i*.

z_r : Vertical coordinate of torsional reference point, in m:

For bulk carrier, $z_r = 0$.

For oil tanker, $z_r = z_{sc}$, shear centre at the middle of the mid-hold.

f_{hik} : Horizontal nodal force, in kN, of node *k* at longitudinal station *i*.

f_{vik} : Vertical nodal force, in kN, of node *k* at longitudinal station *i*.

y_{ik} : *Y*-coordinate, in m, of node *k* at longitudinal station *i*.

z_{ik} : *Z*-coordinate, in m, of node *k* at longitudinal station *i*.

$M_{T\text{-}FEM0}$: Lumped torsional moment, in kNm, due to local load at aft end of the FE model (forward end for foremost cargo hold model), taken as:

$$M_{T-FEM0} = -\sum_k [f_{h0k}(z_{0k} - z_r)] + \sum_k (f_{v0k} y_{0k}) + R_{H_fwd} \cdot (z_{ind} - z_r) \quad \text{for foremost cargo hold model}$$

$$M_{T-FEM0} = \sum_k [f_{h0k}(z_{0k} - z_r)] - \sum_k (f_{v0k} y_{0k}) + R_{H_aft} \cdot (z_{ind} - z_r) \quad \text{for the other cargo hold models}$$

R_{H_fwd} : Horizontal reaction forces, in kN, at the forward end, as defined in [4.4.3].

R_{H_aft} : Horizontal reaction forces, in kN, at the aft end, as defined in [4.4.3].

z_{ind} : Vertical coordinate, in m, of independent point as defined in [2.5.3].

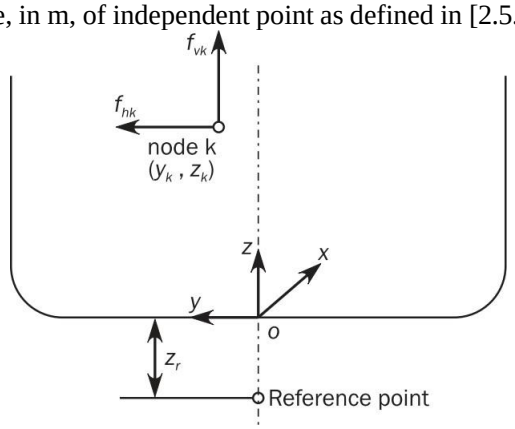


Figure20 Station forces and acting location of torsional moment at section

4.5.3 Hull girder torsional moment

The hull girder torsional moment, $M_{T\text{-}FEM}$ (x_j) in kNm, is obtained by accumulating the station torsional moment from the aft end section (forward end for foremost cargo hold model) as follows:

$$M_{T-FEM}(x_j) = \sum_i M_{T-FEMi}$$

- when $x_i \geqslant x_j$ for foremost cargo hold model,
- when $x_i < x_j$ otherwise.

where:

$M_{T\text{-}FEM}$ (x_j): Hull girder torsional moment, in kNm, at longitudinal station x_j.

x_j : *X*-coordinate, in m, of considered longitudinal station *j*.

The torsional moment distribution given in [4.5.2], has a step at each longitudinal station.

4.5.4 Procedure to adjust hull girder torsional moment to target value

The torsional moment is to be adjusted by applying a hull girder torsional moment $M_{T\text{-}end}$ in kNm, at the independent point of the aft end section of the model (forward end for foremost cargo hold model), given as follows:

$$M_{T-end} = M_{wt\text{-}targ} - M_{wt}(x_{targ})$$

where:

x_{targ} : *X*-coordinate, in m, of the target location for hull girder torsional moment, as defined in

[4.3.5].

$M_{wt\text{-}targ}$: Target hull girder torsional moment, in kNm, specified in [4.3.5], to be achieved at the target location.

$M_{T\text{-}FEM}\,(x_{targ})$: Hull girder torsional moment, in kNm, at target location due to local loads.

Due to the step of hull girder torsional moment at each longitudinal station, the hull girder torsional moment is to be selected from the values aft and forward of the target location as follows: Maximum value for positive torsional moment and minimum value for negative torsional moment.

4.6 Summary of hull girder load adjustments

4.6.1

The required methods of hull girder load adjustments for different cargo hold regions are given in Table 9.

Overview of hull girder load adjustments in FE analyses **Table 9**

	Midship cargo hold region	After and Forward cargo hold region	Aft most cargo holds	Foremost cargo holds
Adjustment of Vertical Shear Forces	See [4.4.5]			
Adjustment of Bending Moments	See [4.4.8]	See [4.4.9]		
Adjustment of Torsional Moment	See [4.5.4]			

5 ANALYSIS CRITERIA

5.1 General

5.1.1 Evaluation areas

Verification of results against the acceptance criteria is to be carried out within the longitudinal extent of the mid-hold, as shown in Figure 21 and Figure 22.

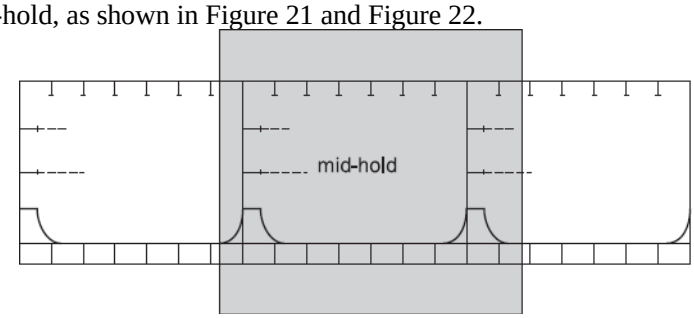

Figure21 Longitudinal extent of evaluation area for oil tanker

5.1.2 Structural members

The following structural elements within the evaluation area are to be verified with the criteria given in [5.2] and [5.3]:

- All hull girder longitudinal structural members,
- All primary supporting structural members and bulkheads within the mid-hold,
- All structural members being part of the transverse bulkheads, such as:
- For oil tanker: stringer, buttress structure, stool tanks, partial girders together with attached transverse structures,
- For bulk carrier: stool tanks together with connected longitudinal girders and double bottom floors,
- All structural members being part of the collision bulkhead, and extending to one web frame spacing forward of the collision bulkhead,
- All structural members being part of the forward transverse bulkhead of the machinery space and all hull girder longitudinal structural members aft of this transverse bulkhead within the extent of 15% of the aftmost cargo hold length excluding slop tanks.

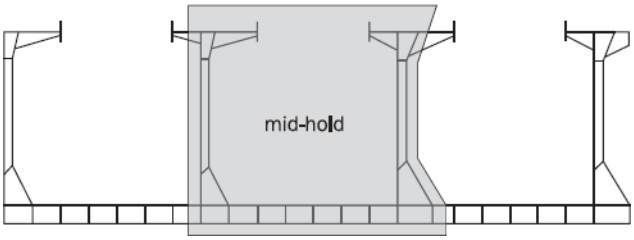

Figure 22 Longitudinal extent of evaluation area for bulk carrier

5.2 Yield strength assessment

5.2.1 Von Mises stress

For all plates of the structural members defined in [5.1.2], the von Mises stress, σ_{vm}, in N/mm^2, is to be calculated based on the membrane normal and shear stresses of the shell element. The stresses are to be evaluated at the element centroid of the mid-plane (layer), as follows:

$$\sigma_{vm} = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau_{xy}^2}$$

where:

σ_x, σ_y : Element normal membrane stresses, in N/mm^2.

τ_{xy} : Element shear stress, in N/mm^2.

5.2.2 Axial stress in beams and rod elements

For beams and rod elements, the axial stress, σ_{axial}, in N/mm^2, is to be calculated based on axial force alone. The axial stress is to be evaluated at the middle of element length.

5.2.3 Coarse mesh permissible yield utilisation factors

The coarse mesh permissible yield utilisation factors, λ_{yperm}, given in Table 10, are based on the mesh sizes and element types described in [2.3] to [2.4].

The yield utilisation factor resulting from element stresses of each structural component are not to exceed the permissible values as given in Table 10.

Coarse mesh permissible yield utilisation factor **Table 10**

Structural component	Coarse mesh permissible yield utilisation factor, λ_{yperm}
Plating of all longitudinal hull girder structural members, primary supporting structural members and bulkheads. Face plate of primary supporting members modelled using shell or rod elements. Dummy rod of corrugated bulkhead	1.0 (load combination S+D) 0.8 (load combination S)
Corrugation of vertically corrugated bulkheads with lower stool and horizontally corrugated bulkhead, under lateral pressure from liquid loads, for shell elements only. Supporting structure in way of lower end of corrugated bulkheads without lower stool (1).	0.90 (load combination S+D) 0.72 (load combination S)
Corrugation of vertically corrugated bulkheads without lower stool under lateral pressure from liquid loads and without lower stool, for shell elements only.	0.81 (load combination S+D) 0.65 (load combination S)

1) Supporting structure for a transverse corrugated bulkhead refers to the structure in the longitudinal direction within half a web frame space forward and aft of the bulkhead, and within a vertical extent equal to the corrugation depth.
Supporting structure for a longitudinal corrugated bulkhead refers to the structure in transverse direction within 3 longitudinal stiffener spacings from each side of the bulkhead, and within a vertical extent equal to the corrugation depth.

5.2.4 Yield criteria

The structural elements given in [5.1.2] are to comply with the following criteria:

$\lambda_y \leqslant \lambda_{ype\ rm}$

where:
λ_y : yield utilisation factor.

$$\lambda_y = \frac{\sigma_{vm}}{R_y} \text{ for shell elements in general.}$$

$$\lambda_y = \frac{|\sigma_{axial}|}{R_y} \text{ for rod or beam elements in general.}$$

σ_{vm} : Von Mises stress, in N/mm^2.
σ_{axial} : Axial stress in rod or beam element, in N/mm^2.
λ_{yperm} : Coarse mesh permissible yield utilisation factors defined in Table 10.

The yield check criteria is to be based on axial stress for the following members:

- The flange of primary supporting members,
- The intersections between the flange and web of the corrugations, according to [5.2.5].

Where the von Mises stress of the elements in the cargo hold FE model in way of the area under investigation by fine mesh exceeds the yield criteria, average von Mises stress, obtained from the fine mesh analysis, calculated over an area equivalent to the mesh size of the cargo hold finite element model is to satisfy the yield criteria above.
In way of cut-outs, yield utilisation factor is to be obtained with shear stress correction, as given in [5.2.6].

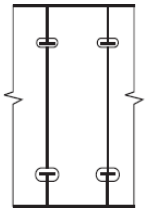
5.2.5 Corrugation of corrugated bulkhead

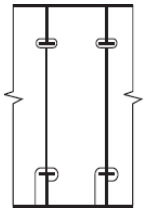
The stress in corrugation of corrugated bulkheads is to be evaluated based on:

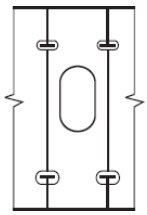
a) The von Mises stress, σ_{vm}, in shell elements on the flange and web of the corrugation.
b) The axial stress, σ_{axial}, in dummy rod elements, modelled with unit cross sectional properties at the intersection between the flange and web of the corrugation.

5.2.6 Shear stress correction for cut-outs

Except as indicated in [5.2.7], the element shear stress in way of cut-outs in webs is to be corrected for loss in shear area in accordance with the following formula. The corrected element shear stress is to be used to calculate the von Mises stress of the element for verification against the yield criteria.







$$\tau_{cor} = \frac{ht_{mod-n50}}{A_{shr-n50}} \tau_{elem}$$

where:
τ_{cor} : Corrected element shear stress, in N/mm^2.
h : Height of web of girder, in mm, in way of opening, see Table 1. Where the geometry of the opening is modelled, h is to be taken as the height of web of the girder deducting the height of the modelled opening.
$t_{mod\text{-}n50}$: Modelled web thickness, in mm, in way of opening.
$A_{shr\text{-}n50}$: Effective net shear area of web, in mm^2, taken as the web area deducting the area lost of all openings, including slots for stiffeners, calculated in accordance with Ch 3, Sec 7, [1.4.8].
τ_{elem} : Element shear stress, in N/mm^2, before correction.

5.2.7 Exceptions for shear stress correction for openings

Correction of element shear stress due to presence of cut-outs is not required for cases given in Table 11 provided λ_y/C_r complies with the criteria given in [5.2.4].

Exceptions for shear stress correction **Table 11**

Identification	Figure	Difference between modelled shear area and the net effective shear area in % of the modelled shear area $\frac{A_{FEM-n50} - A_{shr-n50}}{A_{FEM-n50}} \cdot 100\%$	Reduction factor for yield criteria, C_r
Upper and lower slots for local support stiffeners fitted with lugs or collar plates		< 15%	0.85
Upper or lower slots for local support stiffeners fitted with lugs or collar plates		< 20%	0.80
In way of opening; upper and lower slots for local support stiffeners fitted with collar plates		< 40%	0.60
$A_{shr\text{-}n50}$: Effective net shear area of the web, in mm^2, taken as the web area without the all opening areas and without the slots for stiffeners, in accordance with Ch 3, Sec 7, [1.4.8].			

5.3 Buckling strength assessment

5.3.1

All structural elements in FE analysis carried out in accordance with this Section are to be assessed individually against the buckling requirements as defined in Ch 8, Sec 4.

Section 3 LOCAL STRUCTURAL STRENGTH ANALYSIS

1 OBJECTIVE AND SCOPE

1.1 General

1.1.1

The local strength analysis of structural details is to be in accordance with the requirements given in this section.

1.1.2

The selection of critical locations on the structural members for fine mesh analysis is to be in accordance with this section.

1.1.3 Fine mesh analysis procedure

The details to be assessed by fine mesh analysis are to be modelled according to the requirements given in [4], under the FE load combinations defined in [5] and to comply with the criteria given in [6].

1.1.4 Scope of local structural strength verification

The fine mesh verification is to be performed as follows:

- Fine mesh analysis for the structural details given in [2],
- Screening procedure according to [3].

2 LOCAL AREAS TO BE ASSESSED BY FINE MESH ANALYSIS

2.1 List of mandatory structural details

2.1.1 List of structural details

In the midship cargo hold region, the following structural details are to be assessed according to the fine mesh analysis procedure defined in [1.1.3]:

a) Hopper knuckles for ship with double side as given in [2.1.2],
b) Side frame end brackets and lower hopper knuckle for single side bulk carrier as given in [2.1.3],
c) Large openings as given in [2.1.4],
d) Connections of deck and double bottom longitudinal stiffeners to transverse bulkhead as given in [2.1.5],
e) Connections of corrugated bulkhead to adjoining structure as given in [2.1.6].
f) Bracket at the heel of horizontal stringer as given in [2.1.7].

For each above mentioned structural detail, one fine mesh model is required within all the cargo hold models covering the midship cargo hold region. The selection of the location of this fine mesh model is to be based on requirements given from [2.1.2] to [2.1.7] from all cargo hold analyses in the midship cargo hold region.

2.1.2 Hopper knuckles for ship with double side

Fine mesh analysis is to be carried out for the lower and upper hopper knuckles of either welded or bent type, in way of a typical transverse web frame, as indicated in Figure 1.

For double side arrangements without the hopper plating, i.e. where the inner hull longitudinal bulkhead is fitted directly to the inner bottom, fine mesh analysis is to be carried out for the heel of the transverse web frame.

The transverse web frame which, in the cargo hold analysis, has the maximum yield utilisation factor, λ_y, in knuckle is to be selected for the fine mesh analysis.

2.1.3 Side frame end brackets and lower hopper knuckle for single side bulk carrier

Fine mesh analysis is to be carried out for the lower hopper knuckle of either welded or bent type, lower and upper end bracket of side frame, as indicated in Figure 2.

The side frame which in the cargo hold analysis has the maximum yield utilisation factor, λ_y , in end bracket joints is to be selected for the fine mesh analysis.

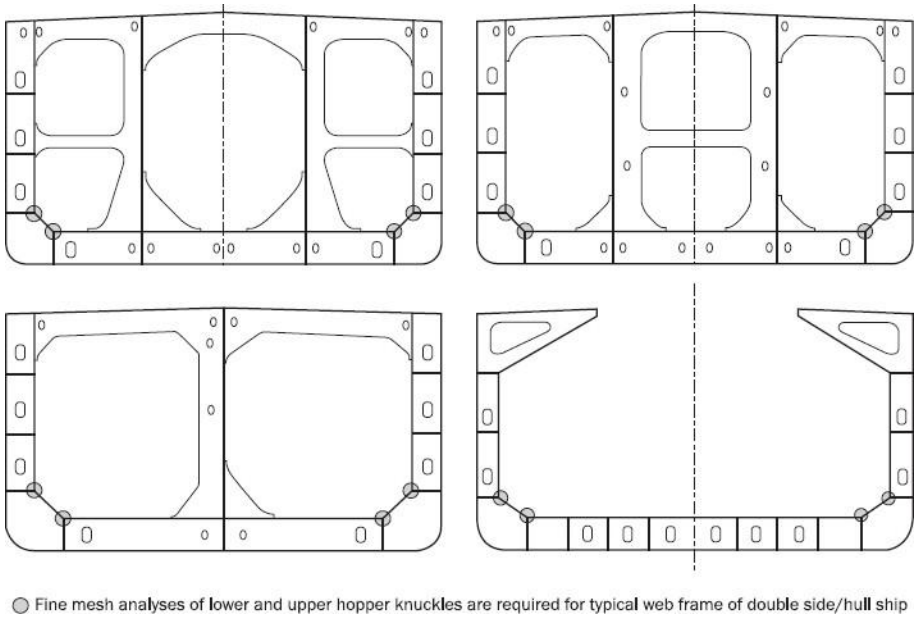


Figure 1 Mandatory areas at hopper knuckles for ships with double side

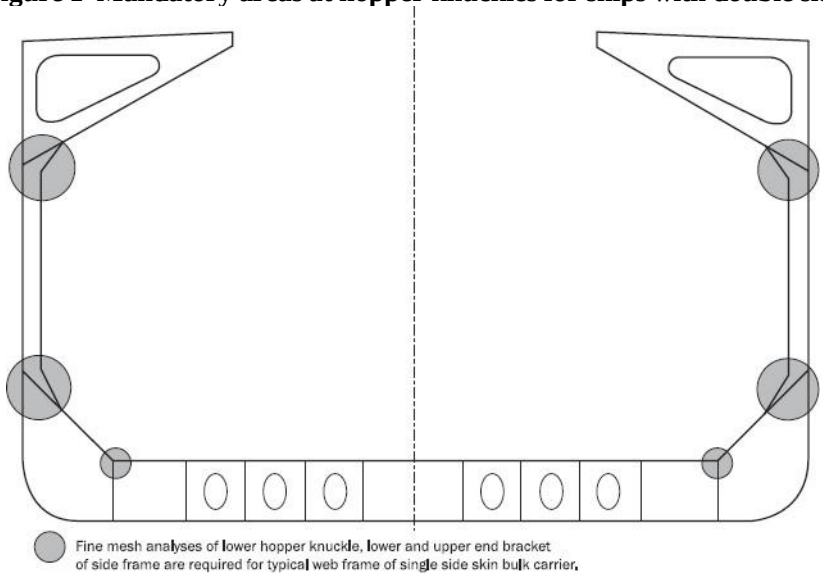

Figure 2 Mandatory areas at lower upper knuckle and side frame end brackets for single side bulk carrier

2.1.4 Large openings

Large openings in way of primary supporting members, for which their geometry is required to be represented in the cargo hold model in accordance with Ch 7, Sec 2, [2.4.9], are to be assessed by fine mesh analysis.

The structural member in way of the large openings having the maximum yield utilisation factor, λ_y , in the cargo hold analysis is to be selected for the fine mesh analysis.

2.1.5 Connections between deck and double bottom longitudinal stiffeners and adjoining structures of transverse bulkhead

Fine mesh analysis is to be carried out for the connections of deck and double bottom longitudinal stiffeners and adjoining structures of transverse bulkhead, either plane or corrugated bulkhead. The adjoining structures of transverse bulkhead include the structural members in way of the bulkhead, the partial deck girders and partial double bottom girders, if any.

For example, the following structural members are to be assessed, some of them being shown in Figure 3:

- At least one pair of connections between inner and outer bottom longitudinal stiffeners and adjoining structures of transverse bulkhead.

- At least one pair of connections between inner and outer bottom longitudinal stiffeners and adjoining structures of adjacent floor to the transverse bulkhead.
- At least one connection between deck longitudinal stiffener (fitted above or below deck) and adjoining vertical structure of transverse oil tight bulkhead.
- Connection between deck longitudinal partial girder on top of transverse oil tight bulkheads when fitted and adjoining vertical structure of transverse oil tight bulkhead.
- Connection between bottom longitudinal partial girder in way of transverse oil tight bulkheads when fitted and adjoining vertical structure of transverse oil tight bulkhead.

The selection of the connections between longitudinal and vertical stiffeners to be analysed is to be based on the maximum relative deflection between supports, i.e. between floor and transverse bulkhead or between deck transverse and transverse bulkhead. Where there is a significant variation in end connection arrangement between stiffeners or scantlings, analyses of additional connections may be required by the Society.

Outside the midship cargo hold region, the scantlings of the connections as given above are not to be less than the required scantlings obtained for the midship cargo hold region unless an equivalent strength is demonstrated by fine mesh analysis.

ISC 2.1.5a Additional fine mesh analysis is to be carried out in the following cases:
Where there is a significant variation in the end connection arrangement between stiffeners or scantlings, e.g. a variation of the shape or arm length of the stiffener end connection bracket, the connecting structure with the maximum relative deflection between supports is to be selected from attached end connections for analysis.

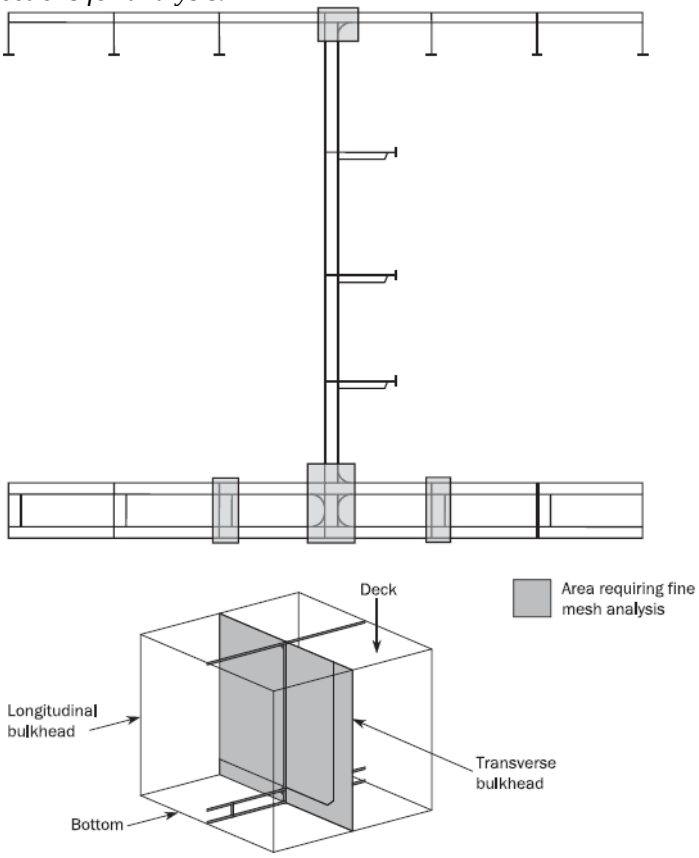

Figure 3 Examples of mandatory areas at connections between double bottom and deck longitudinals and adjoining structure of transverse bulkhead

2.1.6 Connections between corrugation and adjoining lower structure

Fine mesh analysis is to be carried out for connections between corrugation and adjoining lower supporting structures. For example, the following structural members, as shown in Figure 4, are to be assessed:

- Connection of the corrugation and supporting structure in way of lower stool shelf plate.
- Connection of the corrugation and lower supporting structure to inner bottom if no

lower stool is fitted.

- Connection of the corrugation and the upper corner of the gusset plate if shedder plate with a gusset plate is fitted at top of the lower stool.

The corrugation unit as defined in Ch 8, Sec 4, [3.3.2] which, in the cargo hold analysis, has the maximum yield utilisation factor, λ_y, in way of the corrugation connection, is to be selected for the fine mesh analysis.

Where there is a significant variation in the arrangement of supporting structure of the corrugation, analysis of additional locations may be required by the Society.

For ships with both longitudinal and transverse corrugated bulkheads, fine mesh analysis is required for the connection between corrugations and supporting structure in way of the lower stool shelf plate or inner bottom, if no lower stool is fitted, at the intersection between longitudinal and transverse corrugated bulkheads.

ISC 2.1.6a Additional fine mesh analysis is to be carried out in the following cases:

1) *For corrugation structure fitted with lower stool, where the corrugation unit which has been selected for fine mesh analysis is not intersected by the diaphragm of lower stool, the fine mesh analysis is to be carried out to the corrugation unit with the maximum yield utilisation factor that is intersected by the diaphragm of lower stool.*
2) *For longitudinal corrugated bulkheads not fitted with lower stool, where the corrugation unit which has been selected for fine mesh analysis is not intersected by the double bottom floor, the fine mesh analysis is to be carried out to the corrugation unit with the maximum yield utilisation factor that is intersected by the double bottom floor.*
3) *For transverse corrugated bulkheads not fitted with lower stool, where the corrugation unit which has been selected for fine mesh analysis is not intersected by the double bottom girder, the fine mesh analysis is to be carried out to the corrugation unit with the maximum yield utilisation factor that is intersected by the double bottom girder.*
4) *When the shape of the corrugation unit as defined in 3.3.2, Section 4, Chapter 8 of this PART is different from the one which has been selected for fine mesh analysis, the fine mesh analysis is to be carried out to the location with the maximum yield utilisation factor for areas of the corrugation units having a different shape respectively.*

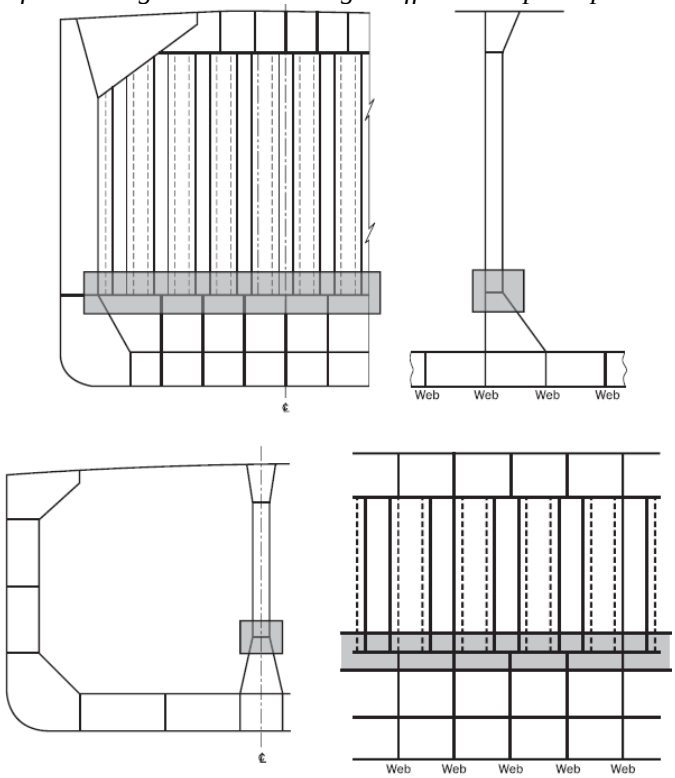

Figure 4 Mandatory areas at connections between corrugations and adjoining lower stool

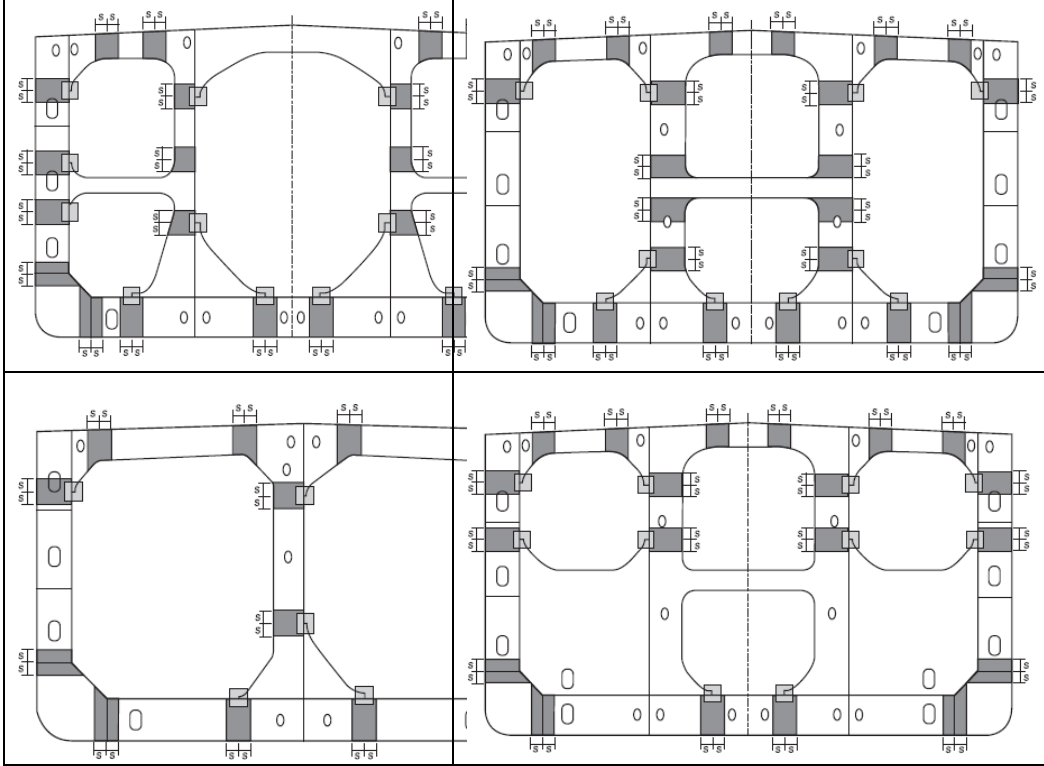
2.1.7 Bracket at the heel of horizontal stringer

Fine mesh analysis is to be carried out for the bracket at the heel of horizontal stringers. All structural elements adjacent to the heel including the inner hull, longitudinal and transverse bulkhead are to satisfy the stress acceptance criteria. The heel of horizontal stringer which, in the cargo hold analysis, has the maximum yield utilization factor, λ_y, is to be selected for the fine mesh analysis. Where there is a significant variation in the arrangement of the bracket at the heel and the horizontal stringer, analysis of additional locations may be required by the Society.

3 SCREENING PROCEDURE

3.1 Screening areas



3.1.1

The structural details subject to this screening procedure are checked in the following ship areas:

3.1.1 Within the full cargo hold region for the details given in [3.2.1],

3.1.2 Outside midship cargo hold region for the details given in [3.2.2].

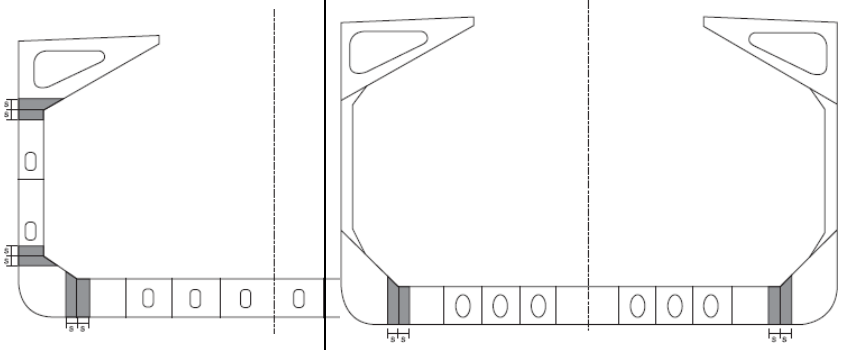
Screening areas of transverse web frame in oil tanker **Table 1**

<table>
<tr><td colspan="3">  </td></tr>
<tr><td></td><td>Bracket toes</td><td></td></tr>
<tr><td></td><td>Openings and manholes (shaded regions)</td><td></td></tr>
<tr><td></td><td>Openings and manholes (unshaded regions)</td><td>Screening check to be performed for openings except if:
h_0/h < 0.35 and g_0 < 1.2, and, each end of the opening forms a semi circle arc (i.e. radius of opening equal to $b/2$). This criterion does not apply to manholes which are to be evaluated by screening irrespective of size.
h_0, h and go is defined in Ch 7, Sec 2, [2.4.9], b is the smallest of the length and breadth of the opening.</td></tr>
</table>

3.2 List of structural details

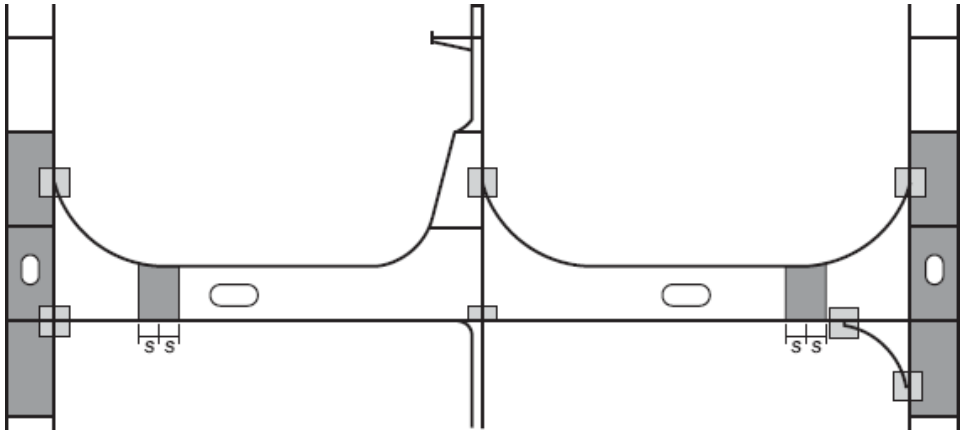
3.2.1 Cargo hold region

The following structural details and areas in the cargo hold region are to be evaluated by screening:

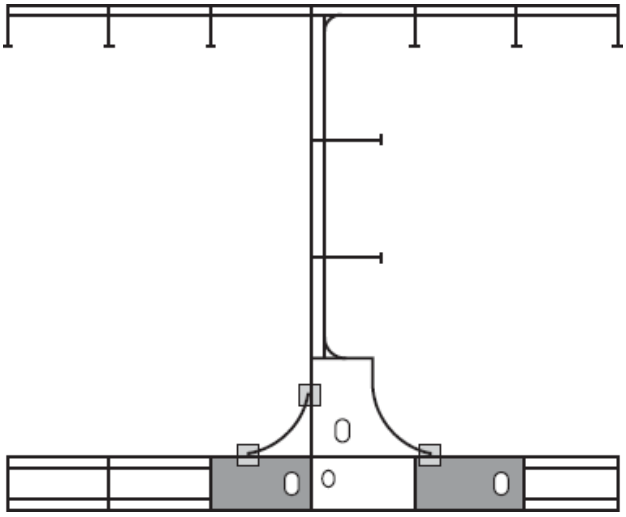


a) Openings which do not require modelling and manholes, see Ch 7, Sec 2, [2.4.9, in way of web of primary supporting members, such as transverse web frame as indicated in

Table 1 and Table 2, horizontal stringers as indicated in Table 3, floors and longitudinal girders in double bottom.



b) Bracket toes on transverse web frame as indicated in Table 1 and Table 2, horizontal stringer and transverse plane bulkhead connected to double bottom or buttress structure specified in Table 3.
c) Heels of transverse bulkhead horizontal stringers specified in Table 3.
d) Connections of transverse lower stool to double bottom girders and longitudinal lower stool to double bottom floors as indicated in Figure 5.
e) Connection of lower hopper to transverse lower stool structure as indicated in Figure 5.
f) Connection of topside tank to inner side as indicated in Figure 6.
g) Connection of corrugation and upper supporting structure to upper stool as indicated in Figure 7.
h) Hatch corner area, such as the hatch coaming end bracket, the hatch corner and the hatch end beam connection as indicated in Figure 8.



Within each group of the structural details having the same geometry and the same relative location inside the cargo region, the screening verification can be performed for the detail for which the yield utilisation factor, λ_y, is maximum.

Screening areas for transverse web frame in bulk carrier **Table 2**

<table>
<tr><td colspan="3">  </td></tr>
<tr><td></td><td colspan="2">Bracket toes</td></tr>
<tr><td></td><td colspan="2">Openings and manholes (shaded regions)</td></tr>

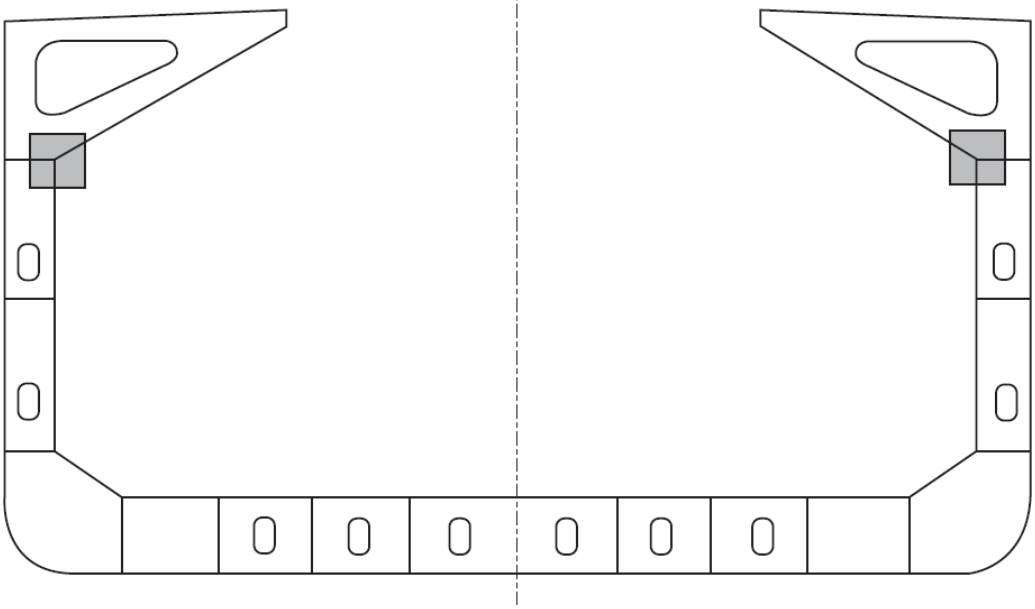

Figure 6 Screening areas at connections of topside tank to inner side

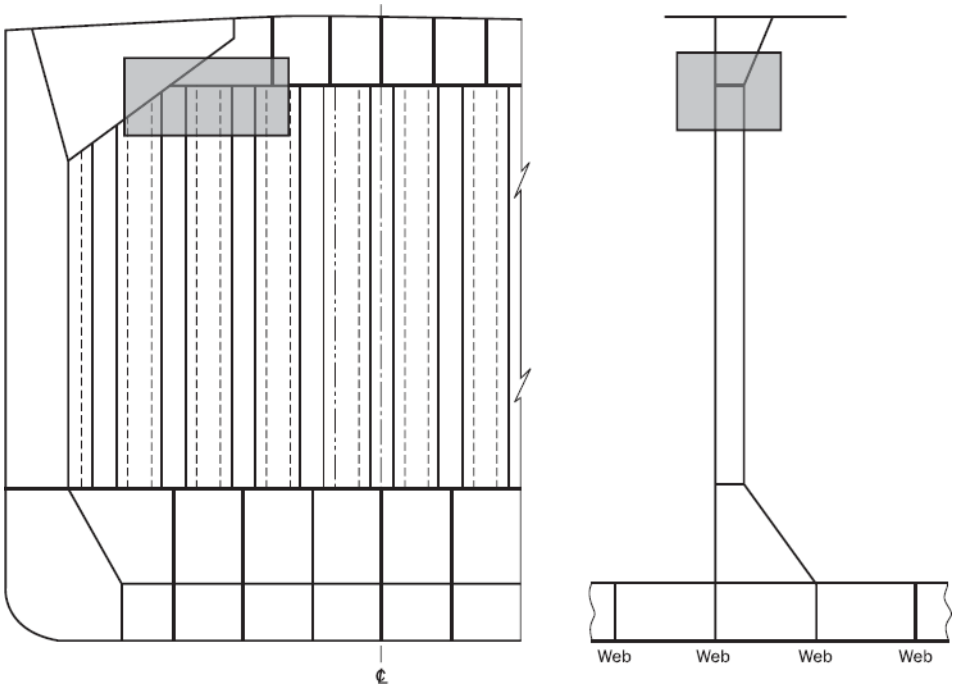

Figure 7 Screening areas at connection of corrugation and upper supporting structure to upper stool

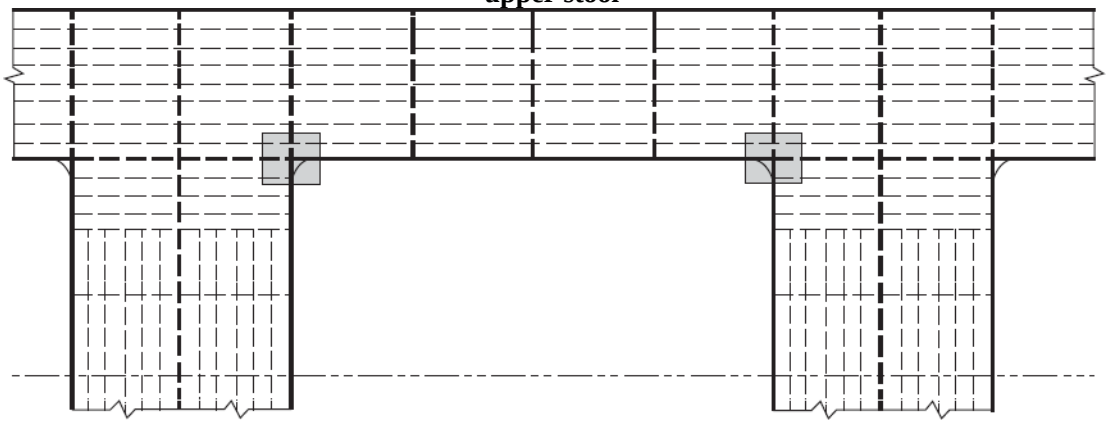

Figure 8 Screening areas at hatch corner in bulk carrier

3.2.2 Outside midship cargo hold region

The following structural details outside midship cargo hold region are to be evaluated by screening:

a) Hopper knuckle, as defined in [2.1.2] and [2.1.3],
b) Side frame end bracket, as defined in [2.1.3],
c) Large openings, as defined in [2.1.4],
d) Connections of corrugation to adjoining structure, as defined in [2.1.6],
e) Bracket at the heel of horizontal stringers in [2.1.7],
f) The connections of corrugation to adjoining structure and the bracket at the heel of horizontal stringers to be screened are to be similar in its geometry, its proportion and its relative location to the corresponding detail modelled in fine mesh in the midship cargo hold region.

When the connections of corrugation to adjoining structure and the bracket at the heel of horizontal stringers outside the midship cargo hold region are different from the corresponding detail modelled in fine mesh in the midship cargo hold region, a fine mesh analysis is to be performed for the detail located where the yield utilisation factor, λ_y, is maximum for structural details having the same geometry and the same relative location.

When it is deemed necessary, the Society may request a fine mesh analysis to be performed according to [1.1.3].

3.3 Screening criteria

3.3.1 Screening factors and permissible screening factors

The screening factors, λ_{sc}, and the permissible screening factors, λ_{scperm}, are given in Table 4 for the screening areas defined in [3.1].

Screening factors and permissible screening factors **Table 4**

Type of Details	Screening factors, λ_{sc}	Permissible screening factors, λ_{scperm}	
Within the whole cargo hold region		S+D	S
Openings for which their geometry is not required to be represented in the cargo hold model in accordance with Ch 7, Sec 2, [2.4.9] in way of webs of primary supporting members, such as transverse web frame as indicated in Table 1 and Table 2, horizontal stringers as indicated in Table 3, floors and longitudinal girders in double bottom.	Table 5	1.70	1.36
Manholes (2)	λ_y	$0.85\lambda_{yperm}$	
Bracket toes on transverse web frames as indicated in Table 1 and Table 2, horizontal stringers and transverse plane bulkhead to double bottom connection or buttress structure specified in Table 3.	Table 6	1.50	1.20
Heels of transverse bulkhead horizontal stringers specified in Table 3.	Table 7	1.50	1.20
Connections of transverse lower stool to double bottom girders and longitudinal lower stool to double bottom floors as indicated in Figure 5. The connection of lower hopper to transverse lower stool structure as indicated in Figure 5. The connection of topside tank to inner side as indicated in Figure 6. The connection of corrugation and upper supporting structure to upper stool as indicated in Figure 7.	λ_y	$0.75\lambda_{yperm}$	
Hatch corner area.	λ_y	$0.95\lambda_{yperm}$	
Outside midship cargo hold region			
Hopper knuckle	$\lambda_{sc} = \frac{K_{sc} \cdot \sigma_c}{R_y}$ (1)	$0.65\ \lambda_{yperm}$ $0.65\lambda_{yperm}$	
Side frame end bracket		$0.85\lambda_{yperm}$ $0.85\lambda_{yperm}$	
Large openings (2)		$0.85\lambda_{yperm}$	
Connections of corrugation to adjoining structure and bracket at the heel of horizontal stringer		1.50 f_f	$1.20f_f$

where:

λ_y : Coarse mesh yield utilisation factor, as defined in Ch 7, Sec 2, [5.2.4].

λ_{yperm} : Coarse mesh permissible yield utilisation factor, as defined in Ch 7, Sec 2, [5.2.4].

K_{sc} : Screening stress concentration factor, taken as:

$$K_{sc} = \frac{\sigma_{FM}}{\sigma_{CM}}$$

σ_{FM} : Von Mises fine mesh stress, in N/mm^2, for the considered detail calculated in the midship cargo hold region according to [2].

σ_{CM} : Von Mises coarse mesh stress, in N/mm^2, for the considered detail calculated in the midship cargo hold region according to Ch 7, Sec 2.

σ_c : Von Mises coarse mesh stress, in N/mm^2, for the area in way of considered detail.

f_f : Fatigue factor defined in [6.2.1].

(1) For each screened detail, σ_{FM} and σ_{CM} are to be taken from the corresponding elements in the same plane position.

(2) The representative element which has maximum yield utilisation factor around the manhole and the large opening is to be verified against criterion.

Screening factor for openings in primary supporting members **Table 5**

λ_{sc} : Screening factor taken as

$$\lambda_{sc} = 0.85 C_h \left(\left| \sigma_x + \sigma_y \right| + \left(2 + \left(\frac{l_0}{2r}\right)^{0.74}\right) \left| \tau_{xy} \right| \right) \frac{k}{235}$$

C_h : Coefficient taken as (2):

- For opening in web of PSM.

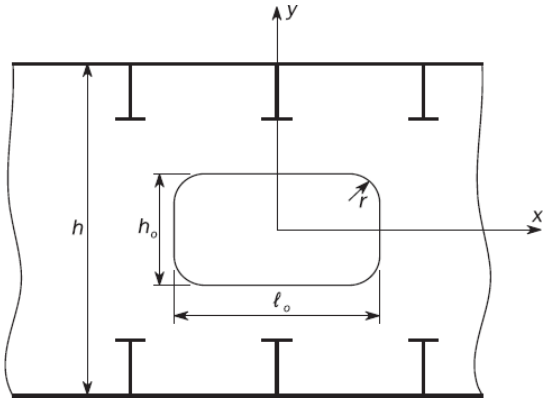
$$C_h = 1.0 - 0.23\left(\frac{h_0}{h}\right) + 2.12\left(\frac{h_0}{h}\right)^2$$

- For opening in web of main bracket and buttress (see figures below).

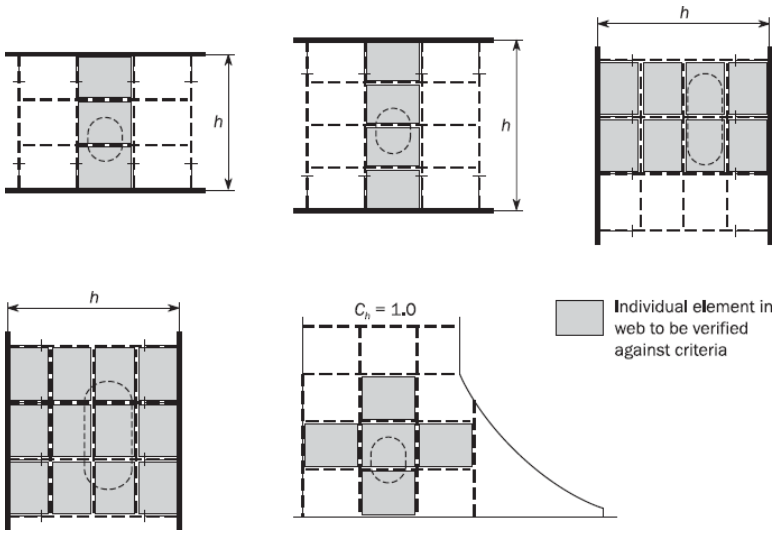
C_h = 1.0

r : Radius of opening, in mm.

h_0 : Height of opening parallel to depth of web, in mm.



l_0 : Length of opening parallel to girder web direction, in mm.



h : Height of web of girder in way of opening, in mm.

σ_x : Axial stress in element x-direction determined from cargo hold FE analysis according to the coordinate system shown, in N/mm^2.

σ_y : Axial stress in element y-direction determined from cargo hold FE analysis according to the coordinate system shown, in N/mm2.

σ_{xy} : Element shear stress determined from cargo hold FE analysis (1), in N/mm^2.

(1) The element shear stress is to be adjusted using the formula given in Ch 7, Sec 2, [5.2.6] prior to the evaluation of yield utilisation factor for verification against the screening criteria.

(2) Where the geometry of the opening is required to be modelled in accordance with Ch 7, Sec 2, [2.4.9], fine mesh FE analysis is to be carried out to determine the stress level and the screening criteria are not applicable.

Screening factor for bracket toes of primary supporting members **Table 6**

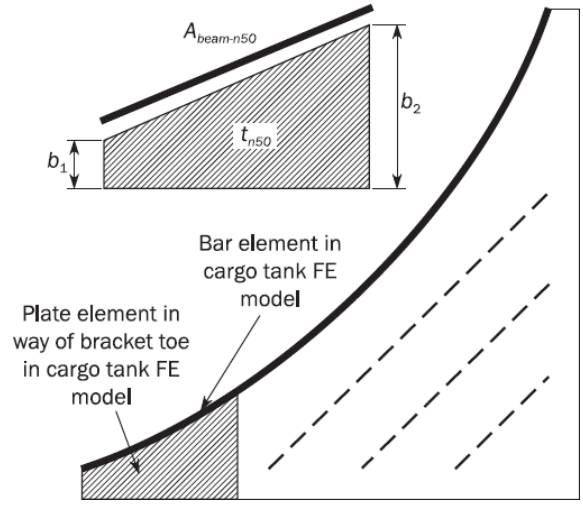
λ_{sc} : Screening factor taken as:

$$\lambda_{sc} = C_a \left(0.68(\frac{b_2}{b_1})^{0.5} \sigma_{vm} + 0.50(\frac{A_{beam-n50}}{b_1 t_{n50}})^{0.5} |\sigma_{beam}| \right) \frac{k}{235}$$

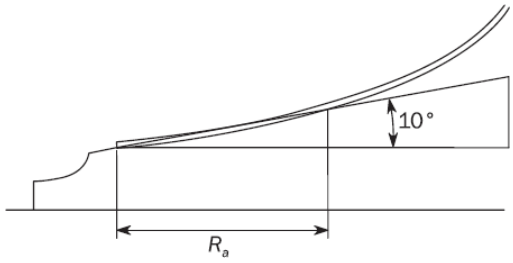
C_a : Coefficient taken as:

$$C_a = 1.0 - 0.2(\frac{R_a}{1400})^2$$

b_1, b_2 : Height of shell element in way of bracket toe in cargo hold FE model, in mm.



$A_{beam-n50}$: Sectional area of beam or rod element in cargo hold FE model representing the face plate of bracket, in mm^2.



σ_{beam} : Beam or rod element axial stress determined from cargo hold FE analysis, in N/mm^2.

σ_{vm} : Von Mises stress of shell element in way of bracket toe determined from cargo hold FE analysis, in N/mm^2.

t_{n50} : Net thickness of shell element in way of bracket toe, in mm.

R_a : Leg length, in mm, not to be taken as greater than 1400 mm.

3.3.2 Screening criteria

Stresses in areas defined in [3.1], calculated for all applicable FE load combinations given in [5], are to be checked against the following screening criteria.

$\lambda_{sc} \leq \lambda_{scperm}$

where:

λ_{sc} : Screening factor defined in [3.3.1]

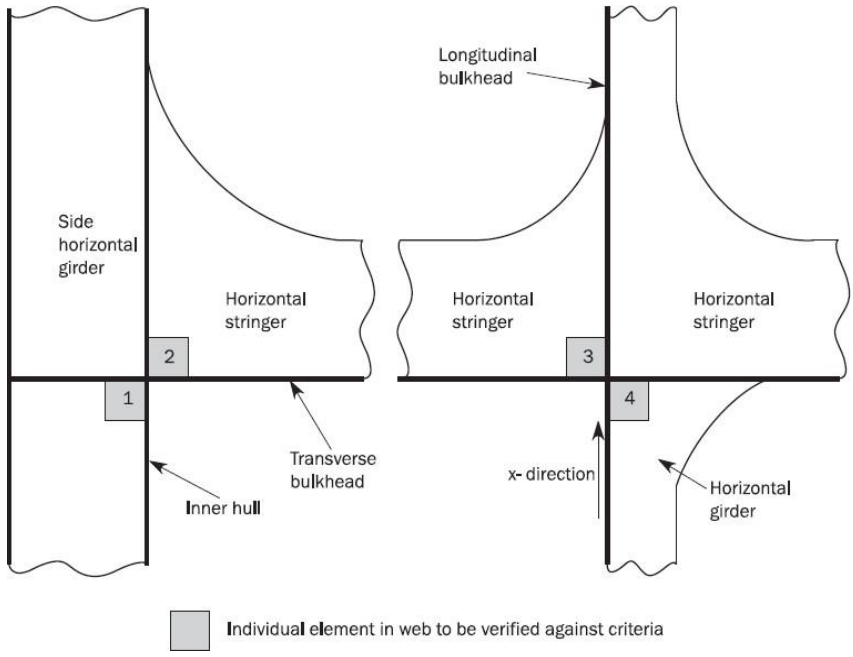
λ_{scperm} : Permissible screening factor defined in [3.3.1]

Where the screening criteria are not met, fine mesh analysis of the corresponding structural detail is required and to be performed according to [1.1.3].

Screening factor for heels of transverse bulkhead horizontal stringers **Table 7**

λ_{sc} : Screening factor taken as:

- For heels at side horizontal girder and transverse bulkhead horizontal stringer, at the locations 1, 2 and 3 in figure below.



$$\lambda_{sc} = 1.67 \sigma_{vm} \frac{k}{235}$$

- For heel at longitu dinal bulkhead horizontal stringer, at the location 4 in figure below.

$$\lambda_{sc} = 3.2 |\sigma_x| \frac{k}{235}$$

σ_x : Axial stress in element x direction determined from cargo hold FE analysis in accordance with the coordinate system shown, in N/mm^2.

σ_{vm} : Von Mises stress of shell element in way of heel determined from cargo hold FE analysis, in N/mm^2.

	Individual element in web to be verified against criteria.

4 STRUCTURAL MODELLING

4.1 General

4.1.1

Evaluation of detailed stresses requires the use of refined finite element mesh in way of areas of high stress. This fine mesh analysis can be carried out by fine mesh zones incorporated into the cargo hold model. Alternatively, separate local FE model with fine mesh zones in conjunction with the boundary conditions obtained from the cargo hold model may be used.

4.2 Extent of model

4.2.1

If a separate local fine mesh model is used, its extent is to be such that the calculated stresses at the areas of interest are not significantly affected by the imposed boundary conditions. The boundary of the fine mesh model is to coincide with primary supporting members in the cargo hold model, such as web frame, girders, stringers and floors.

4.3 Mesh size

4.3.1

The mesh size in the fine mesh zones is not to be greater than 50 ×50 mm.

4.3.2

The extent of the fine mesh zone is not to be less than 10 elements in all directions from the area under investigation. A smooth transition of mesh density from fine mesh zone to the boundary of the fine mesh model is to be maintained.

4.4 Elements

4.4.1

All plating within the fine mesh zone is to be represented by shell elements. The aspect ratio of elements within the fine mesh zone is to be kept as close to 1 as possible. Variation of mesh density within the fine mesh zone and the use of triangular elements are to be avoided. In all cases, the elements within the fine mesh model are to have an aspect ratio not exceeding 3. Distorted elements, with element corner angles of less than 45°or greater than 135°, are to be avoided. Stiffeners inside the fine mesh zone are to be modelled using shell elements. Stiffeners outside the fine mesh zones may be modelled using beam elements.

4.4.2
Where fine mesh analysis is required for main bracket end connections, including the end connection of hold frames of single skin bulk carriers, the fine mesh zone is to be extended at least 10 elements in all directions from the area subject to assessment, see Figure 9.

4.4.3
Where fine mesh analysis is required for an opening, the first two layers of elements around the opening are to be modelled with mesh size not greater than 50 ×50 mm. A smooth transition from the fine mesh to the coarser mesh is to be maintained. Edge stiffeners which are welded directly to the edge of an opening are to be modelled with shell elements. Web stiffeners close to an opening may be modelled using rod or beam elements located at a distance of at least 50 mm from the edge of the opening. Example of fine mesh zone around an opening is shown in Figure 10.

4.4.4
Face plates of openings, primary supporting members and associated brackets are to be modelled with at least two elements across their width on either side.

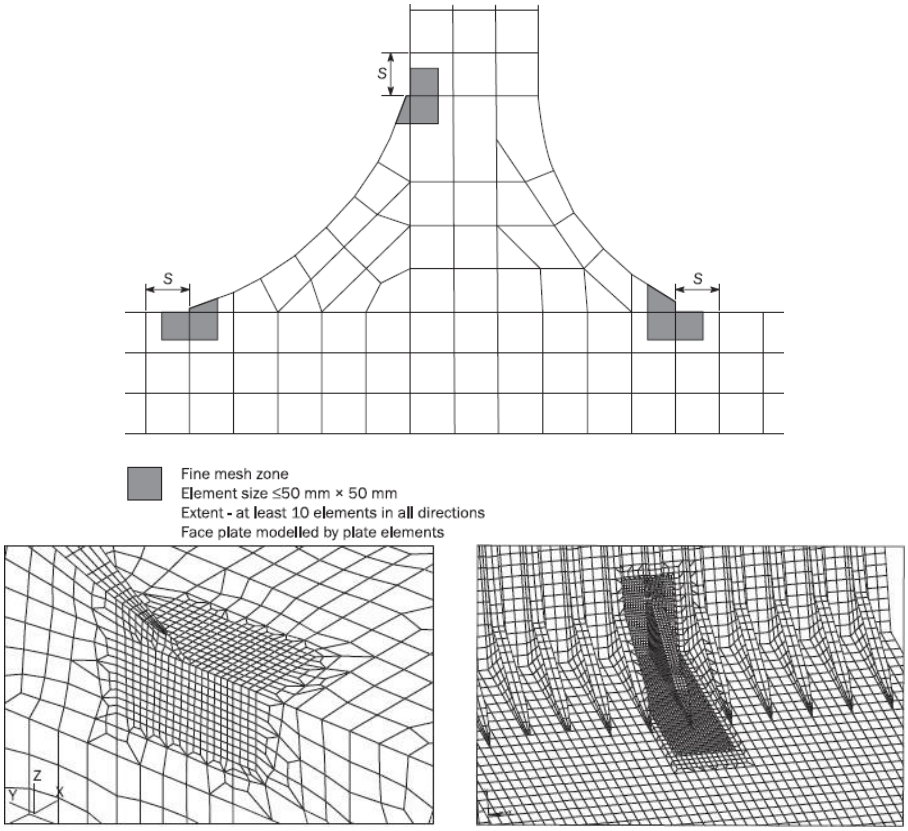


Figure 9 Fine mesh zone around bracket toes

4.5 Transverse web frames

4.5.1
In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable to the analysis of a typical transverse web frame.

4.5.2
Where a FE sub model is used, the model is to have an extent of at least 1+1 web frame spaces, i.e. one web frame space extending either side of the transverse web frame under investigation. For bulk carriers, the web frame space is the longer space of web frames in the upper wing and the lower hopper tanks. The transverse web frames forward and aft of the web frame under investigation need not be included in the sub model.

4.5.3

The full depth and full breadth of the ship are to be modelled, see Figure 11.

Figure 12 shows a close up view of the finite element mesh at the lower part of the vertical web and backing brackets.

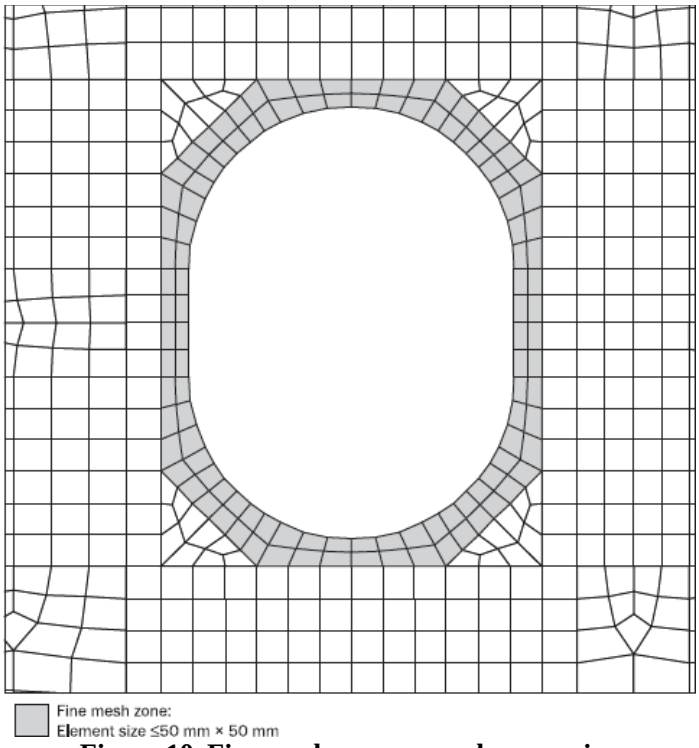

Figure 10 Fine mesh zone around an opening

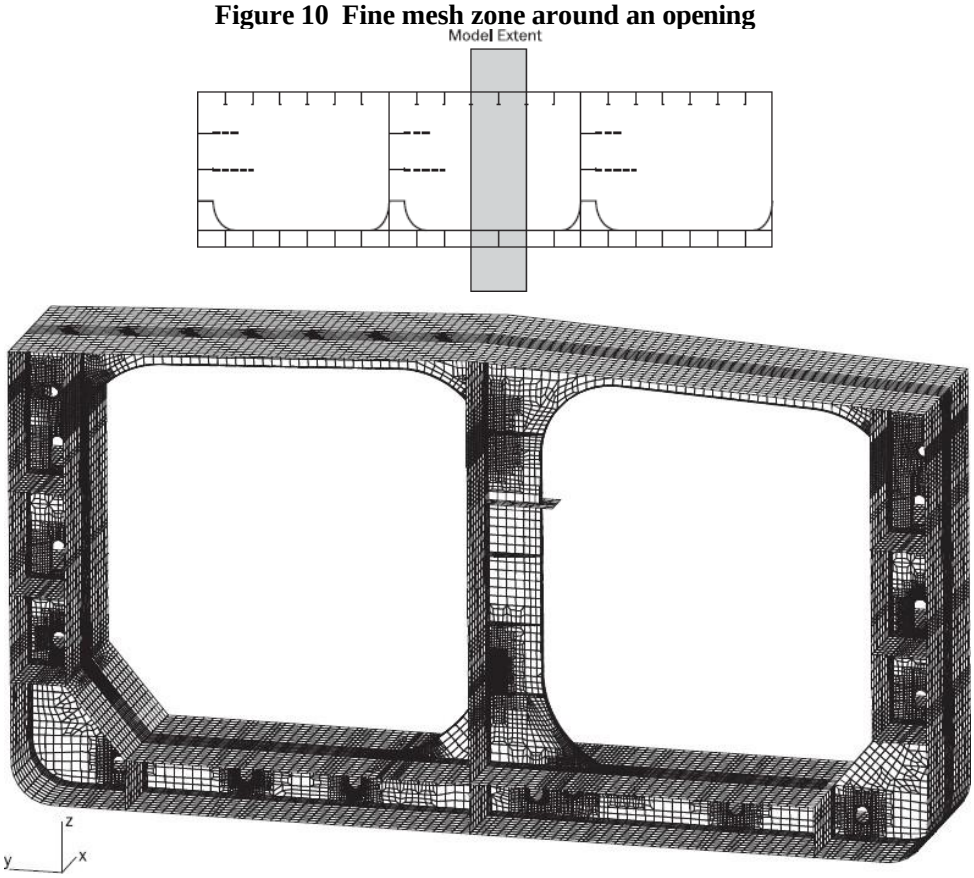

Figure 11 Example of extent of local model for fine mesh analysis of web frame bracket connections and openings

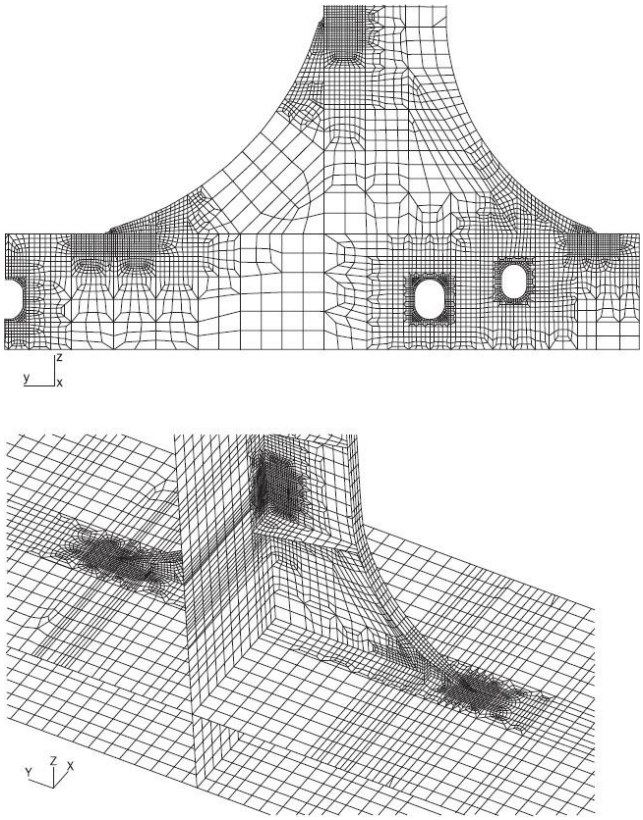

Figure 12 Close-up view of finite element mesh at the lower part of a transverse web frame

4.6 Transverse bulkhead stringers, buttress and adjacent web frame

4.6.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable to the analysis of transverse bulkhead structures and adjacent web frame.

4.6.2

Due to the structural interaction among the transverse bulkhead, horizontal stringers, web frames, deck and double bottom, it is recommended that the FE local model represents a full section of the hull. Longitudinally, the ends of the model should be extended at least one web frame space beyond the areas that require investigation, see Figure 13.

4.6.3

Alternatively, it is acceptable to use a number of local models, as shown in Figure 14, to analyse different parts of the structure. For the analysis of the transverse bulkhead horizontal stringers the full breadth of the ship are to be modelled. For the analysis of buttress structure, the local model width should be at least 4+4 longitudinal spaces, i.e. four longitudinal spaces at each side of the buttress.

4.6.4

Figure 15 shows the finite element mesh on a transverse bulkhead horizontal stringer. Figure 16 shows the local model for the analysis of buttress connections to transverse bulkhead and double bottom structure, and openings.

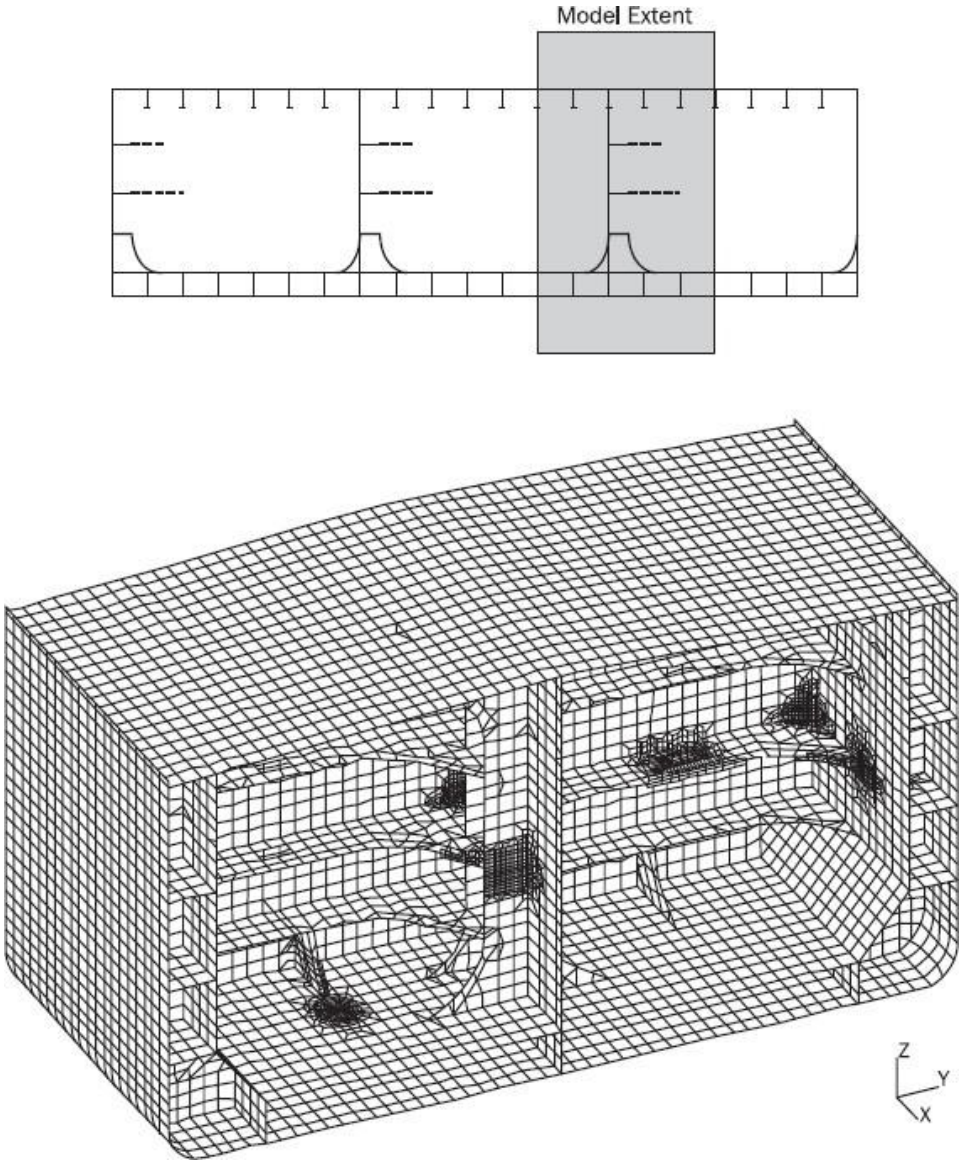

Figure 13 Example of local model for fine mesh analysis of transverse bulkhead and adjacent structure

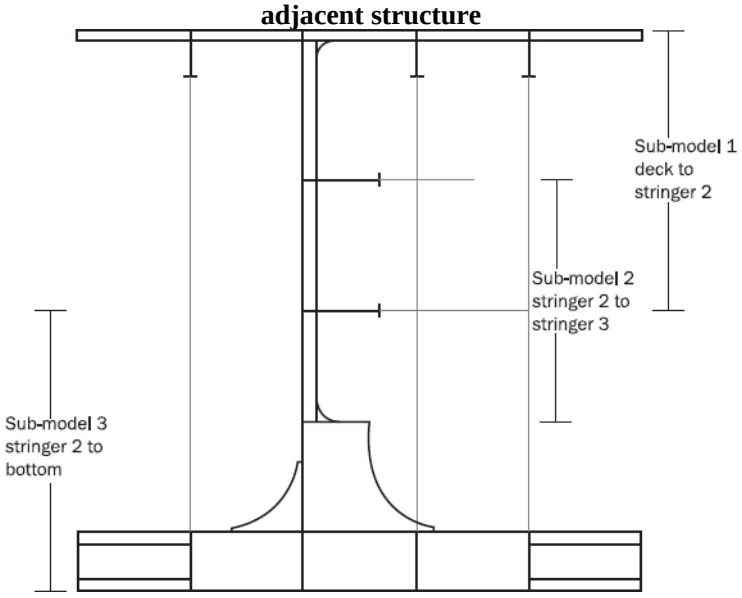

Figure 14 Example of local analysis of transverse bulkhead structure using local models

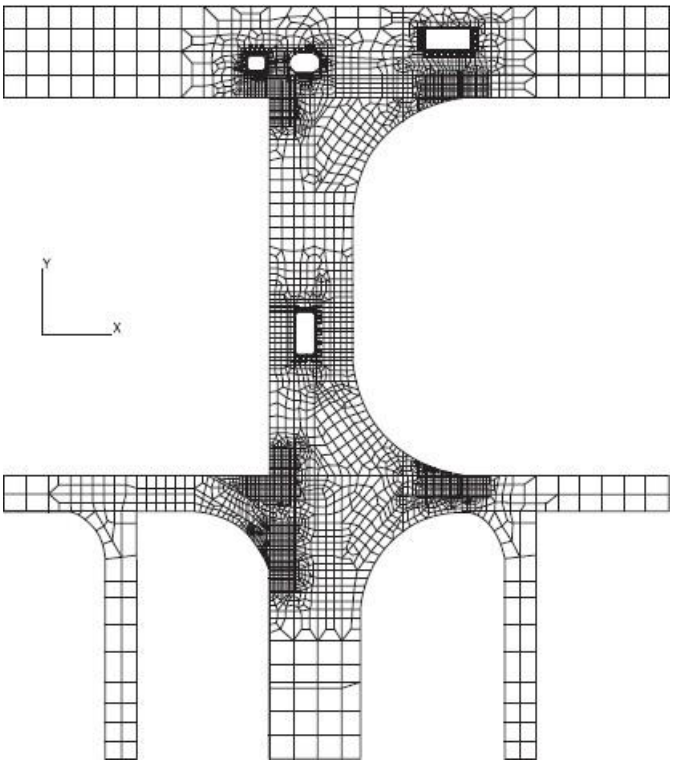

Figure 15 Example of finite element mesh on transverse bulkhead horizontal stringer

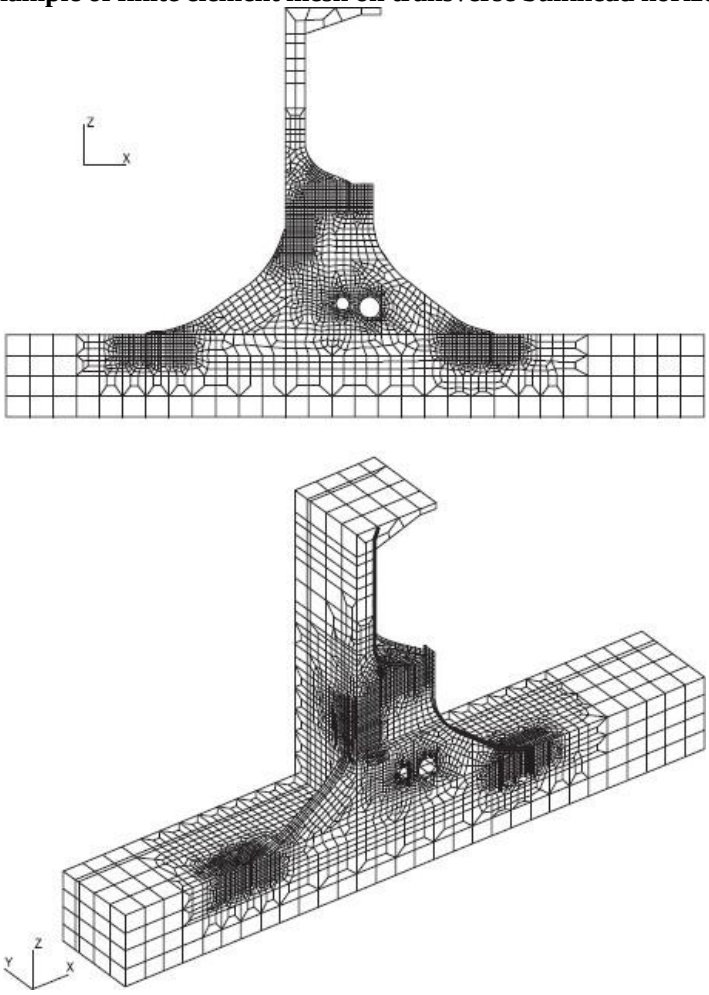

Figure 16 Example of local model for the analysis of buttress connections to bulkhead and double bottom structure, showing port half of model

4.7 Deck, double bottom longitudinal and adjoining transverse bulkhead vertical stiffeners

4.7.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-section are applicable specifically to the analysis of longitudinal and vertical stiffener end connections and attached web stiffeners.

4.7.2

Where a local FE model is used, each end of the model is to be extended longitudinally at least two web frame spaces from the areas under investigation. The model width is to be at least 2+2 longitudinal spaces. Figure 17 shows the longitudinal extent of the local model for the analysis of deck and double bottom longitudinal stiffeners and adjoining transverse bulkhead vertical stiffener.

4.7.3

The web of the longitudinal stiffeners outside of the fine mesh zone should be represented by at least 3 shell elements across its depth. Similar size elements should be used to represent the plating of the bottom shell and inner bottom. The flange of the longitudinal stiffeners and face plate of brackets should be modelled with at least two shell elements across its width at one side.

4.7.4

The mesh size and extent of the fine mesh zone is to be in accordance with [4.3.1], see also Figure 17.

4.8 Corrugated bulkheads

4.8.1

In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-article are applicable to the analysis of connections of corrugated bulkheads to lower stool and the connection between lower stool and inner bottom.

4.8.2

The minimum extents of the local model are as follows, see also Figure 18:

a) Vertically, the model is to be extended from the bottom of the ship to a level at least 2 m above the corrugation and lower stool connection. The upper boundary of the local model is to coincide with the horizontal mesh line of the cargo hold FE model for the purpose of applying boundary displacements, see [4.2].

b) For transverse corrugated bulkheads, the local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. the local model covers two lower stool transverse web/diaphragm spaces). The end diaphragms need not be modelled.

c) For the longitudinal corrugated bulkheads, the local model is to be extended to the nearest web frame on each side of the fine mesh zone (i.e. the local model covers two frame spaces). The end web frames need not be modelled.

d) For the corrugation and lower stool connection located close to the intersection of transverse and longitudinal corrugated bulkheads, such as for product tanker, the local model is to cover the structure between the diaphragms (in transverse direction) and web frames (in longitudinal direction) closest to the detail, whichever is relevant. In addition the local model is to be extended at least one diaphragm/web frame outside the intersection between the transverse stool and the longitudinal stool.

e) For lower stool to inner bottom connection, the connection between inner bottom, lower stool plate, diaphragm and double bottom girder, where applicable, is the centre of the fine mesh zone.

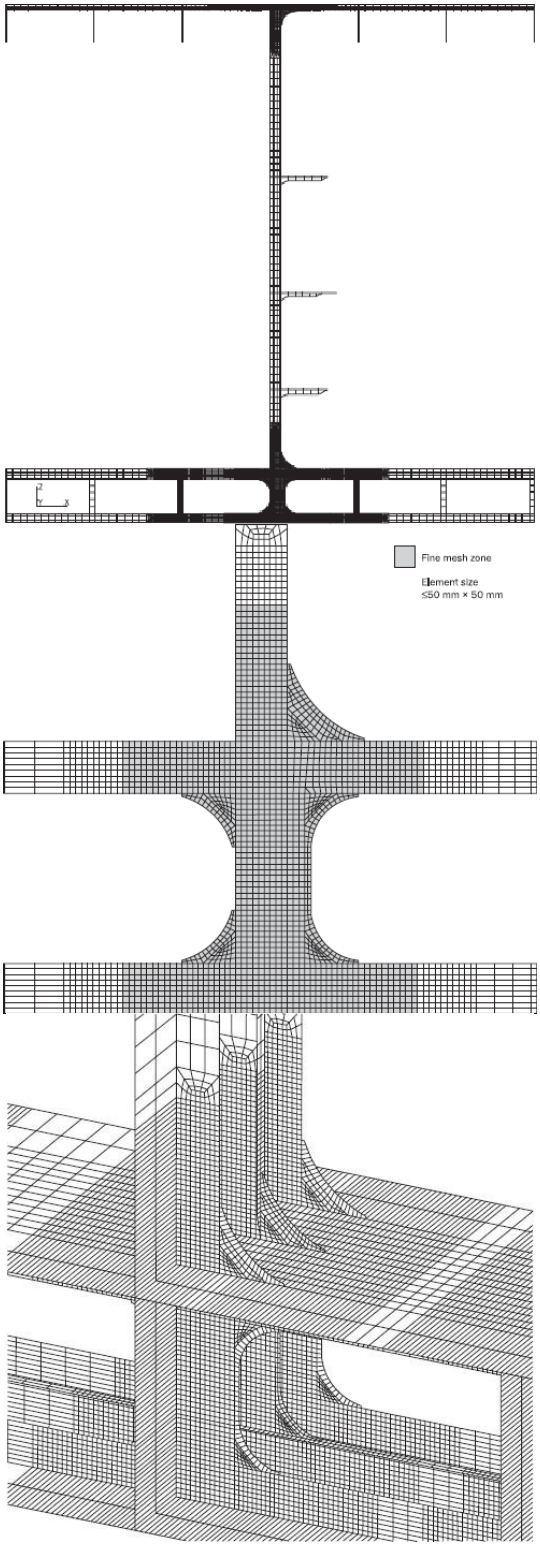

Figure 17 Example of local model for fine mesh analysis of end connections and web stiffeners of deck and double bottom longitudinals

4.8.3

For corrugation connection, the fine mesh zone is to cover at least the corrugation flange under investigation, the adjacent corrugation webs and a further extension of 500 mm from each end of the corrugation web, i.e. the fine mesh zone covers at least four corrugation knuckles, see Figure 18 and Figure 19. The mesh size within the fine mesh zone is not to be greater than 50 ×50 mm.

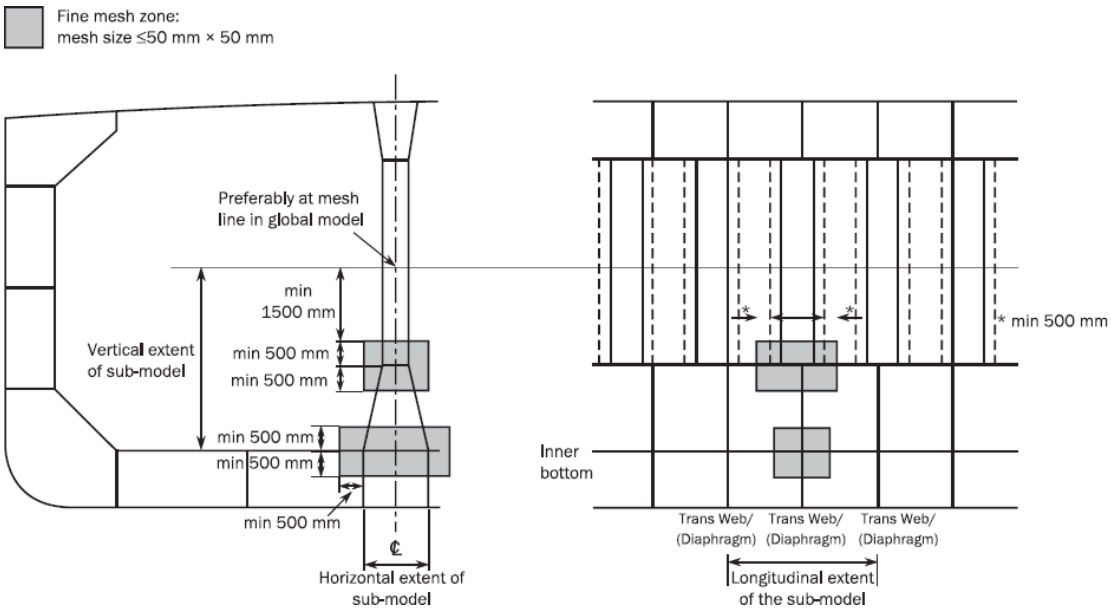

Figure 18 Extent of local model and fine mesh zone for the analysis of corrugated bulkhead connection to lower stool and inner bottom

Above figures show extent of local model and fine mesh zone on longitudinal corrugated bulkhead connection to lower stool. Similar extent applies to transverse corrugated bulkhead.
The model extents shown above are the minimum extents.

4.8.4

Diaphragm webs, brackets inside the lower stool and all stiffeners on the stool plate and diaphragm are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragm, web and flange of vertically orientated stiffeners, and brackets in the fine mesh zone.

4.8.5

Horizontally orientated stiffeners within the fine mesh zone are to be represented by either shell or beam elements.

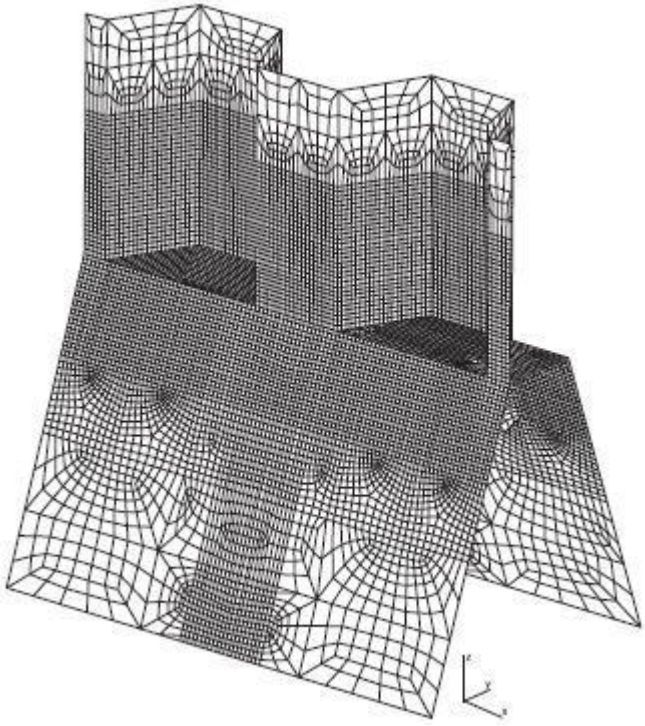

Figure 19 Example of partial local model for the analysis of connection of corrugated bulkhead to lower stool

4.8.6
Figure 19 shows the details of finite element local model for the fine mesh analysis of longitudinal bulkhead to lower stool connection.

4.8.7
Figure 20 shows the details finite element local model for the fine mesh analysis of lower stool to inner bottom connection.

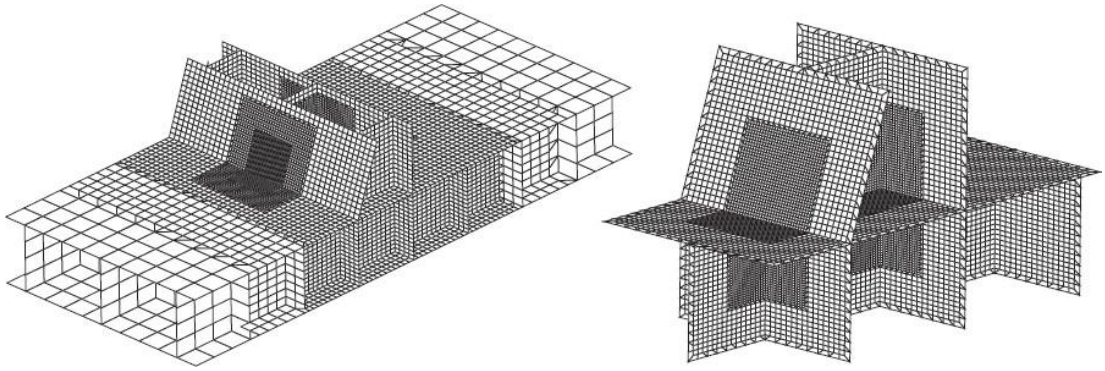

Figure 20 Example of partial local model for the analysis of connection of lower stool to inner bottom

4.9 Hatch corner structures
4.9.1
In addition to the requirements of [4.2] to [4.4], the modelling requirements in this sub-article are applicable to the analysis of hatch corner structures.

4.9.2
The high stress areas, such as the hatch coaming end bracket, the hatch corner and the hatch end beam connection, need to be analysed by fine mesh model. The fine mesh zones should cover these areas, see Figure 21.

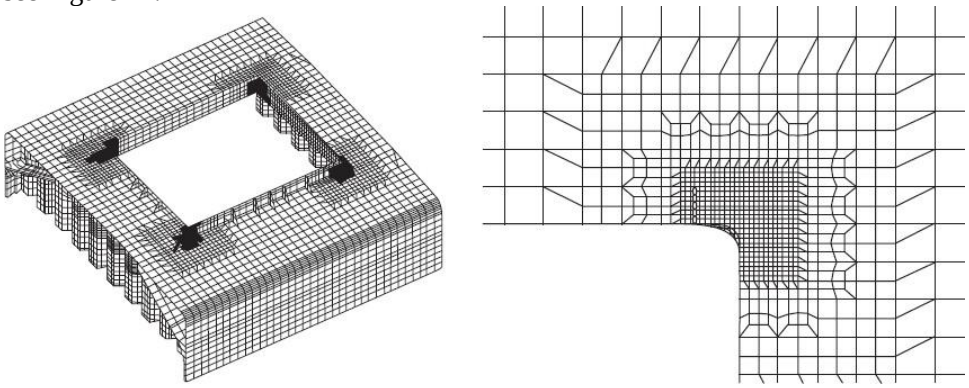

Figure 21 Example of local model for the analysis of hatch opening structures

5 FE LOAD COMBINATIONS
5.1 General
5.1.1
The fine mesh detailed stress analysis is to be carried out for all FE load combinations applied to the corresponding cargo hold analysis.
5.2 Application of loads and boundary conditions
5.2.1 General
Where a separate local model is used for the fine mesh detailed stress analysis, the nodal displacements from the cargo tank model are to be applied to the corresponding boundary nodes on the local model as prescribed displacements. Alternatively, equivalent nodal forces from the cargo tank model may be applied to the boundary nodes.
Where there are nodes on the local model boundaries which are not coincident with the nodal

points on the cargo tank model, it is acceptable to impose prescribed displacements on these nodes using multi-point constraints. The use of linear multi-point constraint equations connecting two neighbouring coincident nodes is considered sufficient.
All local loads, including any loads applied for hull girder bending moment and/or shear force adjustments, in way of the structure represented by the separate local finite element model are to be applied to the model.

6 ANALYSIS CRITERIA

6.1 Stress assessment

6.1.1 General

Stress assessment of the fine mesh analysis is to be carried out for the FE load combinations specified in Ch4, Sec 8.

6.1.2 Reference stress

Reference stress is von Mises stress, σ_{vm}, which is to be calculated based on the membrane normal and shear stresses of the shell element evaluated at the element centroid. The stresses are to be evaluated at the mid plane of the element.

6.1.3 Permissible stress

The maximum permissible stresses are based on the mesh size of 50 ×50 mm as specified in [4.1] to [4.4]. Where a smaller mesh size is used, an area weighted von Mises stress calculated over an area equal to the specified mesh size may be used to compare with the permissible stresses. The averaging is to be based only on elements with their entire boundary located within the desired area. The average stress is to be calculated based on stresses at element centroid; stress values obtained by interpolation and/or extrapolation are not to be used. Stress averaging is not to be carried across structural discontinuities and abutting structure.

6.2 Acceptance criteria

6.2.1

Verification of stress results against the acceptance criteria is to be carried out in accordance with [6.1]. The structural assessment is to demonstrate that the stress complies with the following criteria:

$\lambda_f \leqslant \lambda_{fperm}$

where:

λ_f : Fine mesh yield utilisation factor.

$$\lambda_f = \frac{\sigma_{vm}}{R_Y} \quad \text{for shell elements in general}$$

$$\lambda_f = \frac{|\sigma_{axial}|}{R_Y} \quad \text{for rod or beam elements in general}$$

σ_{vm} : Von Mises stress, in N/mm^2.

σ_{axial} : Axial stress in rod element, in N/mm^2.

λ_{fperm} : Permissible fine mesh utilisation factor, taken as:

- Element not adjacent to weld:
  - λ_{fperm} = 1.70 f_f for S+D
  - λ_{fperm} = 1.36 f_f for S
- Element adjacent to weld:
  - λ_{fperm} = 1.50 f_f for S+D
  - λ_{fperm} = 1.20 f_f for S

f_f : Fatigue factor, taken as:

- f_f = 1.0 in general, including the free edge of base material,
- f_f =1.2 for details assessed by very fine mesh analysis complying with the fatigue assessment criteria. given in Ch 9, Sec 2.

Note 1: The maximum permissible stresses are based on the mesh size of 50 ×50 mm. Where a smaller mesh size is used, an average von Mises stress calculated in accordance with [6.1] over an area equal to the specified mesh size may be used to compare with the permissible stresses.

Note 2: Average von Mises stress is to be calculated based on weighted average against element areas:

$$\sigma_{vm-av} = \frac{\sum_1^n A_i \sigma_{vm-i}}{\sum_1^n A_i}$$

where:

σ_{vm-av} is the average von Mises stress.

Note 3: Stress averaging is not to be carried across structural discontinuities and abutting structure.

6.2.2 Lower stool not fitted to a transverse or longitudinal corrugated bulkhead

Where a lower stool is not fitted to a transverse or longitudinal corrugated bulkhead, the permissible stresses given in [6.2.1] are to be reduced by 10% for the areas under investigation by fine mesh analysis.

Chapter 8 BUCKLING

Section 1 GENERAL

1 INTRODUCTION

1.1 Assumption

1.1.1

This chapter contains the strength criteria for buckling and ultimate strength of local supporting members, primary supporting members and other structures such as pillars, corrugated bulkheads and brackets. These criteria are to be applied as specified in Ch 6 for hull local scantlings and in Ch 7 for direct strength analysis.

1.1.2

For each structural member, the characteristic buckling strength is to be taken as the most unfavourable /critical buckling failure mode.

1.1.3

Unless otherwise specified, the scantling requirements of structural members in this chapter are based on net scantling obtained by removing *tc* from the gross offered thickness, where *tc* is defined in Ch 3, Sec 3.

1.1.4

In this chapter, compressive and shear stresses are to be taken as positive, tension stresses are to be taken as negative.

2 APPLICATION

2.1 Scope

2.1.1

The buckling checks are to be performed according to:

- Ch 8, Sec 2 for the slenderness requirements of plates, longitudinal and transverse stiffeners, primary supporting members and brackets.
- Ch 8, Sec 3 for the prescriptive buckling requirements of plates, longitudinal and transverse stiffeners, primary supporting members and other structures.
- Ch 8, Sec 4 for the buckling requirements of the FE analysis for the plates, stiffened panels and other structures.
- Ch 8, Sec 5 for the buckling capacity of prescriptive and FE buckling requirements.

2.1.2 Stiffener

The buckling check of the stiffeners referred to in this Chapter is applicable to the stiffener fitted along the long edge of the buckling panel.

2.1.3 Enlarged stiffener

Enlarged stiffeners, used for Permanent Means of Access (PMA), whose net web height are above 700 mm, and net offered section modulus are 3 times greater than the smaller one of adjacent surrounding stiffeners not used for PMA, are to comply with the following requirements:

a) Slenderness requirements for primary supporting members as follows:
   - For enlarged stiffener web, see item (a) of Ch 8, Sec 2, [4.1.1].
   - For enlarged stiffener flange, see item (b) of Ch 8, Sec 2, [4.1.1] and Ch 8, Sec 2, [5.1].
   - For stiffeners fitted on enlarged stiffener web, see Ch 8, Sec 2, [3.1.1] and Ch 8, Sec 2, [3.1.3].

b) Buckling strength of prescriptive requirements as follows:
   - For enlarged stiffener web, see Ch 8, Sec 3, [3.2].
   - For stiffeners fitted on enlarged stiffener web, see Ch 8, Sec 3, [3.1] and Ch 8, Sec 3, [3.3].

c) All structural elements used for PMA are to be complied with for the buckling requirements of the FE analysis in Ch 8, Sec 4 when applicable.

d) Buckling strength of longitudinal PMA platforms without stiffeners fitted on enlarged stiffener web is to be checked using the criteria for local supporting members in Ch 8, Sec 3, [3.1] and Ch 8, Sec 3, [3.3].

3 DEFINITIONS

3.1 General

3.1.1 Buckling definition

'Buckling' is used as a generic term to describe the strength of structures, generally under in-plane compressions and/or shear and lateral load. The buckling strength or capacity can take into account the internal redistribution of loads depending on the load situation, slenderness and type of structure.

3.1.2 Buckling capacity

Buckling capacity based on this principle gives a lower bound estimate of ultimate capacity, or the maximum load the panel can carry without suffering major permanent set.

Buckling capacity assessment utilises the positive elastic post-buckling effect for plates and accounts for load redistribution between the structural components, such as between plating and stiffeners. For slender structures, the capacity calculated using this method is typically higher than the ideal elastic buckling stress (minimum Eigen value). Accepting elastic buckling of structural components in slender stiffened panels implies that large elastic deflections and reduced in-plane stiffness will occur at higher buckling utilisation levels.

3.1.3 Assessment methods

The buckling assessment is carried out according to one of the two methods taking into account different boundary condition types:

- Method A: All the edges of the elementary plate panel are forced to remain straight (but free to move in the in-plane directions) due to the surrounding structure/neighbouring plates.
- Method B: The edges of the elementary plate panel are not forced to remain straight due to low in-plane stiffness at the edges and/or no surrounding structure/neighbouring plates.

3.2 Buckling utilisation factor

3.2.1

The utilisation factor, η, is defined as the ratio between the applied loads and the corresponding ultimate capacity or buckling strength.

3.2.2

For combined loads, the utilisation factor, η_{act}, is to be defined as the ratio of the equivalent applied stress and the corresponding buckling capacity, as shown in Figure 1, and is to be taken as:

$$\eta_{act} = \frac{W_{act}}{W_u} = \frac{1}{\gamma_c}$$

where:

W_{act} : Equivalent applied stress, in N/mm^2, the actual applied stress are given in Sec 3 and Sec 4 respectively for buckling assessment by prescriptive and direct strength analysis.

W_u : Equivalent buckling capacity, in N/mm^2, for plates and stiffeners, their respective buckling or ultimate capacities are given in Sec 5.

γ_c : Stress multiplier factor at failure.

For each typical failure mode, the corresponding capacity of the panel is calculated by applying the actual stress combination and then increasing or decreasing the stresses proportionally until collapse.

Figure 1 illustrates the buckling capacity and the buckling utilisation factor of a structural member subject to σ_x and σ_y stresses.

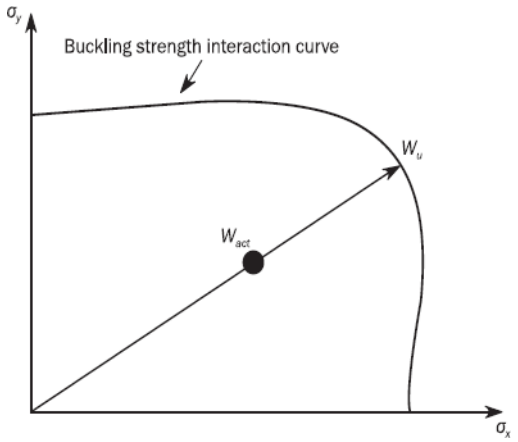

Figure 1 Example of buckling capacity and buckling utilisation factor

3.3 Allowable buckling utilisation factor

3.3.1 General structural elements

The allowable buckling utilisation factor is defined in Table 1.

Allowable buckling utilisation factor **Table 1**

Structural component	η_{all}, Allowable buckling utilisation factor
Plates and stiffeners Stiffened and unstiffened panels Vertically stiffened side shell plating of single side skin bulk carrier Web plate in ways of openings	1.00 for load combination: S+D 0.80 for load combination: S
Struts, pillars and cross ties	0.75 for load combination: S+D 0.65 for load combination: S
Corrugation of vertically corrugated bulkheads with lower stool and horizontally corrugated bulkhead, under lateral pressure from liquid loads, for shell elements only. Supporting structure in way of lower end of corrugated bulkheads without lower stool.	0.90 for load combination: S+D 0.72 for load combination: S
Corrugation of vertically corrugated bulkheads without lower stool under lateral pressure from liquid loads, for shell elements only.	0.81 for load combination: S+D 0.65 for load combination: S
Note1: Supporting structure for a transverse corrugated bulkhead refers to the structure in longitudinal direction within half a web frame space forward and aft of the bulkhead, and within a vertical extent equal to the corrugation depth. Note2: Supporting structure for a longitudinal corrugated bulkhead refers to the structure in transverse direction within three longitudinal stiffener spacings from each side of the bulkhead, and within a vertical extent equal to the corrugation depth.	

3.4 Buckling acceptance criteria

3.4.1

A structural member is considered to have an acceptable buckling strength if it satisfies the following criterion:

$\eta_{act} \leqslant \eta_{all}$

where:

η_{act} :Buckling utilisation factor based on the applied stress, defined in [3.2.2].

η_{all} :Allowable buckling utilisation factor as defined in [3.3].

Section 2 SLENDERNESS REQUIREMENTS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

$b_{f\text{-}out}$: Maximum distance, in mm, from mid thickness of the web to the flange edge, as shown in Figure 1.

h_w : Depth of stiffener web, in mm, as shown in Figure 1.

l_b : Effective length of edge of bracket, in mm, as defined in Table 3.

s_{eff} : Effective width of attached plate of stiffener, in mm, taken equal to:

$s_{eff} = 0.8\ s$

t_f : Net flange thickness, in mm.

t_p : Net thickness of plate, in mm.

t_w : Net web thickness, in mm.

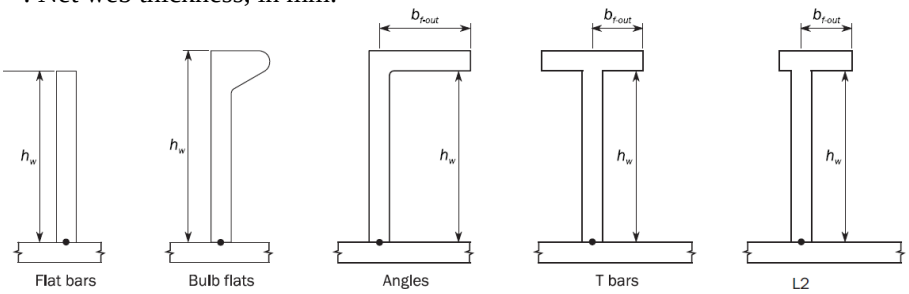

Figure 1 Stiffener scantling parameters

1 STRUCTURAL ELEMENTS

1.1 General

1.1.1

All structural elements are to comply with the applicable slenderness and proportion requirements given in [2] to [6], except for the ones listed below:

- Bilge plates within the cylindrical part of the ship and radius gunwale;
- Corrugation;
- Structure members in superstructures and deck houses, if the structural members do not contribute to the longitudinal strength.

Pillars in superstructures and deckhouses are to comply with the applicable slenderness and proportion requirements given in [6.1].

2 PLATES

2.1 Net thickness of plate panels

2.1.1

The net thickness of plate panels is to satisfy the following criteria:

$$t_p \geq \frac{b}{C}\sqrt{\frac{R_{eH}}{235}}$$

where:

C : Slenderness coefficient taken as:

$C = 100$ for hull envelope and cargo and tank boundaries.

$C = 125$ for other structures.

R_{eH} : Specified minimum yield stress of the plate material, in N/mm^2.

A lower specified minimum yield stress may be used in this slenderness criterion provided the requirements specified in Sec 3 and Sec 4 are satisfied for the strake assumed in the same lower specified minimum yield stress value

3 STIFFENERS

3.1 Proportions of stiffeners

3.1.1 Net thickness of all stiffener types

The net thickness of stiffeners is to satisfy the following criteria:

a) Stiffener web plate:

$$t_w \geq \frac{h_w}{C_w}\sqrt{\frac{R_{eH}}{235}}$$

b) Flange:

$$t_f \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{R_{eH}}{235}}$$

where:
C_w, C_f : Slenderness coefficients given in Table 1.

If requirement b) is not fulfilled, the effective free flange outstand, in mm, used in strength assessment including the calculation of actual net section modulus, is to be taken as:

$$b_{f-out-\max} = C_f t_f \sqrt{\frac{235}{R_{eH}}}$$

Slenderness coefficients **Table 1**

Type of Stiffener	C_w	C_f
Angle and L2 bars	75	12
T-bars	75	12
Bulb bars	45	-
Flat bars	22	-

For built-up profile where the relevant yielding strength defined in Ch 6 and Ch 7 for the web of built-up profile without the edge stiffener is acceptable, as an alternative the web can be assessed according to the web requirements of Angle and L2 in Ch 8, Sec 2, Table 1 and the edge stiffener can be assessed as a flat bar stiffener according to [3.1.1]. The requirement to flange in [3.1.2] shall still apply.

3.1.2 Net dimensions of angle , L2 and T-bars
The total flange breadth b_f in mm, for angle, L2 and T-bars is to satisfy the following criterion:
$b_f \geqslant 0.2h_w$

3.1.3 Bending stiffness of stiffeners
The net moment of inertia, in cm^4, of the stiffener with the effective width of attached plate, s_{eff} about the neutral axis parallel to the attached plating , is not to be less than the minimum value given by:

$$I_{st} \geq Cl^2 A_{eff} \frac{R_{eH}}{235}$$

where:
A_{eff} : Net sectional area of stiffener including effective attached plate, s_{eff}, in cm^2.
R_{eH} : Specified minimum yield stress of the material of the attached plate, in N/mm^2.
C : Slenderness coefficient taken as:
C = 1.43 for longitudinal stiffeners including sniped stiffeners.
C = 0.72 for other stiffeners.

4 PRIMARY SUPPORTING MEMBERS

4.1 Proportions and stiffness

4.1.1 Proportions of web plate and flange

The net thicknesses of the web plates and flanges of primary supporting members are to satisfy the following criteria:

a) Web plate:

$$t_w \geq \frac{s_w}{C_w}\sqrt{\frac{R_{eH}}{235}}$$

b) Flange:

$$t_f \geq \frac{b_{f-out}}{C_f}\sqrt{\frac{R_{eH}}{235}}$$

where:

s_w : Plate breadth, in mm, taken as the spacing of the web stiffeners.

C_w : Slenderness coefficient for the web plate taken as:
$C_w = 100$

C_f : Slenderness coefficient for the flange taken as:
$C_f = 12$

R_{eH} : Specified minimum yield stress of the plate material, in N/mm^2.
For the web plates, a lower R_{eH} may be used in this slenderness criterion provided the requirements specified in Sec 3 and Sec 4, if applicable, are satisfied for the structure assumed in the same lower R_{eH}.

If requirement b) is not fulfilled, the effective free flange outstand, in mm, used in strength assessment including the calculation of actual net section modulus, is to be taken as:

$$b_{f-out-\max} = C_f t_f \sqrt{\frac{235}{R_{eH}}}$$

4.1.2 Deck transverse primary supporting members

The net moment of inertia for deck transverse primary supporting members, $I_{psm\text{-}n50}$, in cm^4, supporting deck longitudinals subject to axial compressive hull girder stress, is to comply, within its central half of the bending span, with the following criterion:

$$I_{psm-n50} \geq 300\frac{l_{bdg}^4}{S^4 s} I_{st}$$

where:

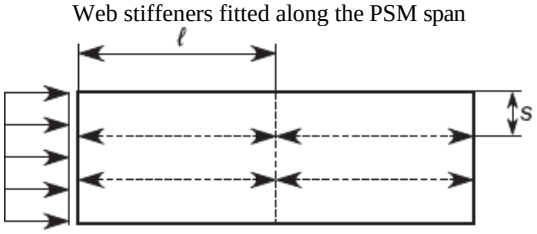
$I_{psm\text{-}n50}$: Net moment of inertia, in cm^4, of deck transverse primary supporting member, with effective width of attached plate equal to 0.8S.

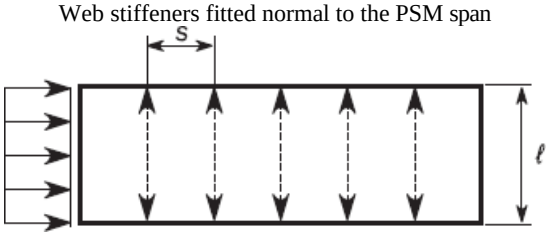
l_{bdg} : Effective bending span of deck transverse primary supporting member, in m, as defined in Ch 3, Sec 7.

S : Spacing of deck transverse primary supporting members, in m, as defined in Ch 3, Sec 7.

I_{st} : Moment of inertia of deck stiffeners within the central half of the bending span, in cm4, as given in[3.1.3].

4.2 Web stiffeners of primary supporting members





4.2.1 Proportions of web stiffeners

The net thickness of web and flange of web stiffeners fitted on primary supporting members is to satisfy the requirements specified in [3.1.1] and [3.1.2].

4.2.2 Bending stiffness of web stiffeners

The net moment of inertia, in cm^4, of web stiffener, I_{st}, fitted on primary supporting members, with effective attached plate, s_{eff}, is not to be less than the minimum moment of inertia defined in Table 2.

Stiffness criteria for web stiffeners **Table 2**

	Stiffener arrangement	Minimum moment of inertia of web stiffeners, in cm^4
A	Web stiffeners fitted along the PSM span 	$I_{st} \geq Cl^2 A_{eff} \frac{R_{eH}}{235}$
B	Web stiffeners fitted normal to the PSM span 	$I_{st} \geq 1.14 ls^2 t_w \left(2.5\frac{1000l}{s} - 2\frac{s}{1000l}\right)\frac{R_{eH}}{235}\cdot 10^{-5}$

where:

C : Slenderness coefficient to be taken as:

C = 1.43 for longitudinal stiffeners including sniped stiffeners.

C = 0.72 for other stiffeners.

L : Length of web stiffener, in m.

For web stiffeners welded to local supporting members, the length is to be measured between the flanges of the local support members.

For sniped web stiffeners, the length is to be measured between the lateral supports, e.g. the total distance between the flanges of the primary supporting member as shown for stiffener arrangement B.

A_{eff} : Net section area of web stiffener including effective attached plate, s_{eff}, in cm^2.

t_w : Net web thickness of the primary supporting member, in mm.

R_{eH} : Specified minimum yield stress of the material of the web plate of the primary supporting member, in N/mm^2.

5 BRACKETS

5.1 Tripping brackets

5.1.1 Unsupported flange length

The unsupported length of the flange of the primary supporting member, in m, i.e. the distance between tripping brackets, is not to be greater than:

$$s_b = b_f C \sqrt{\frac{A_{f-n50}}{\left(A_{f-n50} + \frac{A_{w-n50}}{3}\right)}\left(\frac{235}{R_{eH}}\right)}$$, but need not be less than $S_{b\text{-}min}$

where:

b_f : Flange breadth of primary supporting members, in mm.

C : Slenderness coefficient taken as:

C = 0.022 for symmetrical flanges.

C = 0.033 for asymmetrical flanges.

$A_{f\text{-}n50}$: Net cross sectional area of flange, in cm^2.

$A_{w\text{-}n50}$: Net cross sectional area of the web plate, in cm^2.

R_{eH} : Specified minimum yield stress of the PSM material, in N/mm^2.

$S_{b\text{-}min}$: Minimum unsupported flange length taken as:

$S_{b\text{-}min}$= 3.0 m for tank/hold boundaries or hull envelope including external decks.

$S_{b\text{-}min}$= 4.0 m for other areas.

5.1.2 Edge stiffening

Tripping brackets on primary supporting members are to be stiffened by a flange or edge stiffener if the effective length of the edge, l_b as defined in Table 3, in mm, is greater than:

$l_b = 75t_b$

where:

t_b : Bracket net web thickness, in mm.

5.2 End brackets

5.2.1 Proportions

The net web thickness of end brackets, in mm, subject to compressive stresses is not to be less than:

$$t_b = \frac{d_b}{C}\sqrt{\frac{R_{eH}}{235}}$$

where:

d_b : Depth of brackets, in mm, as defined in Table 3.

C : Slenderness coefficient as defined in Table 3.

R_{eH} : Specified minimum yield stress of the end bracket material, in N/mm^2.

5.3 Edge reinforcement

5.3.1 Edge reinforcements of bracket edges

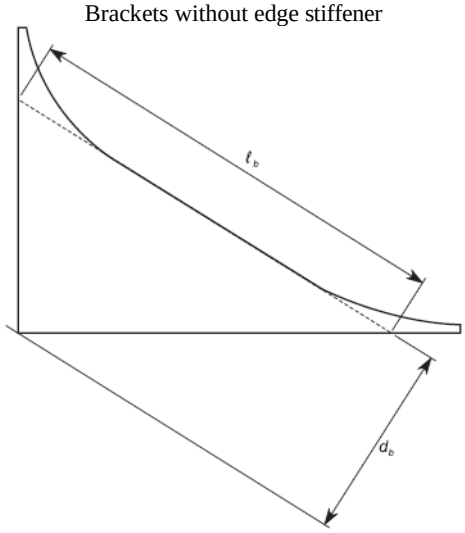
The depth of stiffener web, h_w in mm, of edge stiffeners in way of bracket edges is not to be less than:

$$h_w = Cl_b / 1000\sqrt{\frac{R_{eH}}{235}}$$ or 50 mm, whichever is greater.

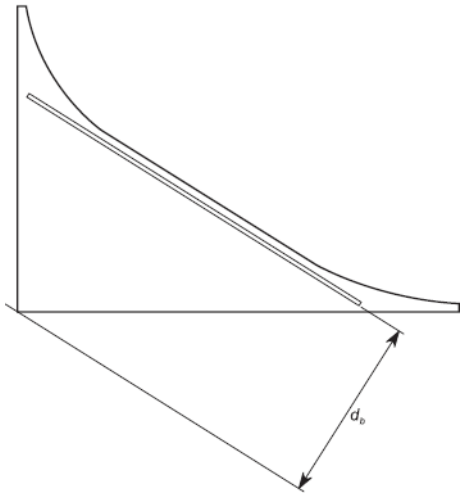
where:

C : Slenderness coefficient taken as:

C = 75 for end brackets.



C = 50 for tripping brackets.



R_{eH} : Specified minimum yield stress of the stiffener material, in N/mm$_2$.

5.3.2 Proportions of edge stiffeners

The net thickness of the web plate and flange of the edge stiffener is to satisfy the requirements specified in[3.1.1] and [3.1.2].

Buckling coefficient, *C*, for proportions of brackets **Table 3**

Mode	*C*
Brackets without edge stiffener 	$C = 20\left(\frac{d_b}{l_b}\right) + 16$ where: $0.25 \le \frac{d_b}{l_b} \le 1.0$

Mode	*C*
Brackets with edge stiffener 	$C = 70$

6 OTHER STRUCTURES

6.1 Pillars

6.1.1 Proportions of I-section pillars

For I-sections, the thickness of the web plate and the flange thickness are to comply with requirements specified in [3.1.1] and [3.1.2].

6.1.2 Proportions of box section pillars

The thickness of thin walled box sections is to comply with the requirements specified in item (a) of [3.1.1].

6.1.3 Proportions of circular section pillars

The net thickness, *t*, of circular section pillars, in mm, is to comply with the following criterion:

$$t \geq \frac{r}{50}$$

where:

r : Mid thickness radius of the circular section, in mm.

6.2 Edge reinforcement in way of openings

6.2.1 Depth of edge stiffener

When fitted as shown in Figure 2, the depth of web, h_w in mm, of edge stiffeners in way of openings is not to be less than:

$$h_w = Cl\sqrt{\frac{R_{eH}}{235}}$$ or 50 mm, whichever is greater.

where:

C : Slenderness coefficient taken as:

$C = 50$

R_{eH} : Specified minimum yield stress of the edge stiffener material, in N/mm^2.

l : Length of edge stiffener in way of opening, in m, as defined in Figure 2.

6.2.2 Proportions of edge stiffeners

The net thickness of the web plate and flange of the edge stiffener is to satisfy the requirements specified in[3.1.1] and [3.1.2].

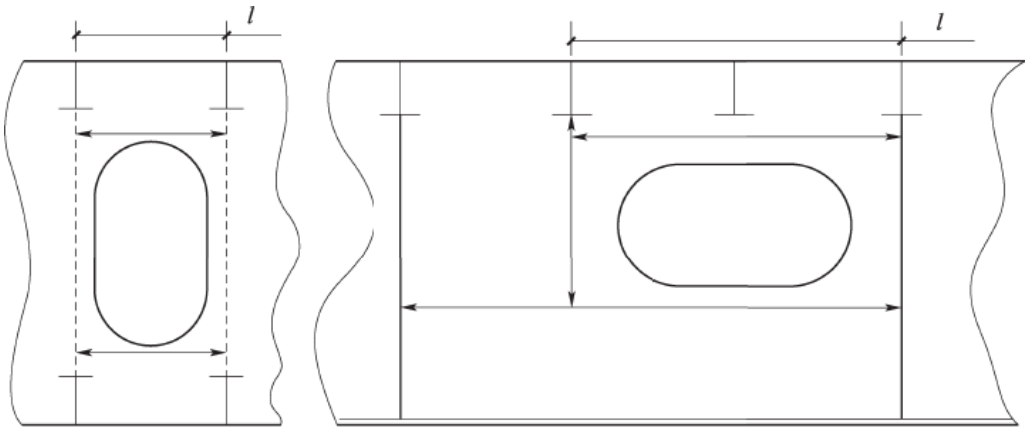


Figure 2 Typical edge reinforcements

Section 3 PRESCRIPTIVE BUCKLING REQUIREMENTS

SYMBOLS

η_{all} : Allowable buckling utilisation factor, as defined in Ch 8, Sec 1, [3.3].
EPP : Elementary Plate Panel as defined in Ch 3, Sec 7, [2.1].
LCP : Load calculation point as defined in Ch 3, Sec 7, [2.2.2] and Ch 3, Sec 7, [3.2].

1 GENERAL

1.1 Scope

1.1.1

This section applies to plate panels including curved plate panels and stiffeners subject to hull girder compression and shear stresses. In addition the following structural members subject to compressive stresses are to be checked:

- Corrugation of longitudinal corrugated bulkhead.
- Strut.
- Pillar.
- Cross tie.

1.1.2

The hull girder buckling strength requirements apply along the full length of the ship.

1.1.3 Design load sets

The buckling checks are to be performed for all design load sets defined in Ch 6, Sec 2, [2], both in intact and in flooded conditions with pressure combination defined in Ch 6, Sec 2, [1.3].
For each design load set, for all dynamic load cases, the lateral pressure is to be determined according to Ch 4 at the load calculation point defined in Ch 3, Sec 7, and is to be applied together with the hull girder stress combinations given in [2.2].

1.2 Equivalent plate panel

1.2.1

In longitudinal stiffening arrangement, when the plate thickness varies over the width b, of a plate panel, the buckling check is to be performed for an equivalent plate panel width, combined with the smaller plate thickness, t_1. The width of this equivalent plate panel, b_{eq}, in mm, is defined by the following formula:

$$b_{eq} = l_1 + l_2 \left(\frac{t_1}{t_2} \right)^{1.5}$$

where:

l_1: Width of the part of the net plate panel with the smaller net plate thickness, t_1, in mm, as defined in Figure 1.

l_2: Width of the part of the net plate panel with the greater net plate thickness, t_2, in mm, as defined in Figure 1.

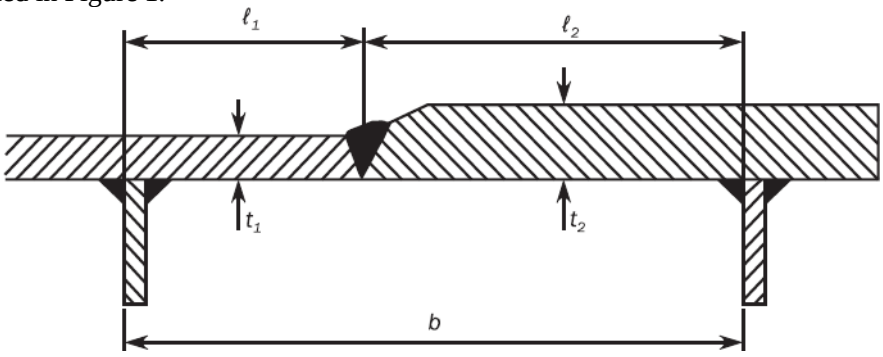

Figure 1 Plate thickness change over the width

1.2.2

In transverse stiffening arrangement, when an EPP is made with different thicknesses, the buckling check of the plate and stiffeners is to be made for each thickness considered constant on the EPP, the stresses and pressures being estimated for the EPP at the LCP.

1.2.3 Materials

When the plate panel is made of different materials, the minimum yield strength is to be used for the buckling assessment.

2 HULL GIRDER STRESS

2.1 General

2.1.1

The hull girder bending stresses, σ_{hg}, in N/mm^2, are determined according to Ch 6, Sec 2.

2.1.2

The hull girder shear stresses, τ_{hg}, in N/mm^2, in the plate *i* are determined as follows:

$$\tau_{hg} = \frac{Q_{Tot}(x) q_{vi}}{t_{i-n50}} 10^3$$

where:

$Q_{Tot}(x)$: Total vertical shear force, in kN, at the ship longitudinal location *x*, taken as follows:

- For the design load combination S+D
  - For seagoing operations:
    $$Q_{Tot}(x) = \left| Q_{sw} + Q_{wv-LC} \right|$$
  - For flooded conditions at sea for bulk carriers having a freeboard length L_{LL} of 150 m or above:
    $$Q_{Tot}(x) = \left| Q_{sw-f} + Q_{wv-LC} \right|$$
- For the design load combination S
  - For harbour/sheltered water operations:
    $$Q_{Tot}(x) = \left| Q_{sw-p} \right|$$

q_{vi} : Contribution ratio in way of the plate *i*, as defined in Ch 5, Sec 1, [3.2.1].

$t_{i\text{-}n50}$: Net thickness of the plate *i*, in mm as defined in Ch 5, Sec 1, [3.2.1], used for shear stress calculation.

Q_{sw} : Permissible positive or negative still water shear force for seagoing operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.3].

$Q_{sw\text{-}p}$: Permissible positive or negative still water shear force for harbour/sheltered operation, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.4].

$Q_{sw\text{-}f}$: Permissible positive or negative still water shear force in flooded condition at sea, in kN, at the hull transverse section considered, as defined in Ch 4, Sec 4, [2.3.5].

$Q_{wv\text{-}LC}$: Vertical wave shear force in seagoing condition, in kN, in intact or flooded conditions at the hull transverse section considered for the considered dynamic load case, defined in Ch 4, Sec 4, [3.5.3].

2.2 Stress combinations

2.2.1

Each elementary plate panel and stiffeners are to satisfy the criteria defined in [3] with the following stress combinations:

a) Longitudinal stiffening arrangement:
   - Stress combination 1 with:
     $\sigma_x = \sigma_{hg}$
     $\sigma_y = 0$
     $\tau = 0.7\tau_{hg}$
   - Stress combination 2 with:
     $\sigma_x = 0.7\sigma_{hg}$
     $\sigma_y = 0$

$\tau = \tau_{hg}$

b) Transverse stiffening arrangement:

- Stress combination 1 with:
  $\sigma_x = 0$
  $\sigma_y = \sigma_{hg}$
  $\tau = 0.7\tau_{hg}$
- Stress combination 2 with:
  $\sigma_x = 0$
  $\sigma_y = 0.7\sigma_{hg}$
  $\tau = \tau_{hg}$

where:

σ_{hg} : Hull girder bending stress in the elementary plate panel or stiffener, as defined in [2.1.1], in N/mm^2.

τ_{hg} : Hull girder shear stress, in N/mm^2, in the elementary plate panel or stiffener attached plate as defined in [2.1.2].

3 BUCKLING CRITERIA

3.1 Overall stiffened panel

3.1.1

The buckling strength of overall stiffened panels is to satisfy the following criterion:

$\eta_{Overall} \leqslant \eta_{all}$

where:

$\eta_{Overall}$: Maximum utilisation factor as defined in Ch 8, Sec 5, [2.1].

3.2 Plates

3.2.1

The buckling strength of elementary plate panels is to satisfy the following criterion:

$\eta_{Plate} \leqslant \eta_{all}$

where:

η_{Plate} : Maximum plate utilisation factor calculated according to SP-A, as defined in Ch 8, Sec 5, [2.2].

For the determination of η_{Plate} of the vertically stiffened side shell plating of single side skin bulk carrier between hopper and topside tanks, the cases 12 and 16 of Ch 8, Sec 5, Table 3 corresponding to the shorter edge of the plate panel clamped are to be considered together with a mean σ_y stress and $\Psi_y = 1$.

3.3 Stiffeners

3.3.1

The buckling strength of stiffeners or of side frames of single side skin bulk carriers is to satisfy the following criterion:

$\eta_{Stiffener} \leqslant \eta_{all}$

where:

$\eta_{Stiffener}$: Maximum stiffener utilisation factor, as defined in Ch 8, Sec 5, [2.3].

Note 1: This capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in [3.1.1], is satisfied.

3.4 Vertically corrugated longitudinal bulkheads

3.4.1

The shear buckling strength of vertically corrugated longitudinal bulkheads is to satisfy the following criterion:

$\eta_{Shear} \leqslant \eta_{all}$

where:

η_{Shear} : Maximum shear corrugated bulkhead utilisation factor.

$$\eta_{Shear} = \frac{\tau_{bhd}}{\tau_c}$$

τ_{bhd} : Hull girder shear stress, in N/mm^2, in the longitudinal bulkhead as defined in [2.1.2].
τ_c: Shear critical stress, in N/mm^2, as defined in Ch 8, Sec 5, [2.2.3].

3.5 Horizontally corrugated longitudinal bulkhead

3.5.1

Each corrugation, within the extension of half flange, web and half flange, is to satisfy the following criterion:

$\eta \leqslant \eta_{all}$

where:

η : Overall column utilisation factor, as defined in Ch 8, Sec 5, [3.1].

3.6 Struts, pillars and cross ties

3.6.1

The compressive buckling strength of struts, pillars and cross ties is to satisfy the following criterion:

$\eta \leqslant \eta_{all}$

where:

η : Maximum buckling utilisation factor of struts, pillars or cross ties, defined in Ch 8, Sec 5, [3.1].

Section 4 BUCKLING REQUIREMENTS FOR DIRECT STRENGTH ANALYSIS

SYMBOLS

η_{all} : Allowable buckling utilisation factor, as defined in Ch 8, Sec 1, [3.3].

α : Aspect ratio of the plate panel, defined in Ch 8, Sec 5.

1 GENERAL

1.1 Scope

1.1.1

The requirements of this Section apply for the buckling assessment of direct strength analysis subjected to compressive stress, shear stress and lateral pressure.

1.1.2

All structural elements in the FE analysis carried out according to Ch 7 are to be assessed individually. The buckling checks have to be performed for the following structural elements:

- Stiffened and unstiffened panels, inclusive curved panels.
- Web plate in way of openings.
- Corrugated bulkhead.
- Vertically stiffened side shell of single side skin bulk carrier.
- Struts, pillars and cross ties.

2 STIFFENED AND UNSTIFFENED PANELS

2.1 General

2.1.1

The plate panel of hull structure is to be modelled as stiffened or unstiffened panel. Method A and Method B as defined in Ch 8, Sec 1, [3] are to be used according to Table 1 and Figure 1 to Figure 9.

2.1.2 Average thickness of plate panel

Where the plate thickness along a plate panel is not constant, the panel used for the buckling assessment is to be modelled according to Ch 7 with a weighted average thickness taken as:

$$t_{avr} = \frac{\sum_{1}^{n} A_i t_i}{\sum_{1}^{n} A_i}$$

where:

Ai : Area of the *i*-th plate element.

ti : Net thickness of the *i*-th plate element.

n : Number of finite elements defining the buckling plate panel.

Structural members **Table 1**

Structural elements	Assessment method	Normal panel definition
Longitudinal structure, see Figure 1, Figure 5 and Figure 7		
Longitudinally stiffened panels Shell envelope Deck Inner hull Hopper tank side Longitudinal bulkheads	SP-A	Length: between web frames Width: between primary supporting members
Double bottom longitudinal girders in line with longitudinal bulkhead or connected to hopper tank side	SP-A	Length: between web frames Width: full web depth

Structural elements	Assessment method	Normal panel definition
Web of double bottom longitudinal girders not in line with longitudinal bulkhead or not connected to hopper tank side	SP-B	Length: between web frames Width: full web depth
Web of horizontal girders in double side space connected to hopper tank side	SP-A	Length: between web frames Width: full web depth
Web of horizontal girders in double side space not connected to hopper tank side	SP-B	Length: between web frames Width: full web depth
Web of single skin longitudinal girders or stringers	UP-B	Plate between local stiffeners/face plate/PSM
Transverse structure, see Figure 2, Figure 6 and Figure 8		
Web of transverse deck frames including brackets	UP-B	Plate between local stiffeners/face plate/PSM
Vertical web in double side space	SP-B	Length: full web depth Width: between primary supporting members
Irregularly stiffened panels, e.g. web panels in way of hopper tank and bilge	UP-B	Plate between local stiffeners/face plate/PSM
Double bottom floors	SP-B	Length: full web depth Width: between primary supporting members
Vertical web frame including brackets	UP-B	Plate between vertical web stiffeners/face plate/PSM
Cross tie web plate	UP-B	Plate between vertical web stiffeners/face plate/PSM
Transverse oil-tight and watertight bulkheads, see Figure 3 and transverse wash bulkheads, see Figure 4		
Regularly stiffened bulkhead panels inclusive the secondary buckling stiffeners perpendicular to the regular stiffener (such as carlings)	SP-A	Length: between primary supporting members Width: between primary supporting members
Irregularly stiffened bulkhead panels, e.g. web panels in way of hopper tank and bilge	UP-B	Plate between local stiffeners/face plate
Web plate of bulkhead stringers including brackets	UP-B	Plate between web stiffeners /face plate
Transverse corrugated bulkheads and cross deck, see Figure 9		
Upper/lower stool including stiffeners	SP-A	Length: between internal web diaphragms Width: length of stool side
Stool internal web diaphragm	UP-B	Plate between local stiffeners /face plate / PSM

Structural elements	Assessment method	Normal panel definition
Cross deck	SP-A	Plate between local stiffeners/ PSM
Note1: SP and UP stand for stiffened and unstiffened panel respectively. Note2: A and B stand for Method A and Method B respectively.		

2.1.3 Yield stress of the plate panel

The panel yield stress R_{eH_P} is taken as the minimum value of the specified yield stresses of the elements within the plate panel.

2.2 Stiffened panels

2.2.1

To represent the overall buckling behaviour, each stiffener with attached plate is to be modelled as a stiffened panel of the extent defined in Table 1.

2.2.2

If the stiffener properties or stiffener spacing varies within the stiffened panel, the calculations are to be performed separately for all configurations of the panels, i.e. for each stiffener and plate between the stiffeners. Plate thickness, stiffener properties and stiffener spacing at the considered location are to be assumed for the whole panel.

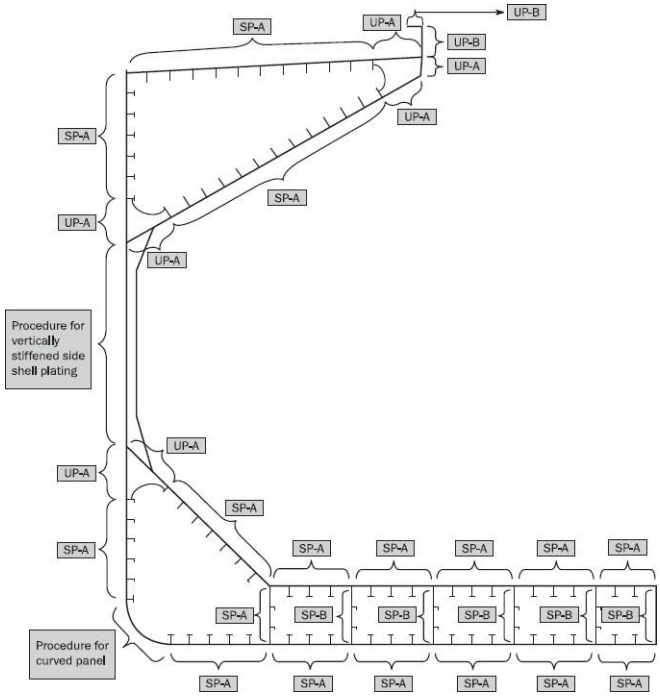

Figure 5 Longitudinal plates for single hull bulk carrier

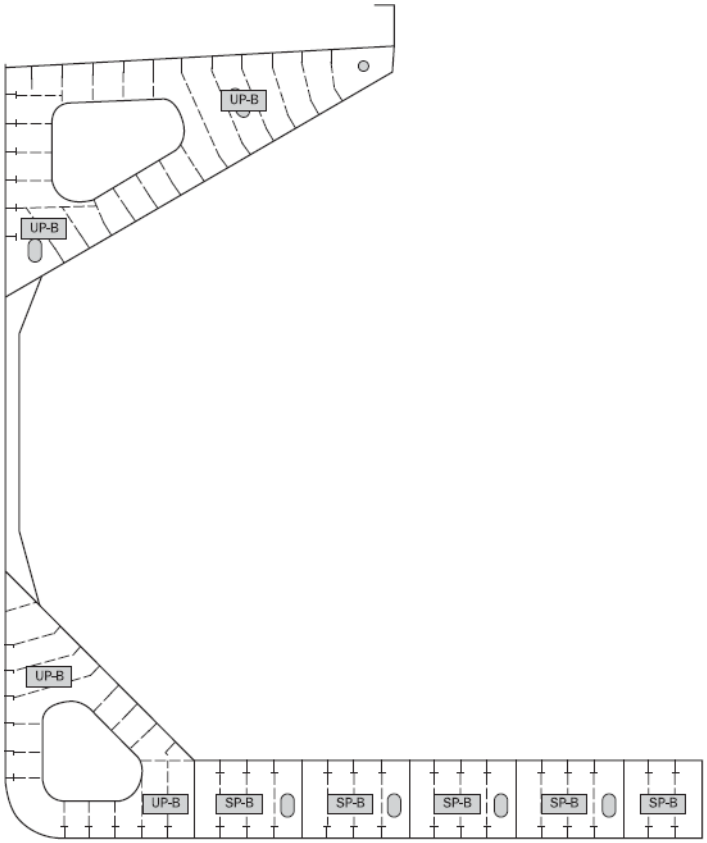

Figure 6 Transverse web frames for single hull bulk carrier

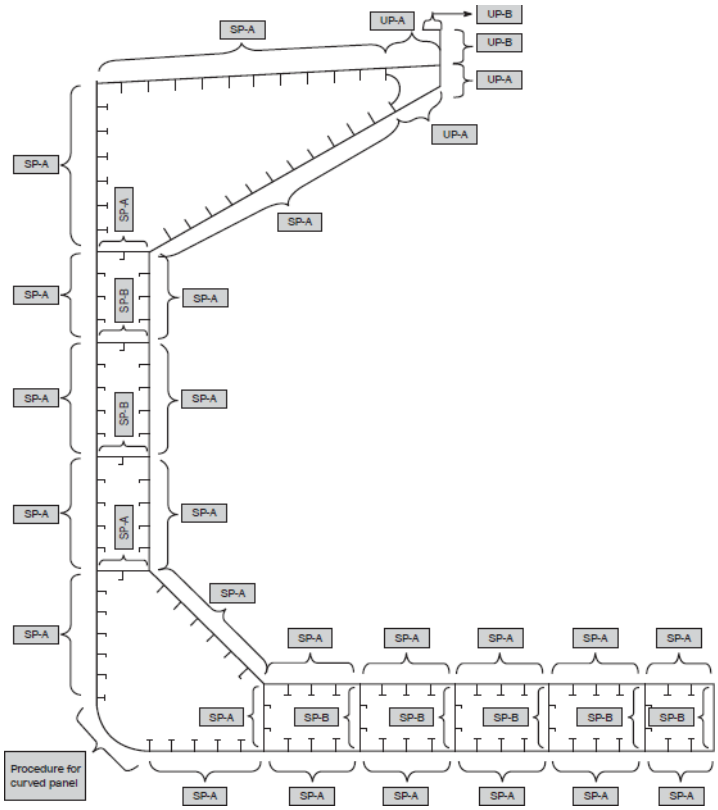

Figure 7 Longitudinal plates for double hull bulk carrier

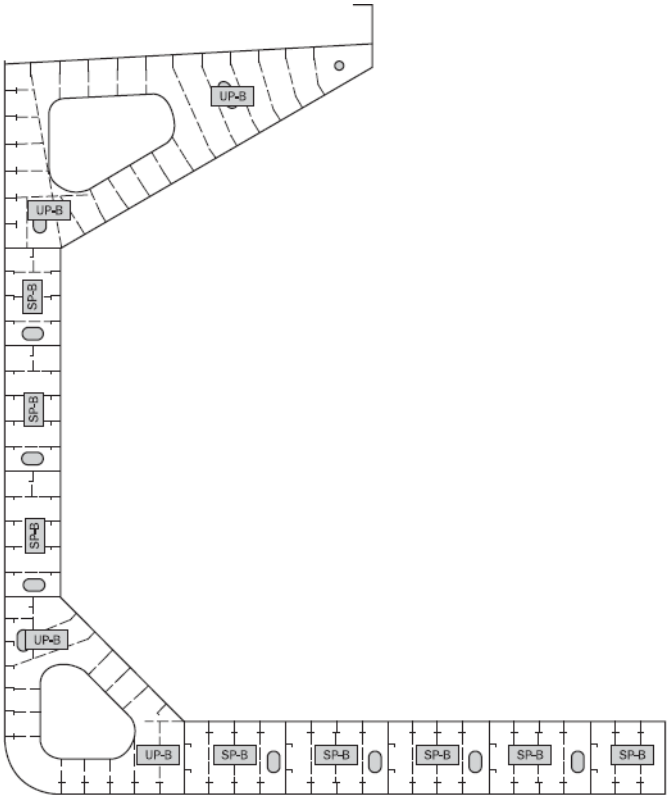

Figure 8 Transverse web frames for double hull bulk carrier

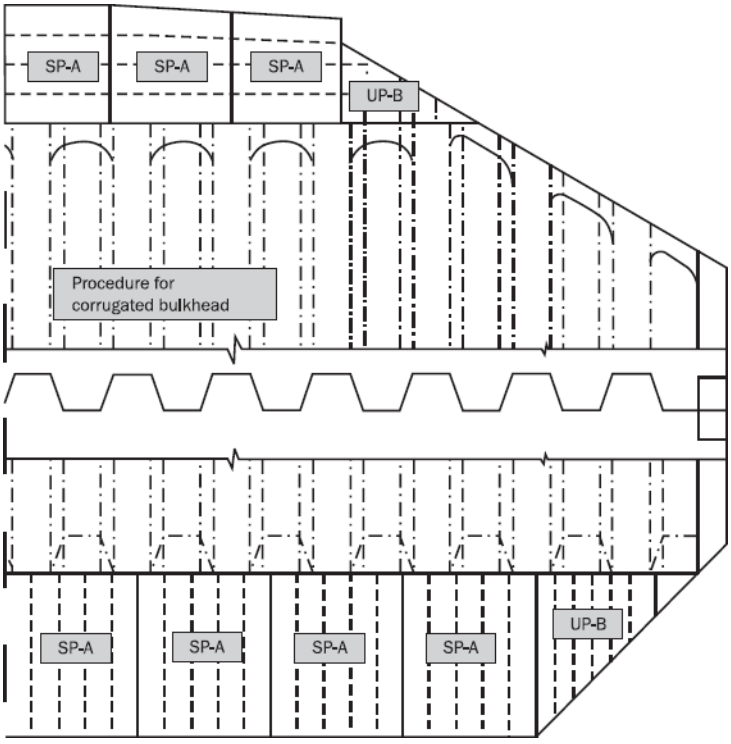

Figure 9 Corrugated bulkhead and cross deck for bulk carriers

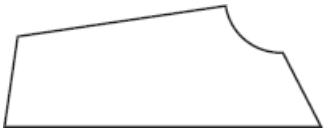
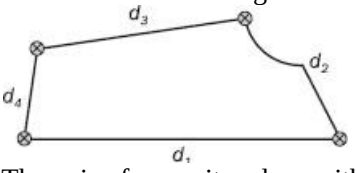
2.3 Unstiffened panels



2.3.1 Irregular plate panel

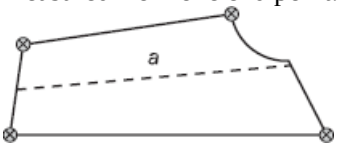
In way of web frames, stringers and brackets, the geometry of the panel (i.e. plate bounded by web stiffeners/face plate) may not have a rectangular shape. In this case, an equivalent rectangular panel is to be defined according to [2.3.2] for irregular geometry and [2.3.3] for triangular geometry and to comply with buckling assessment.



2.3.2 Modelling of an unstiffened panel with irregular geometry

Unstiffened panels with irregular geometry are to be idealised to equivalent panels for plate buckling assessment according to the following procedure:

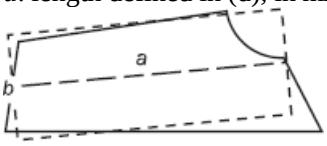
a) The four corners closest to a right angle, 90 deg, in the bounding polygon for the plate are identified.



b) The distances along the plate bounding polygon between the corners are calculated, i.e. the sum of all the straight line segments between the end points.

c) The pair of opposite edges with the smallest total length is identified, i.e. minimum of $d_1 + d_3$ and $d_2 + d_4$

d) A line joins the middle points of the chosen opposite edges (i.e. a mid point is defined as the point at half the distance from one end). This line defines the longitudinal direction for the capacity model. The length of the line defines the length of the capacity model, a measured from one end point.



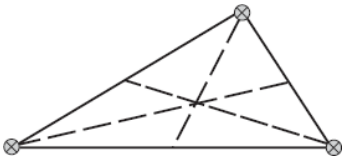
e) The length of shorter side, b in mm, is to be taken as:

$b = A/a$

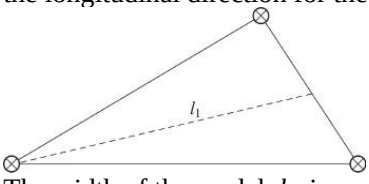
where:

A: Area of the plate, in mm^2

a: length defined in (d), in mm



f) The stresses from the direct strength analysis are to be transformed into the local coordinate system of the equivalent rectangular panel. These stresses are to be used for the buckling assessment.

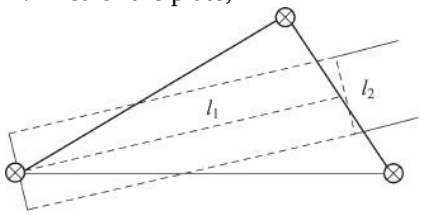


2.3.3 Modelling of an unstiffened plate panel with triangular geometry

Unstiffened panels with triangular geometry are to be idealised to equivalent panels for plate buckling assessment according to the following procedure:

a) Medians are constructed as shown below.

b) The longest median is identified. This median the length of which is l_1, in mm, defines the longitudinal direction for the capacity model.



c) The width of the model, l_2, in mm, is to be taken as:

$l_2 = A / l_1$

where:

A: Area of the plate, in mm^2

d) The lengths of shorter side, *b*, and of the longer side, *a*, in mm, of the equivalent rectangular plate panel are to be taken as:

$$b = \frac{l_2}{C_{tri}}$$

$a = l_1 C_{tri}$

where:

$$C_{tri} = 0.4\frac{l_2}{l_1} + 0.6$$

e) The stresses from the direct strength analysis are to be transformed into the local coordinate system of the equivalent rectangular panel and are to be used for the buckling assessment of the equivalent rectangular panel.

2.4 Reference stress

2.4.1

The stress distribution is to be taken from the direct strength analysis and applied to the buckling model.

2.4.2

The reference stresses are to be calculated using the Stress based reference stresses as defined in App 1.

2.5 Lateral pressure

2.5.1

The lateral pressure applied to the direct strength analysis is also to be applied to the buckling assessment.

2.5.2

Where the lateral pressure is not constant over a buckling panel defined by a number of finite plate elements, an average lateral pressure, N/mm^2, is calculated using the following formula:

$$P_{avr} = \frac{\sum_1^n A_i P_i}{\sum_1^n A_i}$$

where:

A_i : Area of the *i*-th plate element, in mm^2.

P_i : Lateral pressure of the *i*-th plate element, in N/mm^2.

n : Number of finite elements in the buckling panel.

2.6 Buckling criteria

2.6.1 UP-A

The compressive buckling strength of UP-A is to satisfy the following criterion:

$\eta_{UP\text{-}A} \leqslant \eta_{all}$

where:

$\eta_{UP\text{-}A}$: Maximum plate utilisation factor, calculated according to Method A as defined in Ch 8, Sec 5, [2.2].

2.6.2 UP-B

The compressive buckling strength of UP-B is to satisfy the following criterion:

$\eta_{UP\text{-}B} \leqslant \eta_{all}$

where:

$\eta_{UP\text{-}B}$: Maximum plate utilisation factor, calculated according to Method B as defined in Ch 8, Sec 5, [2.2].

2.6.3 SP-A

The compressive buckling strength of SP-A is to satisfy the following criterion:

$\eta_{SP\text{-}A} \leqslant \eta_{all}$

where:

$\eta_{SP\text{-}A}$: Maximum stiffened panel utilisation factor taken as the maximum of:

- The overall stiffened panel capacity as defined in Ch 8, Sec 5, [2.1].
- The plate capacity calculated according to Method A as defined in Ch 8, Sec 5, [2.2].
- The stiffener buckling strength as defined in Ch 8, Sec 5, [2.3] considering separately the properties (thickness, dimensions), the pressures defined in [2.5.2] and the reference stresses of each EPP at both sides of the stiffener.

Note1: The stiffener buckling capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in Ch 8, Sec 5, [2.1], is satisfied.

2.6.4 SP-B

The compressive buckling strength of SP-B is to satisfy the following criterion:

$\eta_{SP\text{-}B} \leqslant \eta_{all}$

where:

$\eta_{SP\text{-}B}$: Maximum stiffened panel utilisation factor taken as the maximum of:

- The overall stiffened panel capacity as defined in Ch 8, Sec 5, [2.1].
- The plate capacity calculated according to Method B as defined in Ch 8, Sec 5, [2.2].
- The stiffener buckling strength as defined in Ch 8, Sec 5, [2.3] considering separately the properties (thickness, dimensions), the pressures defined in [2.5.2] and the reference stresses of each EPP at both sides of the stiffener.

Note1: The stiffener buckling capacity check can only be fulfilled when the overall stiffened panel capacity, as defined in Ch 8, Sec 5, [2.1], is satisfied.

2.6.5 Web plate in way of openings

The web plate of primary supporting members with openings is to satisfy the following criterion:

$\eta_{opening} \leqslant \eta_{all}$

where:

$\eta_{opening}$: Maximum web plate utilisation factor in way of openings, as defined in Ch 8, Sec 5, [2.4].

3 CORRUGATED BULKHEAD

3.1 General

3.1.1

Three buckling failure modes are to be assessed on corrugated bulkheads:

3.1.1 Corrugation overall column buckling.

3.1.2 Corrugation flange panel buckling.

3.1.3 Corrugation web panel buckling.

3.2 Reference stress

3.2.1

Each corrugation flange and web panel is to be assessed.

3.2.2

The membrane stresses at element centroid are to be used.

3.2.3

The maximum normal stress parallel to the corrugation, σ_x, is the maximum of the 2 following stresses:

- The normal stress parallel to the corrugation taken at $b/2$ from the corrugation ends,
- The normal stress parallel to the corrugation within the mid span of the corrugation.

When the corrugation end is fitted with a shedder plate, the normal stress parallel to the corrugation at end is to be taken at $b/2$ from the intersection of the shedder plate with the point at mid breadth of the flange or of the web, as the case may be.

The maximum shear stress is the shear stress which is maximum at the corrugation flange or web at the point

$b/2$ from ends as defined above for the normal stress parallel to the corrugation.

The in plane stresses, σ_x and σ_y, and shear stress, τ, are to be taken as the element stresses averaged over the width of the considered member (flange or web) at the considered location.

When the stress value at $b/2$ from ends cannot be obtained directly from FE element, the stress at this location is to be obtained by interpolation. This interpolation is to be made on elements extending over a distance equal to $3b$ to a point located at $b/2$ from the end of the corrugation or from the intersection of the shedder plate if fitted, measured at the mid breadth of the flange or of the web. The interpolation of the in plane stresses, σ_x and σ_y, are to be made in accordance with Ch 8, App 1, [2.1].

The shear stress at $b/2$ is obtained by linear interpolation between the elements most close to '$b/2$' location. For the application of this requirement, b is defined as follows:

b : Width of the considered member of the corrugation, i.e. flange or web.

3.2.4

Where more than one plate thicknesses are used for flange or web panel, maximum stress is to be obtained for each thickness range and to be checked with the buckling criteria for each thickness.

3.3 Overall column buckling

3.3.1

The overall buckling failure mode of corrugated bulkheads subjected to axial compression is to be checked for column buckling (e.g. horizontally corrugated bulkheads and vertically corrugated bulkheads subjected to local vertical forces).

Application of overall column buckling for corrugated bulkhead **Table 2**

Bulkhead orientation	Corrugation Orientation	
	Horizontal	Vertical
Longitudinal bulkhead	Required	Required, when subjected to local vertical forces (e.g. crane loads)
Transverse bulkhead	Required	

3.3.2

Each corrugation unit within the extension of half flange, web and half flange (i.e. single corrugation as shown in grey in Figure 10) is to satisfy the following criterion:

$\eta_{Overall} \leqslant \eta_{all}$

where:

$\eta_{Overall}$: Maximum overall column utilisation factor, as defined in Ch 8, Sec 5, [3.1.1] and Ch 8, Sec 5, [3.1.2], considered as a pillar with a unsupported length taken as the length of the corrugation.

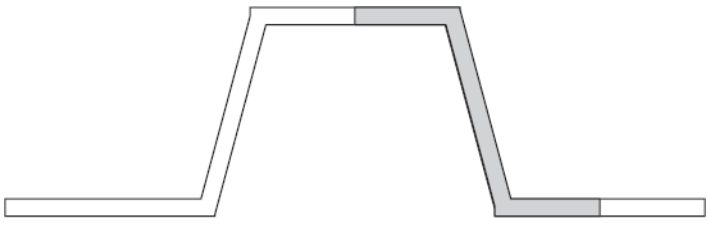


Figure 10 Single Corrugation

3.3.3
End constraint factor, f_{end} corresponding to pinned ends is to be applied except for fixed end support to be used in way of stool with width exceeding 2 times the depth of the corrugation.

3.4 Local buckling

3.4.1
The compressive buckling strength of a unit flange and a unit web of corrugation bulkheads is to satisfy the following criterion:

$\eta_{Corr} \leqslant \eta_{all}$

where:

η_{Corr} : Maximum unit flange or unit web utilisation factor, as defined in Ch 8, Sec 5, [3.2.1].

Two stress combinations are to be considered for the application of the above criterion:

3.4.1 The maximum normal stress parallel to the corrugation, σ_x, combined with the stress perpendicular to the corrugation, σ_y, and with the shear stress, τ, at the location where the maximum normal stress parallel to the corrugation occurs.

3.4.2 The maximum shear stress, τ, combined with the normal stress parallel to the corrugation, σ_x, and with the stress perpendicular to the corrugation, σ_y, at the location where the maximum shear stress occurs.

The buckling assessment is to be performed for an aspect ratio α equal to 2, and for the thicknesses of the member where the maximum compressive/shear stress occurs (see [3.2.4]).

4 VERTICALLY STIFFENED SIDE SHELL OF SINGLE SIDE SKIN BULK CARRIER

4.1 Buckling criteria

4.1.1 Side shell plating

The compressive buckling strength of the vertically stiffened side shell plating of single side skin bulk carrier is to satisfy the following criterion:

$\eta_{vss} \leqslant \eta_{all}$

where:

η_{vss}: Maximum vertically stiffened side shell plating utilisation factor calculated according to Method A as defined in Ch 8, Sec 5, [2.2.1] and considering the following boundary conditions and stress combinations:

- 4 edges simply supported (cases 1, 2 and 15 of Ch 8, Sec 5, Table 3):
  - Pure vertical stress:
    - The maximum vertical stress of stress elements is used with $\alpha = 1$ and $\Psi_x = 1$.
  - Maximum vertical stress combined with longitudinal and shear stress:
    - The maximum vertical stress in the buckling panel plus the shear and longitudinal stresses at the location where the maximum vertical stress occurs is used with $\alpha = 2$ and $\Psi_x = \Psi_y = 1$.
    - The plate thickness to be considered in the buckling strength check is the one where the maximum vertical stress occurs.
  - Maximum shear stress combined with longitudinal and vertical stress:
    - The maximum shear stress in the buckling panel plus the longitudinal and vertical stresses at the location where maximum shear stress occurs is used with $\alpha = 2$ and $\Psi_x = \Psi_y = 1$.
    - The plate thickness to be considered in the buckling strength check is the one where the maximum shear stress occurs.
- The 2 shorter edges of the plate panel clamped (cases 11, 12 and 16 of Ch 8, Sec 5, Table 3):
  - Distributed longitudinal stress associated with vertical and shear stress:
    - The actual size of the buckling panel is used to define α.
    - The average values for longitudinal, vertical and shear stresses are to be used.
    - $\Psi_x = \Psi_y = 1$.

- The plate thickness to be considered in the buckling strength check is the minimum thickness of the buckling panel.

4.1.2 Side frames

The buckling strength of side frames of single side skin bulk carriers is to satisfy the following criterion:

$\eta_{Stiffener} \leqslant \eta_{all}$

where:

$\eta_{Stiffener}$: Maximum stiffener utilisation factor, as defined in Ch 8, Sec 5, [2.3].

5 STRUTS, PILLARS AND CROSS TIES

5.1 Buckling criteria

5.1.1

The compressive buckling strength of struts, pillars and cross ties is to satisfy the following criterion:

$\eta_{Pillar} \leqslant \eta_{all}$

The buckling strength of elementary plate panels of cross ties is to satisfy the following criterion:

$\eta_{Pillar} \leqslant \eta_{all}$

where:

η_{Pillar} : Maximum utilisation factor of struts, pillars or cross ties, as defined in Ch 8, Sec 5, [3.1].

η_{Plate} : Maximum plate utilisation factor calculated according to UP-B, as defined in Ch 8, Sec 5, [2.2].

Section 5 BUCKLING CAPACITY

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

A_s : Net sectional area of the stiffener without attached plating, in mm^2.

A_p : Net sectional area of the stiffener attached plating, in mm^2, taken as:

$A_p = st_p$

a : Length of the longer side of the plate panel, in mm.

b : Length of the shorter side of the plate panel, in mm.

b_{eff} : Effective width of the attached plating of a stiffener, in mm, as defined in [2.3.5].

b_{eff1} :Effective width of the attached plating of a stiffener, in mm, without the shear lag effect taken as:

- For $\sigma_x > 0$
  - For prescriptive assessment:

$$b_{eff1} = \frac{C_{x1}b_1 + C_{x2}b_2}{2}$$

  - For FE analysis:

$b_{eff1} = C_x b$

- For $\sigma_x \leq 0$

$b_{eff1} = b$

b_f : Breadth of the stiffener flange, in mm.

b_1, b_2 : Width of plate panel on each side of the considered stiffener, in mm.

C_{x1},C_{x2} : Reduction factor defined in Table 3 calculated for the EPP1 and EPP2 on each side of the considered stiffener according to case 1.

d : Length of the side parallel to the axis of the cylinder corresponding to the curved plate panel as shown in Table 4, in mm.

d_f : Distance in mm, for the extension of flange for L2 profiles, as defined in Ch3, Sec2, Figure 3.

e_f : Distance from attached plating to centre of flange, in mm, as shown in Figure 1 to be taken as:

$e_f = h_w$ for flat bar profile.

$e_f = h_w - 0.5t_f$ for bulb profile.

$e_f = h_w + 0.5t_f$ for angle, L2 and Tee profiles.

F_{long} : Coefficient defined in [2.2.4].

F_{tran} : Coefficient defined in [2.2.5].

h_w : Depth of stiffener web, in mm, as shown in Figure 1.

l : Span, in mm, of stiffener equal to spacing between primary supporting members or span of side frame equal to the distance between the hopper tank and top wing tank as defined in Pt 2, Ch 1, Sec 2, Figure 2.

R : Radius of curved plate panel, in mm.

R_{eH_P} : Specified minimum yield stress of the plate in N/mm^2.

R_{eH_S} : Specified minimum yield stress of the stiffener in N/mm^2.

S : Partial safety factor to be taken as:

- S = 1.1 for structures which are exposed to local concentrated loads (e.g. container loads on hatch covers, foundations).
- S = 1.15 for bulk carrier stiffeners located on the hatchway coamings, the sloping plate of the topside and hopper tanks, the inner bottom, the inner side if any, the side shell of single side skin construction and the top and bottom stools of transverse bulkheads.
- S = 1.0 for all other cases.

t_p : Net thickness of plate panel, in mm.

t_w : Net stiffener web thickness, in mm. t_f

: Net flange thickness, in mm.

x axis : Local axis of a rectangular buckling panel parallel to its long edge.

y axis : Local axis of a rectangular buckling panel perpendicular to its long edge.

α : Aspect ratio of the plate panel, defined in Table 3 to be taken as:

$$\alpha = \frac{a}{b}$$

β : Coefficient taken as:

$$\beta = \frac{1-\Psi}{\alpha}$$

ω : Coefficient taken as:

$\omega = \min(3;\sigma)$

σ_x : Stress applied on the edge along x axis of the buckling panel, in N/mm^2.

σ_y : Stress applied on the edge along y axis of the buckling panel, in N/mm^2.

σ_1 : Maximum stress, in N/mm^2.

σ_2 : Minimum stress, in N/mm^2.

σ_E : Elastic buckling reference stress, in N/mm^2 to be taken as:

- For the application of plate limit state according to [2.2.1]:

$$\sigma_E = \frac{\pi^2 E}{12(1-v^2)}\left(\frac{t_p}{b}\right)^2$$

- For the application of curved plate panels according to [2.2.6]:

$$\sigma_E = \frac{\pi^2 E}{12(1-v^2)}\left(\frac{t_p}{d}\right)^2$$

τ : Applied shear stress, in N/mm^2.

τ_c : Buckling strength in shear, in N/mm^2, as defined in [2.2.3].

ψ : Edge stress ratio to be taken as:

$$\psi = \frac{\sigma_2}{\sigma_1}$$

γ : Stress multiplier factor acting on loads. When the factor is such that the loads reach the interaction formulae, $\gamma = \gamma_c$.

γ_c : Stress multiplier factor at failure.

γ_{GEB} : Stress multiplier factor of global elastic buckling capacity.

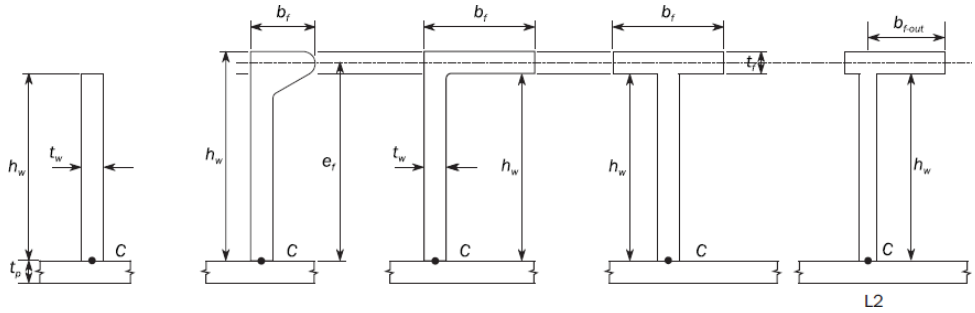

Figure 1 Stiffener cross sections

1 General

1.1 Scope

1.1.1

This section contains the methods for determination of the buckling capacity of plate panels, stiffeners, pri- mary supporting members, struts, pillars, cross ties and corrugated bulkheads.

1.1.2

For the application of this section, the stresses σ_x, σ_y and τ applied on the structural members are defined in:

- Ch 8, Sec 3 for prescriptive requirements.
- Ch 8, Sec 4 for FE analysis requirements.

1.1.3 Ultimate buckling capacity

The ultimate buckling capacity is calculated by applying the actual stress combination and then increasing or decreasing the stresses proportionally until the interaction formulae defined in [2.1.1], [2.2.1], and [2.3.4] are equal to 1.0.

1.1.4 Buckling utilisation factor

The buckling utilisation factor of the structural member is equal to the highest utilisation factor obtained for the different buckling modes.

1.1.5 Lateral pressure

The lateral pressure is to be considered as constant in the buckling strength assessment.

2 Buckling Capacity of Plates and Stiffeners

2.1 Overall stiffened panel capacity

2.1.1

The elastic stiffened panel limit state is based on the following interaction formula, which sets a precondition for the buckling check of stiffeners in accordance with [2.3.4]:

$$\frac{\gamma}{\gamma_{GEB}} = 1$$

where the stress multiplier factor corresponding to global elastic buckling capacity, γ_{GEB} , is to be calculated based on the following formulae:

$\gamma_{GEB} = \gamma_{GEB,bi+\tau}$ for $\tau \neq 0$ and ($\sigma x > 0$ or $\sigma y > 0$)

$\gamma_{GEB} = \gamma_{GEB,bi}$ for $\tau = 0$ and ($\sigma x > 0$ or $\sigma y > 0$)

$\gamma_{GEB} = \gamma_{GEB,\tau}$ for $\tau \neq 0$ and ($\sigma x \leqslant 0$ and $\sigma y \leqslant 0$)

where $\gamma_{GEB,bi+\tau}$, $\gamma_{GEB,bi}$, and $\gamma_{GEB,\tau}$ are stress multiplier factors for different load combinations as defined in [2.1.2], [2.1.3] and [2.1.4], respectively. For the calculation of $\gamma_{GEB,i+\tau}$, $\gamma_{GEB,bi}$, and $\gamma_{GEB,\tau}$, neither σ_x nor σ_y shall be taken less than 0.

σ_x, σ_y : Applied normal stresses to the plate panel, in N/mm^2, to be taken as defined in [2.2.7].

τ : Applied shear stress, in N/mm^2, to be taken as defined in [2.2.7].

2.1.2

The stress multiplier factor $\gamma_{GEB,i}$, for the stiffened panel subjected to biaxial loads is taken as:

$$\gamma_{GEB,bi} = \frac{\pi^2}{L_{B1}^2 L_{B2}^2} \frac{\left[D_{11} L_{B2}^4 + 2(D_{12} + D_{33}) n^2 L_{B1}^2 L_{B2}^2 + n^4 D_{22} L_{B1}^4 \right]}{L_{B2}^2 N_x + n^2 L_{B1}^2 N_y}$$

where:

N_x : Load per unit length applied on the edge along x axis of the stiffened panel, in N/mm, taken as

$$N_x = \sigma_{x,av}(A_p + A_s)/s$$

For stiffened panels fitted with U-type stiffeners, stiffener spacing s is taken as:

$$s = b_1 + b_2$$

Where b_1 and b_2 are as defined in Pt 2, Ch 1, Sec 5, Figure 1.

N_y : Load per unit length applied on the edge along y axis of the stiffened panel, in N/mm, taken as:

$N_y = c\sigma_y t_p$

L_{B1} : Stiffener span, in mm, equal to spacing between primary supporting members, i.e. $L_{B1} = l$. For vertically stiffened side shell of single side skin bulk carriers, $L_{B1} = 0.8l$.

L_{B2} : Width of the stiffened panel, in mm, taken as 6 times of the stiffener spacing, i.e. 6s.

n : Number of half waves along the direction perpendicular to the stiffener axis. The factor $\gamma_{GEB,i}$ is to be minimized with respect to the wave parameter n, i.e. to be taken as the smallest value larger than zero.

c : Factor taking into account the stresses in the attached plating acting perpendicular to the stiffener axis:

$c = 0.5(1+\psi)$ for $0 \leqslant \Psi \leqslant 1$

$c = \frac{1}{2(1-\psi)}$ for $\Psi < 0$

ψ : Edge stress ratio for case 2 according to Table 3.

$\sigma_{x,av}$: Average stress for both plate and stiffener with Poisson correction, taken as:

$$\sigma_{x,\ av} = \sigma_x - vc\sigma_v A_s / (A_p + A_s) \geq 0 \qquad \text{for } \sigma_x>0 \text{ and } \sigma_y>0$$

$\sigma_{x,av}=\sigma_x$ for $\sigma_x \leqslant 0$ or $\sigma_y \leqslant 0$

D_{11},D_{12},D_{22},D_{33} : Bending stiffness coefficients, in Nmm, of the stiffened panel, defined in general as:

$$D_{11} = \frac{EI_{eff}10^4}{S}$$

$$D_{12} = \frac{Et_p^{\ 3}v}{12\left(1-v^2\right)}$$

$$D_{22} = \frac{Et_p^{\ 3}}{12\left(1-v^2\right)}$$

$$D_{33} = \frac{Et_p^{\ 3}}{12\left(1+v\right)}$$

For stiffened panels fitted with U-type stiffeners, D_{12} and D_{22} are defined as:

$$D_{22} = \frac{Et_p^3}{12(1-v^2)}\left[1.2 + 4.8 \times \text{Min}\left(1.0, \frac{b_1^2}{h_w(b_1+b_2)}\right) \times \text{Min}\left(1.0, \left(\frac{t_w}{t_p}\right)^3\right)\right]$$

$$D_{12} = vD_{22}$$

h_w : Breadth of U-type stiffener web as defined in Pt 2, Ch 1, Sec 5, Figure 1.

I_{eff} : Moment of inertia, in cm^4, of the stiffener including effective width of attached plating, the same as I defined in [2.3.4].

2.1.3

The stress multiplier factor $\gamma_{GEB,\tau}$ for the stiffened panel subjected to pure shear load is taken as:

$$\gamma_{GEB,\tau} = \frac{\sqrt[4]{D_{11}^3 D_{22}}}{(L_{B1}/2)^2 N_{xy}}\left[8.125 + 5.64\sqrt{\frac{(D_{12}+D_{33})^2}{D_{11}D_{22}}} - 0.6\frac{(D_{12}+D_{33})^2}{D_{11}D_{22}}\right] \qquad \text{for } D_{11}D_{22} \geqslant (D_{12}+D_{33})^2$$

$$\gamma_{GEB,\tau} = \frac{\sqrt{2D_{11}(D_{12}+D_{33})}}{(L_{B1}/2)^2 N_{xy}}\left[8.3 + 1.525\sqrt{\frac{D_{11}D_{22}}{(D_{12}+D_{33})^2}} - 0.493\frac{D_{11}^{\ 2}D_{22}^{\ 2}}{(D_{12}+D_{33})^4}\right] \qquad \text{for } D_{11}D_{22} < (D_{12}+D_{33})^2$$

where

$N_{xy}=\tau t_p$

2.1.4

The stress multiplier factor $\gamma_{GEB,i+i}$ for the stiffened panel subjected to combined loads is taken as:

$$\gamma_{GEB,\text{bi+}\tau} = \frac{1}{2}\gamma_{GEB,\tau}^{\ 2}\left[-\frac{1}{\gamma_{GEB,bi}} + \sqrt{\frac{1}{\gamma_{GEB,bi}^{\ 2}} + 4\frac{1}{\gamma_{GEB,\tau}^{\ 2}}}\right]$$

where $\gamma_{GEB,bi}$ and $\gamma_{GEB,\tau}$ are as defined in [2.1.2] and [2.1.3], respectively.

2.2 Plate capacity

2.2.1 Plate limit state

The plate limit state is based on the following interaction formulae:

$$\left(\frac{\gamma_{c1}\sigma_x S}{\sigma_{cx}^{'}}\right)^{e_0} - B\left(\frac{\gamma_{c1}\sigma_x S}{\sigma_{cx}^{'}}\right)^{e_0/2}\left(\frac{\gamma_{c1}\sigma_y S}{\sigma_{cy}^{'}}\right)^{e_0/2} + \left(\frac{\gamma_{c1}\sigma_y S}{\sigma_{cy}^{'}}\right)^{e_0} + \left(\frac{\gamma_{c1}|\tau| S}{\tau_c^{'}}\right)^{e_0} = 1$$

$$\left(\frac{\gamma_{c2}\sigma_x S}{\sigma_{cx}^{'}}\right)^{2/\beta_p^{0.25}} + \left(\frac{\gamma_{c2}|\tau| S}{\tau_c^{'}}\right)^{2/\beta_p^{0.25}} = 1 \text{ for } \sigma_x \geqslant 0$$

$$\left(\frac{\gamma_{c3}\sigma_y S}{\sigma_{cx}^{'}}\right)^{2/\beta_p^{0.25}} + \left(\frac{\gamma_{c3}|\tau|S}{\tau_c^{'}}\right)^{2/\beta_p^{0.25}} = 1 \text{ for } \sigma_y \geqslant 0$$

$$\frac{\gamma_{c4}|\tau|S}{\tau_c^{'}} = 1$$

with

$\gamma_c = \min(\gamma_{c1}, \gamma_{c2}, \gamma_{c3}, \gamma_{c4})$

where:

σ_x, σ_y : Applied normal stress to the plate panel, in N/mm^2, to be taken as defined in [2.2.7].

τ : Applied shear stress to the plate panel, in N/mm^2.

$\sigma_{cx}^{'}$: Ultimate buckling stress, in N/mm^2, in direction parallel to the longer edge of the buckling panel as defined in [2.2.3].

$\sigma_{cy}^{'}$: Ultimate buckling stress, in N/mm^2, in direction parallel to the shorter edge of the buckling panel as defined in [2.2.3].

$\tau_c^{'}$: Ultimate buckling shear stresses, in N/mm^2, as defined in [2.2.3].

γ_{c1}, γ_{c2}, γ_{c3}, γ_{c4}: Stress multiplier factors at failure for each of the above different limit states. γ_{c1} and γ_{c2} are only to be considered when $\sigma_x \geqslant 0$ and $\sigma_y \geqslant 0$ respectively.

B : Coefficient given in Table 1.

e_0 : Coefficient given in Table 1.

β_p :Plate slenderness parameter taken as:

$$\beta_p = \frac{b}{t_p}\sqrt{\frac{R_{eH_P}}{E}}$$

Definition of coefficients *B* and e_0 **Table 1**

Applied Stress	B	e_0
$\sigma_x \geq 0$ and $\sigma_y \geq 0$	$0.7\text{-}0.3\beta_p/\alpha^2$	$2/\beta_p^{0.25}$
$\sigma_x < 0$ or $\sigma_y < 0$	1.0	2.0

2.2.2 Reference degree of slenderness

The reference degree of slenderness is to be taken as:

$$\lambda = \sqrt{\frac{R_{eH_P}}{K\sigma_E}}$$

where:

K : Buckling factor, as defined in Table 3 and Table 4.

2.2.3 Ultimate buckling stresses

The ultimate buckling stresses of plate panels, in N/mm^2, are to be taken as:

$$\sigma_{cx}' = C_x R_{eH_P}$$

$$\sigma_{cy}' = C_y R_{eH_P}$$

The ultimate buckling stress of plate panels subject to shear, in N/mm^2, is to be taken as:

$$\tau_c^{'} = C_\tau \frac{R_{eH_P}}{\sqrt{3}}$$

where:

C_x, C_y, C_τ :Reduction factors, as defined in Table 3

- For the 1st Equation of [2.2.1], when $\sigma_x < 0$ or $\sigma_y < 0$, the reduction factors are to taken as: $C_x = C_y = C_\tau = 1$.
- For the other cases:
  - For SP-A and UP-A, C_y is calculated according to Table 3 by using

$$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

  - For SP-B and UP-B, C_y is calculated according to Table 3 by using

$c_1 = 1$

- For vertically stiffened single side skin of bulk carrier, C_y is calculated according to Table 3 by using

$$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

For corrugation of corrugated bulkheads, C_y is calculated according to Table 3 by using

$$c_1 = \left(1 - \frac{1}{\alpha}\right) \geq 0$$

The boundary conditions for plates are to be considered as simply supported, see cases 1, 2 and 15 of Table 3. If the boundary conditions differ significantly from simple support, a more appropriate boundary condition can be applied according to the different cases of Table 3 subject to the agreement of the Society.

2.2.4 Correction factor Flong

The correction factor F_{long} depending on the edge stiffener types on the longer side of the buckling panel is defined in Table 2. An average value of F_{long} is to be used for plate panels having different edge stiffeners. For stiffener types other than those mentioned in Table 2, the value of c is to be agreed by the Society. In such a case, value of c higher than those mentioned in Table 2 can be used, provided it is verified by buckling strength check of panel using non-linear FE analysis and deemed appropriate by the Society.

Correction factor F_{long} **Table 2**

<table>
<tr><th colspan="3">Structural element types</th><th>F_{long}</th><th>c</th></tr>
<tr><td colspan="3">Unstiffened Panel</td><td>1.0</td><td>N/A</td></tr>
<tr><td rowspan="7">Stiffened Panel</td><td colspan="2">Stiffener not fixed at both ends</td><td>1.0</td><td>N/A</td></tr>
<tr><td rowspan="6">Stiffener fixed at both ends</td><td>Flat bar (1)</td><td rowspan="4">$F_{long}=c$ for $\frac{t_w}{t_p} > 1$
$F_{long} = c\left(\frac{t_w}{t_p}\right)^3 + 1$ for $\frac{t_w}{t_p} \leq 1$</td><td>0.10</td></tr>
<tr><td>Bulb profile</td><td>0.30</td></tr>
<tr><td>Angle and L2 profiles</td><td>0.40</td></tr>

  • For $b_2 < b_1$: $F_{long}=1$
  • For $b_2 \geq b_1$: $F_{long} = \left(1.55 - 0.55\frac{b_1}{b_2}\right)\left[1 + c\left(\frac{t_w}{t_p}\right)^3\right]$
• Other plate of the U type profile: $F_{long}=1$</td><td>0.2</td></tr>
<tr><td colspan="5">(1) t_w is the net web thickness, in mm, without the correction defined in [2.3.2].
(2) b_1 and b_2 are defined in Pt 2, Ch 1, Sec 5,Figure 1.</td></tr>
</table>

ISC 2.2.4a The correction factor, F_{long} , of U type stiffened panel in hatch cover is calculated in accordance with the following formula:

$$F_{long} = \left(1.55 - 0.55\frac{b_1}{b_2}\right)\left[1 + c\left(\frac{t_w}{t_p}\right)^3\right]$$

where: b_1— width of opening of U type, in mm, see Figure ISC 2.2.4a;

b_2 — *web spacing of two adjacent U type, in mm, see Figure ISC 2.2.4a;*
c =0.2, when $b_2 \geqslant b_1$

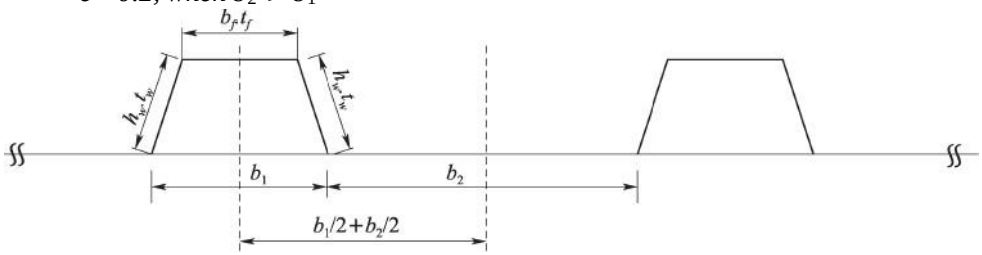

Figure ISC 2.2.4a U Type of Hatch Cover

2.2.5 Correction factor Ftran

The correction factor F_{tran} is to be taken as:

- For transversely framed EPP of single side skin bulk carrier, between the hopper and top wing tank:
  - F_{tran} = 1.25 when the two adjacent frames are supported by one tripping bracket fitted in way of the adjacent plate panels.
  - F_{tran} = 1.33 when the two adjacent frames are supported by two tripping brackets each fitted in way of the adjacent plate panels.
  - F_{tran} = 1.15 elsewhere.
- For the attached plate of a U-type stiffener fitted on a hatch cover:

$$F_{tran} = \text{Max}\left(3 - 0.08(F_{tran0} - 6)^2, 1.0\right) \leq 2.25$$

where,

$$F_{tran0} = \text{Min}\left(\frac{b_2}{b_1} + \frac{6b_2^2}{\pi^2 h_w (b_1 + b_2)}\left(\frac{t_w}{t_p}\right)^3, 6\right) \quad \text{for EPP } b_2$$

$$F_{tran0} = \text{Min}\left(\frac{b_1}{b_2} + \frac{6b_1^2}{\pi^2 h_w (b_2 + b_1)}\left(\frac{t_w}{t_p}\right)^3, 6\right) \quad \text{for EPP } b_1$$

with b_1, b_2 and h_w as defined in Pt 2, Ch 1, Sec 5, Figure 1.
Coefficient F defined in Case 2 of Table 3 is to be replaced by the following formula:

$$F = \left[1 - \left(\frac{K_y}{0.91 F_{tran}} - 1\right) / \lambda_p^2\right] c_1 \geq 0$$

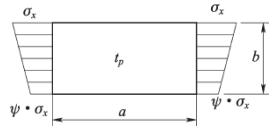
- For other cases: F_{tran} = 1

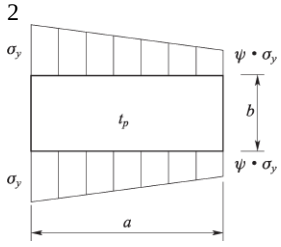
2.2.6 Curved plate panels

This requirement for curved plate limit state is applicable when $R/t_p \leq 2500$. Otherwise, the requirement for plate limit state given in [2.2.1] is applicable.
The curved plate limit state is based on the following interaction formula:

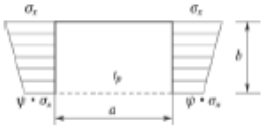
$$\left(\frac{\gamma_c \sigma_{ax} S}{C_{ax} R_{eH_P}}\right)^{1.25} - 0.5\left(\frac{\gamma_c \sigma_{ax} S}{C_{ax} R_{eH_P}}\right)\left(\frac{\gamma_c \sigma_{tg} S}{C_{tg} R_{eH_P}}\right) + \left(\frac{\gamma_c \sigma_{tg} S}{C_{tg} R_{eH_P}}\right)^{1.25} + \left(\frac{\gamma_c \tau \sqrt{3} S}{C_\tau R_{eH_P}}\right)^2 = 1.0$$

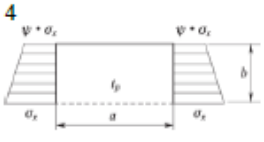
where:



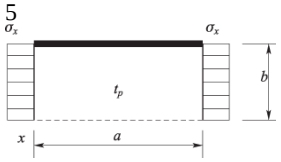


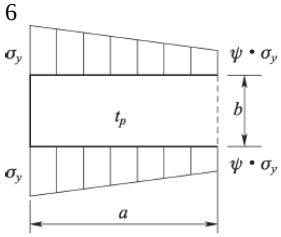
σ_{ax} : Applied axial stress to the cylinder corresponding to the curved plate panel, in N/mm^2.In case of tensile axial stresses, σ_{ax} = 0.

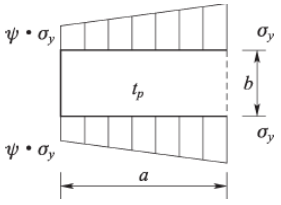


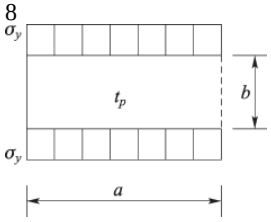


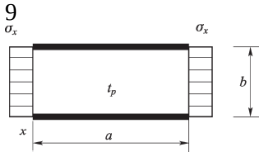
σ_{tg} : Applied tangential stress to the cylinder corresponding to the curved plate panel, in N/mm^2. In case of tensile tangential stresses, σ_{tg} = 0.

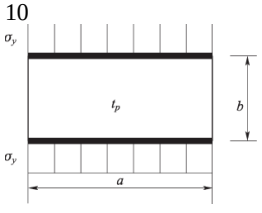


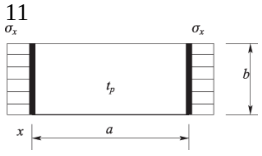




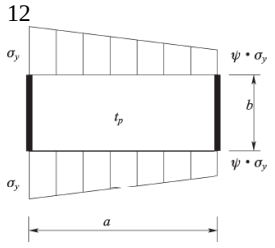


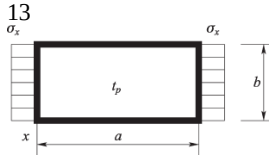


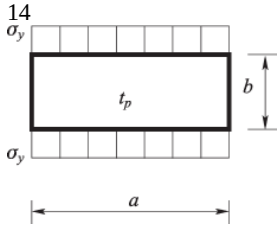


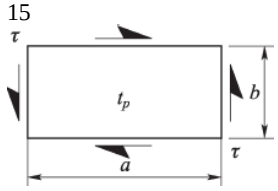


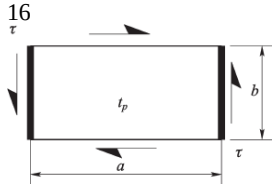
C_{ax}, C_{tg}, C_τ: Buckling reduction factor of the curved plate panel, as defined in Table 4.

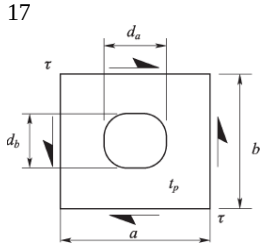




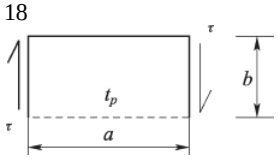


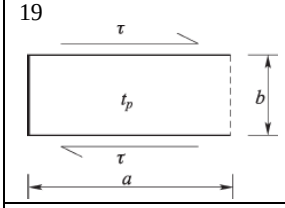






The stress multiplier factor, γ_c, of the curved plate panel need not be taken less than the stress multiplier factor, γ_c, for the expanded plane panel according to [2.2.1].





Buckling factor and reduction factor for plane plate panels **Table 3**

Case	Stress Ratio ψ	Aspect Ratio α	Buckling factor K	Reduction factor C

2.2.7 Applied normal and shear stresses to plate panels

The normal stresses, σ_x and σ_y, in N/mm^2, to be applied for the overall stiffened panel capacity and the plate panel capacity calculations, as given in in [2.1.1] and [2.2.1] respectively, are to be taken as follows:

- For FE analysis, the reference stresses as defined in Ch 8, Sec 4, [2.4].

- For prescriptive assessment of the overall stiffened panel capacity and the plate panel capacity, the axial or transverse compressive stresses calculated according to Ch 8, Sec 3, [2.2.1], at load calculation points of the considered stiffener or the considered elementary plate panel, as defined in Ch 3, Sec 7, [3] and [2], respectively. However, in case of transverse stiffening arrangement, the transverse compressive stress used for the assessment of the overall stiffened panel capacity is to be taken as the compressive stress calculated at load calculation points of the stiffener attached plating, as defined in Ch 3, Sec 7, [2].
- For grillage analysis where the stresses are obtained based on beam theory, the stresses taken as:

$$\sigma_x = \frac{\sigma_{xb} + \nu\sigma_{yb}}{1-\nu^2}$$

$$\sigma_y = \frac{\sigma_{yb} + \nu\sigma_{xb}}{1-\nu^2}$$

Where:

σ_{xb}, σ_{yb} : Stress, in N/mm^2, from grillage beam analysis respectively along *x* or *y* axis of the plate attached to the PSM web.

The shear stress τ, in N/mm^2, to be applied for the overall stiffened panel capacity and the plate panel capacity calculations, as given in in [2.1.1] and [2.2.1] respectively ,are to be taken as follows:

- For FE analysis, the reference shear stresses as defined in Ch 8, Sec 4, [2.4].
- For prescriptive assessment of the plate panel capacity, the shear stresses calculated according to Ch 8, Sec 3, [2.2.1], at load calculation points of the considered elementary plate panel, as defined in Ch 3, Sec 7, [2].
- For prescriptive assessment of the overall stiffened panel capacity, the shear stresses calculated according to Ch 8, Sec 3, [2.2.1], at the following load calculation point:
  - At the middle of the full span, *ll*, of the considered stiffener.
  - At the intersection point between the stiffener and its attached plating.
- For grillage beam analysis, τ= 0 in the plate attached to the PSM web.

2.3 Stiffeners

2.3.1 Buckling modes

The following buckling modes are to be checked:

- Stiffener induced failure (*SI*).
- Associated plate induced failure (*PI*).

2.3.2 Web thickness of flat bar

For accounting the decrease of the stiffness due to local lateral deformation, the effective web thickness of flat bar stiffener, in mm, is to be used in [2.1] and [2.3.4] for the calculation of the net sectional area, *As*, the net section modulus, *Z*, and the moment of inertia, *I*, of the stiffener and is taken as:

$$t_{w_red} = t_w\left(1 - \frac{2\pi^2}{3}\left(\frac{h_w}{s}\right)^2\left(1 - \frac{b_{eff1}}{s}\right)\right)$$

2.3.3 Idealisation of bulb profile

Bulb profiles are to be considered as equivalent angle profiles, as defined in Ch 3, Sec 7, [1.4.1].

2.3.4 Ultimate buckling capacity

When $\sigma_a+\sigma_b+\sigma_w>0$ while initially setting γ = 1, the ultimate buckling capacity for stiffeners is to be checked according to the following interaction formula:

$$\frac{\gamma_c\sigma_a + \sigma_B + \sigma_w}{R_{eH}} S = 1$$

where:

σ_a : Effective axial stress, in N/mm^2, at mid span of the stiffener, acting on the stiffener with its

attached plating.

$$\sigma_a = \sigma_x \frac{st_p + A_s}{b_{eff1} t_p + A_s}$$

σ_x : Nominal axial stress, in N/mm^2, acting on the stiffener with its attached plating.

- For FE analysis, σ_x is the FE corrected stress as defined in [2.3.6] in the attached plating in the direction of the stiffener axis.
- For prescriptive assessment, σ_x is the axial stress calculated according to Ch 8, Sec 3, [2.2.1] at load calculation point of the stiffener, as defined in Ch 3, Sec 7, [3].
- For grillage beam analysis, σ_x is the stress acting along the x-axis of the attached buckling panel.

R_{eH} : Specified minimum yield stress of the material, in N/mm^2:

$R_{eH} = R_{eH_S}$ for stiffener induced failure (*SI*).

$R_{eH} = R_{eH_P}$ for plate induced failure (*PI*).

σ_b : Bending stress in the stiffener, in N/mm^2:

$$\sigma_b = \frac{M_0 + M_1 + M_2}{1000Z}$$

Z : Net section modulus of stiffener, in cm^3, including effective width of plating according to [2.3.5], to be taken as:

- The section modulus calculated at the top of stiffener flange for stiffener induced failure (*SI*).
- The section modulus calculated at the attached plating for plate induced failure (*PI*).

C_{PI} : Plate induced failure pressure coefficient:

C_{PI} = 1 if the lateral pressure is applied on the side opposite to the stiffener.

C_{PI} = -1 if the lateral pressure is applied on the same side as the stiffener.

C_{SI} : Stiffener induced failure pressure coefficient:

C_{SI} = -1 if the lateral pressure is applied on the side opposite to the stiffener.

C_{SI} = 1 if the lateral pressure is applied on the same side as the stiffener.

M_2 : Bending moment, in Nmm, due to eccentricity of sniped stiffeners, to be taken as

M_2=0 for continuous stiffeners

$M_2 = C_{snip} w_{na} \gamma \sigma_x (A_p + A_s)$ for stiffeners sniped at one or both ends.

C_{snip} : Coefficient to account for the end effect of the stiffener sniped at one or both ends, to be taken as

C_{snip}= -1.2 for stiffener induced failure (*SI*)

C_{snip}= 1.2 for plate induced failure (*PI*).

M_1 : Bending moment, in Nmm, due to the lateral load P:

$$M_1 = C_i \frac{|P| s l^2}{24 \times 10^3} \text{ for continuous stiffener}$$

$$M_1 = C_i \frac{|P| s l^2}{8 \times 10^3} \text{ for sniped stiffener}$$

$$M_1 = C_i \frac{|P| s l^2}{14.2 \times 10^3} \text{ for stiffener sniped at one end and continuous at the other end}$$

P : Lateral load, in kN/m^2.

- For FE analysis, P is the average pressure as defined in Ch 8, Sec 4, [2.5.2] in the attached plating.
- For prescriptive assessment, P is the pressure calculated at load calculation point of the stiffener, as defined in Ch 3, Sec 7, [3].

C_i : Pressure coefficient:

$C_i = C_{SI}$ for stiffener induced failure (*SI*).

$C_i = C_{PI}$ for plate induced failure (*PI*).

M_0 : Bending moment, in Nmm, due to the lateral deformation w of stiffener:

$$M_0 = F_E C_{sl} \frac{\gamma}{\gamma_{GEB} - \gamma} w_0 \quad \text{with precondition } \gamma_{GEB} - \gamma > 0$$

where γ_{GEB} is the stress multiplier factor of global elastic buckling capacity as defined in [2.1].

C_{sl} : Deformation reduction factor to account for global slenderness, to be taken as:

$$C_{sl} = 1 - \frac{1}{12}\lambda_G^4 \qquad \text{for } \lambda \leqslant 1.56$$

$$C_{sl} = 3/\lambda_G^4 \qquad \text{for } \lambda > 1.56$$

λ_G : The reference degree of global slenderness of the stiffened panel, to be taken as

$$\lambda_G = \sqrt{\frac{\gamma_{ReH}}{\gamma_{GEB}}} \quad \text{and} \quad \gamma_{ReH} = \frac{\min(R_{eH_P}, R_{eH_S})}{\sqrt{\sigma_{x,av}^2 + \sigma_y^2 - \sigma_{x,av}\sigma_y + 3\tau_{xy}^2}}$$

F_E : Ideal elastic buckling force of the stiffener, in N

$$F_E = \left(\frac{\pi}{l}\right)^2 EI \cdot 10^4$$

I : Moment of inertia, in cm^4, of the stiffener including effective width of attached plating according to [2.3.5]. I is to comply with the following requirement:

$$I \geq \frac{st_p^3}{12 \cdot 10^4}$$

t_p : Net thickness of plate, in mm, to be taken as

- For prescriptive requirements: the mean thickness of the two attached plating panels,
- For FE analysis: the thickness of the considered EPP on one side of the stiffener.

w_0 : Assumed imperfection, in mm, to be taken as:

$w_0 = l/1000$

w_{na} : Distance from the mid-point of attached plating to the neutral axis of the stiffener calculated with the effective width of the attached plating according to [2.3.5].

σ_w : Stress due to torsional deformation, in N/mm^2, to be taken as:

- For stiffener induced failure (*SI*)
  - For $\sigma_a > 0$

$$\sigma_w = Ey_w e_f \Phi_0 \left(\frac{m_{tor}\pi}{l_{tor}}\right)^2 \left(\frac{1}{1 - \frac{\gamma\sigma_a}{\sigma_{ET}}} - 1\right) \quad \text{for with precondition } \sigma_{ET} - \gamma\sigma_a > 0$$

  - For $\sigma_a \leqslant 0$

    $\sigma_w = 0$
- For plate induced failure (*PI*)

  $\sigma_w = 0$

l_{tor} : Stiffener span, distance equal to spacing between primary supporting members, i.e. $l_{tor} = l$. When the stiffener is supported by tripping brackets, l_{tor} should be taken as the maximum spacing between the adjacent primary supporting members and fitted tripping brackets.

y_w : Distance, in mm, from centroid of stiffener cross section to the free edge of stiffener flange, to be taken as:

$$y_w = \frac{t_w}{2} \qquad \text{for flat bar}$$

$$y_w = b_f - \frac{h_w t_w^2 + t_f b_f^2}{2A_s} \qquad \text{for angle and bulb profiles}$$

$$y_w = b_{f-out} + 0.5t_w - \frac{h_w t_w^2 + t_f(b_f^2 - 2b_f d_f)}{2A_s} \qquad \text{for L2 profile}$$

$$y_w = \frac{b_f}{2} \qquad \text{for T profile.}$$

Φ_0 : Coefficient taken as:

$$\Phi_0 = \frac{l_{tor}}{m_{tor} h_w} 10^{-4}$$

σ_{ET} : Reference stress for torsional buckling, in N/mm^2:

$$\sigma_{ET} = \frac{E}{I_p}\left[\left(\frac{m_{tor}\pi}{l_{tor}}\right)^2 I_w \cdot 10^2 + \frac{1}{2(1+\nu)} I_T + \left(\frac{l_{tor}}{m_{tor}\pi}\right)^2 \varepsilon \cdot 10^{-4}\right]$$

I_P : Net polar moment of inertia of the stiffener, in cm^4, about point *C* as shown in Figure 1, as defined in Table 5.

I_T : Net St. Venant's moment of inertia of the stiffener, in cm^4, as defined in Table 5.

I_ω : Net sectorial moment of inertia of the stiffener, in cm^6, about point *C* as shown in Figure 1, as defined in Table 5

m_{tor} : Number of half waves within $lltttttt$, taken as a positive integer so as to give smallest reference stress for torsional buckling.

ε : Degree of fixation.

$$\varepsilon = \left(\frac{3b}{t_p^3} + \frac{2h_w}{t_w^3}\right)^{-1} \qquad \text{for bulb,angle,L2 ,L3 and T profiles;}$$

$$\varepsilon = \left(\frac{t_p^3}{3b}\right) \qquad \text{for flat bars.}$$

A_w : Net web area, in mm^2.

A_f : Net flange area, in mm^2.

Moments of inertia **Table 5**

	Flat bars (1)	Bulb, angle , L2 and T profiles
I_P	$\frac{h_w^3 t_w}{3 \cdot 10^4}$	$\left(\frac{A_w(e_f - 0.5t_f)^2}{3} + A_f e_f^2\right)10^{-4}$
I_T	$\frac{h_w t_w^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_w}{h_w}\right)$	$\frac{(e_f - 0.5t_f)t_w^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_w}{e_f - 0.5t_f}\right) + \frac{b_f t_f^3}{3 \cdot 10^4}\left(1 - 0.63\frac{t_f}{b_f}\right)$
I_ω	$\frac{h_w^3 t_w^3}{36 \cdot 10^6}$	For bulb, angle and L2 profiles(2). $\frac{A_f^3 + A_w^3}{36 \cdot 10^6} + \frac{e_f^2}{10^6}\left(\frac{A_f b_f^2 + A_w t_w^2}{3} - \frac{\left(A_f(b_f - 2d_f) + A_w t_w\right)^2}{4(A_f + A_w)} - A_f d_f (b_f - d_f)\right)$ For T profiles $\frac{b_f^3 t_f e_f^2}{12 \cdot 10^6}$

(1) t_w is the net web thickness, in mm. t_{w_red} as defined in [2.3.2] is not to be used in this table.
(2) d_f is to be taken as 0 for bulb and angle profiles.

2.3.5 Effective width of attached plating

The effective width of attached plating of stiffeners, b_{eff}, in mm, is to be taken as:

- For $\sigma_x > 0$:
  - For FE analysis,
    $b_{eff} = \min(C_x b, \chi_s s)$
  - For prescriptive assessment,

$$b_{eff} = \min\left(\frac{C_{x1}b_1 + C_{x2}b_2}{2}, \chi_s s\right)$$

- For $\sigma_x \leqslant 0$:
  - $b_{eff} = \chi_s s$

where:

χ_s : Effective width coefficient to be taken as:

$$\chi_s = \min\left[\frac{1.12}{1+\frac{1.75}{\left(\frac{l_{eff}}{s}\right)^{1.6}}}; 1.0\right]$$

l_{eff} : Effective length of the stiffener, in mm, taken as:

$l_{eff} = \frac{l}{\sqrt{3}}$ for stiffener fixed at both ends.

$l_{eff} = 0.75l$ for stiffener simply supported at one end and fixed at the other.

$l_{eff} = l$ for stiffener simply supported at both ends.

2.3.6 FE corrected stresses for stiffener capacity

When the reference stresses σ_x and σ_y obtained by FE analysis according to Ch 8, Sec 4, [2.4] are both com- pressive, σ_x is to be corrected according to the following formula:

- If $\sigma_x < \nu\sigma_y$:
  $\sigma_{xcor} = 0$
- If $\sigma_x \geqslant \nu\sigma_y$:
  $\sigma_{xcor} = \sigma_x - \nu\sigma_y$

2.4 Primary supporting members

2.4.1 Web plate in way of openings

The web plate of primary supporting members with openings is to be assessed for buckling based on the com- bined axial compressive and shear stresses.

The web plate adjacent to the opening on both sides is to be considered as individual unstiffened plate panels as shown in Table 6.

The interaction formulae of [2.2.1] are to be used with:

- $\sigma_x = \sigma_{av}$
- $\sigma_y = 0$
- $\tau = \tau_{av}$

where:

σ_{av} : Weighted average compressive stress, in N/mm^2, in the area of web plate being considered , i.e. P1, P2,or P3 as shown in Table 6.,

For the application of the Table 6, the weighted average shear stress is to be taken as:

- Opening modelled in primary supporting members:
  τ_{av}: Weighted average shear stress, in N/mm^2, in the area of web plate being considered , i.e. P1, P2,or P3 as shown in Table 6.
- Opening not modelled in primary supporting members:
  τ_{av}: Weighted average shear stress, in N/mm^2, given in Table 6.

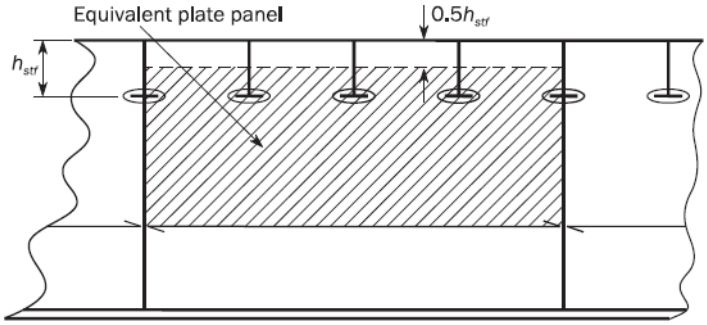
2.4.2 Reduction factors of web plate in way of openings

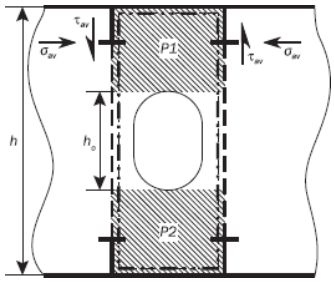
The reduction factors, C_x or C_y in combination with, C_τ of the plate panel(s) of the web adjacent to the opening is to be taken as shown in Table 6.

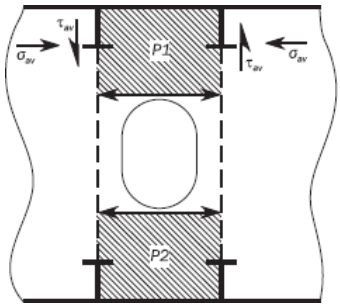
2.4.3

The equivalent plate panel of web plate of primary supporting members crossed by perpendicular

stiffeners is to be idealised as shown in Figure 2.







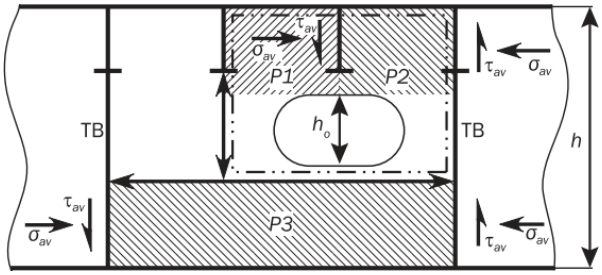


Figure 2 Web plate idealization

The correction of panel breadth is applicable also for other slot configurations provided that the web or collar plate is attached to at least one side of the passing stiffener.

Reduction factors **Table 6**

Configuration[1]	C_x, C_y	C_τ	
		Opening modelled in PSM	Opening not modelled in PSM
(a) Without edge reinforcements: [2] 	Separate reduction factors are to be applied to areas *P*1 and *P*2 using case 3 or case 6 in Table 3, with edge stress ratio: Ψ=1.0	Separate reduction factors are to be applied to areas *P*1 and *P*2 using case 18 or case 19 in Table 3	When case 17 of Table 3 is applicable: A common reduction factor is to be applied to areas *P1* and *P2* using case 17 in Table 3 with: $\tau_{av} = \tau_{av}$(web)
			When case 17 of Table 3 is not applicable: Separate reduction factors are to be applied to areas *P1* and *P2* using case 18 or case 19 in Table 3 with: $\tau_{av} = \tau_{av}$*(web)* $h/(h\text{-}h_0)$
(b) With edge reinforcements: 	Separate reduction factors are to be applied for areas *P*1 and *P*2 using C_x for case 1 or C_y for case 2 in Table 3 with stress ratio: Ψ=1.0	Separate reduction factors are to be applied for areas *P*1 and *P*2 using case 15 in Table 3.	Separate reduction factors are to be applied to areas *P*1 and *P*2 using case 15 in Table 3 with: $\tau_{av} = \tau_{av}$*(web)* $h/(h\text{-}h_0)$

Configuration[1]	C_x, C_y	C_τ	
		Opening modelled in PSM	Opening not modelled in PSM
(c) Example of hole in web:  		Panels *P*1 and *P*2 are to be evaluated in accordance with (a). Panel *P*3 is to be evaluated in accordance with (b).	

Where:
h : Height, in m, of the web of the primary supporting member in way of the opening.
h_0 : Height in m, of the opening measured in the depth of the web.
$\tau_{av}(web)$: Weighted average shear stress, in N/mm^2, over the web height h of the primary supporting member.
Note (1): Web panels to be considered for buckling in way of openings are shown shaded and numbered *P*1, *P*2, etc.
Note (2) : For a PSM web panel with opening and without edge reinforcements as shown in configuration (a), the applicable buckling assessment method depends on its specific boundary conditions. If one of the long edges along the face plate or along the attached plating is not subject to "inline support", i.e. the edge is free to pull in, Method B should be applied. In other cases, typically such as when the short plate edge is attached to the plate flanges, Method A is applicable.

3 Buckling capacity of other structures

3.1 Struts, pillars and cross ties

3.1.1 Buckling utilisation factor

The buckling utilisation factor, η, for axially compressed struts, pillars and cross ties is to be taken as:

$$\eta = \frac{\sigma_{av}}{\sigma_{cr}}$$

where:
σ_{av} : Average axial compressive stress in the member, in N/mm^2.
σ_{cr} : Minimum critical buckling stress, in N/mm^2, taken as:

$$\sigma_{cr} = \sigma_E \text{ for } \sigma_E \leq 0.5R_{eH_S}$$

$$\sigma_{cr} = \left(1 - \frac{R_{eH_S}}{4\sigma_E}\right) R_{eH_S} \text{ for } \sigma_E > 0.5R_{eH_S}$$

σ_E : Minimum elastic compressive buckling stress, in N/mm^2, according to [3.1.2] to [3.1.4].
R_{eH_S}: Specified minimum yield stress of the considered member, in N/mm^2. For built up members, the low-est specified minimum yield stress is to be used.

3.1.2 Elastic column buckling stress

The elastic compressive column buckling stress, σ_{EC} in N/mm^2 of members subject to axial compression is to be taken as:

$$\sigma_{EC} = \pi^2 E f_{end} \frac{I}{A l_{pill}^2} 10^{-4}$$

where:
I : Net moment of inertia about the weakest axis of the cross section, in cm^4.
A : Net cross sectional area of the member, in cm^2.
l_{pill} : Length of the member, in m, taken as:

- For pillar and strut: unsupported length of the member
- For cross tie:
  - In centre tank: distance between the flanges of longitudinal stiffeners on the

starboard and port longitudinal bulkheads to which the cross tie's horizontal stringer is attached.

- In wing tank: distance between the flanges of longitudinal stiffeners on the longitudinal bulkhead to which the cross tie's horizontal stringer is attached, and the inner hull plating.

f_{end} : End constraint factor, taken as:

- For pillar and strut:
  - f_{end} = 1.0 where both ends are simply supported.
  - f_{end} = 2.0 where one end is simply supported and the other end is fixed.
  - f_{end} = 4.0 where both ends are fixed.
- For cross tie:
  - f_{end} = 2.0

A pillar end may be considered fixed when brackets of adequate size are fitted. Such brackets are to be sup- ported by structural members with greater bending stiffness than the pillar.

3.1.3 Elastic torsional buckling stress

The elastic torsional buckling stress, σ_{ET}, in N/mm^2, with respect to axial compression of members is to be taken as:

$$\sigma_{ET} = \frac{GI_{sv}}{I_{pol}} + \frac{\pi^2 f_{end} E c_{warp}}{I_{pol} l_{pill}^2} 10^{-4}$$

where:

I_{sv} : Net St. Venant's moment of inertia, in cm^4, see Table 7 for examples of cross sections.

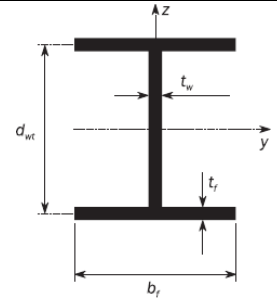
I_{pol} : Net polar moment of inertia about the shear centre of cross section, in cm^4

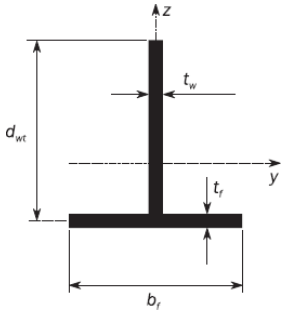
$$I_{pol} = I_y + I_z + A(y_0^2 + z_0^2)$$

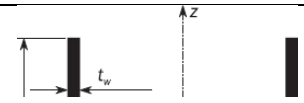
c_{warp} : Warping constant, in cm6, see Table 7 for examples of cross sections.

l_{pill} : Length of the member, in m as defined in [3.1.2].

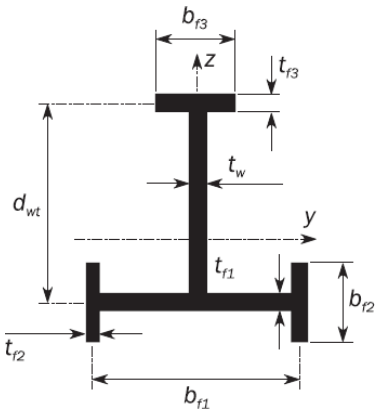
y_0 : Transverse position of shear centre relative to the cross sectional centroid, in cm, see Table 7 for examples of cross sections.







z_0 : Vertical position of shear centre relative to the cross sectional centroid, in cm, see Table 7 for exam- ples of cross sections.



A : Net cross sectional area, in cm^2, as defined in [3.1.2]

I_y : Net moment of inertia about y axis, in cm^4.

I_z : Net moment of inertia about z axis, in cm^4.

Cross sectional properties **Table 7**

	$I_{sv} = \frac{1}{3}\left(2b_f t_f^3 + d_{wt} t_w^3\right)10^{-4}$	cm^4
	$c_{warp} = \frac{d_{wt}^2 b_f^3 t_f}{24} 10^{-6}$	cm^6
	$I_{sv} = \frac{1}{3}\left(2b_f t_f^3 + d_{wt} t_w^3\right)10^{-4}$	cm^4
	$y_0 = 0$	cm
	$z_0 = -\frac{0.5 d_{wt}^2 t_w}{d_{wt} t_w + b_f t_f} 10^{-1}$	cm
	$c_{warp} = \frac{b_f^3 t_f^3 + 4 d_{wt}^3 t_w^3}{144} 10^{-6}$	cm^6
	$I_{sv} = \frac{1}{3}\left(b_{fu} t_f^3 + 2 d_{wt} t_w^3\right)10^{-4}$	cm^4

	$y_0 = 0$	cm
	$z_0 = -\frac{d_{wt}^2 t_w 10^{-1}}{2d_{wt}t_w + b_{fu}t_f} - \frac{0.5d_{wt}^2 t_w 10^{-1}}{d_{wt}t_w + b_{fu}t_f \ / \ 6}$	cm
	$c_{warp} = \frac{b_{fu}^2 d_{wt}^3 t_w (d_{wt}t_w + 2b_{fu}t_f)}{12(6d_{wt}t_w + b_{fu}t_f)} 10^{-6}$	cm^6
	$I_{sv} = \frac{1}{3}\left(b_{f1}t_{f1}^3 + 2b_{f2}t_{f2}^3 + b_{f3}t_{f3}^3 + d_{wt}t_w^3\right)10^{-4}$	cm^4
	$y_0 = 0$	cm
	$z_0 = z_s - \frac{(b_{f3}d_{wt}t_{f3} + 0.5d_{wt}^2 t_w)10^{-1}}{d_{wt}t_w + b_{f1}t_{f1} + 2b_{f2}t_{f2} + b_{f3}t_{f3}}$	cm
	$C_{warp} = \left(I_{f1}Z_s^2 + \frac{I_{f2}b_{f1}^2}{200} + I_{f3}\left(\frac{d_{wt}}{10} - Z_s\right)^2 \right)$	cm^6
	$I_{f1} = \left(\frac{\left(b_{f1} - t_{f2}\right)^3 t_{f1}}{12} + \frac{b_{f2}t_{f2}b_{f1}^2}{2} \right) 10^{-4}$	cm^4
	$I_{f2} = \frac{b_{f2}^3 t_{f2}}{12} 10^{-4}$	cm^4
	$I_{f3} = \frac{b_{f3}^3 t_{f3}}{12} 10^{-4}$	cm^4
	$z_s = \frac{I_{f3}d_{wt}}{I_{f1} + I_{f3}} 10^{-1}$	cm
Note1: All dimensions are in mm. Note2: Cross sectional properties are given for typical cross sections. Properties for other cross sections are to be determined by direct calculation.		

3.1.4 Elastic torsional/column buckling stress

For cross sections where the centroid and the shear centre do not coincide, the interaction between the tor- sional and column buckling mode is to be examined. The elastic torsional/column buckling stress, σ_{ETF}, with respect to axial compression is to be taken as:

$$\sigma_{ETF} = \frac{1}{2\zeta}\left[\left(\sigma_{EC} + \sigma_{ET}\right) - \sqrt{\left(\sigma_{EC} + \sigma_{ET}\right)^2 - 4\zeta\sigma_{EC}\sigma_{ET}} \right]$$

where:

ζ : Coefficient taken as:

$$\zeta = 1 - \frac{\left(y_0^2 + z_0^2\right)A}{I_{pol}}$$

y_0 : Transverse position of shear centre relative to the cross sectional centroid, in cm, as defined in [3.1.3].

z_0 : Vertical position of shear centre relative to the cross sectional centroid, in cm, as defined in [3.1.3].

A : Net cross sectional area, in cm^2, as defined in [3.1.2].

I_{pol} : Net polar moment of inertia about the shear centre of cross section, in cm^4 as defined in [3.1.3].

σ_{EC} : Elastic column compressive buckling stress, as defined in [3.1.2].

σ_{ET} : Elastic torsional buckling stress, as defined in [3.1.3].

3.2 Corrugated bulkhead

3.2.1

The buckling utilisation factor of flange and web of corrugation of corrugated bulkheads is based on the combination of in plane stresses and shear stress.

The interaction curve of [2.2.1] is to be used with the following coefficients:

3.2.1 α=2

3.2.2 $\psi_x = \psi_y = 1$

Appendix 1 STRESS BASED REFERENCE STRESSES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

a : Length, in mm, of the longer side of the plate panel as defined in Sec 5.

b : Length, in mm, of the shorter side of the plate panel as defined in Sec 5.

A_i : Area, in mm^2, of the i-th plate element of the buckling panel.

n : Number of plate elements in the buckling panel.

σ_{xi} : Actual stress, in N/mm^2, at the centroid of the i-th plate element in x direction, applied along the shorter edge of the buckling panel.

σ_{yi} : Actual stress, in N/mm^2, at the centroid of the i-th plate element in y direction, applied along the longer edge of the buckling panel.

Ψ : Edge stress ratio as defined in Sec 5.

τ_i : Actual membrane shear stress, in N/mm^2, at the centroid of the i-th plate element of the buckling panel.

1 STRESS BASED METHOD

1.1 Introduction

1.1.1

This section provides a method to determine stress distribution along edges of the considered buckling panel by 2nd order polynomial curve, by linear distribution using least square method and by weighted average approach. This method is called Stress based Method.

The reference stress is the stress components at centre of plate element transferred into the local system of the considered buckling panel.

1.1.2 Definition

A regular panel is a plate panel of rectangular shape. An irregular panel is plate panel which is not regular, as detailed in Ch 8, Sec 4, [2.3.1].

1.2 Stress application

1.2.1 Regular panel

The reference stresses are to be taken as defined in [2.1] for a regular panel when the following conditions are satisfied:

- At least, one plate element centre is located in each third part of the long edge a of a regular panel and
- This element centre is located at a distance in the panel local x direction not less than $a/4$ to at least one of the element centres in the adjacent third part of the panel.

Otherwise, the reference stresses are to be taken as defined in [2.2] for an irregular panel.

1.2.2 Irregular panel and curved panel

The reference stresses of an irregular panel or of a curved panel are to be taken as defined in [2.2].

2 REFERENCE STRESSES

2.1 Regular Panel

2.1.1 Longitudinal stress

The longitudinal stress σ_x applied on the shorter edge of the buckling panel is to be calculated as follows:

- For plate buckling assessment, the distribution of $\sigma_x(x)$ is assumed as 2nd order polynomial curve as:

  $\sigma_x = Cx^2 + Dx + E$

  The best fitting curve $\sigma_x(x)$ is to be obtained by minimising the square error Π considering the area of each element as a weighting factor.

  $$\Pi = \sum_{i=1}^{n} A_i \left[\sigma_{xi} - \left(Cx^2 + Dx + E \right) \right]^2$$

  The unknown coefficients C, D and E must yield zero first derivatives, $\partial \Pi$ with respect

to C, D and E
respectively.

$$\frac{\partial \Pi}{\partial C} = 2\sum_{i=1}^{n} A_i x_i^2 \left[\sigma_{xi} - (Cx_i^2 + Dx_i + E) \right] = 0$$

$$\frac{\partial \Pi}{\partial D} = 2\sum_{i=1}^{n} A_i x_i \left[\sigma_{xi} - (Cx_i^2 + Dx_i + E) \right] = 0$$

$$\frac{\partial \Pi}{\partial E} = 2\sum_{i=1}^{n} A_i \left[\sigma_{xi} - (Cx_i^2 + Dx_i + E) \right] = 0$$

The unknown coefficients C, D and E can be obtained by solving the 3 above equations.

$$\sigma_{x1} = \frac{1}{b}\int_0^b \sigma_x(x)\mathrm{d}x = \frac{b^2}{3}C + \frac{b}{2}D + E$$

$$\sigma_{x2} = \frac{1}{b}\int_{a-b}^{a} \sigma_x(x)\mathrm{d}x = \left(a^2 - ab + \frac{b^2}{3} \right)C + \left(a - \frac{b}{2} \right)D + E$$

If $-D/2C < b/2$ or $-D/2\ C > a-b/2$, σ_{x3} is to be ignored. Otherwise, σ_{x3} is taken as:

$$\sigma_{x3} = \frac{1}{b}\int_{x\min}^{x\max} \sigma_x(x)\mathrm{d}x = \frac{b^2}{12}C - \frac{D^2}{4C} + E$$

where:

$$x_{\min} = -\frac{b}{2} - \frac{D}{2C}$$

The longitudinal stress is to be taken as:

$\sigma_x = \max(\sigma_{x1};\ \sigma_{x2};\ \sigma_{x3})$

The edge stress ratio is to be taken as:

$\psi_x = 1$

- For overall stiffened panel buckling and stiffener buckling assessments, $\sigma_x(x)$ applied on the shorter edge of the attached plate is to be taken as:

$$\sigma_x = \frac{\sum_1^n A_i \sigma_{xi}}{\sum_1^n A_i}$$

The edge stress ratio ψ_x for the stress σ_x is equal to 1.0.

2.1.2 Transverse stress

The transverse stress σ_y applied along the longer edges of the buckling panel is to be calculated by extrapolation of the transverse stresses of all elements up to the shorter edges of the considered buckling panel.

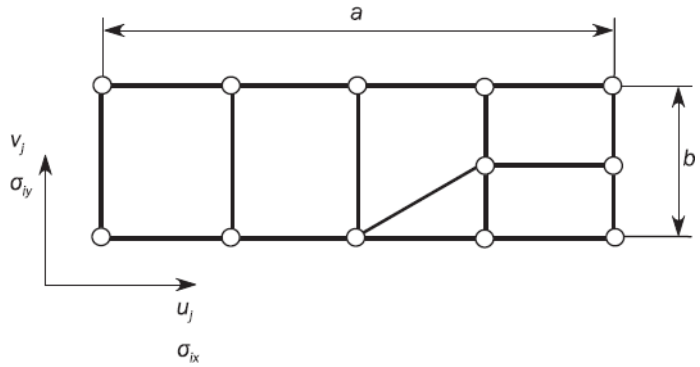


Figure 1 Buckling panel

The distribution of $\sigma_y(x)$ is assumed as straight line. Therefore:

$\sigma_y(x) = A+Bx$

The best fitting curve $\sigma_y(x)$ is to be obtained by the least square method minimising the square error Π considering area of each element as a weighting factor.

$$\Pi = \sum_{i=1}^{n} A_i \left[\sigma_{yi} - (A + Bx_i) \right]^2$$

The unknown coefficients A and B must yield zero first partial derivatives, $\partial\Pi$ with respect to A and B, respectively.

$$\frac{\partial \Pi}{\partial A} = 2\sum_{i=1}^{n} A_i \left[\sigma_{yi} - (A + Bx_i) \right] = 0$$

$$\frac{\partial \Pi}{\partial B} = 2\sum_{i=1}^{n} A_i x_i \left[\sigma_{yi} - (A + Bx_i) \right] = 0$$

The unknown coefficients A and B are obtained by solving the 2 above equations and are given as follow:

$$\begin{cases} A = \dfrac{\left(\sum_{i=1}^{n} A_i \sigma_{yi}\right)\left(\sum_{i=1}^{n} A_i x_i^2\right) - \left(\sum_{i=1}^{n} A_i x_i\right)\left(\sum_{i=1}^{n} A_i x_i \sigma_{iy}\right)}{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i x_i^2\right) - \left(\sum_{i=1}^{n} A_i x_i\right)^2} \\ B = \dfrac{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i x_i \sigma_{iy}\right) - \left(\sum_{i=1}^{n} A_i x_i\right)\left(\sum_{i=1}^{n} A_i \sigma_{iy}\right)}{\left(\sum_{i=1}^{n} A_i\right)\left(\sum_{i=1}^{n} A_i x_i^2\right) - \left(\sum_{i=1}^{n} A_i x_i\right)^2} \end{cases}$$

$$\sigma_y = \max(A,\ A+Ba)$$

$$\psi_y = \frac{\min(A,\ A+Ba)}{\max(A,\ A+Ba)} \quad \text{for } \sigma_y \geqslant 0$$

$$\Psi_y = 1 \quad \text{for } y < 0$$

2.1.3 Shear stress

The shear stress τ is to be calculated using a weighted average approach, and is to be taken as:

$$\tau = \frac{\sum_{1}^{n} A_i \tau_i}{\sum_{1}^{n} A_i}$$

2.2 Irregular panel and curved panel

2.2.1 Reference stresses

The longitudinal, transverse and shear stresses are to be calculated using a weighted average approach. They are to be taken as:

$$\sigma_x = \frac{\sum_{1}^{n} A_i \sigma_{xi}}{\sum_{1}^{n} A_i}$$

$$\sigma_y = \frac{\sum_{1}^{n} A_i \sigma_{yi}}{\sum_{1}^{n} A_i}$$

$$\tau = \frac{\sum_{1}^{n} A_i \tau_i}{\sum_{1}^{n} A_i}$$

The edge stress ratios are to be taken as

Ψ_x =1

Ψ_y =1

Chapter 9 FATIGUE

Section 1 GENERAL CONSIDERATIONS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

T_{DF}: Design fatigue life, in year, specified by the designer, but not to be taken less than 25 years.

1 RULE APPLICATION FOR FATIGUE REQUIREMENTS

1.1 Scope

1.1.1 General

This chapter provides requirements applicable to ships having rule a freeboard length L_{LL} between 150 m and 500 m to evaluate fatigue strength of the ship's structural details considering an operation time in North Atlantic environment equal to the design fatigue life, T_{DF}.

1.1.2 Assessed area

Fatigue assessment is performed for structural details located in the ship's cargo hold region in order to prevent the following types of fatigue failure:

- Fatigue cracks initiating from the toe of the weld and propagating into the plate.
- Fatigue cracks initiating from free edge of non-welded details.

1.1.3 Structural details to be assessed

The structural details required for fatigue assessment are given in Ch 9, Sec 2:

- Structural details to be checked are listed in:
  - Ch 9, Sec 2, [1] for simplified stress analysis according to Ch 9, Sec 4, or
  - Ch 9, Sec 2, [2] for finite element stress analysis according to Ch 9, Sec 5.
- Structural details to be checked by screening fatigue assessment are listed in Ch 9, Sec 2, Table 2.

Additional specific details may be requested to be checked on a case-by-case basis by the Society.

ISC 1.1.3a Where the fatigue strength of details other than those specified in Section 2 of this Chapter needs to be verified, fatigue assessment may be carried out in accordance with the requirements of this Chapter.

1.1.4 Detail design standard

Detail design standard given in Ch 9, Sec 6 provides welding requirement at critical structural details in order to prevent the following types of fatigue failure:

- Fatigue cracks initiating from the weld toe into the base material.
- Fatigue cracks initiating from the weld root and propagating into the plate section under the weld.
- Fatigue cracks initiating from the weld root and propagating through the weld throat.
- Fatigue cracks initiating from surface irregularity or notch at the free edge into the base material.

1.1.5 Material

The fatigue assessment is applicable for steel material with specified minimum yield stress less than or equal to 390 N/mm^2. For steel with specified minimum yield stress value higher than 390 N/mm^2 and for steels with improved fatigue performance, the S-N curves to be used are considered by the Society on a case-by-case basis.

ISC 1.1.5a S-N curves in Chapter 9 of this PART or those in air and/or corrosive environment in IIW, HSE or ISO standards may be used, taking into account the applicability of the minimum yield stress. S-N curves obtained from testing may also be used and the probability of survival is not to be less than 97.7%.

ISC 1.1.5b Where S-N curves of other standards are used, relevant technical documents are to

be submitted as audit basis.
ISC 1.1.5c Where S-N curves obtained from testing are used, relevant testing reports are to be submitted as audit basis and the qualification proof of testing organization is also to be submitted.
ISC 1.1.5d Where S-N curves in corrosive environment are obtained from testing, the evidence demonstrating that the corrosive environment used in testing is equivalent to that of sea water is also to be submitted.

1.1.6 Wave loads
Fatigue assessment is based on quasi-static wave loads.

1.1.7 Loads other than wave loads
Fatigue induced by low cycle loads such as cargo variations or impact loads such as sloshing in partially filled tanks which may induce fatigue damage is disregarded in this chapter.

2 DEFINITION

2.1 Hot spots

2.1.1
Hot spots are locations in the structure where fatigue cracks may initiate due to the combined effect of nominal structural stress fluctuation and stress raising effects due to the weld geometry or similar effects due to notch in the base material.
Hot spots may be located at:

2.1.1 Weld toe.

2.1.2 Weld root of partial penetration or fillet weld.

2.1.3 Base material at free edge of plate.

2.2 Nominal stress

2.2.1
Nominal stress is the stress in a structural component taking into account macro-geometric effect but disregarding the stress concentration due to structural discontinuities and the presence of welds. Nominal stress is to be obtained either using coarse or fine mesh FE analysis, as required in Ch 9, Sec 5 or using analytical calculation based on beam theory, as required in Ch 9, Sec 4.

2.3 Hot spot stress

2.3.1
Hot spot stress is the stress at the weld toe taking into account the stress concentration due to structural discontinuities and presence of welded attachments but disregarding the non-linear stress peak caused by the notch at the weld toe. The hot spot stresses to be considered correspond to the two principal stresses on the surface plating at the weld toe. The first principal stress acts within ±45°, perpendicular to the weld and the second principal stress acts outside ±45°.
The hot spot stress is to be obtained by multiplying the nominal stress by a Stress Concentration Factor (SCF), according to Ch 9, Sec 4, [5] or directly by a very fine mesh FE analysis, according to Ch 9, Sec 5, [3] and Ch 9, Sec 5, [4].

2.4 Local stress at free edge

2.4.1
Local stress at free edge is the stress at the plate free edge derived using finite element analysis according to Ch 9, Sec 5, [3.2].

2.5 Fatigue stress

2.5.1
Fatigue stress is the stress relevant for fatigue assessment purpose,i.e.:

2.5.1 Maximum of the two principal hot spot stress for weld toe with the mean stress effect and thickness effect corrections.

2.5.2 Local stress at free edge with corrections due to the base material surface finishing, mean stress effect, thickness effect and material strength.

3 ASSUMPTIONS

3.1 General

3.1.1

The following assumptions are made in the fatigue assessment:

a) A linear cumulative damage model, i.e. Palmgren-Miner's Rule, given in Ch 9, Sec 3, [5], has been used in connection with the design S-N curves, given in Ch 9, Sec 3, [4].
b) Design fatigue life, T_{DF}, is taken not less than 25 years.
c) Rule quasi-static wave induced loads are based on North Atlantic wave environment. They are determined at 10^{-2} probability level of exceedance by the Equivalent Design Wave (EDW) concept.
d) Net thickness t_{n50} approach is used, according to [5].
e) Type of stress used for crack initiating at the weld toe is the hot spot stress. Type of stress used for crack initiating at free edge of non-welded details is local stress at free edge.
f) Fatigue stress range $\Delta\sigma_{FS}$ may be calculated by simplified stress analysis or by finite element stress analysis for details with more complex geometry.
g) Long term distribution of stress range of a structural detail is assumed to follow a two-parameter Weibull distribution. Weibull shape parameter is equal to 1 and the fatigue stress range $\Delta\sigma_{FS}$ is given at the reference probability level of exceedance equal to 10^{-2}.
h) The acceptance criteria for fatigue checking are the total fatigue damage D to be less than 1 for the design fatigue life, as required in Ch 9, Sec 3, [2].

4 METHODOLOGY

4.1 Principles

4.1.1 General

Appropriate fatigue strength of structural details is ensured by use of:

- Detail design standards given in Ch 9, Sec 6, providing specific design requirements.
- Fatigue strength assessment by fatigue life calculation, based on three different methods for hot spot stress calculation: simplified stress analysis, very fine mesh finite element stress analysis and fatigue screening assessment.

4.2 Simplified stress analysis

4.2.1

Procedure based on simplified stress analysis, required in Ch 9, Sec 4, is used to determine the hot spot stress at weld toe of longitudinal stiffener end connections, given in Ch 9, Sec 2, [1.1].

Nominal stresses are calculated by using analytical method based on beam theory according to Ch 9, Sec 4, [3] and Ch 9, Sec 4, [4]. Hot spot stresses are obtained by multiplying nominal stresses by stress concentration factors (SCF) of the considered detail according to Ch 9, Sec 4, [5.2].

4.3 Finite element stress analysis

4.3.1

Procedure based on finite element stress analysis, required in Ch 9, Sec 5, is used to determine hot spot stress at weld toe of specified structural details, from very fine mesh models.

The hot spot stress is generally highly dependent on the finite element model used for representing the structure.

General procedure for the calculation of hot spot stress at weld toe for any welded details except for web stiffened cruciform joints is given in Ch 9, Sec 5, [3.1]. Procedure for the calculation of hot spot stress at the flange connections for web stiffened cruciform joints is given in Ch 9, Sec 5, [4]. Calculation of local stress for non-welded area is provided in Ch 9, Sec 5, [3.2].

A list of details for which the fatigue assessment is to be made through a compulsory very fine mesh finite element analysis or through the compliance with the design standard given in Ch 9, Sec 6 if a very fine mesh finite element analysis is omitted, is given respectively in Ch 9, Sec 2, Table 1 and Ch 9, Sec 2, Table 3.

4.4 Fatigue screening assessment

4.4.1

A fatigue screening procedure is used to assess the fatigue strength of specified structural details, given in Ch 9, Sec 2, [2.1.3]. The screening procedure is based on screening hot spot stress at

weld toe of specified structural details determined by multiplying the stresses obtained from a local fine mesh finite element model, required in Ch 7, Sec 3, by stress magnification factor of the considered detail, given in Ch 9, Sec 5, Table 2.

4.5 Fatigue design standards

4.5.1

Detail design standards given in Ch 9, Sec 6 are provided to ensure improved fatigue performance of critical structural details. Alternative detail design configurations may be accepted subject to demonstration of satisfactory fatigue performance.

5 CORROSION MODEL

5.1 Net thickness

5.1.1 General

The fatigue assessment should be performed based on net thicknesses according to Ch 3, Sec 2.

5.1.2 Stress correction

The hull girder stresses for simplified stress analysis and stresses calculated by FE analysis are to be corrected by multiplying the calculated stress by f_c, correction factor taken as:

f_c =0.95

6 LOADING CONDITIONS

6.1 Description

6.1.1

Fatigue analyses are to be carried out for representative loading conditions according to the intended ship's operation as given in [6.2] and [6.3].

6.2 Loading conditions for oil tankers

6.2.1

The loading conditions to be considered for oil tankers and corresponding fraction of time for each loading condition, $\alpha_{(j)}$, are defined in Table 1. The standard loading conditions for fatigue assessment of oil tankers are provided in Ch 4, Sec 8, [5.1].

Fraction of time in each loading condition for oil tanker **Table 1**

Loading conditions	$\alpha_{(j)}$
Full Load condition (Homogeneous)	0.5
Normal ballast condition	0.5

6.3 Loading conditions for bulk carriers

6.3.1

The loading conditions to be considered for bulk carriers and corresponding fraction of time for each loading condition, $\alpha_{(j)}$, are defined respectively in Table 2 and Table 3 depending on the ship's type (BC-A, BC-B, BC-C). The standard loading conditions for fatigue assessment of bulk carriers are provided in Ch4, Sec 8, [5.2].

Loading conditions for bulk carriers **Table 2**

Ship type	Full load condition		Ballast condition	
	Homogeneous	Alternate	Normal ballast	Heavy ballast
BC-A	X	X	X	X
BC-B	X	-	X	X
BC-C	X	-	X	X

7 LOAD CASES

7.1 Assumptions

7.1.1

The load cases to be considered for fatigue assessment are given in Ch 4, Sec 2, [3].

The design load scenario for fatigue assessment is defined in Ch 4, Sec 7, Table 3.

For each loading condition defined in [6], all fatigue load cases are to be considered to generate the combination of dynamic loads for fatigue assessment

7.1.2 Predominant load case

The predominant load case for each loading condition (j) is defined as load case where the fatigue stress range for the critical location is the maximum among all fatigue load cases.

Fraction of time for each loading condition of bulk carriers **Table 3**

Ship length	Loading conditions	$\alpha_{(j)}$	
		BC-A	BC-B, BC-C
L < 200 m	Homogeneous	0.60	0.70
	Alternate	0.10	-
	Normal ballast(1)	0.15	0.05
	Heavy ballast(1)	0.15	0.25
$L \geqslant$ 200 m	Homogeneous	0.25	0.50
	Alternate	0.25	-
	Normal ballast	0.20	0.20
	Heavy ballast	0.30	0.30

(1) For BC-B and BC-C without heavy ballast cargo hold, fraction of time $\alpha_{(j)}$ for normal ballast is 0.30 and for heavy ballast 0.

Section 2 STRUCTURAL DETAILS TO BE ASSESSED

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

EA : Empty cargo hold in alternate loading condition.

FA : Full cargo hold in alternate loading condition.

1 SIMPLIFIED STRESS ANALYSIS

1.1 Structural details to be assessed

1.1.1

Critical structural details to be checked over the full extent of the cargo region for fatigue assessment by simplified stress analysis according to Ch 9, Sec 1 are:

- End connections of longitudinal stiffeners to transverse bulkheads, including swash bulkheads,
- End connections of longitudinal stiffeners to floors and web frames.

2 FINITE ELEMENT ANALYSIS

2.1 Structural details to be assessed

2.1.1 General

Critical structural details to be checked for fatigue by finite element analysis according to Ch 9, Sec 5 are given in [2.1.2] to [2.1.4].

Table 4 to Table 19 give the list of hot spots for structural details.

ISC 2.1.1a The requirements in Table 16 apply to the hot spots corresponding to the 6th item in Table 3 of Section 2, Chapter 9. Fatigue assessment of the following hot spots is to be carried out, see Figure ISC 2.1.1a.

(1) in way of corner of curvature of free edge of the cut-out, see hot spots 1, 2 and 3 in Figure ISC 2.1.1a;

(2) *intersection of web of transverse frame to longitudinal web, see hot spots 4 and 5 in Figure ISC 2.1.1a;*

(3) *intersection of lug plate to longitudinal web, see hot spots 6 and 7 in Figure ISC 2.1.1a;*

(4) *intersection of web of transverse frame to lug plate, see hot spots 8, 9, 10 and 11 in Figure ISC 2.1.1a (where hot spots 10 and 11 are located near the middle point of side length);*

(5) *intersection of web of transverse frame to attached plating of longitudinal, see hot spots 12 and 13 in Figure ISC 2.1.1a.*

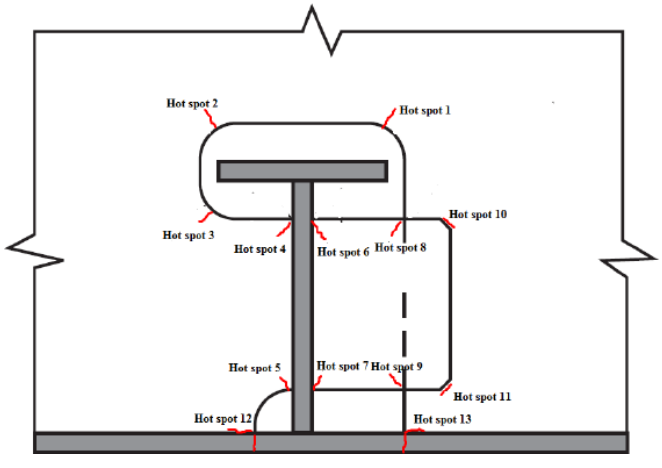

Figure ISC 2.1.1a Critical Hot Spot

ISC 2.1.1b The general requirements for FE modeling of Table 16 are given in 2.1.1 to 2.1.7 of Section 5.

ISC 2.1.1c The FE modeling requirements in way of the cut-out in Table 16 are given in ISC 2.2.1a of Section 6. In way of hot spots 10 and 11, the number of mesh along the side length is not

to be less than 4.
ISC 2.1.1d The fatigue assessment method in Table 16 is given in Sections 1 and 3.

2.1.2 Details to be checked by very fine mesh analysis

Critical structural details to be assessed for fatigue by very fine mesh analysis according to Ch 9, Sec 5, [1] to Ch 9, Sec 5, [4] are provided in Table 1, irrespective of their compliance with the design standard given in Ch 9, Sec 6.

2.1.3 Details to be checked by screening fatigue assessment

The structural details listed in Table 2 for which FE fine mesh models have been analysed according to yielding requirements given in Ch 7, Sec 3 are to be assessed using the screening fatigue procedure as given in Ch 9, Sec 5, [6]. or to be assessed by very fine mesh analysis according to Ch 9, Sec 5, [1] to [4].

2.1.4 Details in accordance with detail design standard

Table 3 gives critical structural details for which fatigue assessment by very fine mesh analysis can be omitted if their design is in accordance with detail design standard given in Ch 9, Sec 6.

Structural details to be assessed by very fine mesh analysis **Table 1**

No	Critical detail	Applicability	
		Oil tanker	Bulk carrier
1	Welded lower hopper knuckle connection (intersection of hopper sloping plate, inner bottom plate, longitudinal girder, floor and transverse web) at the most critical frame location. (1)	One cargo tank (4)	Ballast hold
2	Radiused lower hopper knuckle connection (intersection of knuckled inner bottom plate, longitudinal girder, floor and transverse web) at the most critical frame location. (1)	One cargo tank (4)	Ballast hold
3	Welded upper knuckle connection (intersection of hopper sloping plate, inner hull longitudinal bulkhead, transverse web and side stringer) where the angle between hopper plate and inner hull longitudinal bulkhead is less than 130 deg, at the most critical frame location. (1)	One cargo tank (4)	Ballast hold of double side bulk carrier
4	Connections of transverse bulkhead lower stools to the inner bottom plating in way of double bottom girders. (2) (3)	One cargo tank (4)	Ballast hold
5	Upper side frame bracket toe in case of flat bottom of top wing tank. (1)	N/A	FA hold (4), EA hold (4) and ballast hold of single skin bulk carrier
6	Deck plating and longitudinal hatch coaming end bracket toe.	N/A	Two aftermost holds, midship hold and two foremost holds

(1) The most critical frame position is generally, but not necessarily, located closest to the mid length of the hold. Where a swash bulkhead is fitted, this is generally located closest to the mid length between the swash bulkhead and the oil-tight bulkhead.
(2) Stool connections at each end of the hold are to be checked unless these are symmetrical about mid-hold.
(3) Position at the mid breadth location of the largest hold.
(4) Cargo hold located closest to the midship.

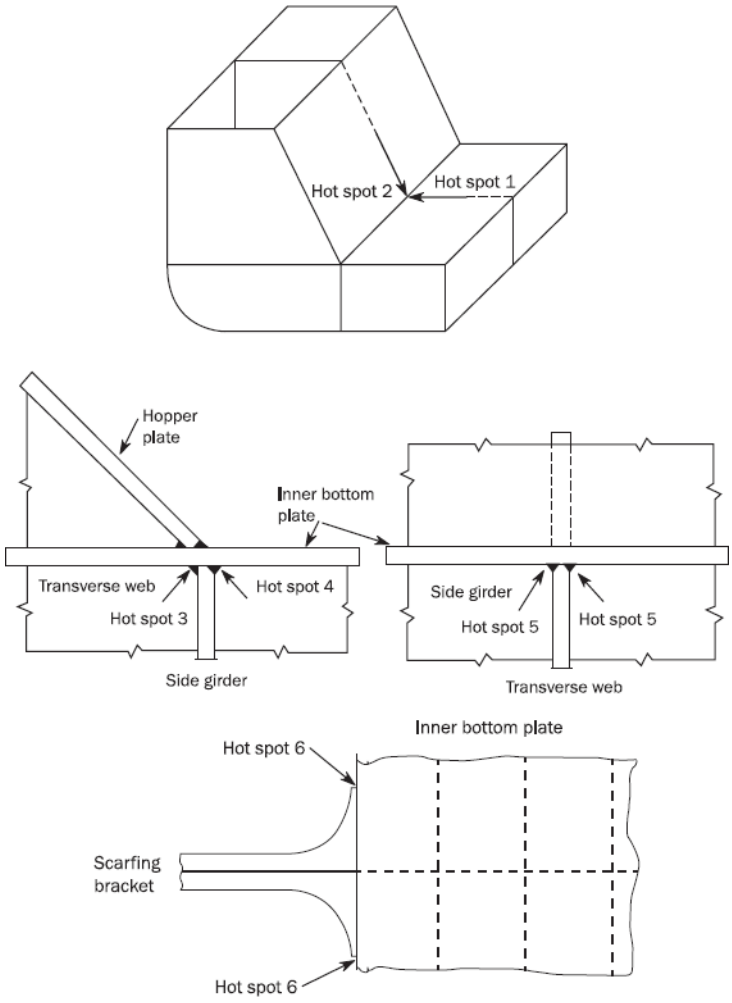
Structural details for screening fatigue assessment **Table 2**

No	Critical detail	Applicability	
		Oil tanker	Bulk carrier
1	Bracket toe of transverse web frame	Applicable (1)	N/A
2	Toe of horizontal stringer	Applicable (1)	N/A

No	Critical detail	Applicability	
		Oil tanker	Bulk carrier
3	Lower hopper knuckle connection in EA hold (2) and in FA hold (2) not assigned as a ballast hold	N/A	Applicable (1)
4	Connections of transverse bulkhead lower stool to inner bottom in EA hold (2) and in FA hold (2) where the ballast hold is not assigned to the ship	N/A	Applicable (1)

(1) For details assessed by fine mesh analysis according to Ch 7, Sec 3, [3.2].
(2) Cargo hold located closest to the midship.

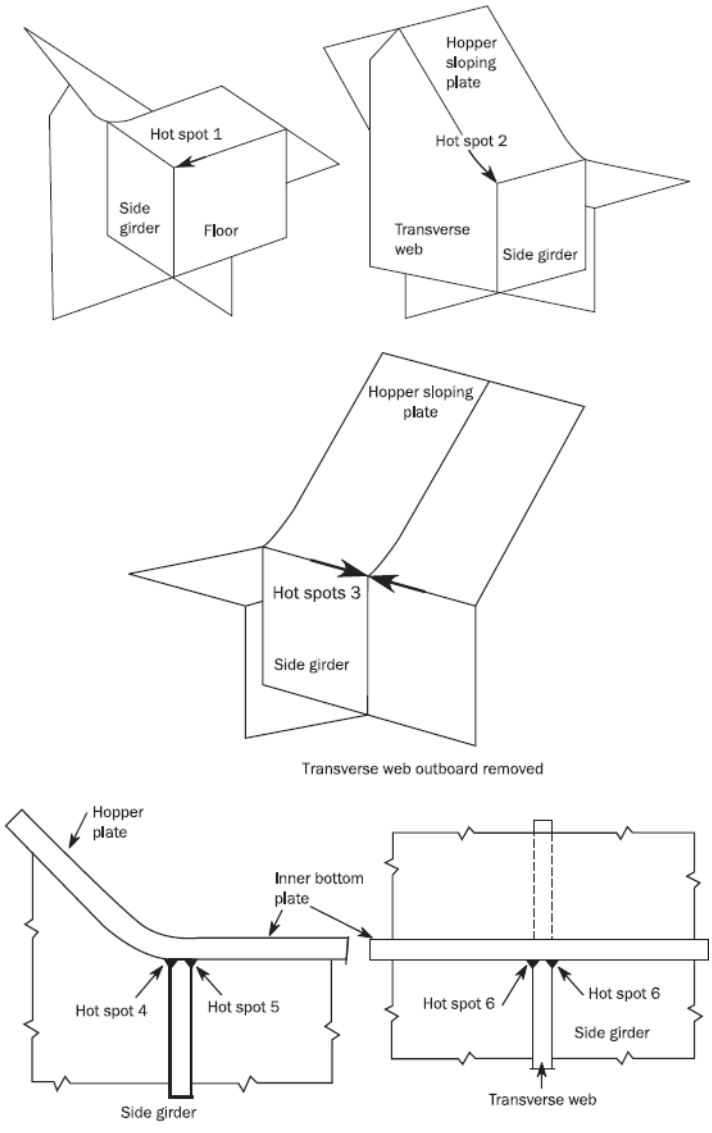
Structural details to be assessed by very fine mesh analysis if not designed in accordance with detail design standard Table 3



No	Critical detail	Corresponding detail design standard	Applicability	
			Oil tanker	Bulk carrier
1	Radiused upper hopper knuckle connection (intersection of knuckled inner side plate, side girder and transverse web) at the most critical frame location. (1)	Ch 9, Sec 6, [4]	One cargo tank (4)	Ballast hold of double side bulk carrier
2	Corrugations of bulkheads to lower stool or inner bottom plating connection. (2) (3)	Ch 9, Sec 6, [6] and Ch 9, Sec 6, [7]	One cargo tank (4)	Ballast hold
3	Corrugations of transverse bulkheads to upper stool. (2) (3)	Ch 9, Sec 6, [6]	N/A	Ballast hold
4	Cruciform heel connections between side stringers in double side and transverse bulkhead horizontal stringers, for the stringer closest to the mid depth and for the uppermost one.	Ch 9, Sec 6, [5]	One cargo tank	N/A
5	Lower and upper side frame bracket toes at the most critical frame position. (1)	Ch 9, Sec 6, [8]	N/A	FA hold (4), EA hold (4) and ballast hold of single skin bulk carrier
6	Cut out for longitudinal stiffeners in web-frame without web stiffener connection.	Ch 9, Sec 6, [2.1]	One cargo tank (4)	FA hold (4), EA hold (4) and ballast hold
7	Scallops in way of block joints on strength deck close to mid hold (and down to 0.1D from deck corner).	Ch 9, Sec 6, [3]	One cargo tank (4)	FA hold (4), EA hold (4) and ballast hold

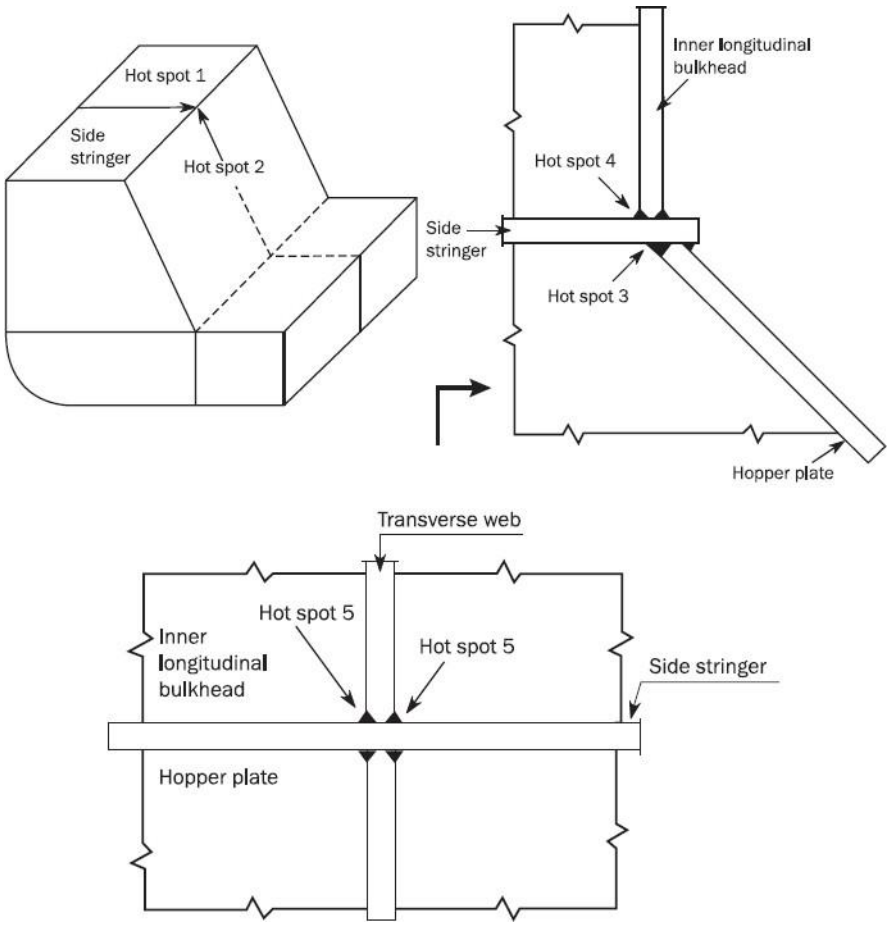
(1) The most critical frame position is generally, but not necessarily, located closest to the mid length of the hold. Where a swash bulkhead is fitted, this is generally located closest to the mid length between the swash bulkhead and the oil-tight bulkhead.
(2) Stool connections at each end of the hold are to be checked unless these are symmetrical about mid-hold.
(3) Position at the mid breadth or length location of the largest hold in the considered transverse section or longitudinal section.
(4) Cargo hold located closest to the midship.

Hot spots for welded lower hopper knuckle connection Table 4



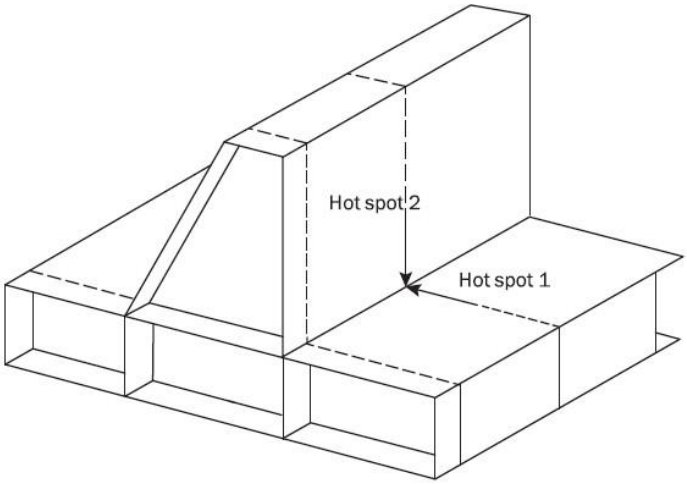
Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Inner bottom plate, on cargo tank side Hot spot 2: Hopper sloping plate, on cargo tank side	Ch 9, Sec 5, [4.2]

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 3: Hopper web, outboard of side girder Hot spot 4: Double bottom floor, inboard the side girder Hot spot 5: Side girder	Ch 9, Sec 5, [4.3]
Hot spot 6: Scarfing bracket to the inner bottom plate	Ch 9, Sec 5, [3.1], type '*b*'

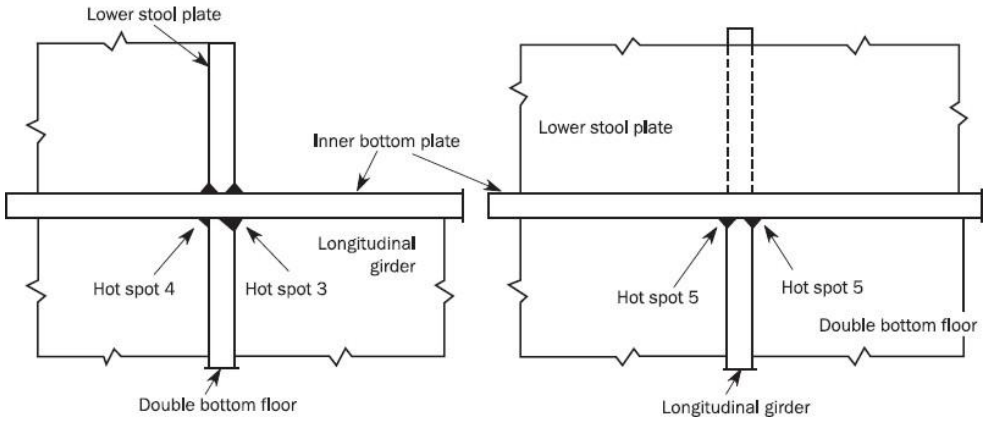


Hot spots for radiused lower hopper knuckle connection **Table 5**

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Inner bottom plate on ballast tank side, inboard of the side girder Hot spot 2: Radiused hopper sloping plate on ballast tank side outboard of the side girder Hot spot 3: Radiused hopper sloping plate on ballast tank side, outboard of the side girder, towards transverse web Hot spot 4: Hopper web, outboard of side girder Hot spot 5: Double bottom floor, inboard of the side girder Hot spot 6: Side girder	Ch 9, Sec 5, [3.3]

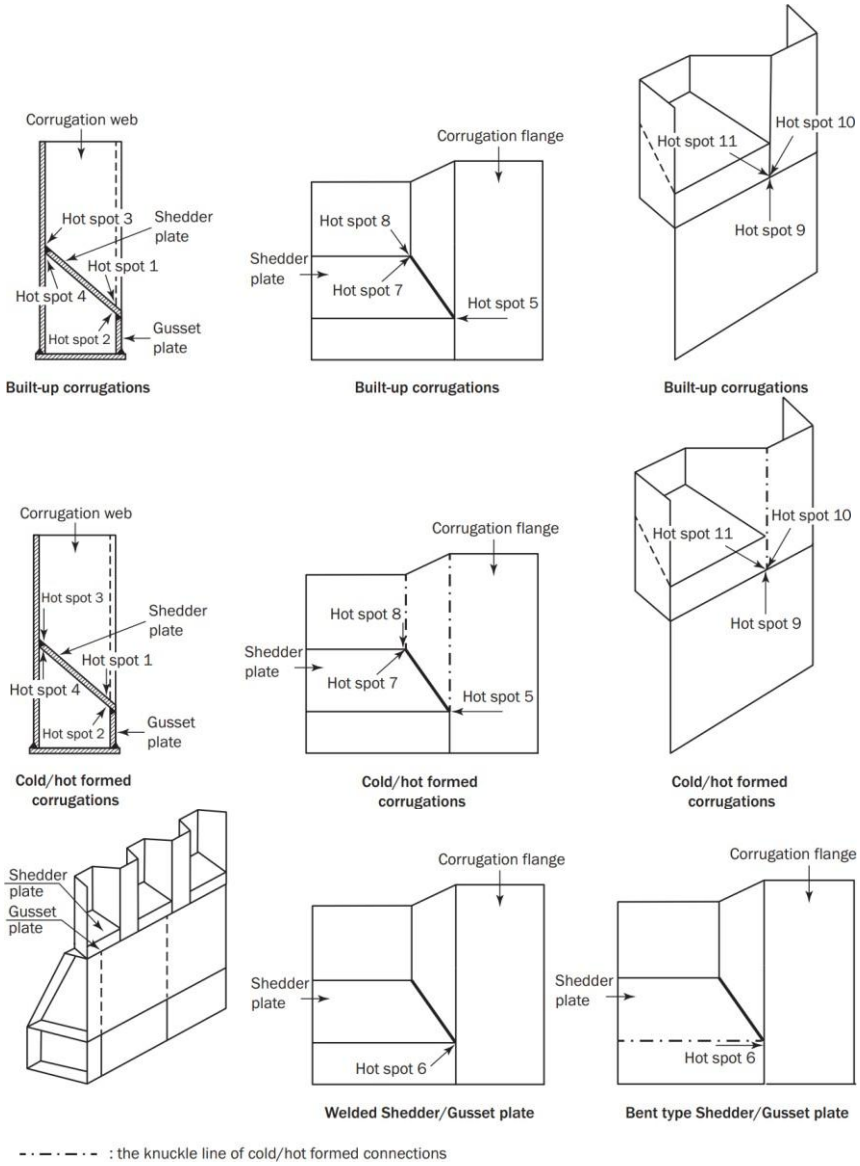


Hot spots for welded upper knuckle connection **Table 6**

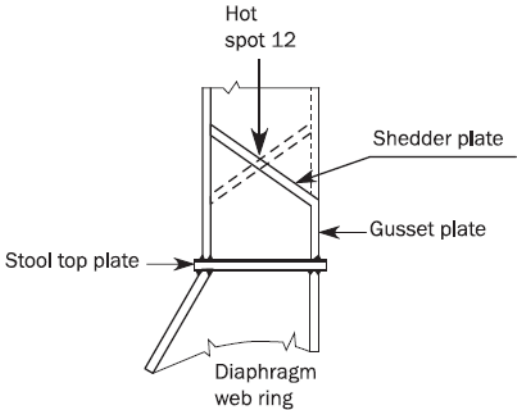


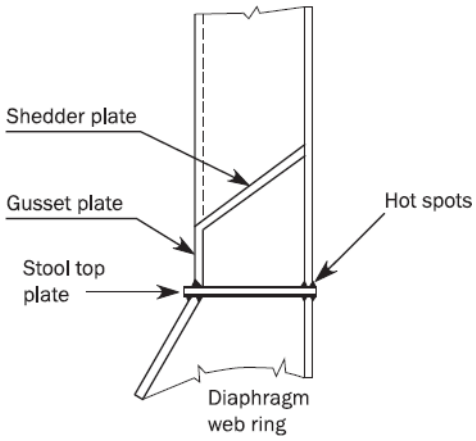
Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Side stringer on ballast tank side Hot spot 2: Hopper sloping plate, on ballast tank side	Ch 9, Sec 5, [4.2]
Hot spot 3: Transverse web, below stringer. Hot spot 4: Transverse side web, above stringer Hot spot 5: Inner hull longitudinal bulkhead on ballast tank side	Ch 9, Sec 5, [4.3]

Hot spots for connections of transverse bulkhead lower stools to the inner bottom plating in way of double bottom girders **Table 7**



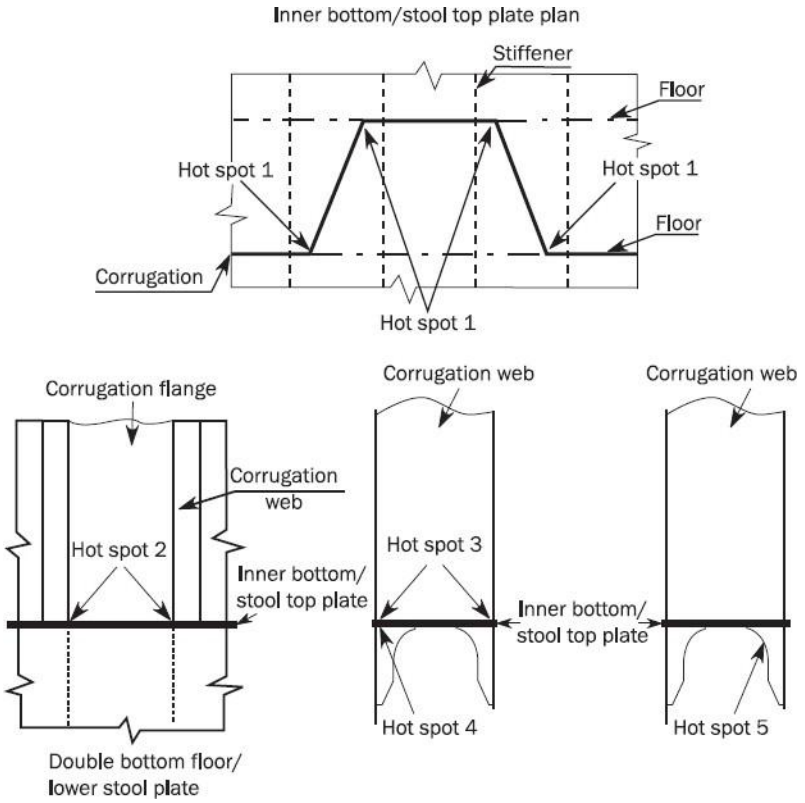
Hot spot ocation	Procedure for calculation of hot spot stress
Hot spot 1: Inner bottom plate, on cargo hold side Hot spot 2: Stool sloping plate, on cargo hold side	Ch 9, Sec 5, [4.2]
Hot spot 3: Longitudinal girder, under hold, to supporting floor in line with stool plate Hot spot 4: Longitudinal girder, under stool space to supporting floor in line with stool plate Hot spot 5: Double bottom supporting floor in line with stool plate	Ch 9, Sec 5, [4.3]





Hot spots for corrugated bulkhead to lower stool connection **Table 8**

Hot spot location		Procedure for calculation of hot spot stress	
		Cold/hot formed corrugations (Bent type)	Built-up corrugations (welded)
Hot spots 1 and 3: Corrugation web above shedder plate Hot spot 4: Corrugation web below shedder plate Hot spot 8: Corrugation flange		Ch 9, Sec 5, [3.1], type 'a'	Ch 9, Sec 5, [4.3]
Hot spot 2: Corrugation web below shedder plate Hot spot 7: Shedder plate Hot spot 10: Corrugation corner to stool top plate Hot spot 11: Gusset plate in way of corrugation corner		Ch 9, Sec 5, [4.3]	
Hot spot 5: Corrugation flange Hot spot 9: Lower stool plate to stool top plate		Ch 9, Sec 5 [3.1], type 'a'	
Hot spot 6: Gusset plate in case of:	welded gusset plate/shedder plate	Ch 9, Sec 5, [4.3]	
	bent type gusset plate/shedder plate	Ch 9, Sec 5, [3.1], type 'a'	



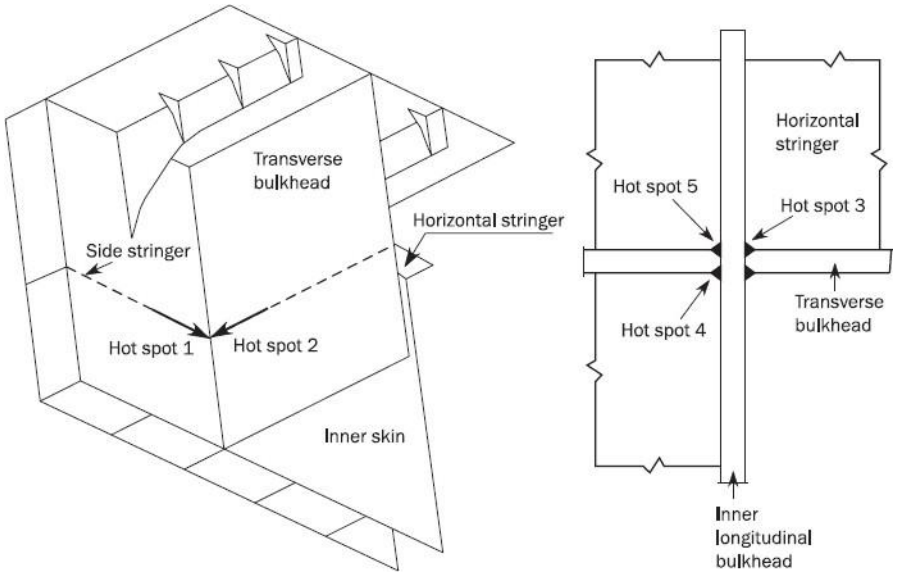
Hot spots for corrugated bulkhead to lower stool - Intersecting shedder plates and single sided shedder plate **Table 9**

Hot spot location	Procedure for calculation of hot spot stress
Intersecting shedder plates	
Hot spot 12: Intersection of shedder plates	Ch 9, Sec 5, [3.1], type '*a*'
	
Single sided shedder plate	
Welded connection of web and flange of corrugation to lower stool top For details of hot spots see Table 10, hot spots 1-3 If supported brackets are fitted, see Table 10 for hot spots 4	Ch 9, Sec 5, [3.1], type '*a*'
	

Hot spots for corrugated bulkhead to lower stool or inner bottom plating connection

Table 10

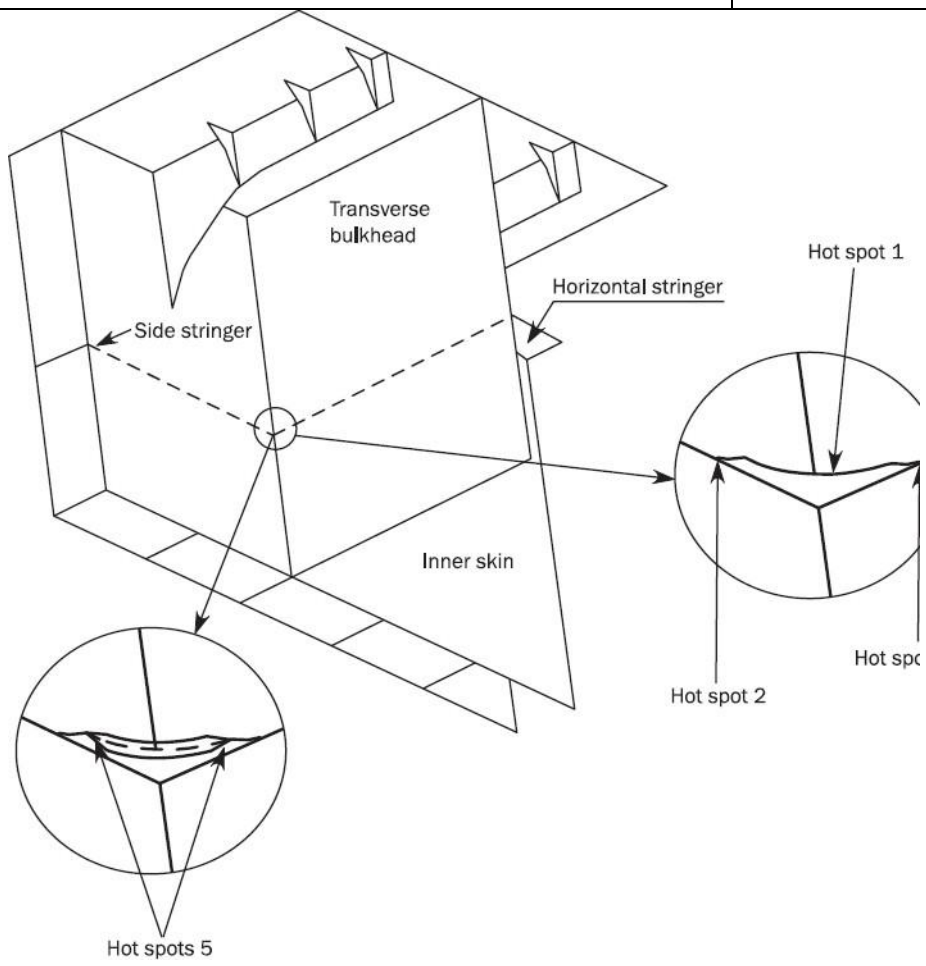
Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1 : Inner bottom/lower stool top Hot spot 2: Corner of corrugation flange in way of inner bottom/lower stool top Hot spot 3: Corner of corrugation web in way of inner bottom/lower stool top Hot spot 4: Inner bottom/lower stool top in way of brackets supporting corrugation web	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 5: Edge of supporting brackets	Ch 9, Sec 5, [3.2].



Hot spots for connections of corrugated longitudinal bulkhead to lower stool top Table 11

Hot spot location	Procedure for calculationof hot spot stress
See Table 9	Ch 9, Sec 5, [3.1], type '*a*'

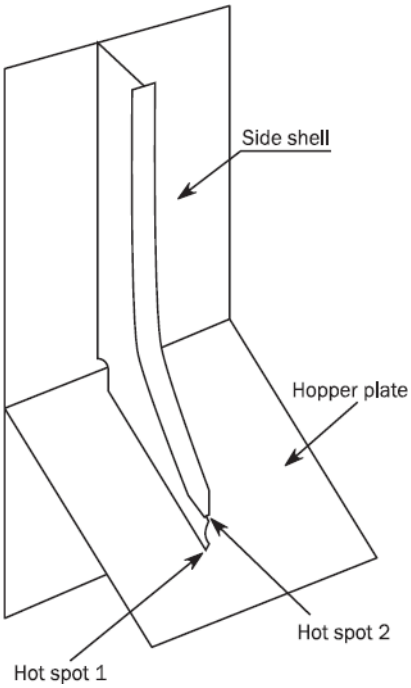
Hot spots for connections of corrugated transverse bulkhead to upper stool bottom plate or to deck plate for tanker design without top stool Table 12



Hot spot location	Procedure for calculation of hot spot stress
See Table 8 and Table 9 Additional bending stresses in the deck stiffeners in way of corrugation flange induced by the bulkhead need to be considered	

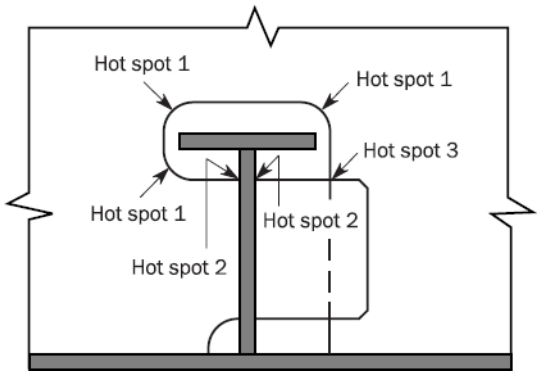
Hot spots for connection between transverse bulkhead and inner hull longitudinal bulkhead in way of transverse bulkhead horizontal stringer and side stringer without backing bracket at stringer heel **Table 13**

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Inner hull longitudinal bulkhead plate on cargo tank side connection to plane side of transverse bulkhead (i.e. opposite side to stiffening) at heel of transverse bulkhead horizontal stringer Hot spot 2: Transverse bulkhead plate on plane side (i.e. opposite stiffening) at heel of transverse bulkhead horizontal stringer	Ch 9, Sec 5, [4.2]
Hot spot 3: Heel of transverse bulkhead horizontal stringer Hot spot 4: Side stringer in double side diagonally opposite horizontal stringer Hot spot 5: Side stringer in double side in line with horizontal stringer	Ch 9, Sec 5, [4.3]
	



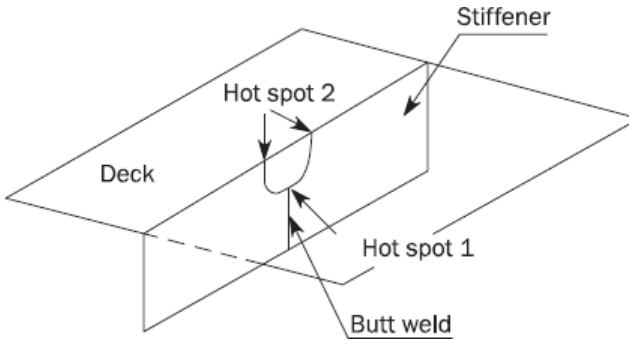
Hot spots for connection between transverse bulkhead and inner hull longitudinal bulkhead in way of transverse bulkhead horizontal stringer and side stringer, with backing bracket at stringer heel **Table 14**

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Bracket edge where a face plate is not fitted to the bracket Hot spot 4: Radius of bracket toe	Ch 9, Sec 5, [3.2]
Hot spot 2: Inner longitudinal bulkhead at bracket toe Hot spot 3: Transverse bulkhead at bracket toe Hot spot 6: Side stringer, in way of bracket toe Hot spot 7: Horizontal stringer in way of bracket toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 5: Where a face plate is fitted to the bracket, the weld connection of face plate to bracket in way of the face plate termination	Ch 9, Sec 5, [3.1], type '*b*'

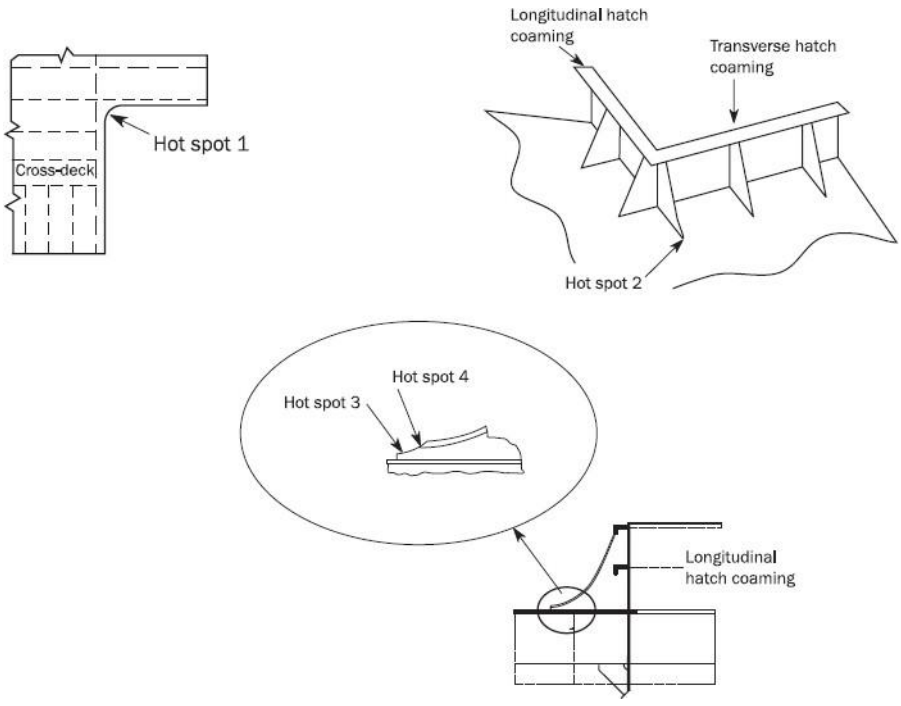


Hot spots for lower side frame bracket toe **Table 15**

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Hopper sloping plate in way of hold frame toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 2: Hold frame toe in way of face plate termination	Ch 9, Sec 5, [3.1], type '*b*'

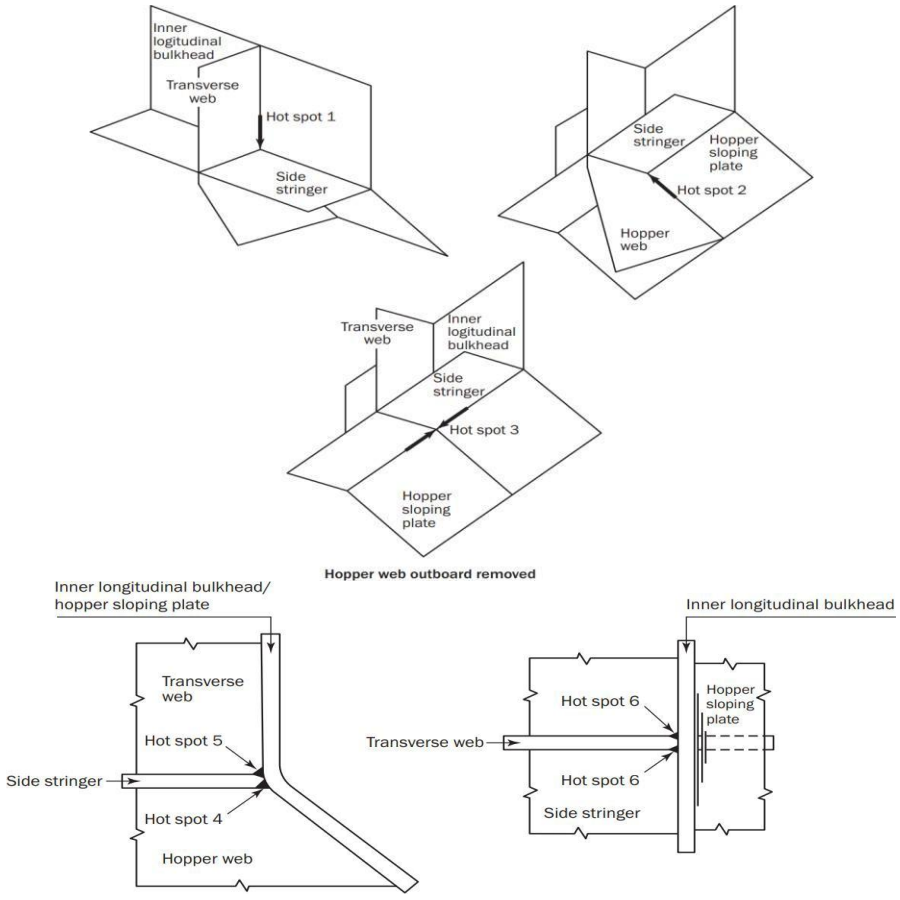


Hot spots for connection of longitudinal stiffener and transverse web including cut-outs and lug plates **Table 16**



Hot spot location	Procedure for calculation of hot spot stress
The critical hot spot has to be decided for each design in agreement with the Society. Typically the following three hot spot types are to be considered:	
Hot spot 1: Corners of the cut-out edge	Ch 9, Sec 5, [3.2].
Hot spot 2: Connection of transverse web/lug-plate to longitudinal stiffener web in way of slot Hot spot 3: Overlapping connection between transverse web and lug plate	Ch 9, Sec 5, [3.1], type '*b*'

Hot spots for scallops in way of block connections joints at deck Table 17



Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Butt weld in longitudinal stiffener web in way of scallop. Hot spot 2: Deck plate in way of scallop.	Ch 9, Sec 5, [3.1], type '*a*'
	

Hot spots for deck plating and longitudinal hatch coaming end bracket toe Table 18

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Hatch corner radiused edge Hot spot 3: Radius of hatch coaming bracket toe	Ch 9, Sec 5, [3.2]
Hot spot 2: Deck plating in way of hatch coaming bracket toe	Ch 9, Sec 5, [3.1], type '*a*'
Hot spot 4: Where a face plate is fitted to the bracket, the weld connection of face plate to bracket in way of the face plate termination	Ch 9, Sec 5, [3.1], type '*b*'
	

Hot spots for radiused upper hopper knuckle connection **Table 19**

Hot spot location	Procedure for calculation of hot spot stress
Hot spot 1: Inner longitudinal bulkhead plate on ballast tank side, above side stringer Hot spot 2: Radiused hopper sloping plate on ballast tank side, below side stringer Hot spot 3: Radiused hopper sloping plate on ballast tank side, below side stringer, towards hopper web Hot spot 4: Hopper web, below side stringer Hot spot 5: Transverse web, above side stringer Hot spot 6: Side stringer, to transverse web	Ch 9, Sec 5, [3.3]

Section 3 FATIGUE EVALUATION

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

(i) : Suffix which denotes load case HSM, FSM, BSR-P, BSR-S, BSP-P, BSP-S, OST-P or OST-S specified in Ch 4, Sec 2, [3].

'*i1*' denotes load case: HSM-1, FSM-1, BSR-1P, BSR-1S, BSP-1P, BSP-1S, OST-1P or OST-1S.

'*i2*' denotes load case: HSM-2, FSM-2, BSR-2P, BSR-2S, BSP-2P, BSP-2S, OST-2P or OST-2S.

(j) : Suffix which denotes loading condition:

Full load or normal ballast for oil tankers as defined in Ch 9, Sec 1, [6.2].

Full load homogeneous, full load alternate, normal ballast or heavy ballast for bulk carriers as defined in Ch 9, Sec 1, [6.3].

T_C : Time in corrosive environment, in years, according to Table 5.

T_D : Design life, in years, to be taken as 25 years.

T_{DF} : Design fatigue life, in year, as defined in Ch 9, Sec 1.

T_F : Fatigue life, in year, calculated according to [5].

m :Inverse slope of the design S-N curve, as given in Table 2 for in-air environment and in Table 3 for corrosive environment.

The inverse slope for S-N curves in-air environment changes from m to m+2 at $N = 10^7$ cycles.

n_{LC} : Number of applicable loading conditions, as defined in Ch 9, Sec 1, [6.2] and Ch 9, Sec 1, [6.3].

fc : Correction factor as defined in Ch 9, Sec 1, [5.1.2].

f_{thick} : Correction factor for plate thickness effect given in [3.3].

$f_{mean,\ i(j)}$: Correction factor for mean stress effect given in [3.2].

1 FATIGUE ANALYSIS METHODOLOGY

1.1 Cumulative damage

1.1.1

The fatigue assessment of the structure is based on the application of the Palmgren-Miner cumulative damage D taken as:

$$D = \sum_{i-1}^{n_{tot}} \frac{n_i}{N_i}$$

where:

n_i : Number of cycles at stress range $\Delta\sigma_i$.

N_i : Number of cycles to failure at stress range $\Delta\sigma_i$.

n_{tot} : Total number of stress range blocks.

i : Stress range block index.

1.1.2

As the long term stress range distribution of a structural detail in a ship can be described by a two-parameter Weibull distribution, as given in Ch 9, Sec 1, [3.1.1], fatigue damage can be obtained by means of a closed- form equation, as given in [5].

1.2 Fatigue strength assessment

1.2.1

Assessment of the fatigue strength of structural members according to [2] includes the following three steps:

a) Calculation of stress ranges, according to [3].
b) Selection of the design S-N curve, according to [4].
c) Calculation of the cumulative damage and the fatigue life calculation, according to [5].

2 ACCEPTANCE CRITERIA

2.1 Fatigue life and acceptance criteria

2.1.1

The calculated fatigue life, T_F, is to comply with the following formula:

$T_F \geqslant T_{DF}$

3 REFERENCE STRESSES FOR FATIGUE ASSESSMENT

3.1 Fatigue stress range

3.1.1

The fatigue stress range for each load case of each loading condition is defined in [3.1.2] for welded joints and in [3.1.3] for base material free edge.

The stress range of each loading condition *(j)* to be considered is the stress range obtained from the predominant load case, according to Ch 9, Sec 1, [7.1.2].

$$\Delta\sigma_{FS,(j)} = \max_i(\Delta\sigma_{FS,i(j)})$$

where:

$\Delta\sigma_{FS,i(j)}$: Fatigue stress range, in N/mm^2, for load case *(i)* of loading condition *(j)*, as defined in [3.1.2] for welded joints and in [3.1.3] for base material free edge.

3.1.2 Welded joints

For welded joints, the fatigue stress range $\Delta\sigma_{FS,i(j)}$, in N/mm^2, corrected for mean stress effect, thickness effect and warping effect, is taken as:

- For simplified stress analysis:

$$\Delta\sigma_{FS,i(j)} = f_{mean,i(j)} \cdot f_{thick} \cdot f_{warp} \cdot \Delta\sigma_{HS,i(j)}$$

- For FE analysis:
  - For web-stiffened cruciform joints:

$$\Delta\sigma_{FS,i(j)} = f_w \cdot f_s \cdot \max(\Delta\sigma_{FS1,i(j)}, \Delta\sigma_{FS2,i(j)})$$

  - For other joints:

$$\Delta\sigma_{FS,i(j)} = \max_{(SideL,SideR)}[\max(\Delta\sigma_{FS1,i(j)}, \Delta\sigma_{FS2,i(j)})]$$

where:

f_w : correction factor for the effect of stress gradient along weld line given as 0.96

f_s : correction factor for the effect of supporting member given as 0.95

$\Delta\sigma_{HS,i(j)}$: Hot spot stress range, in N/mm^2, due to dynamic loads in load case (*i*) of loading condition *(j)* given in Ch 9, Sec 4, [2.1.1].

$\Delta\sigma_{FS1,i(j)}$: Fatigue stress range, in N/mm^2,due to the principal hot spot stress range $\Delta\sigma_{HS1,i(j)}$

$$\Delta\sigma_{FS1,(j)} = f_{mean1,i(j)} \cdot f_{thick} \cdot f_c \cdot \Delta\sigma_{HS1,i(j)}$$

$\Delta\sigma_{FS2,i(j)}$: Fatigue stress range, in N/mm^2,due to the principal hot spot stress range $\Delta\sigma_{HS2,i(j)}$

$$\Delta\sigma_{FS2,i(j)} = 0.9 \cdot f_{mean2,i(j)} \cdot f_{thick} \cdot f_c \cdot \Delta\sigma_{HS2,i(j)}$$

SideL, *SideR*: Left and right side respectively of the line A-A as shown in Ch 9, Sec 5, Figure 15 and Ch 9, Sec5, Figure 16.

$f_{mean1,\ i(j)}$: Correction factor for mean stress effect given in [3.2].

$f_{mean2,\ i(j)}$: Correction factor for mean stress effect given in [3.2].

f_{warp} : Correction factor due to warping effect, taken as:

- f_{warp} = 1.07 for the deck longitudinal stiffener of bulk carrier, the closest to the longitudinal hatch coaming in way of the hatch corner as shown in Figure 1, except f_{warp} =1.0 when OST is not the dominant load case for all loading conditions
- f_{warp} = 1.04 for following deck longitudinal stiffeners of bulk carrier, except f_{warp} =1.0 when OST is not the dominant load case for all loading conditions
  - The closest stiffener to the longitudinal hatch coaming at one web frame away from the hatch corner, in way of the hatch opening as shown in Figure 1,
  - The second closest stiffener away from the longitudinal hatch coaming in way of the hatch corner as shown in Figure 1,
- f_{warp} = 1.0 for the other cases.

$\Delta\sigma_{HS1,i(j)}$: Principal hot spot stress ranges, in N/mm^2, due to dynamic loads for load case (*i*) of loading condition *(j)* which acts within ±45° of the perpendicular to the weld toe,

determined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3] for the two types of shell elements (4-node or 8- node).

$\Delta\sigma_{HS2,i(j)}$: Principal hot spot stress ranges, in N/mm^2, due to dynamic loads for load case (*i*) of loading condition *(j)* which acts outside ±45°of the perpendicular to the weld toe, determined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3] for the two types of shell elements (4-node or 8- node).

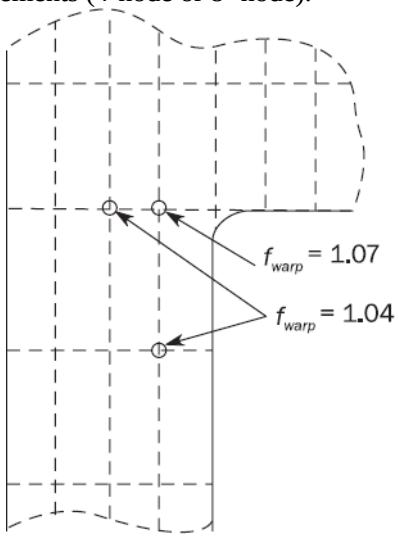


Figure 1 Warping effect on deck longitudinal stiffeners of bulk carrier

3.1.3 Base material free edge

For base material free edge, the fatigue stress range, $\Delta\sigma_{FS,i(j)}$ in N/mm^2, is taken as the local stress range at free edge, $\Delta\sigma_{BS,i(j)}$, as defined in Ch 9, Sec 1, [2.4] with correction factors:

$$\Delta\sigma_{FS,i(j)} = K_{sf} \cdot f_{material} \cdot f_{mean,i(j)} \cdot f_{thick} \cdot f_c \cdot \Delta\sigma_{BS,i(j)}$$

where:

K_{sf} : Surface finishing factor for base material given in [4.2.3].

$f_{material}$: Correction factor for material strength, taken as:

$$f_{material} = \frac{1200}{965 + R_{eH}}$$

$\Delta\sigma_{BS,i(j)}$: Local stress range, in N/mm^2, due to dynamic loads in load case (*i*) of loading condition *(j)* taken as:

$$\Delta\sigma_{BS,i(j)} = \left|\sigma_{BS,i1(j)} - \sigma_{BS,i2(j)}\right|$$

$\sigma_{BS,i(j)}$, $\sigma_{BS,i(j)}$: Local stress, in N/mm^2, in load case '*i1*' and '*i2*' of loading condition *(j)*, obtained by very fine mesh FE analysis specified in Ch 9, Sec 5.

3.2 Mean stress effect

3.2.1 Correction factor for mean stress effect

The mean stress correction factor to be considered for each principal hot spot stress range of welded joint, $\Delta\sigma_{HS,i(j)}$, or for local stress range at free edge, $\Delta\sigma_{BS,\,i(j)}$, is taken as:

a) For welded joint:

$$f_{mean,i(j)} = \begin{cases} \min[1.0,\ 0.9 + 0.2\dfrac{\sigma_{mCor,i(j)}}{2\Delta\sigma_{HS,i(j)}}] & \text{for} \quad \sigma_{mCor,i(j)} \geq 0 \\ \max[0.3,\ 0.9 + 0.8\dfrac{\sigma_{mCor,i(j)}}{2\Delta\sigma_{HS,i(j)}}] & \text{for} \quad \sigma_{mCor,i(j)} < 0 \end{cases}$$

b) For base material:

$$f_{mean,i(j)} = \begin{cases} \min[1.0, 0.8 + 0.4\dfrac{\sigma_{mCor,i(j)}}{2\Delta\sigma_{BS,i(j)}}] & \text{for} \quad \sigma_{mCor,i(j)} \geq 0 \\ \max[0.3, 0.8 + \dfrac{\sigma_{mCor,i(j)}}{2\Delta\sigma_{BS,i(j)}}] & \text{for} \quad \sigma_{mCor,i(j)} < 0 \end{cases}$$

where:

$$\sigma_{mCor,i(j)} = \begin{cases} \sigma_{mean,i(j)} & \text{for} \quad \sigma_{max} \leq R_{eEq} \\ R_{eEq} - \sigma_{max} + \sigma_{mean,i(j)} & \text{for} \quad \sigma_{max} > R_{eEq} \end{cases}$$

$$\sigma_{max} = \begin{cases} \max_{i,(j)}(\Delta\sigma_{HS,i(j)} + \sigma_{mean,i(j)}) & \text{for welded joint} \\ \max_{i,(j)}(\Delta\sigma_{BS,i(j)} + \sigma_{mean,i(j)}) & \text{for base material} \end{cases}$$

R_{eEq}= *max* (315 ; R_{eH})

$\sigma_{mean,\ i(j)}$: Fatigue mean stress, in N/mm^2, for base material calculated according to [3.2.2] or welded joint calculated according to [3.2.3] or [3.2.4] as applicable.

3.2.2 Mean stress for base material free edge

The fatigue mean stress for base material free edge, $\sigma_{mean,i(j)}$, in N/mm^2, due to static and dynamic loads case '*i1*' and '*i2*' of loading condition (*j)* is calculated by the following formula based on local stress:

$$\sigma_{mean,i(j)} = \frac{\sigma_{BS,i1(j)} + \sigma_{BS,i2(j)}}{2}$$

3.2.3 Mean stress for simplified method

The fatigue mean stress to be considered for welded joint assessed by the simplified stress analysis is to be obtained from Ch 9, Sec 4, [2.2].

3.2.4 Mean stress for FE analysis

The fatigue mean stresses for welded joint due to static and dynamic loads, $\sigma_{mean,i(j),pX}$, and$\sigma_{mean,i(j),pY}$, in N/mm^2, for load cases '*i1*' and '*i2*' of loading condition (j) ,belonging to the two principal hot spot stress range directions, *pX* and *pY*, is calculated by the following formula based on hot spot stress components as defined in Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [3.3.2] and Ch 9, Sec 5, [4.2.3]:

$$\sigma_{mean,i(j)pX} = \frac{(\sigma_{HS,i1(j)})_{xx} + (\sigma_{HS,i2(j)})_{xx} + (\sigma_{HS,i1(j)})_{yy} + (\sigma_{HS,i2(j)})_{yy}}{4} +$$
$$(\frac{(\sigma_{HS,i1(j)})_{xx} + (\sigma_{HS,i2(j)})_{xx} - (\sigma_{HS,i1(j)})_{yy} - (\sigma_{HS,i2(j)})_{yy}}{4}) \cdot \cos 2\theta + (\frac{(\sigma_{HS,i1(j)})_{xy} + (\sigma_{HS,i2(j)})_{xy}}{4}) \cdot \sin 2\theta$$

$$\sigma_{mean,i(j)pY} = \frac{(\sigma_{HS,i1(j)})_{xx} + (\sigma_{HS,i2(j)})_{xx} + (\sigma_{HS,i1(j)})_{yy} + (\sigma_{HS,i2(j)})_{yy}}{4} -$$
$$(\frac{(\sigma_{HS,i1(j)})_{xx} + (\sigma_{HS,i2(j)})_{xx} - (\sigma_{HS,i1(j)})_{yy} - (\sigma_{HS,i2(j)})_{yy}}{4}) \cdot \cos 2\theta - (\frac{(\sigma_{HS,i1(j)})_{xy} + (\sigma_{HS,i2(j)})_{xy}}{4}) \cdot \sin 2\theta$$

θ :Angle between the direction x of the element coordinate system and the principal direction *pX* of the principal hot spot stress range coordinate system (Ch 9, Sec 5, [3.1.2], Ch 9, Sec 5, [4.2.3]). The direction x of the element coordinate system is defined as the normal to the weld toe.

The one of the two mean stresses $\sigma_{mean,i(j),pX}$ and $\sigma_{mean,i(j),pY}$ which has a principal stress direction with an absolute value less than 45°is defined as $\sigma_{mean1,i(j)}$ belonging to $\Delta\sigma_{HS1,i(j)}$ The other mean stress is defined as$\sigma_{mean2,i(j)}$ belonging to $\Delta\sigma_{HS2\ ,i(j)}$.

3.3 Thickness effect

3.3.1

Plate thickness primarily influences the fatigue strength of welded joints through the effect of geometry, and through-thickness stress distribution. The correction factor, f_{thick},, for plate thickness effect is taken as:

- For $t_{n50} \leqslant 22$ mm, $f_{thick} = 1.0$.
- For $t_{n50} > 22$ mm, $f_{thick} = (t_{n50}/22)^n$

where:

t_{n50} : Net thickness of the considered member in way of the hot spot for welded joints or base material free edge, in mm.

- For simplified stress analysis, the net thickness to be considered for stiffeners is as follows:
  - Flat bar and Bulb profile: no correction,
  - Angle bar and T-bar: flange net thickness.
- For FE analysis, the net thickness to be considered is the net thickness of the member where the crack is likely to initiate and propagate.
  For 90°attachments, i.e. cruciform welded joints, transverse T-joints and plates with transverse attachment, the net thickness to be considered is to be taken as:

$$t_{n50} = \min\left(\frac{d}{2}, t_{1n50}\right)$$

n : Thickness exponent provided in Table 1 and Table 4 respectively for welded and non-welded joints. n is to be selected according to the considered stress direction. For this selection, $\Delta\sigma_{HS1}$ and $\Delta\sigma_{HS2}$ are considered perpendicular and parallel to the weld respectively.

d : Toe distance, in mm, as shown in Figure 2, taken as:
$d = t_{2n50} + 2\, l_{leg}$

t_{1n50} : Net thickness, in mm, of the continuous plate as shown in Figure 2.

t_{2n50} : Net thickness, in mm, of the transverse attach plate where the hot spot is assessed, as shown in Figure 2.

l_{leg} : Fillet weld leg length, in mm.

When post-weld treatment methods are applied to improve the fatigue life of considered welded joint, the thickness exponent is provided in [6].

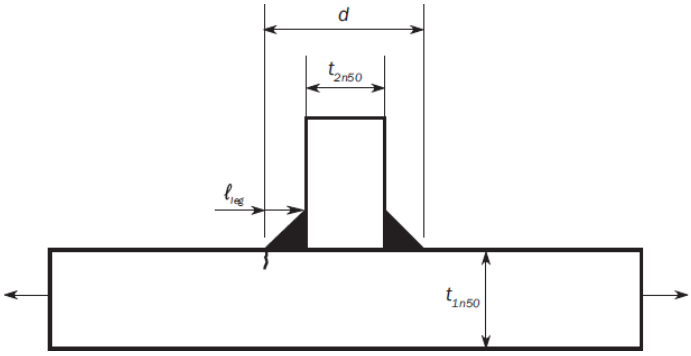

Figure 2 Toe distance for cruciform welded joints, transverse T-joints and plates with transverse attachment

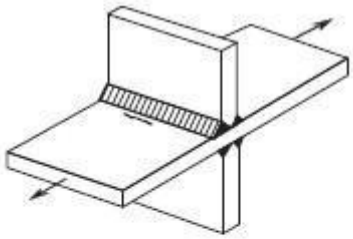
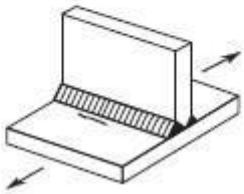
4 S-N CURVES

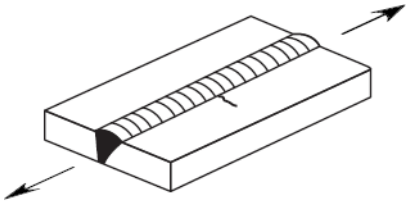
4.1 Basic S-N curves

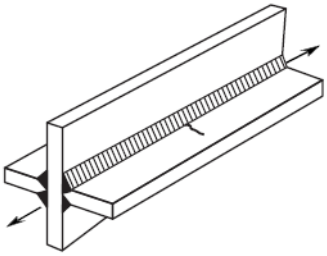
4.1.1 Capacity

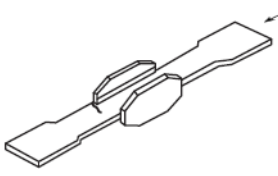
The capacity of welded steel joints and steel base material with respect to fatigue strength is defined by S-N curves which provide the relationship between the stress range applied to the detail and the number of constant amplitude load cycles to failure.



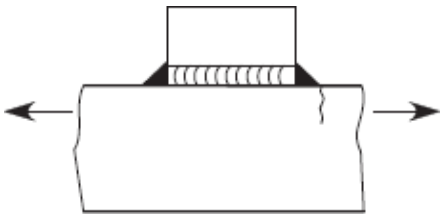


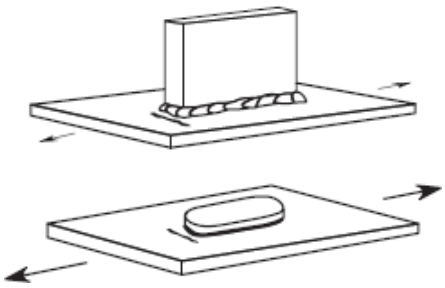


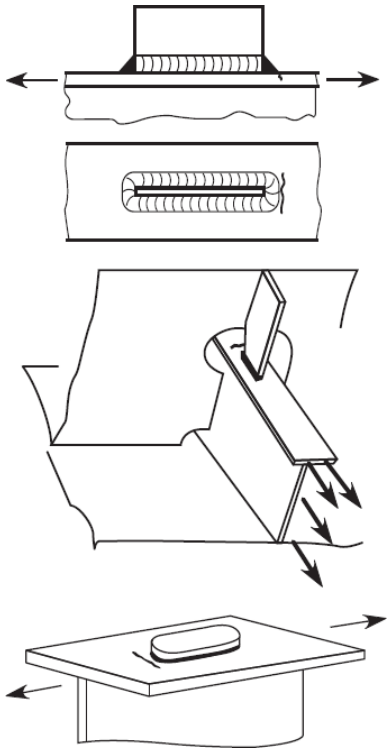




4.1.2 Design S-N curves







The fatigue assessment is based on use of S-N curves which are obtained from fatigue tests. The design S-N curves are established at two standard deviations below the mean S-N curves corresponding to 50% of probability of survival for relevant experimental data. Design S-N curves given in Table 2 and Table 3 correspond to a probability of survival of 97.7%.

4.1.3 S-N curve scope of application

The S-N curves are applicable to normal and high strength steels up to a specified minimum yield stress equal to 390 N/mm^2.

Welded joints: thickness exponents **Table 1**

No	Joint category description	Geometry	Condition	*n*
1	Cruciform joints, transverse T-joints, plates with transverse attachments		As-welded	0.25
			Weld toe treated by post-weld improvement method	0.2
2	Transverse butt welds		As-welded	0.2
			Ground flush or weld toe treated by post-weld improvement method	0.1
3	Longitudinal welds or attachments to plate edges		Any	0.1
		 	Weld toe treated by post-weld improvement method	0.1
(1) No benefit applicable for post-weld treatment of longitudinal end connections.				

No	Joint category description	Geometry	Condition	*n*
4	Longitudinal attachments on the flat bar or bulb profile		Any	0
			Weld toe treated by post-weld improvement method (1)	0
5	Longitudinal attachments and doubling plates		As-welded	0.2
			Weld toe treated by post-weld improvement method	0.1
6	Longitudinal attachments and doubling plates supported longitudinally		As-welded	0.1
			Weld toe treated by post-weld improvement method (1)	0
(1) No benefit applicable for post-weld treatment of longitudinal end connections.				

4.1.4 In-air environment

The basic design curves in-air environment shown in Figure 3 are represented by linear relationships between log ($\Delta\sigma$) and log (N) as follows:

$\log(N) = \log(K_2) - m \log(\Delta\sigma)$

where:

$\log(K_2) = \log(K_1) - 2\log(\delta)$

K_1 : Constant related to mean S-N curve, as given in Table 2.
K_2 : Constant related to design S-N curve, as given in Table 2.
δ : Standard deviation of log (N), as given in Table 2.
$\Delta\sigma_q$: Stress range at N = 107 cycles related to design S-N curve, in N/mm2, as given in Table 2.

Basic S-N curve data, in-air environment **Table 2**

Class	K_1		m	Standard deviation δ	K_2	Design stress range at 10^7 cycles	Design stress range at 2×10^6 cycles
	K_1	$\log_{10}K_1$		$\log_{10}\delta$	K_2	$\Delta\sigma_q$ N/mm^2	N/mm^2
B	2.343E15	15.3697	4.0	0.1821	1.01E15	100.2	149.9
C	1.082E14	14.0342	3.5	0.2041	4.23E13	78.2	123.9
D	3.988E12	12.6007	3.0	0.2095	1.52E12	53.4	91.3

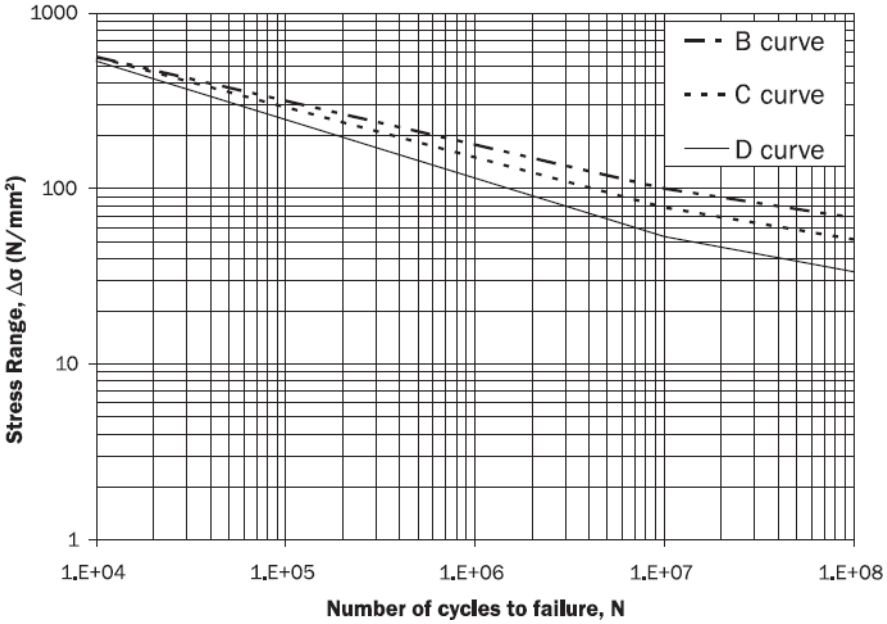


Figure 3 Basic design S-N curves, in-air environment

4.1.5 Corrosive environment

The basic design curves for corrosive environment shown in Figure 4 are represented by linear relationships between log ($\Delta\sigma$) and log (N) as follows:
$\log(N)=\log(K_2)-m\log(\Delta\sigma)$
N : Predicted number of cycles to failure under stress range .
K_2 : Constant related to design S-N curve as given in Table 3.

Basic S-N curve data, corrosive environment **Table 3**

Class	K_2	m	Design stress range at 2×10^6 cycles, N/mm^2
B_{corr}	5.05×10^{14}	4.0	126.1
C_{corr}	2.12×10^{13}	3.5	101.6
D_{corr}	7.60×10^{11}	3.0	72.4

4.2 Selection of S-N curves

4.2.1 Welded joints

For fatigue assessment of welded joints exposed to in-air environment, S-N curve D as defined in Table 2 is to be used. For corrosive environment, S-N curve D_{corr} as defined in Table 3 is to be used.

4.2.2 Base material free edge

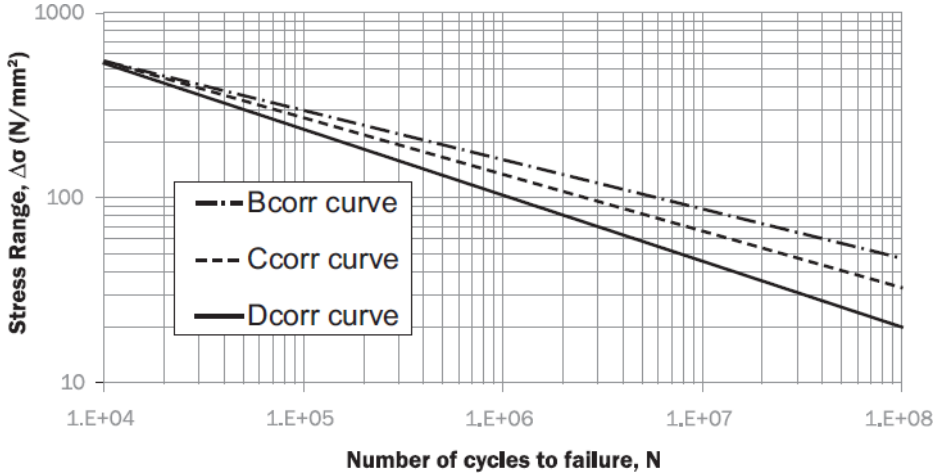
For fatigue assessment of base material at free edge exposed to in-air environment, S-N curves B

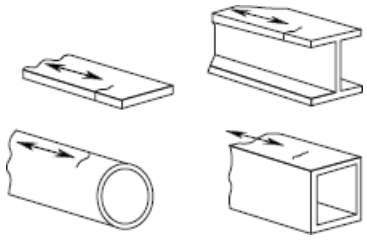
or C as defined in Table 2 are to be used. For corrosive environment, S-N curves B_{corr} or C_{corr} as defined in Table 3 are to be used.

4.2.3 Surface finishing factor

The S-N curve *C* is applicable to most of non-welded locations taking into account the likelihood of some notching from corrosion, wear and tear in service with surface finishing factor as given in Table 4.

Higher surface finishing quality may be applied in using S-N curve *B* as given in Table 4, provided adequate protective measures are taken against wear, tear and corrosion and finite element analysis according Sec 5, [2] is carried out.





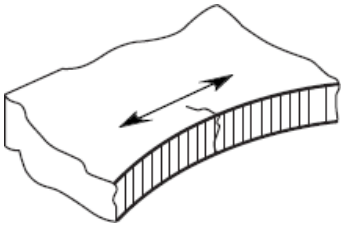


Figure 4 Basic design S-N curves, corrosive environment

ISC 4.2.3a Surface finishing factors are to be selected according to the joint configurations in Table 4, Section 3, Chapter 9 of this PART and submitted to ISC as the basis for selection of such factors corresponding to joint configurations. For the surface finishing factor corresponding to joint configuration 2, edge cutting process, edge treatment and surface finishing are to be taken into account.

Non-welded joints: thickness exponent and surface finishing factor **Table 4**

	Joint configuration, fatigue crack location and stress direction	Edge Cutting process	Edge treatment	Surface finishing	n	K_{sf}	S-N curve
1	Rolled or extruded plates and sections as well as seamless pipes, no surface or rolling defects 	N/A	N/A	No surface nor roll defect(1), (2)	0	0.94	B

Joint configuration, fatigue crack location and stress direction		Edge Cutting process	Edge treatment	Surface finishing	n	K_{sf}	S-N curve
2	Cut edges 	Machine-cutting e.g. by a thermal process. or sheared edge cutting.	Cutting edges chamfered or rounded by means of smooth grinding, groove direction parallel to the loading direction	Smooth surface free of cracks and notches[(1), (2)]	0.1	1.00	B
			Cutting edges broken or rounded.	Smooth surface free of cracks and notches. [(1), (2)]	0.1	1.07	B
			No edge treatment	Surface free of cracks and severe notches (inspection procedure) [(1), (2)]	0.1	1.0	C
		Manually thermally cut e.g. by flame cutting	No edge treatment	Surface free of cracks and severe notches (inspection procedure) [(1), (2)]	0.1	1.24	C
Note1: Stress increase due to geometry of cut-outs to be considered. Note2: Fine mesh FE analysis according to Sec 5, [2].							

5 FATIGUE DAMAGE CALCULATION

5.1 General

5.1.1

The design fatigue life is divided into a number of time periods due to different loading conditions and due to limitation of the corrosion protection.

It is assumed that the corrosion protection (i.e. coating system) is only effective for a limited number of years during which the structural details are protected, i.e. in-air environment. During the remaining part of the design life as specified in Table 5, the structural details are unprotected i.e. exposed to corrosive environment.

5.1.2

The elementary fatigue damage, given in [5.2], is the damage accumulated during a specific loading condition *(j)* associated with a specific environmental condition either protected condition, i.e. in-air environment, or unprotected condition, i.e. corrosive environment.

The combined fatigue damage, given in [5.3], is the combination of damage accumulated for a specific loading condition *(j)* for the in-air and corrosive environment time.

Total fatigue damage, given in [5.4], is the sum of the combined fatigue damages obtained for all loading conditions.

5.2 Elementary fatigue damage

5.2.1

The elementary fatigue damage for each fatigue loading condition *(j)* is to be calculated

independently for both protected in-air environment and unprotected corrosive environment, based on the fatigue stress range obtained for the predominant load case as follows:

$$D_{E(j)} = \frac{\alpha_{(j)} \cdot N_D}{K_2} \frac{\Delta\sigma_{FS,(j)}^m}{\left(\ln N_R\right)^{m/\xi}} \cdot \mu_{(j)} \cdot \Gamma\left(1+\frac{m}{\xi}\right)$$

where:

N_D : Total number of wave cycles experienced by ship during the design fatigue life, taken as:
$N_D = 31.557 \times 106\ (f_0 T_D) / (4 \log L)$

f_0 :Factor taking into account time in seagoing operations excluding time in loading and unloading, repairs, etc.
$f_0 = 0.85$.

$\alpha_{(j)}$: Fraction of time in each loading condition given in Ch 9, Sec 1, Table 1 for oil tanker and in Ch 9, Sec1, Table 3 for bulk carrier.

$\Delta\sigma_{FS,i(j)}$: Fatigue stress range at the reference probability level of exceedance of 10^{-2}, in N/mm^2.

N_R : Number of cycles corresponding to the reference probability of exceedance of 10^{-2}.
$N_R = 100$.

ξ : Weibull shape parameter,
$\xi = 1$.

$\Gamma(x)$: Complete Gamma function.

K_2 : Constant of the design S-N curve, as given in Table 2 for in-air environment and in Table 3 for corrosive environment.

$\mu_{(j)}$: Coefficient taking into account the change of inverse slope of the S-N curve, m,

- For in-air environment:

$$\mu_{(j)} = 1 - \frac{\left\{\gamma\left(1+\frac{m}{\xi}, \nu_{(j)}\right) - \nu_{(j)}^{-\Delta m/\xi} \cdot \gamma\left(1+\left(\frac{m+\Delta m}{\xi}\right), \nu_{(j)}\right)\right.}{\Gamma\left(1+\frac{m}{\xi}\right)}$$

$$\nu_{(j)} = \left(\frac{\Delta\sigma_q}{\Delta\sigma_{FS,(j)}}\right)^{\xi} \ln N_R$$

- For corrosive environment:
$\mu_{(j)} = 1.0$

$\gamma(a,x)$: Incomplete Gamma function.

$\Delta\sigma_q$: Stress range, in N/mm^2, corresponding to the intersection of the two segments of design S-N curve at $N=10^7$ cycles, as given in Table 2.

Δm : Change in inverse slope of S-N curve at $N=10^7$ cycles.
$\Delta m = 2$

5.3 Combined fatigue damage

5.3.1

The combined fatigue damage in protected in-air environment and unprotected corrosive environment for each loading condition *(j)* is to be calculated as follows:

$$D_{(j)} = D_{E,air(j)} \cdot \frac{T_D - T_C}{T_D} + D_{E,corr(j)} \cdot \frac{T_C}{T_D}$$

where:

$D_{E,air(j)}$: The elementary fatigue damage for in-air environment for loading condition *(j)* given in [5.2.1].

$D_{E,corr(j)}$: The elementary fatigue damage for corrosive environment for loading condition *(j)* as calculated in [5.2.1].

5.4 Total fatigue damage

5.4.1

The total fatigue damage for all applicable loading conditions is calculated as follows:

$$D = \sum_{j=1}^{n_{LC}} D_{(j)}$$

where:

$D_{(j)}$: Combined fatigue damage for each applicable loading condition, as given in [5.3].

Time in corrosive environment, T_C **Table 5**

Location of weld joint or structural detail	Time in corrosive environment T_C, in years
Water ballast tank	10
Oil cargo tank	
Lower part (1) of bulk cargo hold and water ballast cargo hold	
Bulk cargo hold and water ballast cargo hold except lower part (1)	5
Void space Other areas	
(1) Lower part means cargo hold part below a horizontal level located at a distance of 300 mm below the frame end bracket for holds of single side skin construction or 300 mm below the hopper tank upper end for holds of double side skin construction (see Pt 2, Ch 1, Sec 2, Figure 1).	

5.5 Fatigue life calculation

5.5.1

The fatigue life, T_F, is taken as:

$$T_F = \frac{T_D}{D_{air}} \qquad \text{if} \quad \frac{T_D}{D_{air}} \le (T_D - T_C)$$

$$T_F = T_D - T_C + \left(\frac{T_D}{D_{air}} - T_D + T_C \right) \frac{D_{air}}{D_{corr}} \qquad \text{otherwise.}$$

where:

D_{air} : Total fatigue damage for all loading conditions in-air environment taken as:

$$D_{air} = \sum_{j=1}^{n_{LC}} D_{E,air(j)}$$

D_{corr} : Total fatigue damage for all loading conditions in corrosive environment taken as:

$$D_{corr} = \sum_{j=1}^{n_{LC}} D_{E,corr(j)}$$

6 WELD IMPROVEMENT METHODS

6.1 General

6.1.1

Post-weld fatigue strength improvement methods are to be considered as a supplementary means of achieving the required fatigue life, and subjected to quality control procedures and corrosion protection in accordance with Pt 1, Ch 3, Sec 4.

6.1.2 Limitation of the benefit of post-weld treatment

For structural details where the benefit of post-weld treatment is applicable, the calculated fatigue life at the design stage for the considered structural detail excluding the post-weld treatment effects, is not to be less than T_{DF} / 1.47.

However, for structural details inside a bulk cargo hold the calculated fatigue life at design stage excluding post-weld treatment effects is not to be less than 25 years.

Note1: When T_{DF} is taken equal to 25 years, the calculated fatigue life at the design stage for the considered structural detail excluding the post-weld treatment effects, is not to be less than 17 years.

6.1.3 Post-weld treatment at fabrication stage

There is one basic post-weld treatment method considered in these Rules to improve fatigue strength at the fabrication stage, i.e. weld geometry control and defect removal method by burr grinding.

6.1.4 Weld toe

The improvement method is applied to the weld toe. Thus, it is intended to increase the fatigue life of the weld from the viewpoint of a potential fatigue failure arising at the weld toe. The possibility of failure initiation at other locations is always to be considered. If the failure is shifted from the weld toe to the root by applying post- weld treatment, there may be no significant improvement in the overall fatigue performance of the joint. Improvements of the weld root cannot be expected from treatment applied to weld toe.

A brief description of the method and the degree of improvement which can be achieved is given in [6.2].

6.1.5 Weld type for post-weld treatment

When weld improvements are planned, full or partial penetration welds with a minimum root face according to Ch 12, Sec 3, [2.4] are to be used to mitigate or to eliminate the possibility of cracking at the weld root.

6.2 Weld toe burr grinding

6.2.1

The weld may be machined using a burr grinding tool to produce a favourable shape to reduce stress concentrations and remove defects at the weld toe, see Figure 5. In order to eliminate defects, such as intrusions, undercuts and cold laps, the material in way of the weld toe is to be removed. The depth of grinding shall be at least 0.5mm below the bottom of any visible undercut. The total depth of the burr grinding is not to be greater than the lesser of 2 mm and of 7% the local gross thickness of the machined plate. Any undercut not complying with this requirement is to be repaired by an approved method.

6.2.2

To avoid introducing a detrimental notch effect due to small radius grooves, the burr diameter is to be scaled to the plate thickness at the weld toe being ground. The diameter is to be in the 10 to 25 mm range for application to welded joints with plate thickness from 10 to 50 mm. The resulting root radius of the groove is to be no less than 0.25 t_{as_built}. The weld throat thickness and leg length after burr grinding must comply with the rule requirements or any increased weld sizes as indicated on the approved drawings.

The inspection procedure is to include a check of the weld toe radius, the depth of burr grinding, and confirmation that the weld toe undercut has been removed completely.

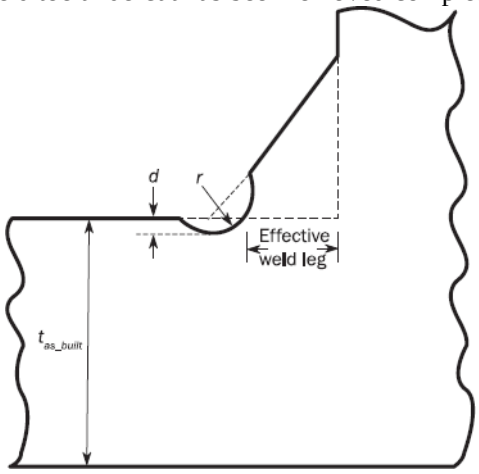

Figure 5 Details of ground weld toe geometry

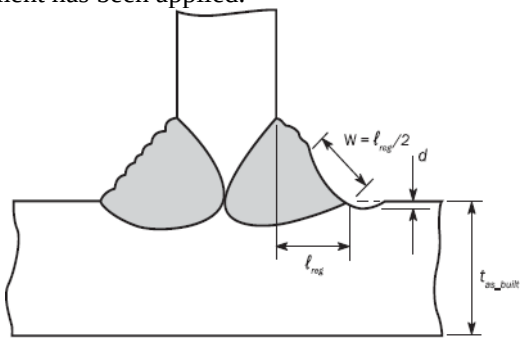
6.3 Fatigue improvement factor

6.3.1

The benefit of burr grinding corresponds to an increase in fatigue strength by a factor of 1.3 (i.e. a



reduction of the effective stress range by 1.3), reducing the damage in air to D_{air} / 2.2,
where:
D_{air} : Fatigue damage in air as given in Ch 9, Sec 3, [5.3.1].

6.4 Applicability

6.4.1

The application of post-weld improvement and fatigue improvement factor provided in this section is subject to following limitations:

- The weld type complies with [6.1.5].
- The weld improvement is effective in improving the fatigue strength of structural details under high cycle fatigue conditions therefore the fatigue improvements factors do not apply to low-cycle fatigue conditions, i.e. when N⩽5×104, where N is the number of life cycles to failure.
- Unless otherwise specifically stated, the fatigue improvement factor is to be used for welds, joining steel plates which are between 6 and 50 mm thick.
- Fatigue improvement factor is to be applied to as-welded transverse butt welds, as-welded T-joint and cruciform welds and as-welded longitudinal attachment welds excluding longitudinal end connections.
- In way of areas prone to mechanical damage, fatigue improvement may only be granted if these are adequately protected.
- Treatment of inter-bead toes is required for large multi-pass welds as shown in Figure 6.
- The builder is to provide the list of details and their locations on the ship for which the post-weld treatment has been applied.

l_{leg}: Weld leg length.
W : Width of groove.
d : Depth of grinding.

Figure 6 Extent of weld toe burr grinding to remove inter-bead toes on weld face

7 WORKMANSHIP

7.1 Application

7.1.1

In general, the fatigue performance of structural details can be improved by adopting enhanced workmanship standards, which include building alignment and weld control.

7.2 Workmanship control for construction details

7.2.1 Building alignment and tolerance control

Building alignment exceeding construction tolerance could introduce additional stress concentration for structural details, reducing the fatigue performance. The builder is responsible to comply with the construction requirements given in Ch 12, Sec 1.

7.2.2 Weld profile control

Poor weld geometry could introduce additional stress concentration; therefore special attention should be given to achieving a favourable geometry and smooth transition at the weld toe. Weld profile control, i.e. enhanced workmanship may be required by the Society in way of critical weld toe locations.
The weld notch stress concentration is a direct function of the weld flank angle and the weld toe radius.

The validity of the aforementioned S-N curves is based on a weld flank angle with a maximum mean value of 50 deg and on a weld toe radius with a minimum mean value of 0.5 mm. Welding details may be requested to be submitted for approval for some critical areas considering the calculated fatigue life.

ISC 7.2.2a For weld toe in critical locations, reference may be made to the requirements of 3.3.1 of ISC Guidelines for Construction Monitoring of Hull Structures.

7.2.3 Post-weld treatment methods

Post-weld treatment methods may be used to improve fatigue resistance of structural detail, as specified in [6].

At the design stage, the calculated fatigue life should not generally take into account any benefit that may be derived from such treatment. This benefit should only be considered in exceptional cases when the design fatigue life can not reasonably be achieved by adopting alternative design measures such as improvement of the shape of the cut-outs, soft brackets toes, local increase in thickness or other changes in geometry of the structural detail. This is to be considered on a case-by-case basis by the Society.

ISC 7.2.3a Where the benefit derived from the post-weld treatment is taken into account, the relevant workmanship requirements of post-weld treatment need to be approved by ISC.

ISC 7.2.3b Where grinding is applied, the following requirements are to be complied with: The grinding standard of structural details including the extent, smoothness particulars, final weld profile, grinding workmanship and quality acceptance criteria are to be clearly shown on the applicable drawings and submitted for review together with supporting calculations. The applicable conditions, methods and workmanship requirements for grinding are to be in accordance with paragraph 6, Section 3, Chapter 9 of this PART. Grinding has to extend to areas well outside the high stress region.

7.2.4 Detail design standard

Requirements for improved design of structural details are provided in Ch 9, Sec 6. The detail design standard also includes workmanship and welding requirements.

Section 4 SIMPLIFIED STRESS ANALYSIS

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

(i) : Suffix which denotes dynamic load case HSM, FSM, BSR-P, BSR-S, BSP-P, BSP-S, OST-P or OST-S specified in Ch 4, Sec 2, [3.1].
'i1' denotes dynamic load case HSM-1, FSM-1, BSR-1P, BSR-1S, BSP-1P, BSP-1S, OST-1P or OST-1S
'i2' denotes dynamic load case HSM-2, FSM-2, BSR-2P, BSR-2S, BSP-2P, BSP-2S, OST-2P or OST-2S.

(j) : Suffix which denotes loading condition:
'Full load' or 'Normal ballast' for oil tankers, as defined in Ch 9, Sec 1, [6.2].
'Full load homogeneous', 'Full load alternate', 'Normal ballast' or 'Heavy ballast' for bulk carriers, as defined in Ch 9, Sec 1, [6.3].

l_{bdg} : Effective bending span of stiffener, in m, as defined in Ch 3, Sec 7.

$I_{y\text{-}n50}$: Net vertical hull girder moment of inertia, at the longitudinal position being considered, in m^4.

$I_{z\text{-}n50}$: Net horizontal hull girder moment of inertia, at the longitudinal position being considered, in m^4.

y : Transverse coordinate of the load calculation point under consideration, in m.

z : Vertical coordinate of the load calculation point under consideration, in m.

z_n : Distance from the baseline to the horizontal neutral axis, in m.

f_c : Correction factor as defined in Ch 9, Sec 1, [5.1.2].

f_{NA} : Correction factor taken as:

- For bulk carrier:
  - $f_{NA} = 1.0$ for $0 < z \leqslant D/2$
  - $f_{NA} = 0.95$ for $z = D$
  - f_{NA} : linear interpolation for other values of z
- For oil tanker: $f_{NA} = 1.0$

K_a : Geometrical stress concentration factor for stress due to axial load given in [5.2].

K_b : Geometrical stress concentration factor for stress due to lateral pressure given in [5.2].

K_n : Stress concentration factor due to unsymmetrical stiffener geometry, as defined in [5.1].

1 GENERAL

1.1 Application

1.1.1

This section defines the procedure for a simplified stress assessment which is to be used to evaluate the fatigue strength of the longitudinal stiffener end connections.

1.1.2

The hot spot stress ranges and hot spot mean stresses in way of each end connection of longitudinal stiffener, as shown in Figure 2 are to be evaluated at the flange of the longitudinal stiffener in the following locations:

a) Transverse webs or floors other than those located
   - At transverse bulkhead including swash bulkhead of cargo hold or
   - In way of stool,

   such that additional hot spot stress due to the relative displacement is not to be considered.

b) Transverse webs or floors located
   - At transverse bulkhead including swash bulkhead of cargo hold or
   - In way of stool,

   such that additional hot spot stress due to the relative displacement are to be considered.

Stress concentration factors due to unsymmetrical stiffener geometry according [5.1] and due to the stiffener end connection geometry at point 'A' and 'B' according to [5.2] are to be applied.

1.2 Assumptions

1.2.1

The following assumptions are made in the fatigue assessment for longitudinal stiffener end connections:

1.2.1 The hot spot stress is based on:

a) Nominal stresses.

b) Stress concentration factors given in [5].

c) Loading conditions specified in Ch 9, Sec 1, [6].

1.2.2 The longitudinal stiffener end connection types are described in [5.2].

1.2.2

The end connections given in [5.2] are based on typical joint geometry under axial and lateral loadings. When a structural detail is different from those shown in Table 4, a finite element analysis is to be used to demonstrate the adequacy of the detail in terms of fatigue strength, according to [5.3].

2 HOT SPOT STRESS

2.1 Hot spot stress range

2.1.1

The hot spot stress range, in N/mm^2, due to dynamic loads for load case (*i*) of loading condition (*j*) is obtained from the following formula:

$$\Delta\sigma_{HS,i(j)} = \left|\left(\sigma_{GD,i1(j)} + \sigma_{LD,i1(j)} + \sigma_{dD,i1(j)}\right) - \left(\sigma_{GD,i2(j)} + \sigma_{LD,i2(j)} + \sigma_{dD,i2(j)}\right)\right|$$

where:

$\sigma_{GD,i1(j)}$,$\sigma_{GD,i2(j)}$: Stresses due to global hull girder wave bending moments, in N/mm^2, as defined in [3.1.1].

$\sigma_{LD,i1(j)}$,$\sigma_{LD,i2(j)}$: Stresses due to local dynamic pressure, in N/mm^2, as defined in [4.1.1].

$\sigma_{dD,i1(j)}$,$\sigma_{dD,i2(j)}$: Stresses due to relative displacement in wave, in N/mm^2, as defined in [4.2.4] and [4.2.5].

2.2 Hot spot mean stress

2.2.1

The hot spot mean stress, in N/mm^2, due to static and dynamic loads for load case (*i*) of loading condition (*j*) is obtained from the following formula:

$$\Delta\sigma_{mean,i(j)} = \sigma_{GS,(j)} + \sigma_{LS,(j)} + \sigma_{dS,(j)} + \sigma_{mLD,i(j)} + \sigma_{mGD,i(j)}$$

where for the load case (*i*) of loading condition (*j*):

$\sigma_{GS,(j)}$: Stress due to still water hull girder bending moment, in N/mm^2, as defined in [3.2.1].

$\sigma_{LS,(j)}$: Stress due to local static pressure, in N/mm^2, as defined in [4.1.2].

$\sigma_{dS,(j)}$: Stress due to relative displacement in still water, in N/mm^2, as defined in [4.2.7].

$\sigma_{mLD,i(j)}$: Mean stress due to local dynamic pressure, in N/mm^2, as defined as:

$$\sigma_{mLD,i(j)} = \frac{\sigma_{LD,i1(j)} + \sigma_{LD,i2(j)}}{2}$$

$\sigma_{LD,i1(j)}$, $\sigma_{LD,i2(j)}$: Stress due to local dynamic pressure, in N/mm^2, as defined in [4.1.1].

$\sigma_{mGD,i(j)}$: Mean stress due to global wave bending moment, in N/mm^2, as defined as:

$$\sigma_{mGD,i(j)} = \frac{\sigma_{GD,i1(j)} + \sigma_{GD,i2(j)}}{2}$$

$\sigma_{GD,i1(j)}$, $\sigma_{GD,i2(j)}$: Stress due to global wave bending moment, in N/mm^2, as defined in [3.1.1].

3 HULL GIRDER STRESS

3.1 Stress due to hull girder wave bending moments

3.1.1

The hull girder hot spot stress, in N/mm^2, for load cases *i1* and *i2* of loading condition (*j*) is obtained from the following formula:

$$\sigma_{GD,ik(j)} = f_c \cdot K_a \left(\frac{M_{wv-LC,ik}}{I_{y-n50}}(z - z_n) \cdot f_{NA} - \frac{M_{wh-LC,ik}}{I_{z-n50}} y\right) 10^{-3}$$

where:

$M_{wv\text{-}LC,\ ik}$: Vertical wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, at the hull girder load calculation point of the considered longitudinal position for the loading condition (*j*) for *ik* being equal to *i*1 and *i*2.

$M_{wh\text{-}LC,\ ik}$: Horizontal wave bending moment, in kNm, of the considered dynamic load case, as defined in Ch 4, Sec 4, at the hull girder load calculation point of the considered longitudinal position for the loading condition (*j*) for *ik* being equal to *i*1 and *i*2.

3.2 Stress due to still water hull girder bending moment

3.2.1

The hull girder hot spot stress due to still water bending moment, in N/mm^2, in loading condition (*j*) is obtained from the following formula:

$$\sigma_{GS,(j)} = \frac{f_c \cdot f_{NA} \cdot K_a \cdot \beta_{(j)} \cdot M_{sw} \cdot (z - z_n)}{I_{y-n50}} 10^{-3}$$

where:

M_{sw} : Permissible still water vertical bending moment, in kNm, as defined in Ch 4, Sec 4 at the hull girder load calculation point of the considered longitudinal position.

$\beta_{(j)}$: Fraction of permissible still water vertical bending moment, as defined in Table 1.

Fraction of permissible still water vertical bending moments, $\beta_{(j)}$ **Table 1**

Ship type	Loading conditions	Longitudinal position on the considered section	$\beta_{(j)}$
Oil tankers	Homogeneous	N/A	0.60 in sagging condition
	Normal ballast		0.80 in hogging condition
Bulk carriers	Homogeneous		0.40 in sagging condition
	Alternate		0.75 in hogging condition
	Normal ballast		0.80 in hogging condition
	Heavy ballast (See Figure 1)	Ballast hold	0.75 in sagging condition
		Cargo holds adjacent to ballast hold	Linear interpolation between 0.75 in sagging condition and 0.45 in hogging condition
		Other cargo holds	0.45 in hogging condition

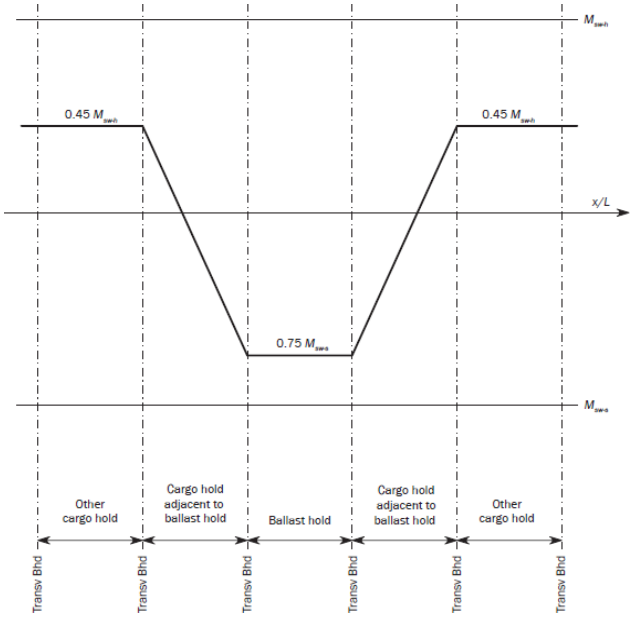


Figure 1 Distribution of still water bending moment for fatigue assessment in way of ballast hold

4 LOCAL STIFFENER STRESS

4.1 Stress due to stiffener bending

4.1.1 Stress due to dynamic pressure

The hot spot stress, in N/mm^2, due to local dynamic pressure in load case *i*1 and *i*2 for loading condition (*j*) is obtained from the following formula:

$$\sigma_{LD,ik(j)} = \frac{K_b K_n s l_{bdg}^2 (\eta_W f_{NL} P_{W,ik(j)} + \eta_{ld} P_{Id,ik(j)} + \eta_{bd} P_{bd,ik(j)}) \left(1 - \frac{6x_e}{l_{bdg}} + \frac{6x_e^2}{l_{bdg}^2}\right)}{12 Z_{eff-n50}}$$

where:

$P_{W,\,ik(j)}$: Dynamic wave pressure, at the mid span, in kN/m^2, specified in Ch 4, Sec 5, [1.4], in load case *i*1 and *i*2 for loading condition (*j*).

$P_{ld,\,ik(j)}$: Dynamic liquid tank pressure, at the mid span, in kN/m^2, as specified in Ch 4, Sec 6, [1.1.1], in load case *i*1 and *i*2 for loading condition (*j*).

Pressure acting on both sides of the stiffener, i.e. applied on the attached plate on stiffener side or on opposite side to the stiffener, could be simultaneously considered if relevant in the loading condition.

For the deck longitudinal stiffeners of bulk carriers, no internal pressure from the topside tank is considered.

$P_{bd,\,ik(j)}$: Dynamic dry bulk cargo pressure at the mid span, in kN/m^2, as specified in Ch 4, Sec 6, [2.4.1], in load case *i*1 and *i*2 for loading condition (*j*).

η_w, η_{ld}, η_{bd}: Pressure normal coefficients, taken as:

$\eta = 1$ when the considered pressure is applied on the stiffener side,

$\eta = -1$ otherwise.

f_{NL} : Correction factor for the non-linearity of the wave pressure taken as:

$$f_{NL} = 1 \qquad z > T_{LC} + 2h_w$$

$$f_{NL} = 2.5\frac{z - T_{LC}}{h_w} - 4 \qquad T_{LC} + 1.8h_w < z \le T_{LC} + 2h_w$$

$$f_{NL} = 0.5\frac{z - T_{LC}}{h_w} - 0.4 \qquad T_{LC} + 1.6h_w < z \le T_{LC} + 1.8h_w$$

$$f_{NL} = 0.4 \qquad T_{LC} + 1.2h_w < z \le T_{LC} + 1.6h_w$$

$$f_{NL} = 0.7 - 0.25\frac{z - T_{LC}}{h_w} \qquad T_{LC} + 0.6h_w < z \le T_{LC} + 1.2h_w$$

$$f_{NL} = 1 - 0.75\frac{z - T_{LC}}{h_w} \qquad T_{LC} - 0.2h_w < z \le T_{LC} + 0.6h_w$$

$$f_{NL} = 0.1875\frac{z - T_{LC}}{h_w} + 1.1875 \qquad T_{LC} - h_w < z \le T_{LC} - 0.2h_w$$

$$f_{NL} = 1 \qquad z \le T_{LC} - h_w$$

h_w : Water head equivalent to the pressure at waterline, in m, as defined in Ch 4, Sec 5.

x_e : Distance, in m, to the hot spot from the closest end of the span l_{bdg}, as defined in Figure 2.

$Z_{eff\text{-}n50}$: Net section modulus, in cm^3, of the considered stiffener calculated considering an effective breadth b_{eff} of attached plating.

b_{eff} : Effective breadth, in mm, of attached plating specified at the ends of the span and in way of end brackets and supports, taken as:

$$b_{eff} = s \cdot \min\left[\frac{1.04}{1 + \frac{3}{\left(\frac{l_{bdg}}{s}\left(1 - \frac{1}{\sqrt{3}}\right) \cdot 10^3\right)^{1.35}}}; 1.0\right] \qquad \text{for} \quad \frac{l_{bdg}}{s}\left(1 - \frac{1}{\sqrt{3}}\right) \times 10^3 \ge 1$$

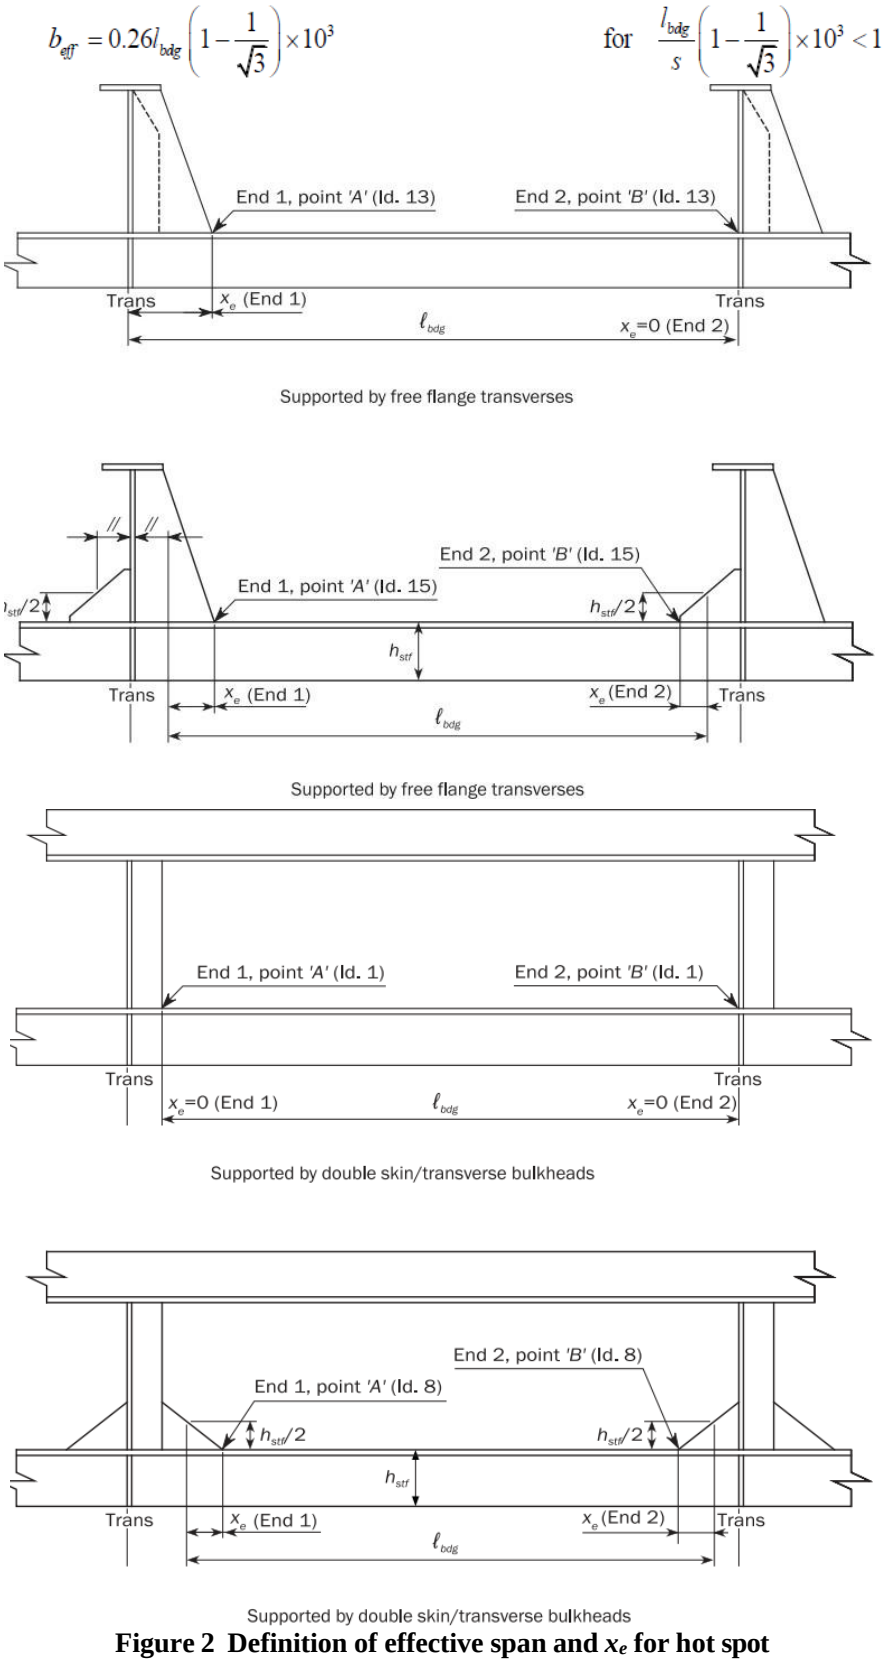

Figure 2 Definition of effective span and x_e for hot spot

4.1.2 Stress due to static pressure

The hot spot stress due to local static pressure, in N/mm2, for loading condition (*j*) is obtained from the following formula:

$$\sigma_{LS,(j)} = \frac{K_b K_n s l_{bdg}^2 (\eta_s P_{s,(j)} + \eta_{ls} P_{ls,(j)} + \eta_{bs} P_{bs,(j)}) \left(1 - \frac{6x_e}{l_{bdg}} + \frac{6x_e^2}{l_{bdg}^2}\right)}{12 Z_{eff-n50}}$$

where:

$P_{S,(j)}$: Static external pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 5, [1.2].

$P_{ls,(j)}$:Static liquid tank pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 6, [1.1.1].Pressure acting on both sides could be simultaneously considered if relevant in the loading condition.

$P_{bs,(j)}$: Static dry bulk cargo pressure, in kN/m^2, in loading condition (j) specified in Ch 4, Sec 6, [2.4.1].

η_s, η_{ls}, η_{bs} : Pressure normal coefficients, taken as:

η = 1 when the considered pressure is applied on the stiffener side,

η = -1 otherwise.

4.2 Stress due to relative displacement

4.2.1 General

For longitudinal stiffener end connections fitted on transverse web or floor located

- At transverse bulkhead including swash bulkhead of cargo hold or
- In way of stool,

the additional hot spot stress due to the relative displacement is to be considered.

4.2.2 Relative displacement definition

The relative displacement is defined as follows.

- For longitudinals penetrating floors in way of stool the relative displacement is defined as the displacement of the longitudinal measured at the first floor forward (*Fwd*) or afterward (*Aft*) relative to the displacement of the longitudinal at the floor in way of stool.
- For other longitudinals, the relative displacement is defined as the displacement of the longitudinal measured at the first transverse web frame (or floor) forward (*Fwd*) or afterward (*Aft*) relative to the displacement of the longitudinal at the transverse bulkhead including swash bulkhead.

4.2.3 Sign convention

Where the stress at the hot spot location, i.e. at the flange of longitudinal, due to relative displacement is in tension, the sign of the relative displacement is positive.

4.2.4 Oil tankers

The additional hot spot stress due to relative displacement for load case $i1$ and $i2$ of loading condition (j) for an oil tanker is to be accounted for either using finite element method as described in [4.2.6] or by applying a stress factor on the local dynamic stress component as described in the following:

$$\sigma_{dD,ik(j)} = (K_d - 1) \cdot \sigma_{LD,ik(j)}$$

where:

$\sigma_{LD,ik(j)}$: Local dynamic stress defined in [4.1.1].

K_d : Bending stress factor for longitudinal stiffeners caused by relative displacement between supports, shown on Figure 3, as given in Table 2.

Bending stress factor of longitudinals due to relative displacement between transverse bulkhead (including swash bulkhead) and adjacent web frames (floors) Table 2

Location		K_d factor	
		Full load condition	Ballast condition
Bottom longitudinal	Mid position between longitudinal bulkhead, bottom girders or buttress structure	1.50	
	At longitudinal bulkhead, bottom girders (except centre line girder) or buttress structure	1.15	
	At centre line girder	1.30	
	Intermediate position between above bottom positions	Linear interpolation	
Side longitudinals	Mid position between lowest side stringer and deck at side	1.30	1.15
	Lowest side stringer and deck at side	1.15	1.15
	Intermediate positions	Linear interpolation	1.15
Other longitudinals		1.15	

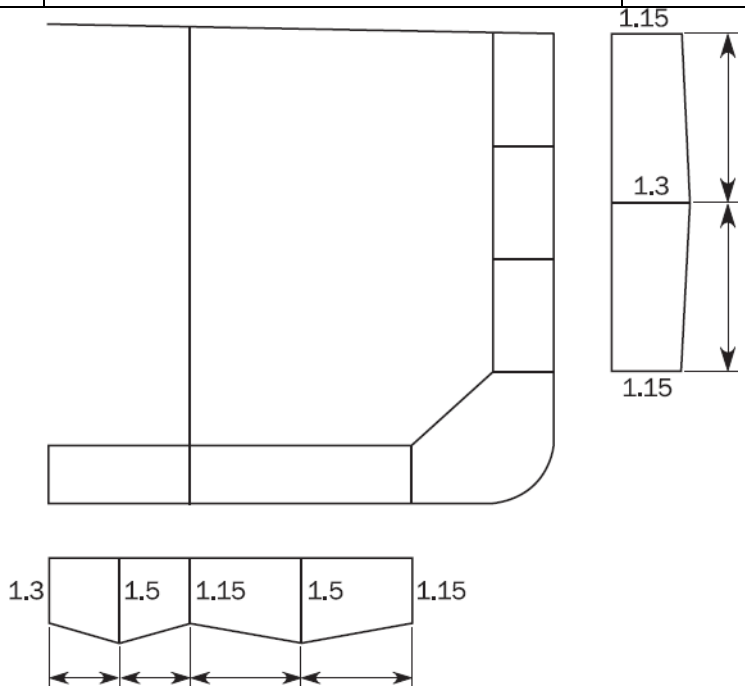

Figure 3 K_d factor in full load condition for oil tanker with two longitudinal bulkheads

4.2.5 Bulk carriers

The additional hot spot stress due to relative displacement for load case *i1* and *i2* of loading condition (*j*) for a bulk carrier is to be calculated using finite element method as described in [4.2.6].

4.2.6 Stress due to relative displacement derived using FE method

The following procedure is based on a cargo hold model complying with Ch 7, Sec 2, [2] to calculate the stress due to relative displacements. The stress due to relative displacements, in N/mm2, for load case *i1* and *i2* of loading condition (*j*) for both locations "*a*" and "*f*" is to be calculated directly using the following expression:

$$\sigma_{dD,ik(j)} = \begin{cases} K_b\sigma_{dFwd-a,ik(j)} + K_b\sigma_{dAft-a,ik(j)} & \text{for location "}a\text{"} \\ K_b\sigma_{dFwd-f,ik(j)} + K_b\sigma_{dAft-f,ik(j)} & \text{for location "}f\text{"} \end{cases} \quad (k = 1, 2)$$

where:

a, f : Suffix which denotes the location as indicated in Figure 4.

Aft, Fwd : Suffix which denotes the direction, afterward (*Aft*) or forward (*Fwd*), from the transverse bulkhead. as shown in Figure 4.

K_b : Stress concentration factor due to bending for the location '*a*' or '*f*' which may correspond to points '*A*' or '*B*' as defined in Table 4.

$\sigma_{dFwd\text{-}a,ik(j)}, \sigma_{dAft\text{-}a,ik(j)}, \sigma_{dFwd\text{-}f,ik(j)}, \sigma_{dAftd\text{-}f,ik(j)}$: Additional stress at location '*a*' and '*f*', in N/mm^2, due to the relative displacement between the transverse bulkhead including swash bulkhead or floors in way of stool and the forward (*Fwd*) and afterward (*Aft*) transverse web or floor respectively for load case *i1* and *i2* of loading condition (*j*), taken as:

$$\sigma_{dFwd-a,ik(j)} = \frac{3.9\delta_{Fwd,ik(j)} EI_{Aft-n50} I_{Fwd-n50}}{Z_{Aft-n50} l_{Fwd} \left(l_{Aft} I_{Fwd-n50} + l_{Fwd} I_{Aft-n50}\right)} \left(1 - 1.15 \frac{|x_{eAft}|}{l_{Aft}}\right) 10^{-5}$$

$$\sigma_{dAft-a,ik(j)} = \left[\frac{3.9\delta_{Aft,ik(j)} EI_{Aft-n50} I_{Fwd-n50}}{Z_{Aft-n50} l_{Aft} \left(l_{Aft} I_{Fwd-n50} + l_{Fwd} I_{Aft-n50}\right)} \left(1 - 1.15 \frac{|x_{eAft}|}{l_{Aft}}\right) - \frac{0.9\delta_{Aft,ik(j)} EI_{Aft-n50} |x_{eAft}|}{Z_{Aft-n50} l_{Aft}^3}\right] 10^{-5}$$

$$\sigma_{dFwd-f,ik(j)} = \left[\frac{3.9\delta_{Fwd,ik(j)} EI_{Aft-n50} I_{Fwd-n50}}{Z_{Fwd-n50} l_{Fwd} \left(l_{Aft} I_{Fwd-n50} + l_{Fwd} I_{Aft-n50}\right)} \left(1 - 1.15 \frac{|x_{eFwd}|}{l_{Fwd}}\right) - \frac{0.9\delta_{Fwdt,ik(j)} EI_{Fwd-n50} |x_{eFwd}|}{Z_{Fwd-n50} l_{Fwd}^3}\right] 10^{-5}$$

$$\sigma_{dAft-f,ik(j)} = \frac{3.9\delta_{Aft,ik(j)} EI_{Aft-n50} I_{Fwd-n50}}{Z_{Fwdt-n50} l_{Aft} \left(l_{Aft} I_{Fwd-n50} + l_{Fwd} I_{Aft-n50}\right)} \left(1 - 1.15 \frac{|x_{eFwd}|}{l_{Fwd}}\right) 10^{-5}$$

$I_{Fwd\text{-}n50}, I_{Aft\text{-}n50}$: Net moment of inertia, in cm^4, of forward (*Fwd*) and afterward (*Aft*) longitudinal.

$Z_{Fwd\text{-}n50}, Z_{Aft\text{-}n50}$: Net section modulus of forward (*Fwd*) and afterward (*Aft*) stiffener, in cm^3.

l_{Fwd}, l_{Aft} : Span, in m, of forward (*Fwd*) and afterward (*Aft*) longitudinal, as shown in Figure 4.

x_{eFwd}, x_{eAft} : Distance, in m, as shown in Figure 2, to the hot spot in location '*a*' or '*f*' from the closest end of l_{Fwd} and l_{Aft} respectively.

$\delta_{Fwd,ik(j)}, \delta_{Aft,ik(j)}$: Relative displacement in the direction perpendicular to the attached plate, in mm, between the transverse bulkhead (including swash bulkhead or floor in way of stools) and the forward (*Fwd*) or afterward (*Aft*) transverse web (or floor) as shown in Figure 4.

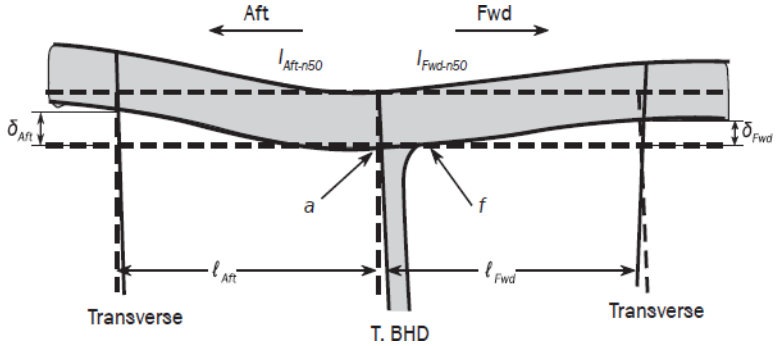

Figure 4 Definition of the relative displacement (example of the side longitudinal)

4.2.7 Stress due to relative displacement in still water

The additional hot spot stress, in N/mm^2, in still water, due to the relative displacement in the direction perpendicular to the attached plate between the transverse bulkhead including swash bulkhead or floor in way of stools and the adjacent transverse web or floor is to be obtained according to procedures of [4.2.4] and [4.2.5] for oil tankers and bulk carriers respectively, replacing dynamic local stress σ_{LD} and dynamic pressure with static local stress σ_{LS} and static pressure.

5 STRESS CONCENTRATION FACTORS

5.1 Unsymmetrical stiffener

5.1.1

The stress concentration factor K_n for unsymmetrical flange of built-up and rolled angle stiffeners under lateral load, calculated at the web's mid-thickness position, as shown in Figure 5, is to be taken as:

$$K_n = \frac{1+\lambda\beta^2}{1+\lambda\beta^2\psi_z}$$

where:

$$\lambda = \frac{3\left(1+\frac{\eta}{280}\right)}{1+\frac{\eta}{40}}$$

$$\eta = \frac{l_{bdg}^4 \cdot 10^{12}}{b_{f-n50}^3 \cdot t_{f-n50} \cdot h_{stf-n50}^2 \cdot \left(\frac{4 \cdot h_{stf-n50}}{t_{w-n50}^3} + \frac{s}{t_{p-n50}^3}\right)}$$

$$\beta = 1 - \frac{2b_{g-n50}}{b_{f-n50}} \quad \text{for built-up profiles}$$

$$\beta = 1 - \frac{t_{w-n50}}{b_{f-n50}} \quad \text{for rolled angle profiles.}$$

$b_{g\text{-}n50}$: Eccentricity of the stiffener equal to the distance from flange's edge to web's centreline, in mm, as shown in Figure 6.

$b_{f\text{-}n50}$: Net breadth of flange, in mm, as shown in Figure 6.

$t_{f\text{-}n50}$: Net flange thickness, in mm, as shown in Figure 6.

$h_{stf\text{-}n50}$: Net stiffener height, including face plate, in mm, as shown in Figure 6.

$t_{w\text{-}n50}$: Net web thickness, in mm, as shown in Figure 6.

$h_{w\text{-}n50}$: Net web's height stiffener, in mm, as shown in Figure 6.

$t_{p\text{-}n50}$: Net thickness of attached plating, in mm, as shown in Figure 6.

Ψ_z : Coefficient given as:

$$\psi_z = \frac{h_{w-n50}^2 t_{w-n50}}{4Z_{n50}} 10^{-3}$$

Z_{n50} : Net section modulus, in cm^3, of stiffener with an attached plating breadth equal to the stiffener spacing.

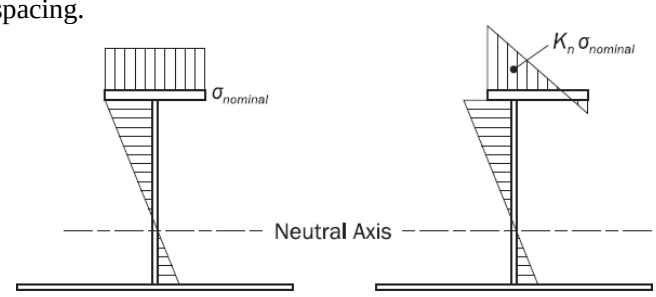

Figure 5 Bending stress in stiffener with symmetrical and unsymmetrical flange

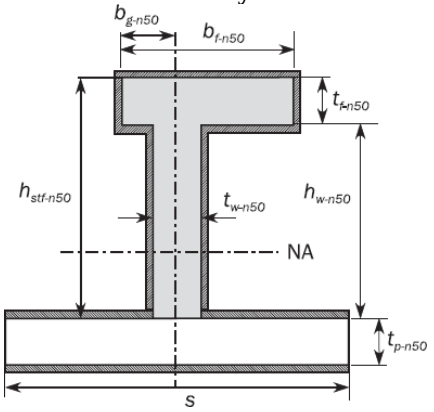

Figure 6 Stiffener - net scantling

5.1.2 Bulb profiles

For bulb profiles K_n factor is to be calculated using the equivalent built-up profile as shown in Figure 7. The flange of the equivalent built-up profile is to have the same properties as the bulb flange, i.e. same cross sectional area and moment of inertia about the vertical axis and neutral axis position. For HP bulb profiles, examples of the equivalent built up profile dimensions are listed in Table 3.

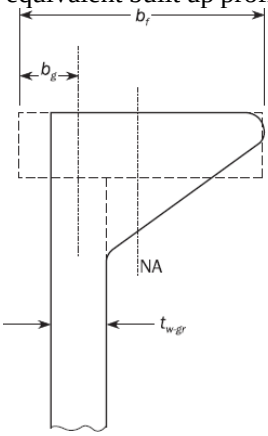

Figure 7 Bulb profile and equivalent built-up profile

HP equivalent built-up profile dimensions **Table 3**

HP-bulb		Equivalent built-up flange in gross thickness		
Height (mm)	Gross web thickness, $t_{w\text{-}gr}$ (mm)	b_f (mm)	$t_{f\text{-}gr}$ (mm)	b_g (mm)
200	9 – 13	$t_{w\text{-}gr}$ + 24.5	22.9	($t_{w\text{-}gr}$ + 0.9)/2
220	9 – 13	$t_{w\text{-}gr}$ + 27.6	25.4	($t_{w\text{-}gr}$ + 1.0)/2
240	10 – 14	$t_{w\text{-}gr}$ + 30.3	28.0	($t_{w\text{-}gr}$ + 1.1)/2
260	10 – 14	$t_{w\text{-}gr}$ + 33.0	30.6	($t_{w\text{-}gr}$ + 1.3)/2
280	10 – 14	$t_{w\text{-}gr}$ + 35.4	33.3	($t_{w\text{-}gr}$ + 1.4)/2
300	11 – 16	$t_{w\text{-}gr}$ + 38.4	35.9	($t_{w\text{-}gr}$ + 1.5)/2
320	11 – 16	$t_{w\text{-}gr}$ + 41.0	38.5	($t_{w\text{-}gr}$ + 1.6)/2
340	12 – 17	$t_{w\text{-}gr}$ + 43.3	41.3	($t_{w\text{-}gr}$ + 1.7)/2
370	13 – 19	$t_{w\text{-}gr}$ + 47.5	45.2	($t_{w\text{-}gr}$ + 1.9)/2
400	14 – 19	$t_{w\text{-}gr}$ + 51.7	49.1	($t_{w\text{-}gr}$ + 2.1)/2
430	15 – 21	$t_{w\text{-}gr}$ + 55.8	53.1	($t_{w\text{-}gr}$ + 2.3)/2

5.2 Longitudinal stiffener end connections

5.2.1

The stress concentration factors K_a and K_b are given in Table 4 for end connection of stiffeners subjected to axial and lateral loads. The values given in Table 4 for soft toe are valid provided the toe geometry complies with the requirements given in [5.2.5]. The stress concentration factor K_b given for lateral loads are to be used also for stress due to relative displacements.

5.2.2 Other connection types

When connection types other than those given in Table 4 are proposed, the fatigue strength for the proposed connection type is to be assessed either by performing a very fine mesh FE analysis as described in Ch 9, Sec 5 to obtain directly the hot spot stress, or by calculating the stress concentration factor using FE analysis according to [5.3].

5.2.3 Overlapped connection

Overlapped connection types for longitudinal stiffeners, i.e. attachments welded to the web of the longitudinals, are not to be used in the cargo hold region.

5.2.4 End stiffener without connection to web stiffener

Where the web stiffener is omitted or not connected to the longitudinal flange in way of:

- Side shell below 1.1 T_{sc}.
- Bottom.
- Inner hull longitudinal bulkhead below 1.1 T_{sc}.
- Hopper.
- Topside tank sloping plating below 1.1 T_{sc}.
- Inner bottom.

the following is required:

- A complete collar as defined in Figure 8 (i.e. connection type ID 31 of Table 4), or,
- A detail design for cut-outs as described in Ch 9, Sec 6, [2.1].

Equivalence to cut-outs given in Ch 9, Sec 6, [2.1] may be accepted provided it is assessed for fatigue by using comparative FE analysis which is based on hot spot stress around the cut-out in the web plate of the primary supporting member inclusive of the collar, as given in Ch 9, Sec 6, [2.2].

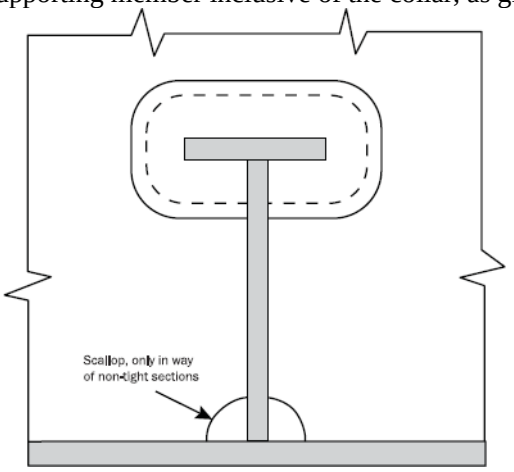

Figure 8 Complete collar

5.2.5 Soft toe of web stiffener and backing bracket

The toe geometry end connection of web stiffener and backing bracket is to comply with the following:

$\theta \leqslant 20$

$h_{toe} \leqslant \max(t_{bkt\text{-}gr}; 15)$

where:

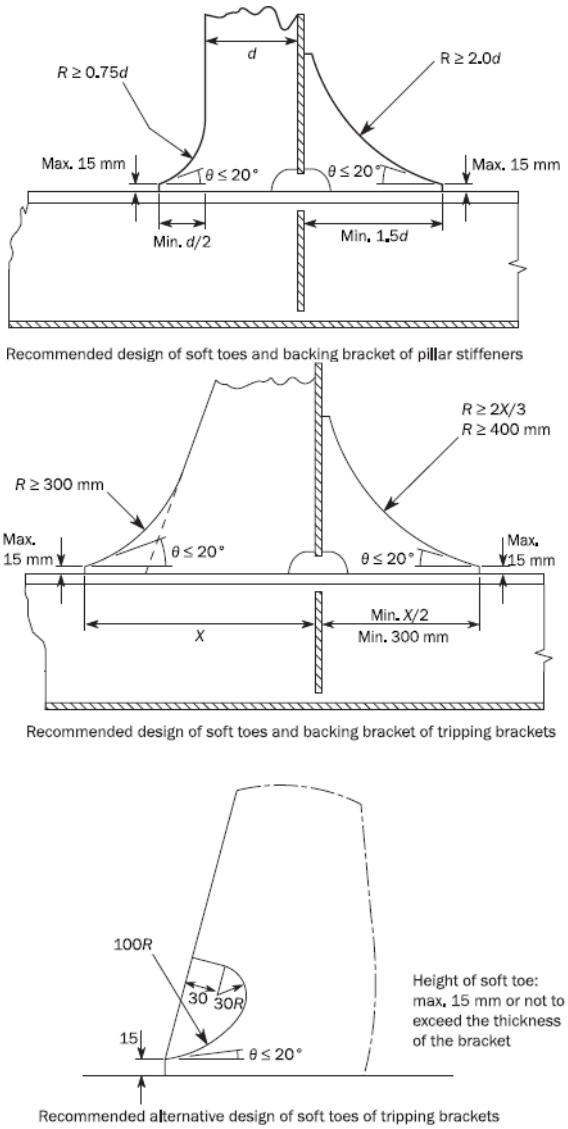
θ : Angle of the toe, in deg, as shown in Figure 9.

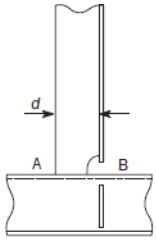
h_{toe} : Height of the toe, in mm, as shown in Figure 9.

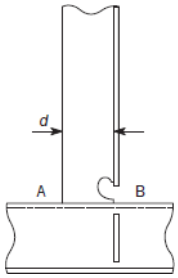
$t_{bkt\text{-}gr}$: Gross thickness of the bracket, in mm.

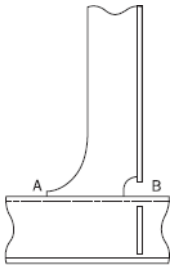
5.2.6 Recommended detail designs

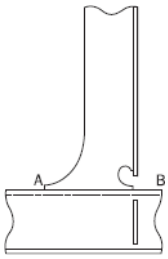
Recommended detail designs for longitudinal end connections with soft toes and backing brackets are given in Figure 9.

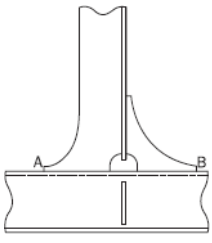


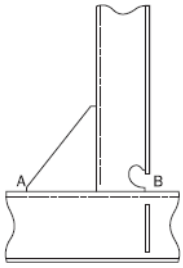


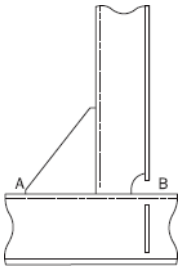


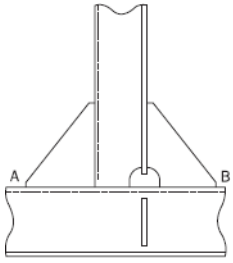


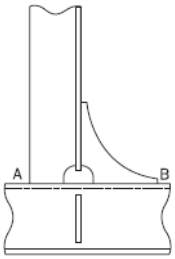


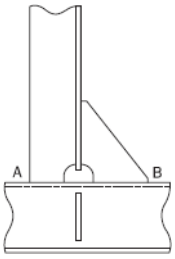


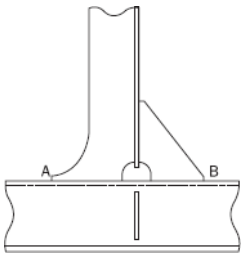


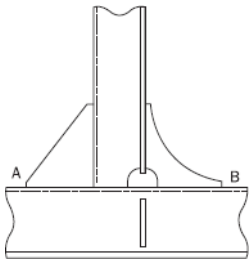


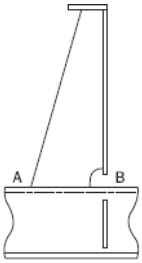


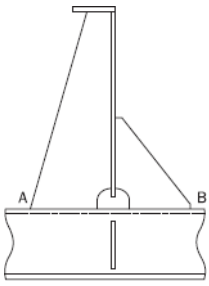


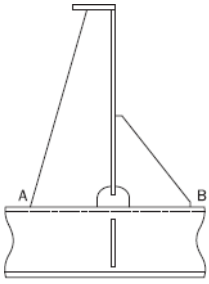


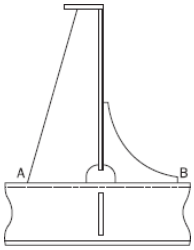


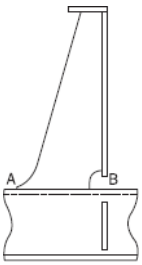


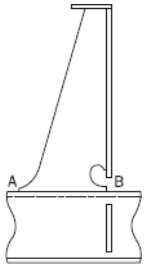


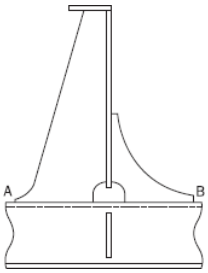


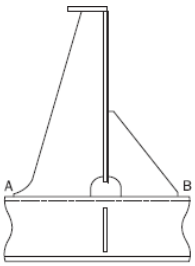


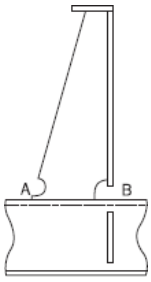


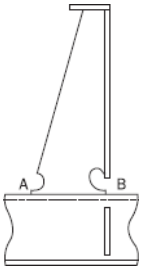












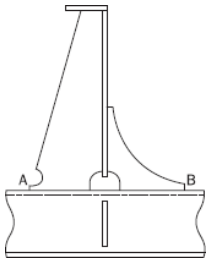


Figure 9 Detail design for soft toes and backing brackets

(1) The attachment length *d*, in mm, is defined as the length of the welded attachment on the longitudinal stiffener flange without deduction of scallop.
(2) Where the longitudinal stiffener is a flat bar and there is a web stiffener/bracket welded to the flat bar stiffener, the stress concentration factor listed in the table is to be multiplied by a factor of 1.12. when the thickness of attachment is thicker than the 0.7 times thickness of flat bar stiffener This also applies to unsymmetrical profiles where there is less than 8 mm clearance between the edge of the stiffener flange and the attachment, e.g. bulb or angle profiles where the clearance of 8 mm cannot be achieved.
(3) Designs with overlapped connection / attachments, see [5.2.3].
(4) ID 31 and 32 refer to details where web stiffeners are omitted or not connected to the longitudinal stiffener flange. See [5.2.4]
(5) For connection type ID 32 with no collar and/or web plate welded to the flange, the stress concentration factors provided in this table are to be used irrespective of slot configuration.
(6) The fatigue assessment point 'A' is located at the connection between the stiffener web and the transverse web frame or lug plate.

5.3 Alternative design

5.3.1 Derivation of alternative stress concentration factors

Upon agreement by the Society, the geometrical stress concentration factors for alternative designs are to be calculated by a very fine mesh FE analysis according to the requirements given in Ch 9, Sec 5. Additional requirements for derivation of geometrical stress concentration factors for stiffener end connections using very fine mesh FE analysis are given below:

a) FE model extent: the FE model, as shown in Figure 10, is to cover at least four web frame spacings in the longitudinal stiffener direction with the detail to be considered located at the middle frame. The same type of end connection is to be modelled at all the web frames. In the transverse direction, the model may be limited to one stiffener spacing.
b) Load application: in general, two loading cases are to be considered:
c) Axial loading by enforced displacement applied to the model ends and
d) Lateral loading by unit pressure load applied to the shell plating.
e) Boundary conditions:
f) Symmetry conditions are applied along the longitudinal cut of the plate flange, along

transverse and vertical cuts on web frames and on top of the web stiffener.

g) For lateral pressure loading: the model is to be fixed in all degrees of freedom at both forward and aft ends.

h) For axial loading: the model is to be fixed for displacement in the longitudinal direction at the aft end of the model while enforced axial displacement is applied at the forward end, or vice versa.

i) FE mesh density: At the location of the hot spots under consideration, the element size is to be in the order of the thickness of the stiffener flange. or 10mm depending on the type of stiffener In the remaining part of the model, the element size is to be in the order of s/10, where s is the stiffener spacing.

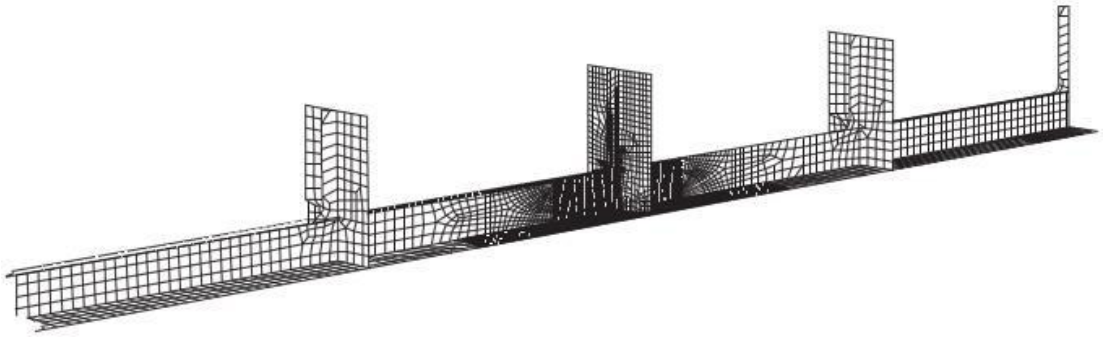

Figure 10 Fine mesh finite element model for derivation of geometrical stress concentration factor(example of stiffener with flange)

For the 2 loading cases specified above, the stress concentration factors are determined as follows:

- For the axial loading case:

$$K_a = \frac{\sigma_{HSAx}}{\sigma_{NomAx}}$$

- For the bending loading case:

$$K_b = \frac{\sigma_{HSBd}}{\sigma_{NomBd}}$$

σ_{HSAx} : Hot spot stress, in N/mm^2, determined at the stiffener flange for the axial load.

σ_{NomAx}: Nominal axial stress, in N/mm^2, calculated at the stiffener flange according to [3.1] for the axial load applied for the FE calculation.

σ_{HSBd} : Hot spot stress, in N/mm^2, determined at the stiffener flange for the unit pressure load.

σ_{NomBd}: Nominal bending stress, in N/mm^2, calculated at the stiffener flange according to [4.1] in way of the hot spot for the unit pressure load applied for the FE calculation.

The derivation of geometrical stress concentration factors for alternative designs is to be documented and provided to the Society.

ISC 5.3.1a FE model extent

(1) FE model extent

The FE model, as shown in Figure ISC 5.3.1a(1), is to cover at least four web frame spacings in the longitudinal stiffener direction with the detail to be considered located at the middle web frame. The same type of end connection is to be modeled at all the web frames. In the transverse direction, the model is to cover at least half the stiffener spacing on both sides; in the vertical direction, it is to maintain at least half the web height.

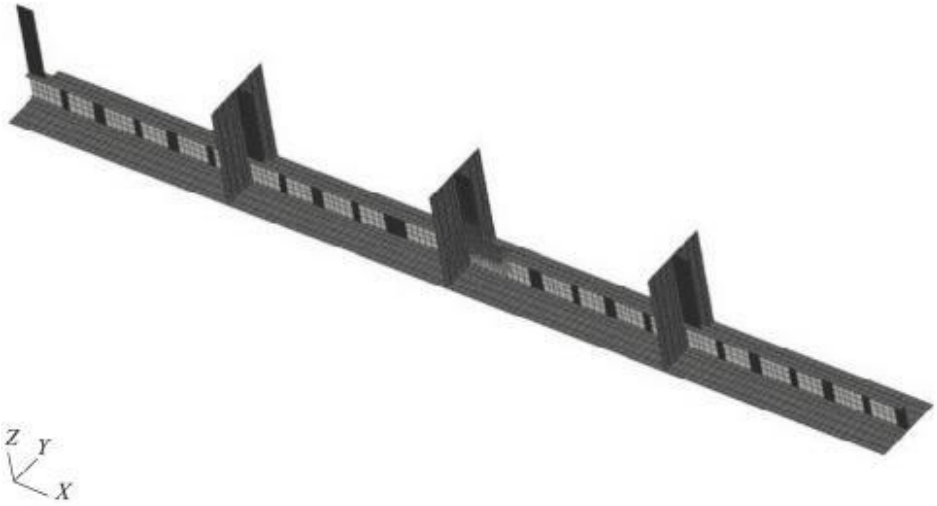

Figure ISC 5.3.1a(1) Longitudinal Extent of Fine Mesh Finite Element Model

(2) FE mesh size

At the location of the hot spots under consideration, the mesh size of at least 10 elements is to be the same as the thickness of the flange of longitudinals. In the remaining part of the model, the mesh size is to be taken as1/10 of the spacing of longitudinals. Attention is to be given to the smooth transition of mesh size. It is recommended to use mm as the length unit during modeling.

(3) Load case

Axial load case: enforced displacement of 1 mm applied to the model ends.

Lateral load case: uniformly distributed unit load applied to the attached plating of longitudinal, in 1 kN/m^2, i.e. 0.001 Mpa.

(4) Boundary conditions

Symmetry conditions:

a) *angular displacement $\theta_x = 0$, displacement $\delta_y = 0$ along the longitudinal edge of the attached plate, see Figure ISC 5.3.1a(2);*
b) *angular displacement $\theta_z = 0$, displacement $\delta_y = 0$ along vertical edge on web frames, see Figure ISC 5.3.1a(3);*
c) *angular displacement $\theta_y = 0$, displacement $\delta_z = 0$ along transverse edge on top of web frames, see Figure ISC 5.3.1a(4);*
d) *angular displacement $\theta_x = 0$, displacement $\delta_z = 0$ on top of the web stiffener, see Figure ISC 5.3.1a(5).*

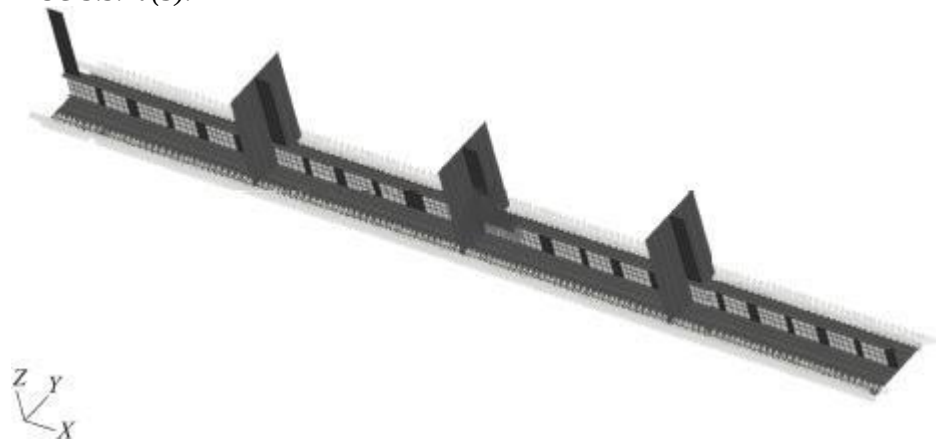

Figure ISC 5.3.1a(2) Boundary Condition of Fine Mesh Finite Element Model (a)

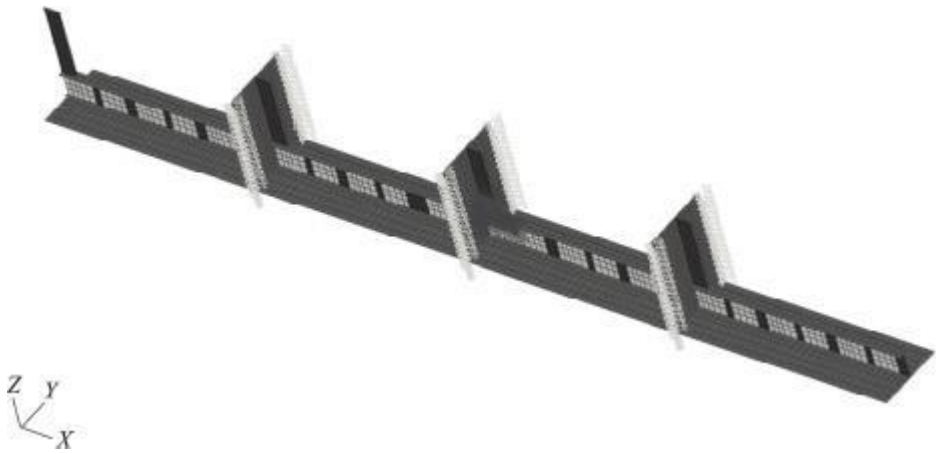

Figure ISC 5.3.1a(3) Boundary Conditions of Fine Mesh Finite Element Model(b)

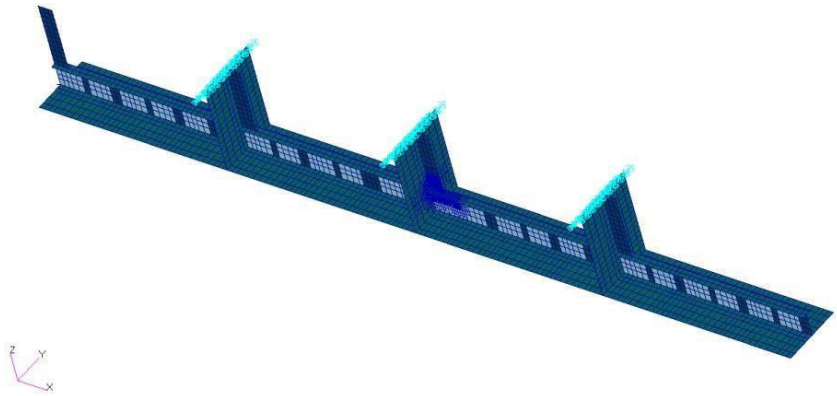

Figure ISC 5.3.1a(4) Boundary Conditions of Fine Mesh Finite Element Model(c)

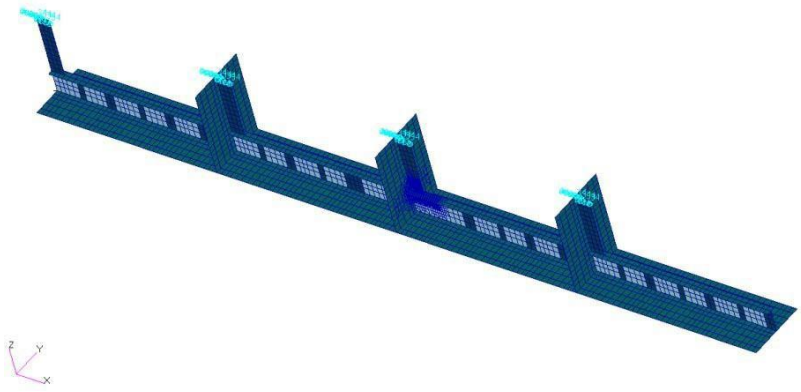

Figure ISC 5.3.1a(5) Boundary Conditions of Fine Mesh Finite Element Model (d)

For axial load case: the model is to be fixed for displacement in the longitudinal direction at the aft end of the model while enforced axial displacement is applied at the forward end, or vice versa. For lateral load case: the model is to be fixed in all degrees of freedom at both forward and aft ends.

ISC 5.3.1b Calculation of stress concentration factors

(1) The geometrical stress concentration factor, K_g , is calculated in accordance with the following formula:

$$K_g = \frac{\sigma_{HS}}{\sigma_{nom}}$$

where:

σ_{HS} : hot spot stress, in N/mm^2, to be calculated in accordance with (2) of this paragraph;

σ_{nom}: nominal stress, in N/mm^2, to be calculated in accordance with (3) of this paragraph and taken as σ_{axial} or $\sigma_{lateral}$.

(2) Hot spot stress σ_{HS} , in N/mm^2, is calculated in accordance with the following formula according to the process as specified in 3.1, Section 5 of Chapter 9:

$$\sigma_{HS} = 1.12\sigma$$

where:

σ : longitudinal stress obtained from interpolation of FE calculation, in N/mm^2.

(3) Calculation of nominal stress

a) The nominal stress σ_{axial} , in N/mm^2, of axial load case is calculated in accordance with the following formula:

$$\sigma_{axial} = \frac{\Delta l}{l} E$$

where:

Δl: axial enforced displacement, in mm;

l : length of FE model, in mm;

E : Young's modulus of elasticity, 2.06×10^5 N/mm^2.

b) The nominal stress $\sigma_{lateral}$, in N/mm^2, of bending load case under lateral load is calculated in accordance with the following formula:

$$\sigma_{lateral} = \frac{sl^2(1-\frac{6x_e}{l}+\frac{6x_e^2}{l^2})}{12Z_{eff-n50}}10^3$$

where:

s : spacing of longitudinals, in m;

l : full length, in m, see definition of l in Symbols of Section 7, Chapter 3;

$Z_{eff\text{-}n50}$:section modulus, in cm^3,deducting corrosion addition of $0.5t_c$ and considering attached plating;

x_e :distance, in m, from the hot spot to the closest end of full length l.

Section 5 FINITE ELEMENT STRESS ANALYSIS

1 GENERAL

1.1 Applicability

1.1.1

This section applies to fatigue assessment by finite element stress analysis. The methods are based on the hot spot stress approach and requirements are given for both welded and non-welded hot spots. The hot spot stress takes into account structural discontinuities due to the structural detail of the welded joint, but not taking into account the notch effect at the weld toe.

1.1.2

The hot spot stress is generally highly dependent on the finite element model used for representation of the structure and the procedure used to calculate the hot spot stress. No other methods than those described in this Section is to be adopted for calculation of FE based hot spot stress.

1.1.3

Two types of hot spots, denoted '*a*' and '*b*' are described in Table 1. These are defined according to their location on the plate and their orientation to the weld toe as illustrated in Figure 1.

Types of hot spots **Table 1**

Type	Description
a	Hot spot at the weld toe on plate surface
b	Hot spot at the weld toe around the plate edge

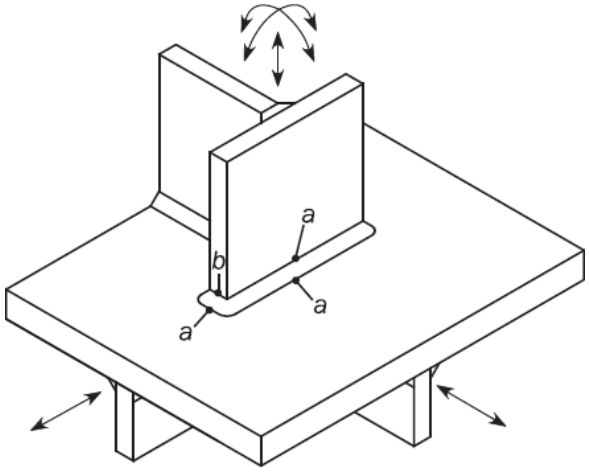

Figure 1 Types of hot spots

1.1.4

The method for calculation of hot spot stress at weld toe for any welded details is given in [3.1] except for web- stiffened cruciform joints. The method for calculation of local stress for non-welded area is given in [3.2].

1.1.5

The method for calculation of hot spot stress at web-stiffened cruciform joints such as hopper knuckle connection, transverse bulkhead lower stool to inner bottom connection and horizontal stringer heel is given in [4].

1.1.6

Attention is to be given to limitations of the hot spot stress methodology for simple connections given in [5].

2 FE MODELLING

2.1 General

2.1.1

Evaluation of hot spot stresses for fatigue assessment requires the use of very fine finite element meshes in way of areas of high stress concentration. These very fine mesh zones may be incorporated into the global model as shown in Figure 2. The coarse mesh model of the cargo holds is to be made according to Ch 7, Sec 2, [2.4]. Alternatively, this very fine mesh analysis can be carried out by means of separate local finite element models with very fine mesh zones in conjunction with the boundary conditions obtained from a global model of the cargo holds. Typical local finite element models of a hopper knuckle with very fine mesh are shown in Figure 3, Figure 4, and Figure 5.

2.1.2 Corrosion model

The very fine mesh finite element models used for fatigue assessment are to be made using net thickness, t_{n50}, in accordance with Ch 9, Sec 1, [5.1].

2.1.3 Separate local FE model

Where a separate local finite element model is used, the extent of the local model is to be such that the calculated stresses are not significantly affected by the imposed boundary conditions and application of loads. The boundary of the fine mesh model is to be taken at adjacent primary supporting members such as girders, stringers and floors in the cargo hold model as far as practicable. Transverse web frames, stringer plates and girders at the boundaries of the local model need not be represented in the local model.

2.1.4

The evaluation of hot spot stress for '*a*' type hot spot is to be based on shell element of mesh size t_{n50}, $\times t_{n50}$, where t_{n50}, is the net thickness of the plate in way of the considered hot spot. The evaluation of hot spot stress for a '*b*' type hot spot is to be based on shell element of mesh size 10×10 mm. The aforementioned mesh size is to be maintained within the very fine mesh zone, extending over at least 10 elements in all directions from the fatigue hot spot position. The transition of element size between the coarser mesh and the very fine mesh zone is to be done gradually and an acceptable mesh quality is to be maintained. This transition mesh is to be such that a uniform mesh with regular shape gradually transitions from smaller elements to larger ones. An example of the mesh transition in way of the side frame bracket toe is shown in Figure 6.

2.1.5

Four-node shell elements with adequate bending and membrane properties are to be used inside the very fine mesh zone. The four node element is to have a complete linear field of in-plane stresses and hence pure in- plane bending of the element can be exactly represented. In case of steep stress gradients, 8 node thin shell elements are to be used if deemed practical. The shell elements are to represent the mid plane of the plating. For practical purposes, adjoining plates of different thickness may be assumed to be median line aligned, i.e. no staggering in way of thickness change is required. The geometry of the weld and construction misalignment is not required to be modelled.

2.1.6

All structure in close proximity to the very fine mesh zones is to be modelled explicitly with shell elements. Triangular elements are to be avoided where possible. Use of extreme aspect ratio (e.g. aspect ratio greater than 3) and distorted elements (e.g. element's corner angle less than 60 deg or greater than 120 deg) are to be avoided.

2.1.7

Where stresses are to be evaluated on a free edge, such as cut-outs for stiffener connections at web frames, edge of plating and hatch corners, beam elements having the same depth as the adjoining plate thickness and negligible width is to be used to obtain the required local edge stress values.

2.2 Hopper knuckle welded connection

2.2.1
In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of bilge hopper lower-knuckle and upper-knuckle welded connections.

2.2.2
Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the transverse web frame of interest). Transverse web frames at the end of the local model need not be represented in the local model.
b) Vertically, the model is to extend from the baseline to the lower stringer in the double side water ballast tank for tankers and double skin bulk carriers. For single skin bulk carriers, the model is to extend from the baseline to the top of the hopper ballast tank. Where a fatigue assessment is also carried out for the upper knuckle connection, the model is to be extended to four longitudinal spaces above the lower stringer in the double side ballast tank.
c) Transversely, for the hopper lower knuckle, the model is to extend from the ship side to 4 longitudinal spaces inboard of the double bottom side girder. For the upper hopper knuckle, the model is to extend from the ship side to the double bottom side girder.

2.2.3
Any scarfing brackets on the web frame adjoining the inner bottom plating, the first longitudinal stiffeners away from the knuckle hot spot as well as any carlings and brackets offset from the main frames are to be modelled explicitly using shell elements. Longitudinal stiffeners further away from the knuckle may be modelled by beam elements. The inner bottom plate 'overhang' outboard of the girder is to be modelled using shell elements up to the extent of the scarfing bracket. Away from the scarfing bracket in longitudinal direction, the inner bottom plate 'overhang' may be modelled using line elements of equivalent the area. Any perforations, such as cut-outs for cabling, pipes and access that are within one stiffener space from the knuckle point are to be modelled explicitly.

2.2.4
Figure 3, Figure 4 and Figure 5 show typical local finite element models of the hopper knuckle connection and close-up views of the $t_{n50} \times t_{n50}$ mesh zone.

2.3 Horizontal stringer heel connection

2.3.1
In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of horizontal stringer heel connections.

2.3.2
Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover one web frame space away from the stringer heel to at least one web frame space ahead of the stringer toe. Transverse web frames at the end of the local model need not be represented in the local model.
b) Vertically, the model is to extend at least to the next stringer level above and below the concerned stringer heel location.
c) Transversely, the model is to extend from the ship side to a half of the tank width in case of a stringer heel located at the inner hull longitudinal bulkhead. In case of stringer heel located at other longitudinal bulkheads the model is to extend transversely up to half the tank width on either side of the concerned stringer heel.

2.3.3
Shell elements are to be used for modelling the stringer heel connection and adjacent stiffeners. The first longitudinal and vertical stiffeners away from the heel hot spot are to be modelled explicitly using shell elements. Longitudinal and vertical stiffeners further away from the hot spot

may be modelled by beam elements. Figure 7 shows a typical finite element model of the stringer heel connection with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.4 Lower stool – inner bottom connection

2.4.1

In addition to [2.1], the modelling requirements in this sub-article are applicable to the assessment of the connection between lower stool plate and inner bottom plate.

2.4.2

The minimum extent of the local model is as follows:

a) Vertically, from the bottom shell to a level at least 2 m above the inner bottom or up to the connection of the corrugation to the upper shelf plate of the lower stool, whichever is greater.
b) The local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. to the adjacent double bottom girder). The end diaphragms need not be modelled.
c) Longitudinally, the model is to cover one floor space aft of the aft lower stool – inner bottom connection and one floor space forward of the forward lower stool – inner bottom connection.

2.4.3

Diaphragm webs, brackets inside the lower stool and stiffeners on the stool plates are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragms and brackets. The first vertical or horizontal stiffeners on the lower stool plate and the first longitudinal stiffeners on the inner bottom are to be represented by shell elements, other stiffeners may be represented by beam elements. Figure 8 shows a typical finite element model of the lower stool - inner bottom connection with very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.3 Lower stool – corrugated bulkhead connection

2.5.1

In addition to [2.1], the modelling requirements in this sub-article are applicable to the assessment of the connection between lower stool plate and corrugated bulkhead.

2.5.2

The minimum extent of the local model is as follows:

a) Vertically, from the bottom of the lower stool to a level at least 2 m above the upper shelf plate of the lower stool.
b) The local model is to be extended transversely to the nearest diaphragm web in the lower stool on each side of the fine mesh zone (i.e. to the adjacent double bottom girder). The end diaphragms need not be modelled.
c) Longitudinally, the model is to cover one floor space aft of the aft lower stool – inner bottom connection and one floor space forward of the forward lower stool – inner bottom connection.

2.5.3

Diaphragm webs, brackets inside the lower stool and stiffeners on the stool plates are to be modelled at their actual positions within the extent of the local model. Shell elements are to be used for modelling of diaphragms, and bracket. The first vertical or horizontal stiffeners on the lower stool plate are to be represented by shell elements, other stiffeners may be represented by beam elements. Figure 9 shows a typical finite element model of the lower stool - corrugated bulkhead connection with very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.4 Side frame bracket to hopper sloping plate connections

2.6.1

In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of a side frame to hopper sloping plate bracket connections.

2.6.2
Shell elements are to be used for modelling the side frame bracket, hopper tank sloping plate and adjacent stiffeners. Figure 10 shows a typical finite element model of the side frame bracket to hopper sloping plate connection with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.6.3
Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the bracket connection of interest). Transverse web frames at the end of the local model need not be represented in the local model.
b) Vertically, the model is to extend from the baseline to the bottom of the topside tank sloping plate.
c) Transversely, the model is to extend from the ship side to the adjacent double bottom side girder.

2.5 Side frame bracket to the upper sloping / flat bottom wing tank connections
2.7.1
In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of a side frame bracket to upper sloping/flat bottom wing tank connections.

2.7.2
Shell elements are to be used for modelling the side frame bracket, upper sloping or flat bottom plate and adjacent stiffeners. Figure 11 shows a typical finite element model of the side frame bracket to upper sloping wing tank with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.7.3
Where a separate local finite element model is used, the minimum extent of the local model is to be according to the following:

a) Longitudinally, the model is to cover two web frame spaces (i.e. one web frame space extending either side of the bracket connection of interest). Transverse web frames at the end of the local model need not be represented in the local model.
b) Vertically, the model is to extend from the deck level to the top of the hopper sloping plate.
c) Transversely, the model is to extend from the ship side to the end of upper sloping/flat bottom wing tank.

2.6 Hatch corners and hatch coaming end bracket
2.8.1
In addition to the general requirements in [2.1], the modelling requirements in this sub-article are applicable to the modelling of hatch corners/hatch coaming end bracket. The selection of hatch corners / hatch coaming end bracket for fatigue analysis is to be determined based on the level of stresses obtained from the cargo hold FE analysis.

2.8.2
Where separate local finite element models are used, the model extents are to be according to the following:

a) Transversely, over the half-breadth of the ship,
b) Longitudinally, from the midpoint of the cargo hold in which the concerned hatch corners/hatch coaming end bracket is located to the adjacent cargo hold up to and including the full width of the cross deck nearest to the concerned hatch corners/hatch coaming end bracket.
c) Vertically, from the top plate of coaming to the intersection of the topside tank sloping plate with the side or inner side shell.

2.8.3
The primary supporting members and coaming stays are to be represented by shell finite elements having both membrane and bending properties. Figure 12 shows a typical FE model of the toe connection of a longitudinal hatch coaming end bracket to the deck plating with the very fine mesh zone having $t_{n50} \times t_{n50}$ mesh size.

2.8.4
The level of FE mesh refinement is to be such as to enable stress concentrations arising from the hatch corner geometry to be captured in the hot spot stress. The plate edge of hatch opening corners at the level of upper deck and cross deck structure is to be assessed. The free edge of hatch coaming end bracket and bracket toe welded connection to the deck plating are also to be assessed. Beam elements having the same depth as the adjoining plate thickness and negligible width are to be used at a plate edge of hatch opening corners or free edge of the hatch coaming end bracket to obtain the required local edge stress values as outlined in [2.1.7].

2.8.5
The local structural geometry, particularly in the areas of concern, is to be represented. The hatch corner area is to be meshed using elements with a sufficiently small size to capture the local stress on the edge. In general, a minimum of 15 elements in a 90 degree arc are to be used to describe the curvature of the hatchway radius plating for a rounded corner (see Figure 13). For an elliptical or parabolic corner, a minimum of 15 elements are to be used from the inboard radius end to a point on the edge located at half the longitudinal distance of the semi- major axis. A total of 20 elements are to be used at the elliptical edge of the hatch corner (see Figure 14). However, the element edge dimensions along the free edge of the radius need not be less than the thickness of the plating being represented and also should not be greater than 5 times the thickness of the plating being represented. Except where necessary from practical meshing considerations, this level of idealisation is to be maintained over the bracket plating and is to extend into the stringer plating, deck plating and coaming. Mesh transitions should not be arranged close to bracket toes.

2.7 Boundary conditions

2.7.7 Cargo hold model
The boundary conditions to be applied to the ends of the cargo hold model are to be in accordance with Ch 7, Sec 2, [2.5].

2.7.8 Separate local finite element model
Where a separate local finite element model is used for evaluating the hot spot stress range, the boundary conditions and application of loads are to be in accordance with Ch 7, Sec 3, [4.2].

3 HOT SPOT STRESS FOR DETAILS DIFFERENT FROM WEB-STIFFENED CRUCIFORM JOINTS

3.1 Welded details

3.1.1

For hot spot type '*a*', the structural hot spot stress, σ_{HS} is calculated from a finite element analysis

with $t_{n50} \times t_{n50}$ mesh density and is obtained by the following formula:
$\sigma_{HS} = 1.12\ \sigma$
where:
σ : Surface principal stress, in N/mm^2, read out at a distance $t_{n50}/2$ away from the intersection line.
t_{n50} *:* Plate net thickness, in mm, in way of the weld toe.
At structural details where the hot spot type '*a*' is classified as a web-stiffened cruciform joint, the stress read out procedure of [4.2] is to be applied.
For hot spot type '*b*', the stress distribution is not dependent on the plate thickness; the structural hot spot stress, σ_{HS}, is derived from a finite element analysis with mesh density 10×10 mm and is obtained by the following formula:
$\sigma_{HS} = 1.12\ \sigma$
where:
σ : Surface principal stress, in N/mm^2, read out at an absolute distance from the intersection line of 5 mm.

3.1.2 Stress read out methods

Depending on the element type, one of the following stress read out method is to be used:

- With 4-node shell element:
  Element surface stress components at the centre points are linearly extrapolated to the line A-A as shown in Figure 15 to determine the stress components for load case '*i*1' and '*i*2' at the stress read out point located at a distance t_{n50} from the intersection line for type 'a' hot spot. Two principal hot spot stress ranges are determined at the stress read out point from the stress components tensor differences (between load case '*i*1' and '*i*2') calculated from each side (side L, side R) of line A-A. The angle θ between the direction x of the element co-ordinate system and the principal direction *pX* of the principal hot spot stress range co-ordinate system has to be determined.
- With 8-node shell element:
  With a $t_{n50} \times t_{n50}$ element mesh using 8-node element type, the element mid-side node is located on the line A-A at a distance *tn50* for type '*a*' hot spots. This node coincides with the stress read out point. The element surface stress components for load case '*i*1' and '*i*2' can be used directly without extrapolation within each adjacent element located on each side (side L, side R) of the line A-A as illustrated in Figure. 16. Two principal hot spot stress ranges are determined at the stress read out point from the stress components tensor difference (between load case '*i*1' and '*i*2') calculated from each side of line A-A. The angle θ between the direction x of the element coordinate system and the principal direction *pX* of the principal hot spot stress range coordinate system has to be determined.

For fatigue assessment of type '*b*' hot spots, a beam element is to be used to obtain the fatigue stress range. The stress range is to be based on axial and bending stress in the beam element. The beam element is to have the same depth as the connecting plate thickness while the in-plane width is negligible.

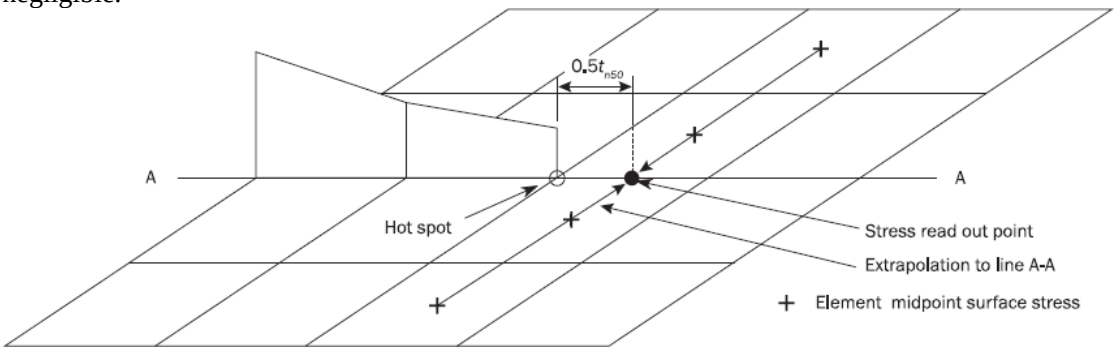

Figure 15 Determination of stress read out points and hot spot stress for 4-node element

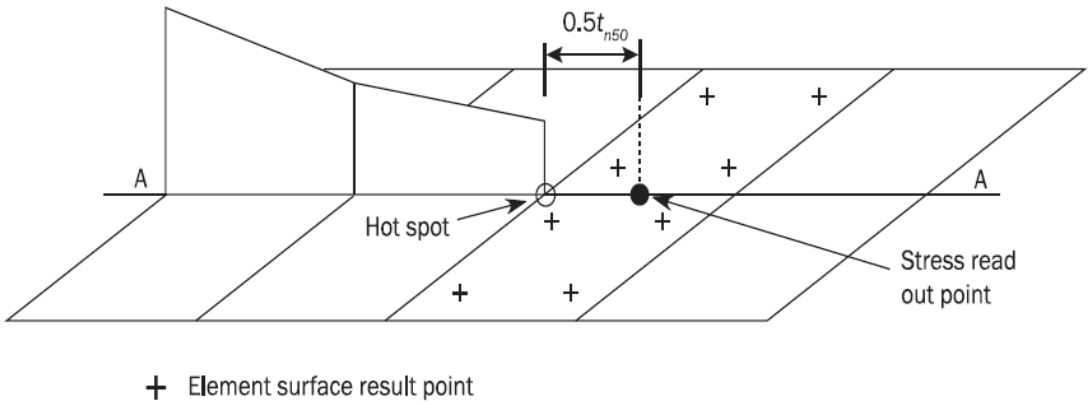

Figure 16 Determination of stress read out points and hot spot stress for 8-node element

3.1.3

The above read out procedure is based on element surface stresses. Generally, in FE software the element stresses are calculated at the Gaussian integration points located inside the element. Depending on the element type implemented in the FE software, it may be necessary to perform several interpolations in order to determine the actual stress at the considered stress read out point at the surface of the element mid-point or element edge.

3.2 Base material

3.2.1

For fatigue assessment at a free plate edge, a beam element is to be used to obtain the fatigue stress range. The beam element is to have the same depth as the connecting plate thickness while the in-plane width should be negligible.

3.3 Bent hopper knuckle

3.3.1

The hot spot stress at the inner bottom/hopper sloping plate and inner hull/hopper sloping plate in transverse, vertical and longitudinal directions (i.e. hot spots 1, 2 and 3 defined in Ch 9, Sec 2, Table 5 and Ch 9, Sec 2, Table 19) of a bent hopper knuckle is to be taken as the surface principal stress read out from a point shifted away from the intersection line between the considered member and abutting member by the weld leg length.

The hot spot stress, in N/mm^2, is obtained by the following formula:

$\sigma_{HS} = \sigma_{shift}$

where:

σ_{shift} : Surface principal stress, in N/mm^2, at the shifted read out position as defined in [4.2.1] and taken as:

$\sigma_{shift} = \sigma_{membrane}\,(x_{shift}) + \sigma_{bending}(x_{shift})$

$\sigma_{bending}\,(x_{shift})$: Bending stress, in N/mm^2, at x_{shift} position.

$\sigma_{membrane}(x_{shift})$: Membrane stress at x_{shift} position, in N/mm^2.

3.3.2

The procedure for calculation of hot spot stress at flange such as inner bottom /hopper sloping plate and inner hull/hopper sloping plate is the same that for web-stiffened cruciform joints as described in [4.2.1]. The procedure that applies for hot spots on the ballast tank side of the inner bottom/hopper plate and inner hull/hopper sloping plate in way of a bent hopper knuckle is in principle the same as that applied on the cargo tank side of the inner bottom plate for welded knuckle in Figure 18 and Figure 19. The intersection line is taken at the mid-thickness of the joint assuming median alignment. The plate angle correction factor and the reduction of bending stress as applied for a web-stiffened cruciform joint in [4.2.2] are not to be applied for the bent hopper knuckle type.

3.3.3

The stress at hot spots located in way of the web such as transverse web, side stringer and side girder (i.e. hot spots 4, 5 and 6 defined in Ch 9, Sec 2, Table 5 and Ch 9, Sec 2, Table 19) at a bent

hopper knuckle type is to be derived as described for web-stiffened cruciform joints in [4.3.1].

4 HOT SPOT STRESS FOR WEB-STIFFENED CRUCIFORM JOINT

4.1 Applicability

4.1.1

Among the structural details to be assessed listed in Ch 9, Sec 2, Table 3 the following structural details are considered as a web-stiffened cruciform joint:

4.1.1Welded hopper knuckle connection, shown in Figure 17.

4.1.2Heel of horizontal stringer, shown in Figure 17.

4.1.3Lower stool – inner bottom connection.

Two kinds of hot spots relative to the web-stiffened cruciform joints are to be assessed:

- Hot spots at the flange of web-stiffened cruciform joint,
- Hot spots in way of the web of web-stiffened cruciform joint.

4.1.2

The procedure for calculating hot spot stress at flange of web-stiffened cruciform joint is given in [4.2].

4.1.3

The procedure for calculating hot spot stress in way of the web of the web-stiffened cruciform joint is given in [4.3].

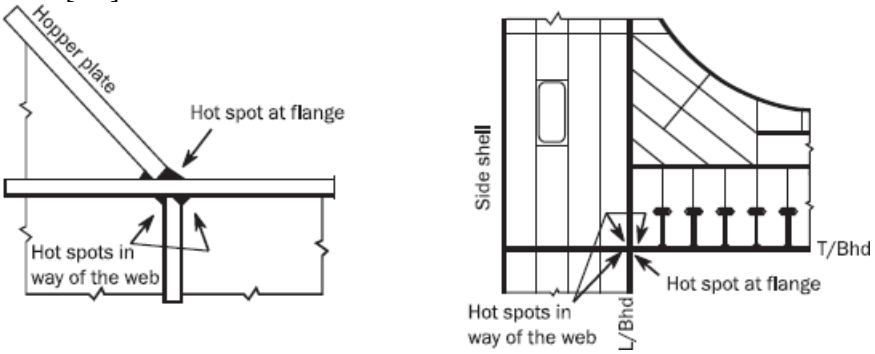

Figure 17 Web-stiffened cruciform joints

4.2 Calculation of hot spot stress at the flange

4.2.1

For hot spot at the flange of web-stiffened cruciform joints, the surface principal stress is to be read out from a point shifted away from the intersection line between the considered member and abutting member to the position of the actual weld toe and multiplied by 1.12. The intersection line is taken at the mid-thickness of the cruciform joint assuming a median alignment.

The hot spot stress, in N/mm^2, is to be obtained as:

$\sigma_{HS} = 1.12\sigma_{shift}$

where:

σ_{shift}: Surface principal stress, in N/mm^2, at shifted stress read out position. The stress read out point shifted away from the intersection line is obtained as:

$$x_{shift} = \frac{t_{1-n50}}{2} + x_{wt}$$

where:

$t_{1\text{-}n50}$: Net plate thickness of the plate number 1, in mm, as shown in Figure 18.

x_{wt} : Extended fillet weld leg length, in mm, as defined in Figure 18, not taken larger than $t_{1\text{-}n50}$.

4.2.2

The stress at the shifted position is derived according to the following formula and illustrated in Figure 19:

$$\sigma_{shift} = \lceil \lfloor \sigma_{membrane}(x_{shift}) + 0.6 \cdot \sigma_{membrane}(x_{shift}) \rfloor \rfloor \cdot \beta$$

where:

$\sigma_{bending}(x_{shift})$: Bending stress, in N/mm^2, at the shifted position taken as:

$\sigma_{bending}\ (x_{shift}) = \sigma_{surface}\ (x_{shift}) - \sigma_{membrane}\ (x_{shift})$

$\sigma_{surface}\ (x_{shift})$: Total surface stress at x_{shift} position (including membrane stress and bending stress), in N/mm^2.

$\sigma_{membrane}\ (x_{shift})$: Membrane stress at x_{shift} position, in N/mm^2.

β : Plate angle hot spot stress correction factor, taken as:

- For α = 135°:

$$\beta = 0.96 - 0.13\frac{x_{wt}}{t_1} + 0.20(\frac{x_{wt}}{t_1})^2$$

- For α= 120°:

$$\beta = 0.97 - 0.14\frac{x_{wt}}{t_1} + 0.32(\frac{x_{wt}}{t_1})^2$$

- For α= 90°:

$$\beta = 0.96 + 0.031\frac{x_{wt}}{t_{1-n50}} + 0.24(\frac{x_{wt}}{t_{1-n50}})^2$$

α : Angle, in deg, between the plates forming a web-stiffened cruciform joint as shown in Figure 19.

Correction factors for connections with plate angles intermediate to those given should be derived based on a linear interpolation of the above values. The calculated hot spot stress is to be used in conjunction with the hot spot S-N curve for weld toe connections according to Ch 9, Sec 3, [4.2].

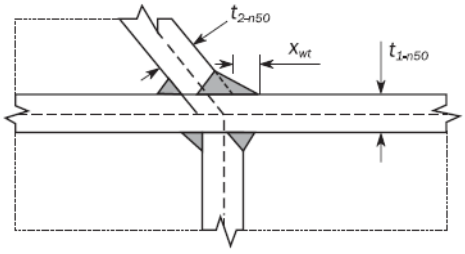

Figure 18 Geometrical parameters of web-stiffened cruciform connections

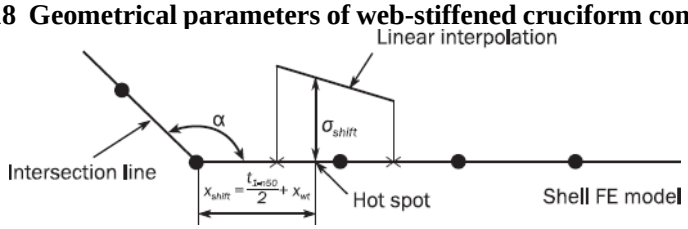

Figure 19 Procedure for calculation of hot spot stress at web-stiffened cruciform connections

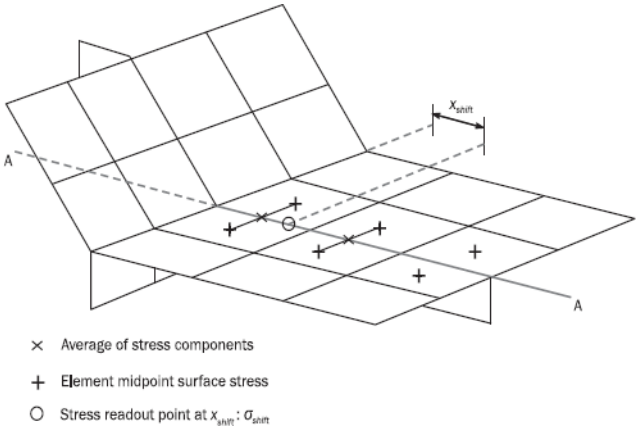

Figure 20 Determination of stress read out points for web-stiffened cruciform connections

4.2.3

Surface principal stresses at the centre point of the two first elements on left and right side of the line A-A are averaged and taken as the surface principal stresses in way of the web position (line A-A). The surface principal stresses for load case '*i1*' and '*i2*' are linearly interpolated along the

line A-A in order to determine hot spot principal stresses at the stress read out point located at the x_{shift} position as shown in Figure 20. The two principal hot spot stress ranges are determined at the stress read out point between load case '*i1*' and '*i2*'.

4.3 Calculation of hot spot stress in the web

4.3.1

Hot spots located in way of the web as indicated in Figure 21 are to be checked with the hot spot stress defined from the maximum principal surface stress at the intersection offset by the distance x_{shift} from the vertical and horizontal element intersection lines as illustrated in Figure 21. The intersection line is taken at the mid thickness of the cruciform joint assuming a median alignment. The hot spot stress, in N/mm^2, is to be obtained as:

$\sigma_{HS} = \sigma_{shift}$

where:

σ_{shift} : Maximum principal surface stress, in N/mm^2, at the intersection offset by the distance x_{shift}.

The stress read out point at the intersection offset is obtained as:

$$x_{shift} = \frac{t_{3-n50}}{2} + x_{wt}$$

where:

$t_{3\text{-}n50}$: Net plate thickness of the web, in mm, as shown in Figure 21

x_{wt} : Extended fillet weld leg length, in mm, , taken as:

x_{wt} = min (l_{leg1},l_{leg2})

l_{leg1},l_{leg2} : Leg length, in mm, of the vertical and horizontal weld lines as shown in Figure 21.

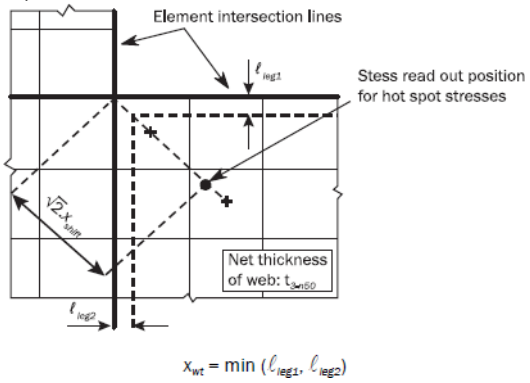

Figure 21 Hot spots in way of web

5 LIMITATIONS OF HOT SPOT STRESS APPROACH

5.1 Scope of application of hot spot stress approach

5.1.1

The hot spot stress approach given in Ch 9, Sec 1, [2.3.1] is not applicable for simple cruciform joints and simple T-joints when the stress flow in direction I as shown in Figure 22 is considered. For stresses in the direction normal to the weld at hot spot location "*c*" (direction I) there is no stress flow into the transverse plating as it is represented only by one plane in the shell model. However, it attracts stresses for in-plane direction (direction II) at hot spot location "*a*".

In situations where a bracket is fitted behind the transverse plate as shown in Figure 1, acting with stiffness in the direction normal to the transverse plate, stresses flow also into the transverse plate and the hot spot methodology is considered applicable.

5.1.2

The hot spot stress at position '*c*' for simple cruciform joints and simple T-joints is to be determined by the stress read out procedure given in [3.1] multiplied by a geometrical stress concentration factor of 1.3 and is taken as:

$\sigma_{HS} = 1.3 \cdot 1.12\sigma$

6 SCREENING FATIGUE ASSESSMENT

6.1 Screening procedure

6.1.1 Assumptions

The screening fatigue procedure is based on:

- Screening hot spot stress obtained by multiplying the stresses calculated from fine mesh analysis according to Ch 7, Sec 3 by the stress magnification factor of the considered structural detail.
- Mean stress effect and thickness effect are used according to Ch 9, Sec 3, [3.2] and Ch 9, Sec 3, [3.3].

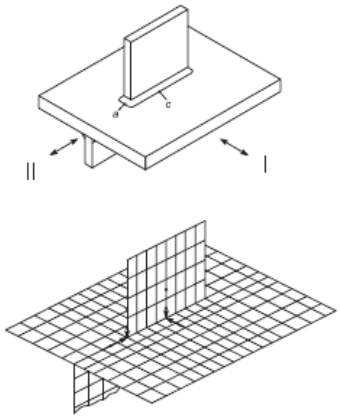

Figure 22 Illustration of check points in way of a welded attachment under orthogonal applied in plane loads

6.1.2 Procedure

The screening fatigue procedure includes the following three phases:

a) Phase 1: Calculation of fatigue stress.
   - Stresses are calculated at the stress read out point from the fine mesh element analysis with elements size of 50 ×50 mm, according to Ch 7, Sec 3 for all fatigue load cases defined in Ch 9, Sec 1, [7], for all loading conditions. Stresses to be used are element average membrane components stress defined in [6.2.3].
   - Hot- spot surface stress components are calculated for each load case '*i*1' and '*i*2' from the stresses multiplied by the stress magnification factor η, taken as:
     - $\sigma_{HS,\, i1(j)} = \eta \sigma_{S,\, i1(j)}$
     - $\sigma_{HS,\, i2(j)} = \eta \sigma_{S,\, i2(j)}$
   - Hot spot principal surface stress ranges are the difference of hot spot stress components obtained for each load case '*i1*' and '*i2*'.
   - Fatigue stress ranges for welded joints are determined from hot spot principal surface stress ranges with correction factor for mean stress and thickness effect.

   where:

   $\sigma_{S,\, i1(j)}$: Stress calculated from the fine mesh analysis in load case '*i1*' of loading condition (*j*) defined in [6.2].

   $\sigma_{S,\, i2(j)}$: Stress calculated from the fine mesh analysis in load case '*i*2' of loading condition (*j*) defined in [6.2].

   η : Stress magnification factor given in Table 2.

b) Phase 2: Selection of S-N curve.
   The S-N curve D defined in Ch 9, Sec 3, [4] is to be used with the fatigue stress range of weld toe in screening fatigue procedure.

c) Phase 3: Calculation of fatigue damage and fatigue life according to [6.1.3].

Stress magnification factor **Table 2**

Ship type	Structural detail category		Bulk hold	Stress magnification factor η
Oil tanker	Toe of stringer		-	2.45
	Bracket toe of transverse web frame		-	1.65
Bulk carrier	Lower hopper welded knuckle		FA(1)	2.28
			EA or C(1)	2.00
	Lower stool -Inner bottom	Non vertical (knuckle angle > 90°)	FA(1)	1.81
			EA or C(1)	1.47
		Vertical (knuckle angle = 90°)	FA(1)	2.09
			EA or C(1)	2.75
(1) FA and EA means "full cargo hold in alternate loading condition" and "empty cargo hold in alternate loading condition" respectively, C means cargo hold of BC-B and BC-C bulk carriers.				

6.1.3 Screening fatigue criteria

The total fatigue damage and the fatigue life of screened details are to comply with the criteria given in Ch 9, Sec 3, [2].

Structural details that do not comply with the acceptance criteria are to be checked with respect to fatigue strength using a very fine mesh finite element analysis as described in Ch 9, Sec 5.

6.2 Stress read out procedure

6.2.1 Bracket toe

For bracket toe, the stress read out point is located at a 50 mm distance away from the bracket toe as shown in Figure 23.

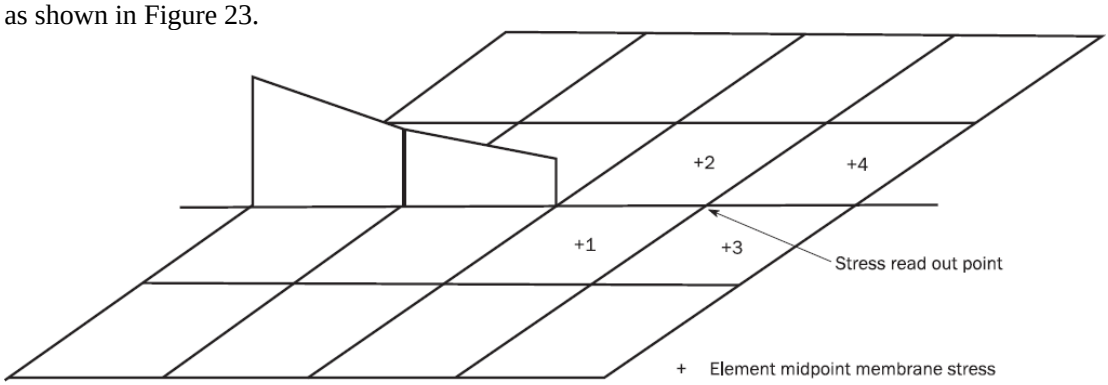

Figure 23 Stress read out point at bracket toe

6.2.2 Knuckle detail

For the lower hopper knuckle and for the connection between transverse bulkhead lower stool and inner bottom, the stress read out point is located at a 50 mm distance away from the knuckle line (i.e. model intersection line) as shown in Figure 24.

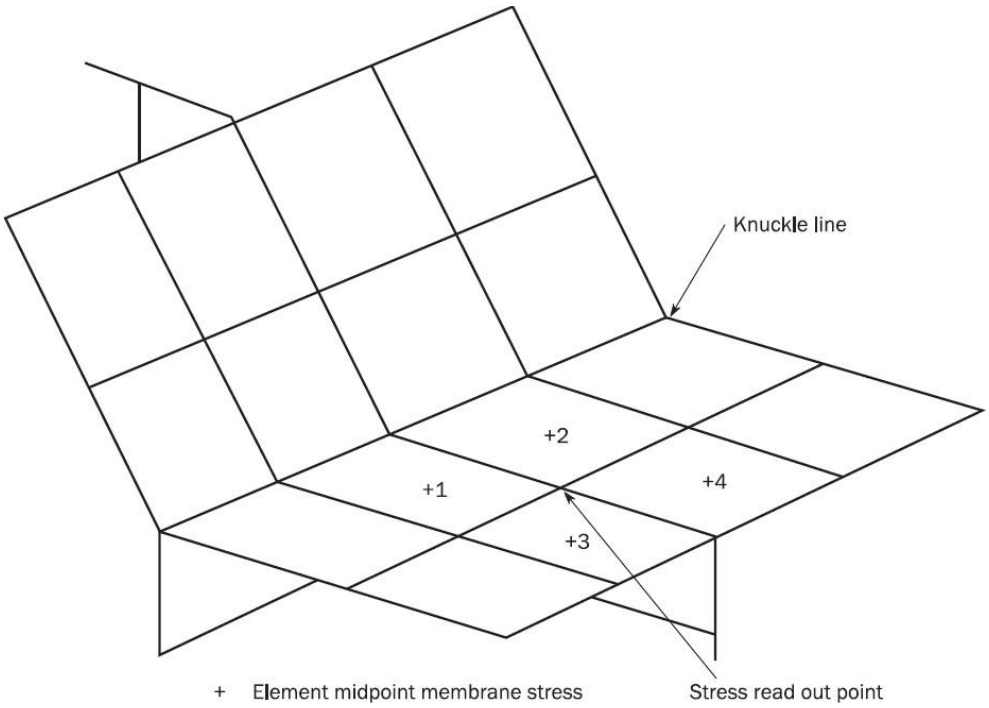

Figure 24 Stress read out point of knuckle detail

6.2.3 Read out point stress

The average of membrane stress components at the centre of four elements, modelled with elements size of 50 × 50 mm connected to the stress read out point (or node) can be used as read out point stress.

When the element size is less than 50 × 50 mm, the stress of read out point can be derived using elements in an equivalent area as shown in Figure 25.

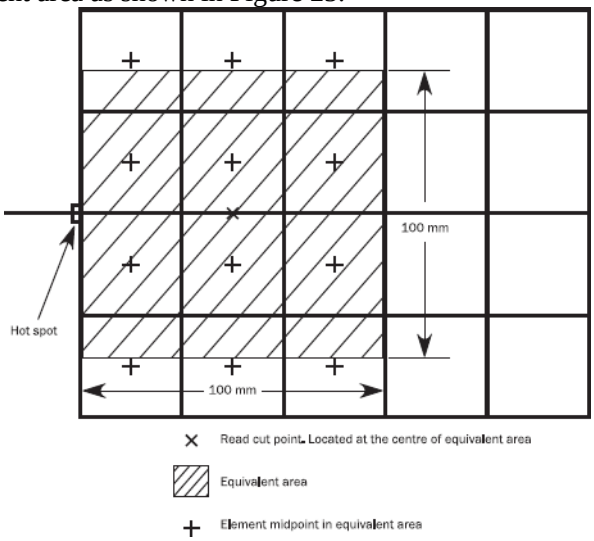

Figure 25 Equivalent area for element size less than 50 ×50 mm

Section 6 DETAIL DESIGN STANDARD

SYMBOLS
For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Purpose

1.1.1
Design standard provides fatigue resistant detail design at an early stage in the structural design process by giving consideration to the following aspects:

- Application of fatigue design principles.
- Construction tolerances and other practical considerations.
- In-service experience and fatigue performance.

1.1.2
The design standard is to be applied to the design of ship structural details in following steps:

- Highlighting potential critical areas within the ship structure.
- Identification of the fatigue hot spot locations for each of the critical structural details.
- Provision of a set of alternative improved configurations from which a suitable solution can be selected.
- Requirements on geometrical configurations, scantlings, welding requirements and construction tolerances.
- Post fabrication method of improving fatigue life, such as weld toe grinding.

1.2 Application

1.2.1
The structural details described in this section are to be designed according to the given design standard but alternative detail design configurations may be accepted subject to demonstration of satisfactory fatigue performance.
For the details given in Ch 9, Sec 2, Table 3, the fatigue assessment by very fine mesh finite element analysis may be omitted if the detail is designed in accordance with the design standard given in this section.

2 STIFFENER-FRAME CONNECTIONS

2.1 Design standard A

2.1.1
Designs for cut outs in cases where web stiffeners are omitted or not connected to the longitudinals are required to adopt tight collar or the improved design standard "*A*" as shown in Table 1 or equivalent, for the following members:

- Side shell below 1.1T_{sc}.
- Bottom.
- Inner hull longitudinal bulkhead below 1.1 T_{sc}.
- Topside tank sloping plating below 1.1 T_{sc}.
- Hopper.
- Inner bottom.

2.1.2
Designs that are different from those shown in Table 1 are acceptable subject to demonstration of satisfactory fatigue performance, e.g. by using comparative finite element analysis. The comparative FE analysis is to be performed following the modelling guidance given in Figure 1.

2.2 Equivalent design of stiffener-frame connections

2.2.1
If the required designs for stiffener-frame connections in [2.1] are not followed, the alternative design is to be verified to have equivalent fatigue strength to the design standard "A" or to be verified to have satisfactory fatigue performance. The alternative design is to be verified

according to the procedure given in [2.2.2] to [2.2.5] and documentation of results is to be submitted to the Society.

ISC 2.2.1a FE modeling

(1) FE model of standard design is to be established according to Table 1 of [2.1], and FE model of alternative design is also to be established according to the modeling method in [2.2.3].

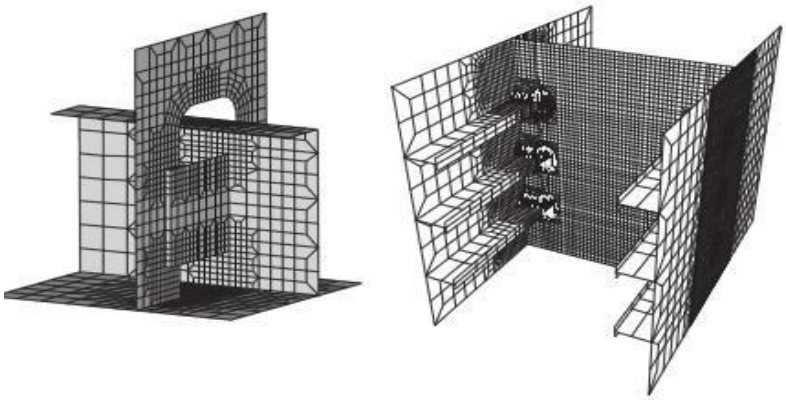

Figure 1 Finite element model for verification of equivalent design

(2) The mesh size in way of hot spot is in general to be t × t. When the hot spots are classified as hot spot type "b" as specified in 1.1.3 of Section 5 and Table 16 of Section 2, the mesh size is to be 10 ×10 mm. The mesh size is to extend at least five elements in all directions. Outside this area, the mesh size may gradually be increased in accordance with the requirements in 2 of Section 5.

(3) Simulated beam elements are to be fitted in way of the edge of cut-out and hot spot type "b". The height of the simulated beam elements is to be consistent with plate thickness of web, the width may be neglected and the area is taken as 1 mm^2.

(4) Shell elements are to be used in the overlap scope of web of transverse frame and lug plates. In order to simulate fillet welds, web of transverse frame and lug plates are to be connected by shell elements in way of the boundary of overlap scope. The height of shell element is to be the distance between mid-layers of web of transverse frame and lug plates having a thickness equal to 2 times the net thickness of web plate, see Figure 2.2.1a(4).

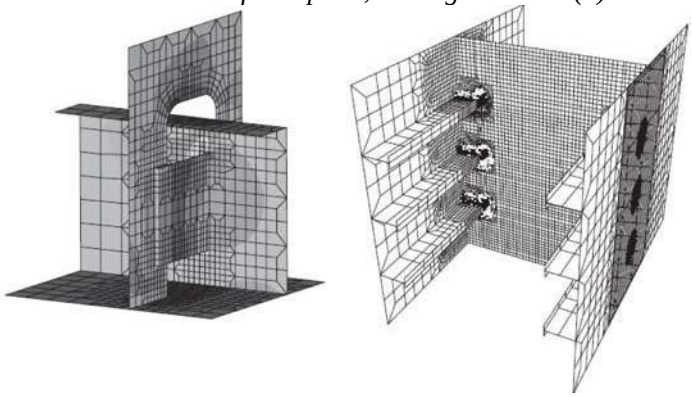

Figure 2.2.1a(1) FE Model of Equivalent Alternative Design

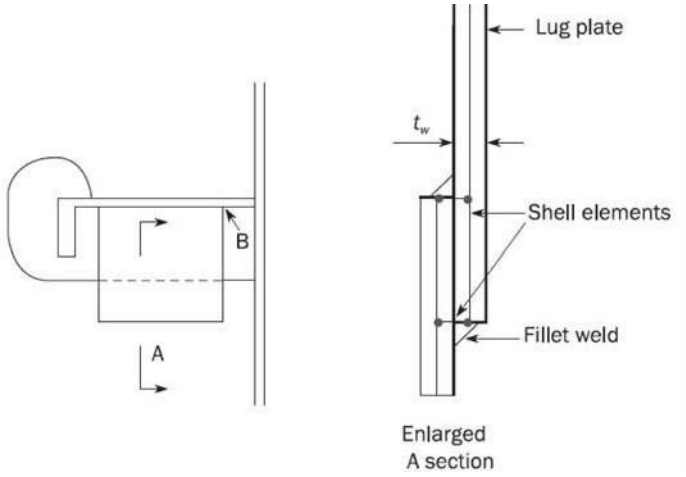

Figure 2.2.1a(4) Element Modeling of Overlap of Lug Plate and Web of Transverse Frame

ISC 2.2.1b Load case

(1) Three load cases are to be applied to the models of the standard design and alternative designs:

LC1: External pressure of unit value, fixed boundary conditions at top and bottom of model.

LC2: Shear stress by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.

LC3: Axial load by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.

(2) The forward and aft part of the model are to have symmetry condition in a double hull structure. Load application and boundary conditions are shown in Figure ISC 2.2.1b(2).

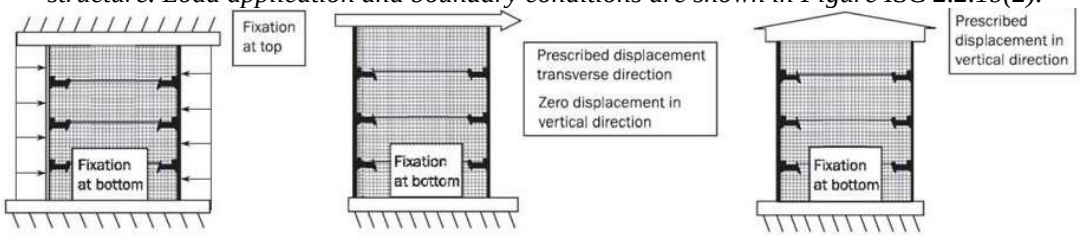

Figure ISC 2.2.1b(2) Load Application and Boundary Conditions

ISC 2.2.1c Reference stress

The stress for assessment is the maximum of the combination of axial and bending stress of simulated beam.

ISC 2.2.1d Assessment criteria of equivalent design

The reference stress (see ISC 2.2.1c) in way of critical hot spots around the cut-out of equivalent design is not greater than the corresponding value of standard design.

2.2.2

The procedure of [2.2.3] and [2.2.4] is provided to verify the alternative design to have equivalent fatigue strength with respect to any position in the transverse ring, i.e. double bottom and double side. The hot spot stress of the alternative design and that of the required design is to be compared to the critical hot spots in way of the cut-out. The critical hot spots depend on the detail design and are to be selected in agreement with the Society. The hot spot stress is to be derived according to Ch 9, Sec 5, [3.1] and Ch 9, Sec 5, [3.2]. It is to be noted that welded hot spots at the free edge are classified as hot spot type "*b*". Example of typical hot spots for checking is shown in Ch 9, Sec 2, [2].

ISC 2.2.2a The critical hot spots in way of the cut-out of alternative design for connection of stiffeners to transverse frames are selected as follows, see Figure ISC 2.2.2a:

(1) in way of corner of curvature of free edge of the cut-out, see hot spots 1, 2 and 3 in Figure

ISC 2.2.2a;

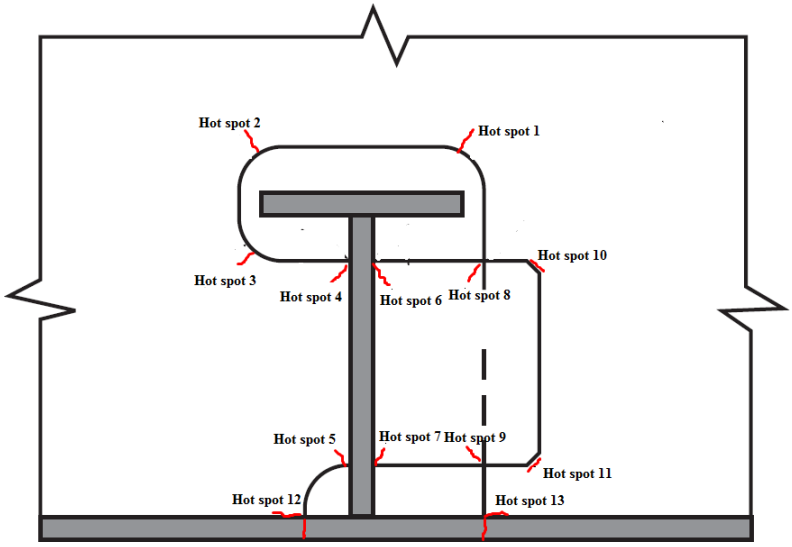
(2) *intersection of web of transverse frame to longitudinal web, see hot spots 4 and 5 in Figure ISC2.2.2a;*

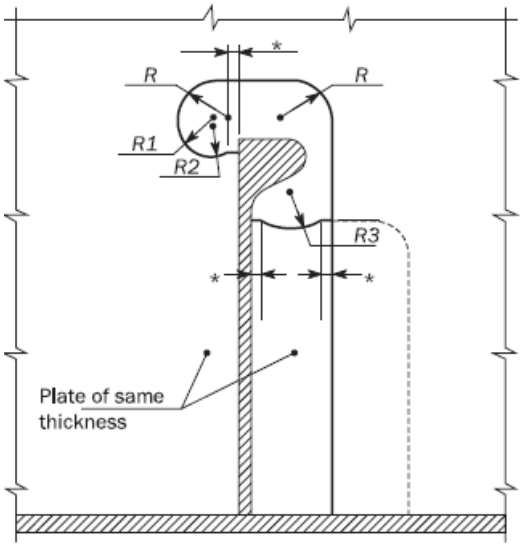
(3) *intersection of lug plate to longitudinal web, see hot spots 6 and 7 in Figure ISC 2.2.2a;*

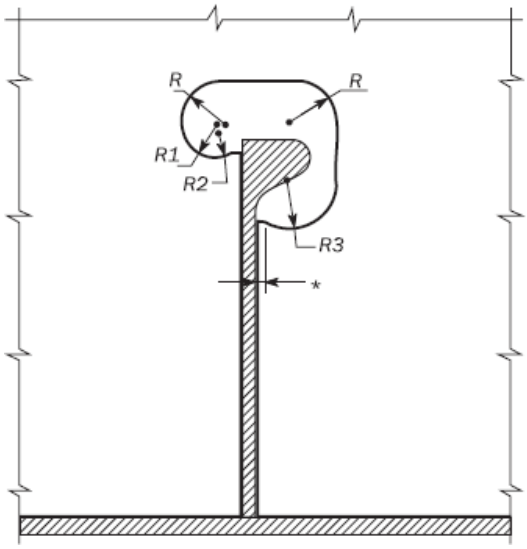
(4) *intersection of web of transverse frame to lug plate, see hot spots 8, 9, 10 and 11 in Figure ISC 2.2.2a (where hot spots 10 and 11 are located near the middle point of side length);*

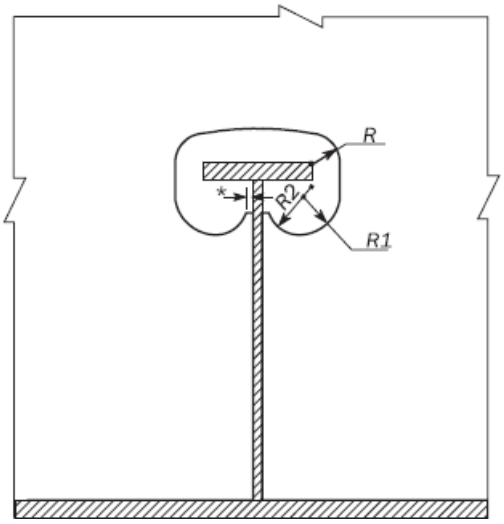
(5) *intersection of web of transverse frame to attached plating of longitudinal, see hot spots 12 and 13 in Figure ISC 2.2.2a.*

ISC 2.2.2b In way of hot spots 10 and 11, the number of mesh along the side length is not to be less than4









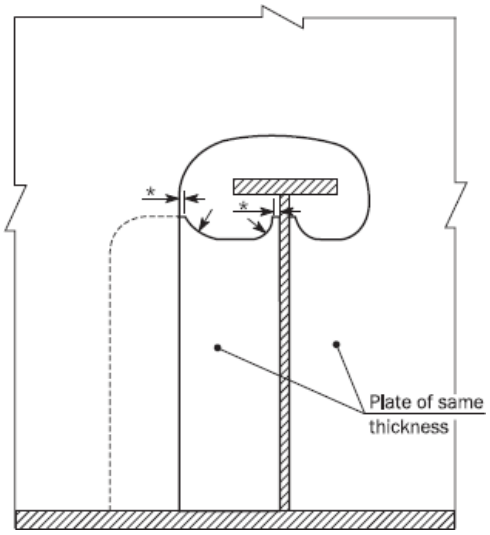


Figure ISC 2.2.2a Selection of Critical Hot Spot in way of Cut-out

Design standard A – stiffener-frame connection **Table 1**

Cut outs for longitudinals in transverse webs where web stiffeners are omitted or not connected to the longitudinal flange	
Design standard *A*	
1	2
	
3	4
	
Note1: Soft toes marked '*' are to be dimensioned to suit the weld leg length such that smooth transition from the weld to the curved part can be achieved. Maximum 15 mm or thickness of transverse web/collar plates/lug plates whichever is the greater. Note2: Configurations 1 and 4 indicate acceptable lapped lug plate connections.	

Critical location	Locations around cut-out with high stress concentration and locations in way of weld terminations
Detail design standard	Improved slot shape to avoid high stress concentrations in transverse webs due to shear loads and local pressure loads transmitted via welded joints
Building tolerances	Ensure alignment of all connecting members and accurate dimensional control of cut-outs according to IACS Recommendation No. 47.
Welding requirements	A wraparound weld, free of undercut or notches, around the transverse web connection to longitudinal stiffener web.

2.2.3

The very fine mesh finite element models are made to analyse the behaviour in way of double side or double bottom. The models should have an extent of 3 stiffeners in cross section, i.e. 4 stiffener spacings, and the longitudinal extent is to be one half frame spacing in both forward and aft direction. A typical model is shown in Figure 1. No cut-outs for access openings are to be included in the models. Connection between the lug or the web-frame to the longitudinal stiffener web, connections of the lug to the web-frame and free edges on lugs and cut-outs in web-frame are to be modelled with elements of net plate thickness size ($t_{n50} \times t_{n50}$). The mesh with net plate thickness size should extend at least five elements in all directions. Outside this area, the mesh size may gradually be increased in accordance with the requirements in Ch 9, Sec 5, [2]. The eccentricity of the lapped lug plates is to be included in the model. Transverse web and lug plates are to be connected by eccentricity elements (transverse plate elements). The height of eccentricity element is to be the distance between mid-layers of transverse web and lug plates having a thickness equal to 2 times the net thickness of web-frame plate $t_{w\text{-}n50}$ Eccentricity elements representing fillet welds are shown in Figure 2.

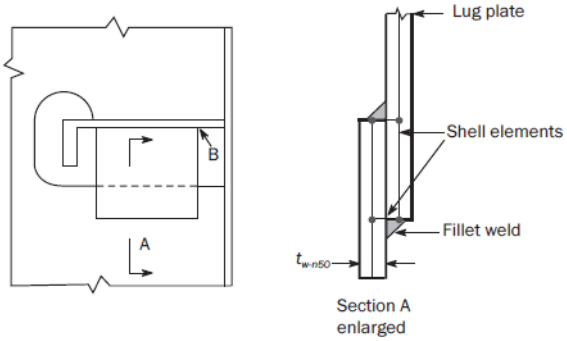

Figure 2 Modelling of eccentric lug plate by shell elements

2.2.4

Three load cases are to be applied to the models of the design standard and alternative designs:

- External pressure of unit value, fixed boundary conditions at top and bottom of model.
- Shear stress by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.
- Axial load by prescribed unit displacement at the model top and fixed boundary conditions at the model bottom.

The forward and aft part of the model should have symmetry condition describing the behaviour in a double hull structure. Load application and boundary conditions are provided in Figure 3.

2.2.5

The alternative design may also be verified to have satisfactory fatigue performance using sub-modelling technique where a very fine mesh model of the alternative design located at the actual position of the stiffener-frame connection is analysed. The alternative design is considered acceptable if the fatigue acceptance criterion of Ch 9, Sec 1 is achieved. The fatigue acceptance criterion is checked by applying the methodology described in Ch 9, Sec 1, Ch 9, Sec 3 and Ch 9, Sec 5. The alternative design is considered acceptable only for the particular position where it is analysed.

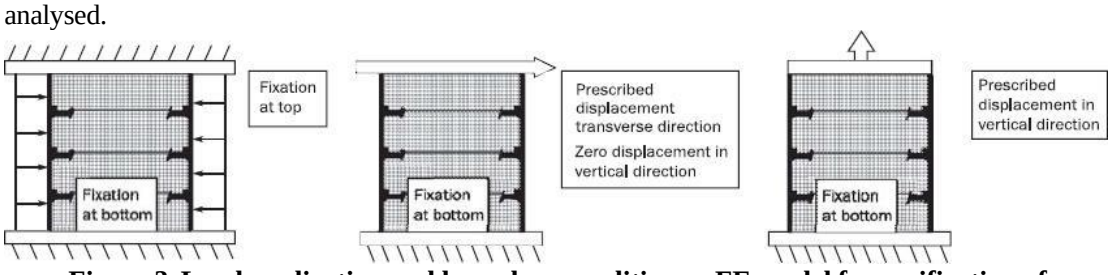

Figure 3 Load application and boundary conditions – FE model for verification of alternative design

3 SCALLOPS IN WAY OF BLOCK JOINTS

3.1 Design standard B

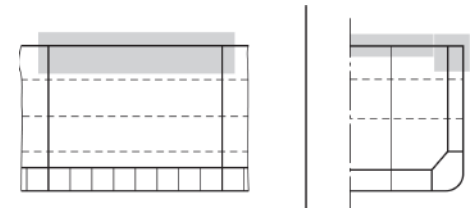
3.1.1
Scallops in way of block joints in the cargo tank/hold region, located on the stiffeners fitted on strength deck, and side above 0.9*D* from the baseline, are required to be designed according to the design standard B as shown in Table 2.

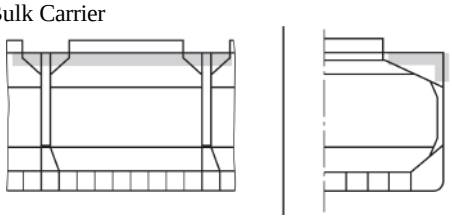
4 HOPPER KNUCKLE CONNECTION

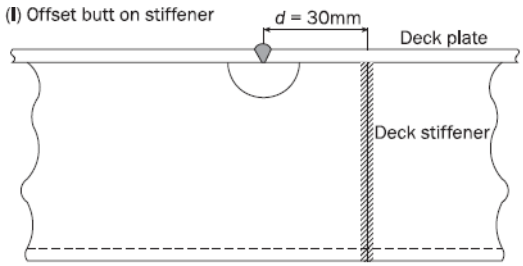
4.1 Design standard C to H

4.1.1
The welded knuckle between hopper plating and inner bottom plating for double-hull oil tankers is to be designed according to the design standard C in Table 3. The design standard D in Table 4 may be used as an alternative to increase fatigue strength at the hopper connection.

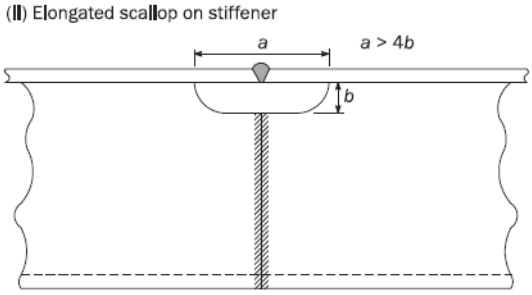
4.1.2
The welded knuckle between hopper plating and inner bottom plating for bulk carriers is to be designed according to the design standard E in Table 5.



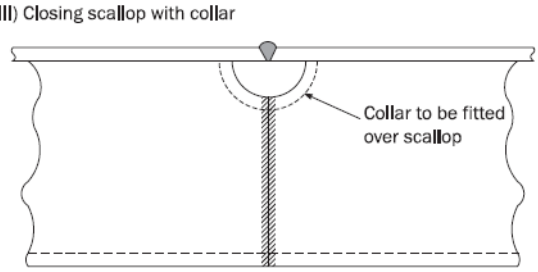




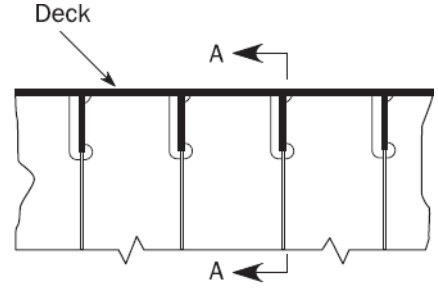
4.1.3
The radiused knuckle between hopper plating and inner bottom plating is to be designed according to the design standard F in Table 6 for double hull oil tankers.
Alternative structural arrangements may be accepted based on verification in accordance with Ch 9, Sec 5, [3.3].



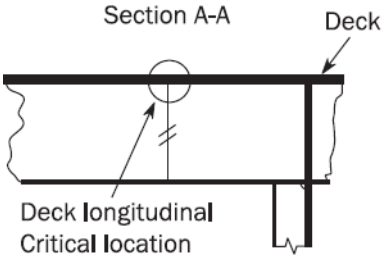
4.1.4
The radiused knuckle between hopper plating and inner bottom plating for bulk carriers is to be designed according to the design standard G in Table 7.



4.1.5
The radiused knuckle between hopper plating and inner side plating for oil tankers and double side bulk carriers is to be designed according to the design standard H in Table 8.



4.1.6
In general, the prescribed minimum requirements for welding, weld dressing and building tolerances as given in Table 3 to Table 8 are to be followed. Alternative positioning and/or dispensation of some support structure, such as transverse and longitudinal brackets may be accepted subject to demonstration of acceptable fatigue lives. Inserts and/or weld dressing additional to those prescribed may be required as a consequence of hot spot fatigue analysis.



Design standard B – scallops in way of block joints **Table 2**

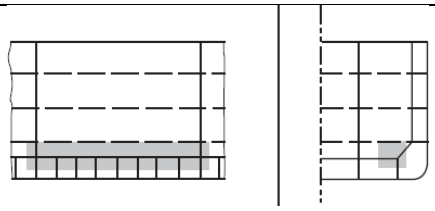
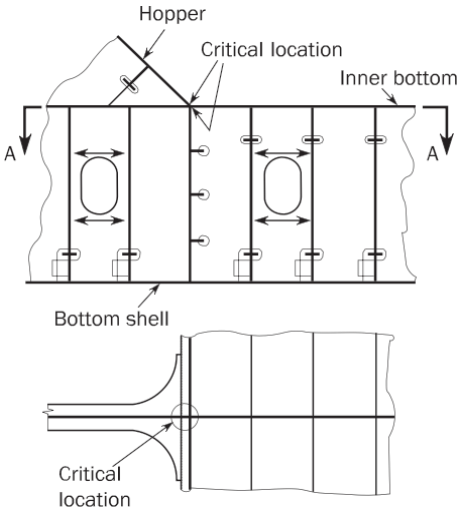
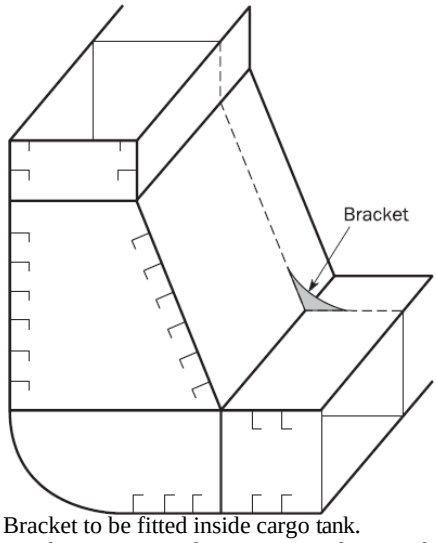
</td></tr>
</table>

Critical location	Welding of deck stiffeners in way of block joints in cargo tank region, the strength deck and side above 0.9*D* from the baseline.
Detail design standard	All scallops are to be fitted according to detail design standard B.
Building tolerances	Ensure alignment of all structural members according to IACS Recommendation No. 47.
Welding requirements	Full penetration butt weld, free of undercut or notches, around the web and flange of the longitudinal stiffener at block joints, particularly in way of the weld termination at the scallop for option II.







Design standard C – hopper knuckle connection detail, welded, without bracket, double hull oil tanker **Table 3**

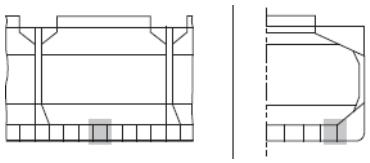
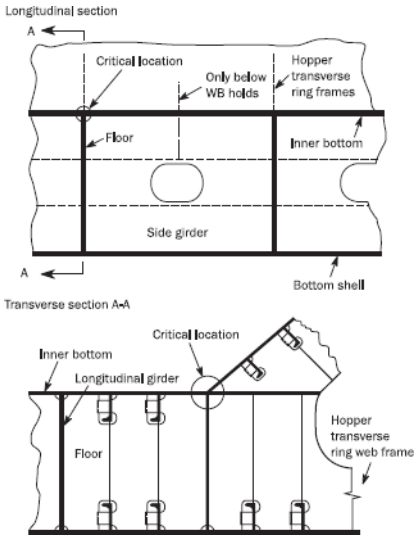
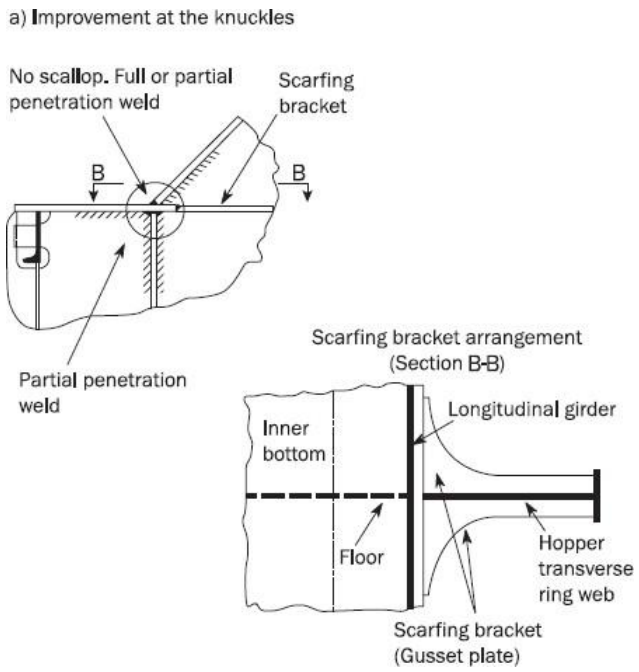
Hopper corner connections employing welded inner bottom and hopper sloping plating</td></tr>
<tr><td>Critical areas</td><td>Design standard C</td></tr>
<tr><td> 
Critical locations
 
</td><td> 

 
</td></tr>
</table>

Minimum requirement	As a minimum, detail design standard C or D is to be fitted. The ground surface is to be protected by a stripe coat of suitable paint composition, where the lower hopper knuckle region of cargo tanks is not coated.
Critical location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girder in way of hopper corners.
Detail design standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness is to be close to that of the inner bottom in way of the knuckle.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of the girder with an allowable tolerance of $t_{as\text{-}built}/3$ or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness. The allowable tolerance is to be measured parallel to the inner bottom.
Welding requirements	Full or partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection. Partial penetration welding is to be applied to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3 Weld between hopper plating and inner bottom plating to be enlarged and ground smooth. Visible undercuts are to be removed, see Ch 9, Sec 3, [6]. Weld enlargement and grinding are applicable to minimum 200 mm on each side of the floor.







Design standard D – hopper knuckle connection detail, welded, with bracket, double hull oil Tanker Table 4

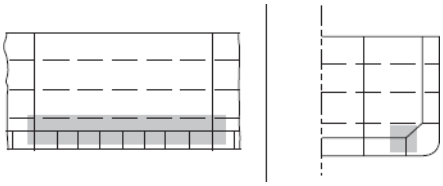
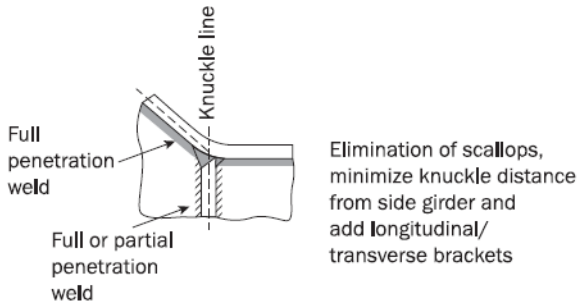
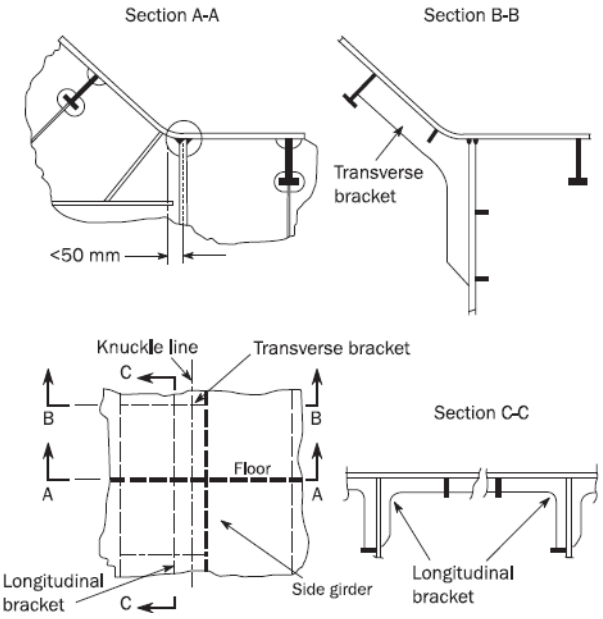
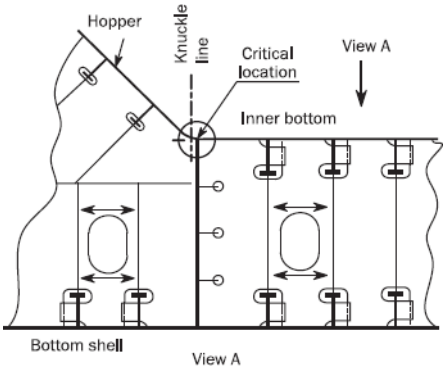
Note5: Slenderness of bracket to be in accordance with Ch 8, Sec 2, [5.2].</td></tr>
</table>

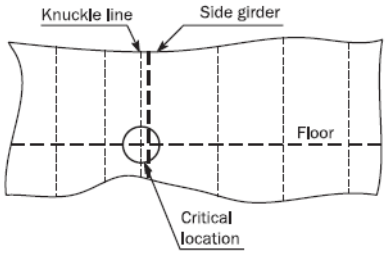
Minimum requirement	As a minimum, detail design standard C or D is to be applied.
Critical location	Hopper sloping plating connections to inner bottom plating in way of floors. Floor connections to inner bottom plating and side girder in way of hopper corners. The bracket connection to inner bottom and hopper sloping plate.
Detail design standard	Elimination of scallops in way of hopper corners, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket thickness similar to that of the inner bottom in way of the knuckle.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of girder with an allowable tolerance of $t_{as\text{-}built}$ /3 or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness.
Welding requirements	Partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection, to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Partial penetration welding is to be applied to the bracket connections to inner bottom and hopper sloping plate, full penetration welding is to be applied at bracket toes. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.









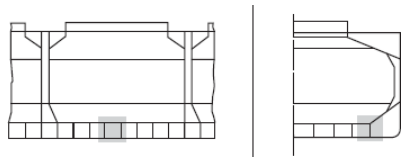


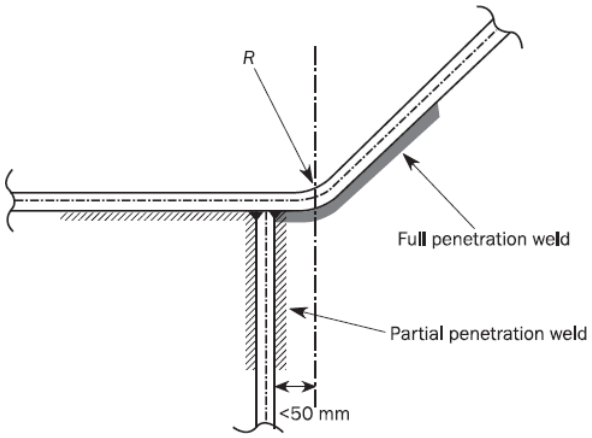
Design standard E – hopper knuckle connection detail, welded, bulk carrier Table5

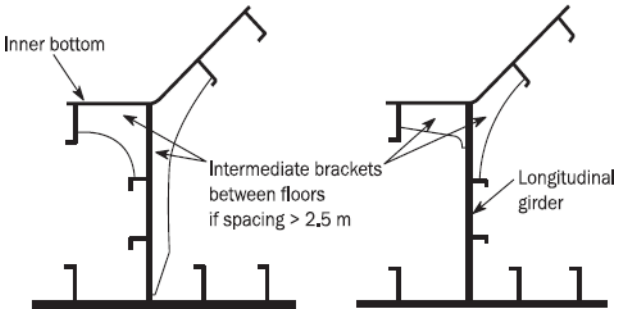
Connections of floors in double bottom tanks to hopper tanks Welded knuckle connection of hopper tank sloping plating to inner bottom plating	
Critical areas	Design standard E
 Critical locations 	

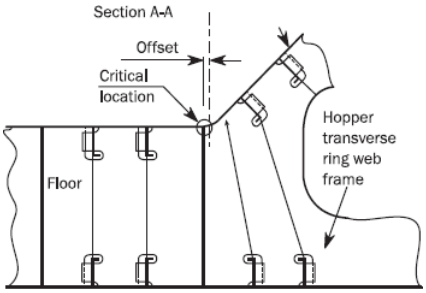
Minimum requirement	As a minimum, detail design standard E is to be fitted. Ballast holds: No scallops or close scallops with collars; scarfing bracket; intermediate bracket if floor spacing greater than 2.5 m. Dry holds: No scallop or close scallops with collars and scarfing bracket.
Critical location	Hopper sloping plating connections to inner bottom plating in way of the floors. Floor connections to inner bottom plating and side girder in way of the hopper knuckle.
Detail design standard	Elimination of scallops in way of hopper knuckle, extension of inner bottom plating to reduce level of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure and hull girder loads. Scarfing bracket net thickness is to be minimum 80% of that of the inner bottom in way of knuckle and steel material to be of the same yield strength.
Building tolerances	Median line of hopper sloping plate is to be in line with the median line of girder with an allowable tolerance of $t_{as\text{-}built}/3$ or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the as-built side girder thickness.
Welding requirements	Full or partial penetration welding is to be applied to hopper sloping plating and inner bottom plating connection for the length of the cargo hold. Partial penetration welding is to be applied to connections of side girder to inner bottom plating, to connections of floors to inner bottom plating and to side girder, to connections of hopper transverse webs to sloping plating, to inner bottom and to side girder in way of the hopper knuckle. Weld between hopper plating and inner bottom plating is to be enlarged and ground smooth. Visible undercuts are to be removed. Weld enlargement and grinding are applicable to minimum 200 mm on each side of the floor. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

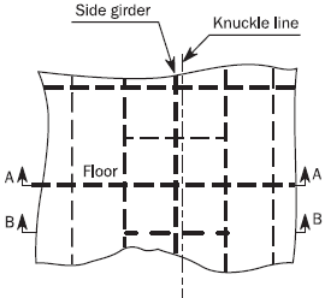
Design standard F – hopper knuckle connection detail, radiused type, for double hull oil tanker **Table 6**











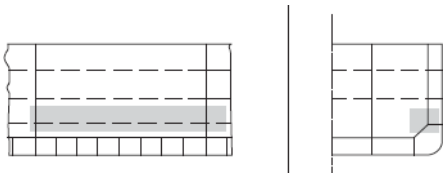
Connections of floors in double bottom tanks to hopper tanks
Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating

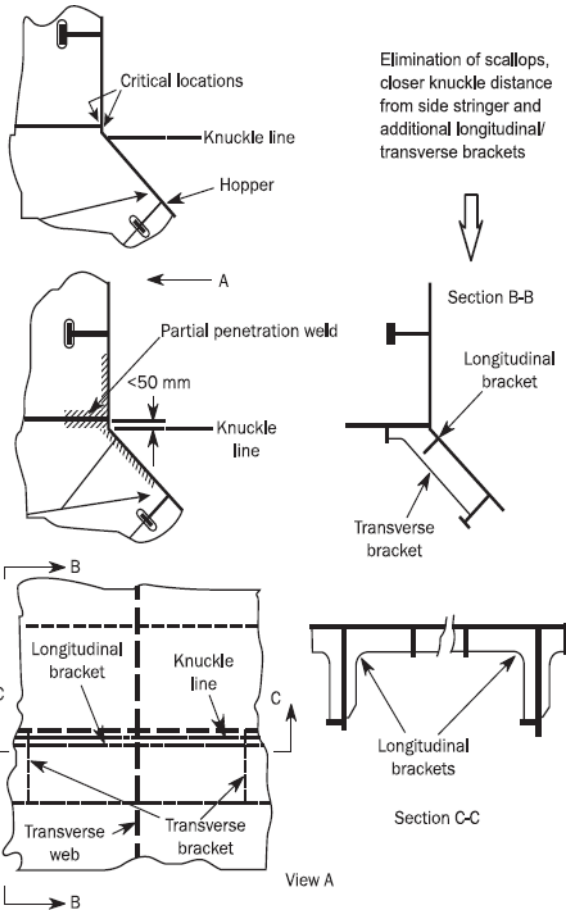
Critical areas	Design standard F
	
Critical locations	
 	Note1: Distance from side girder to centre of knuckle is to be as small as practicable, but is not to exceed 50 mm. Note2: The knuckle radius is not to be less than 4.5 $t_{as\text{-}built}$ or 100 mm, whichever is the greater, where $t_{as\text{-}built}$ is the as-built thickness of the knuckle part. Note3: Additional transverse brackets offset at a suitable distance on either side of transverse floor/hopper connection. Note4: Additional longitudinal bracket on the side of sloping plate. Note5: Longitudinal and/or transverse brackets may be omitted if it can be demonstrated that the girder provides sufficient support at the knuckle line, i.e. that fatigue requirements according to Ch 9, Sec 5 and local strength analysis requirements according to Ch 7, Sec 3 are fulfilled.

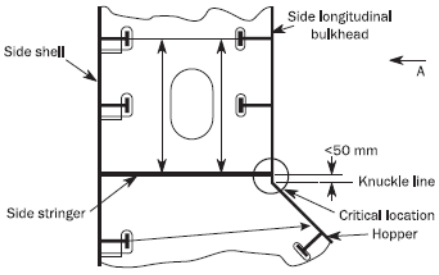
Critical location	Floor and hopper transverse web connections to inner bottom plating and hopper sloping plate, respectively and to side girder in way of hopper knuckle. Side girder connections to inner bottom plating in way of floors.

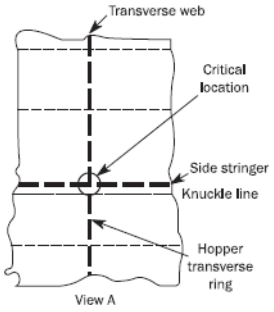
Connections of floors in double bottom tanks to hopper tanks Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating	
Detail design standard	Elimination of scallops in way of hopper/girder connection and additional transverse and longitudinal brackets to reduce peak and range of resultant stresses arising from cyclic external hydrodynamic pressure, cargo inertia pressure, and hull girder global loading, and provide additional support to sloping plate.
Building tolerances	The nominal distance between the centres of thickness of the two abutting members (e.g. floor and hopper web plate) is not to exceed 1/3 of the as-built thickness of the side girder.
Welding requirements	Full penetration welding is to be applied to connections of floors to hopper/inner bottom plating in way of radiused hopper knuckle. Partial penetration welding is to be applied to connections of floors/hopper transverse webs to the side girder in way of hopper corner, and to connections of side girder to hopper/inner bottom plating. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3. In order to improve the fatigue strength, weld enlargement and grinding are applicable to full and partial penetration welds with a minimum distance of 300 mm from the intersection point between the radiused knuckle, the floor and the side girder.

Design standard G – hopper knuckle connection detail, radiused type, bulk carrier Table 7









Connections of floors in double bottom tanks to hopper tanks Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating	
Critical areas	Design standard G
	 Intermediate bracket arrangement (Section B-B). Two intermediate brackets at both sides of floor/transverse web. 
Critical locations	
 	Note1: Distance from side girder to centre of knuckle is to be as small as practicable, but is not to exceed 50 mm. Note2: The knuckle radius is not to be less than 4.5 $t_{as\text{-}built}$ or 100 mm, whichever is the greater, in cases where $t_{as\text{-}built}$ is the as-built thickness of the knuckle part. Note3: Additional transverse brackets on both side of transverse floor/hopper connection. Note4: Transverse brackets may be omitted if it can be demonstrated that the girder provides sufficient support at the knuckle line, i.e. that fatigue requirements according to Ch 9, Sec 5 and local strength analysis requirements according to Ch 7, Sec 3 are fulfilled.

Critical location	Side girder connections to inner bottom plating in way of floors. Floor and hopper transverse web connections to inner bottom plating and hopper sloping plate, respectively, and to side girder in way of hopper corners.
Detail design standard	Elimination of scallops in way of hopper/girder connection. Ballast holds: Intermediate brackets fitted at approximately 0.5 floor space from floor/hopper web. Dry holds: Intermediate brackets fitted at 0.5 floor space from floor/hopper web if floor spacing is equal to or greater than 2.5 m.
Building tolerances	The nominal distance between the centres of thickness of the two abutting members (e.g. floor and hopper web plate and additional supporting brackets) should not exceed 1/3 of the as-built thickness of the side girder.

Connections of floors in double bottom tanks to hopper tanks Hopper corner connections employing radiused knuckle between inner bottom and hopper sloping plating	
Welding requirements	Full penetration welding is to be applied to connections of floors to hopper /inner bottom plating in way of radiused hopper knuckle. Partial penetration welding is to be applied to connections of floors/hopper transverse webs to side girder in way of hopper corners, to connections of side girder to hopper /inner bottom plating. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.

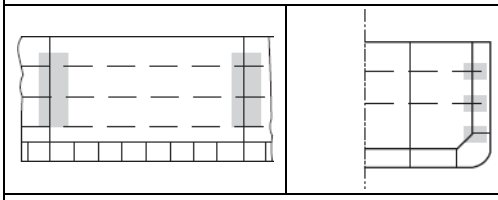
Design standard H – upper hopper knuckle connection detail, radiused type, oil tankers and double side bulk carrier **Table 8**

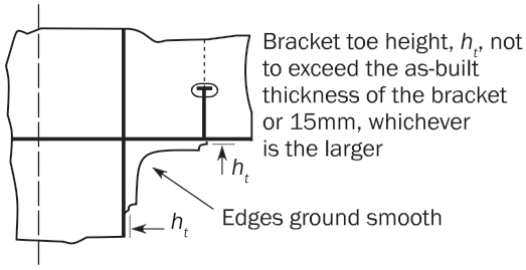
Connections of transverse webs in double side tanks to hopper tanks
Hopper corner connections employing radiused knuckle between side longitudinal bulkhead and hopper sloping plating

Critical areas	Design standard H
	
Critical locations	
 	Note1: Distance from side stringer to centre of knuckle is to be as small as practicable, but is not to exceed 50 mm. Note2: The knuckle radius is not to be less than 4.5 $t_{as\text{-}built}$ or 100 mm, whichever is the greater, where $t_{as\text{-}built}$ is the as-built thickness of the knuckle part, according to Ch 12 Sec 1 [3] & [4]. Note3: Additional transverse brackets offset at a suitable distance on either side of transverse floor/hopper connection. Note4: Additional longitudinal bracket on the side of sloping plate. Note5: Longitudinal and/or transverse brackets may be omitted if it can be demonstrated that the girder provides sufficient support at the knuckle line, i.e. that fatigue requirements according to Ch 9, Sec 5 and local strength analysis requirements according to Ch7, Sec 3 are fulfilled.

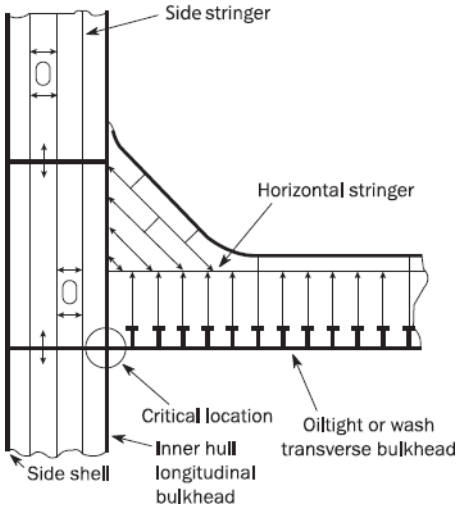
Critical location	Side stringer connections to side longitudinal bulkhead in way of transverse webs. Double side tank transverse web and hopper transverse web connections to side longitudinal bulkhead and to side stringers in way of hopper corners.

Connections of transverse webs in double side tanks to hopper tanks Hopper corner connections employing radiused knuckle between side longitudinal bulkhead and hopper sloping plating	
Detail design standard	Elimination of scallops in way of hopper corners, closer knuckle distance from side stringers. Additional longitudinal / transverse brackets to reduce peak and range of resultant stresses arising from cyclic external hydrodynamic pressure and cargo inertia pressure.
Building tolerances	The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the as-built thickness of the side stringer.
Welding requirements	Partial penetration welding is applied to connection of side stringers to side longitudinal bulkhead, connection of double side tank transverse webs to side longitudinal bulkhead and to side stringers, connection of hopper transverse webs to sloped side longitudinal bulkhead and to side stringers in way of hopper corners. Small scallops of suitable shape, which are to be closed by welding after completion of the continuous welding of side stringers to longitudinal bulkhead, are to be provided where scallops are eliminated. Definition of full and partial penetration welding and their required extent are given in Ch 12, Sec 3.





5 HORIZONTAL STRINGER HEEL



5.1 Design standard I

5.1.1

The horizontal stringer heel location between transverse oil-tight/swash bulkhead plating and inner hull longitudinal bulkhead plating for double hull oil tankers are required to be designed according to design standard I, as shown in Table 9.

Design Standard I – transverse bulkhead horizontal stringer heel **Table 9**

<table>

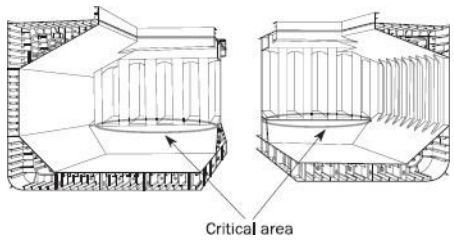
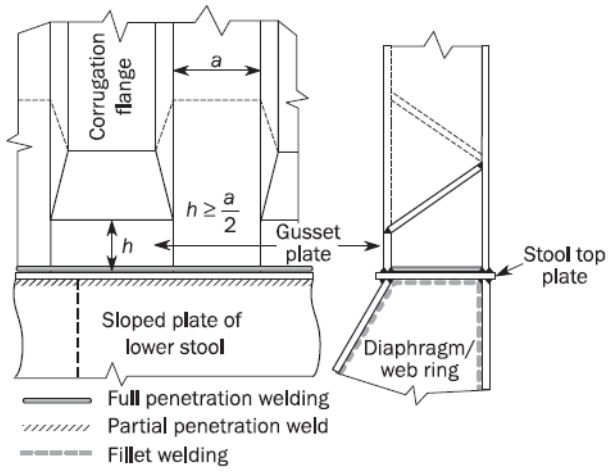
<tr><td>Detail design standard</td><td colspan="2">A soft toe backing bracket is to be fitted. The following bracket sizes are recommended:
● VLCC: 800×800×30, R600 with soft toe as shown in figure above,
● Other tankers: 800×600×25, R550 with soft toe as shown in figure above, where the longer arm length is in way of the inner skin.
The specified minimum yield stress for the bracket is not to be less than 315 N/mm^2. The free edge is to be ground smooth with corners rounded.</td></tr>
<tr><td>Building tolerances</td><td colspan="2">The nominal distance between the centres of thickness of the two abutting members should not exceed 1/3 of the as-built plate thickness of the inner hull longitudinal bulkhead.</td></tr>
<tr><td>Welding requirements</td><td colspan="2">Vertical weld between the inner hull plating and transverse bulkhead plating, fillet welding having minimum weld factor 0.44.
Welding between the backing bracket and the adjoining plates is to be double sided fillet welding having minimum weld factor 0.44 except in way of the bracket toes. Full penetration welding is to be used for the connection of bracket toes to the inner hull and transverse bulkhead plating for a distance of 200 mm from the toes and the weld toes are to be ground smooth in way.</td></tr>
</table>

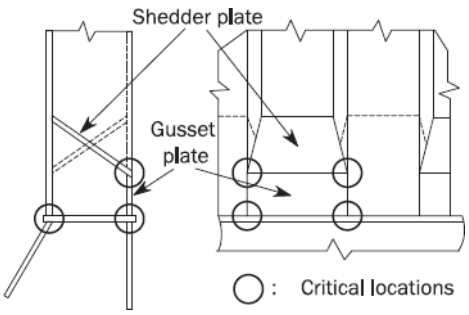
6 BULKHEAD CONNECTION TO LOWER AND UPPER STOOL

6.1 Design standard J, K and L

6.1.1

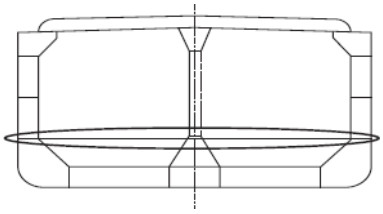


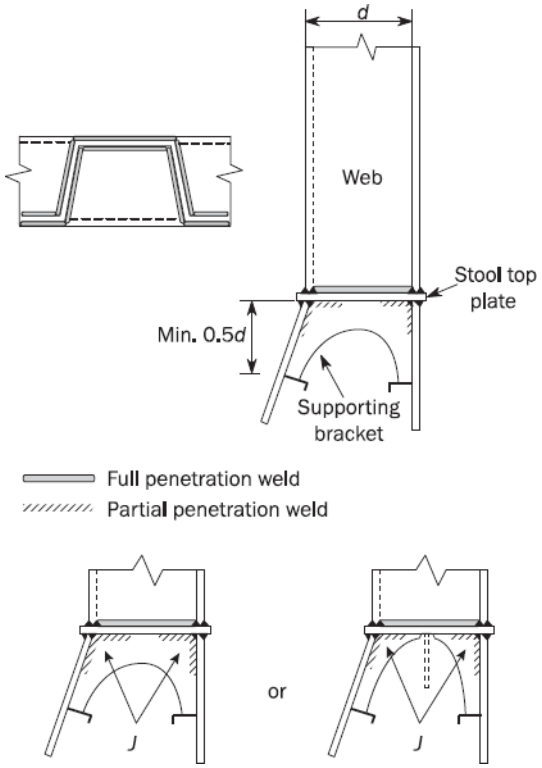


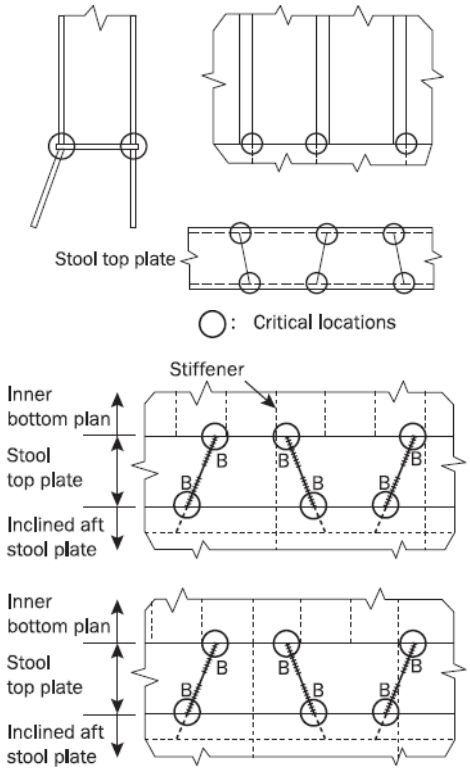


The welded connection of bulkhead to lower stool of bulk carriers and oil tankers are to be designed according to the design standard J and K respectively, as shown in Table 10 and Table 11.

6.1.2







The welded connection of bulkhead to upper stool of bulk carriers are to be designed according to the design standard L, as shown in Table 12.

Design standard J – transverse bulkhead connection detail, bulk carrier (Ballast hold)

Table 10

</table>

Critical location	Connections of lower stool top plate to corrugated transverse or longitudinal bulkheads.
Detail design standard	The use of scallops is to be avoided on diaphragms/web at lower stool top plates. Supporting brackets are to be fitted in line with corrugation web as required in Ch 6, Sec 4, [2.6.2]. Scallop is not permitted in the supporting bracket.
Building tolerances	Ensure alignment between lower stool side plates and corrugation faces according to IACS Recommendation No. 47.
Welding requirement	Full or partial penetration welding is to be applied between lower stool top plates and the side plating of lower stools. Full penetration welding is to be applied between lower stool top plates and vertical corrugated bulkheads. Full or partial penetration welding is to be applied between lower stool top plates and supporting brackets. Ensure start and stop of welding is as far away as practicable from the critical corners. Connection 'J', as shown in the figure, of in line supporting bracket to stool top plate and side plate of lower stool is to be full or partial penetration welding, on minimum 300 mm from the corner.

</td></tr>
</table>

Critical location	Connections of corrugated transverse bulkhead to the topside tank sloping plating and upper stool.
Detail design standard	The use of scallops is to be avoided on diaphragms/web at upper stool bottom plates. Gusset plates are to be fitted between the face plates of corrugated bulkheads in way of heavy ballast hold. In way of heavy ballast hold, a deep transverse web or well-stiffened backing stiffener is to be provided in the topside tank in line with the face plate of the bulkhead corrugations to ensure that the loads are effectively dissipated. Gusset plates are to have a thickness and material properties not less than those required for corrugation flanges.
Building tolerances	Ensure alignment between the face plates of corrugated bulkheads with the stool side plates as well as the watertight bulkheads and deep transverse web (or well- stiffened backing stiffener) in the topside tanks according to IACS Recommendation No. 47.
Welding requirement	Partial or full penetration welding is to be applied between upper stool bottom plates and corrugation. ● Fillet welding having minimum weld factor of 0.44 is to be applied between upper stool bottom plates and upper stool side plating. ● Fillet welding having minimum weld factor of 0.44 is to be applied between upper stool bottom plates and diaphragms/web rings. Ensure start and stop of welding is as far away as practicable from the critical corners in all holds.

</table>

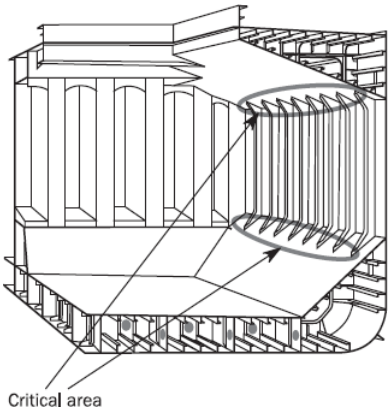
Critical location	-
Material and scantling requirement	Inner bottom and hopper tank plating in way of corrugations is to be in accordance to Ch 6, Sec 4, [2.6.4]. Floors/girders and hopper web that support corrugation flange is to be in accordance to Ch 6, Sec 4, [2.6.4]. Supporting bracket aligned with corrugation web is to be in accordance with Ch 8, Sec 2, [5.2] and Ch 6, Sec 4, [2.6.4].
Detail design standard	Supporting brackets are to be fitted in line with corrugation web as required in Ch 6, Sec 4, [2.6.2]. Scallop is not permitted in the supporting bracket.
Building tolerances	Median line of corrugation is to be in line with the median line of the supporting members with an allowable tolerance of $t_{as\text{-}built}$ /3 or 5 mm, whichever is less, where $t_{as\text{-}built}$ is the inner bottom thickness.
Welding requirement	For the connection of vertically corrugated bulkheads to the inner bottom/hopper plating, full penetration welding is to be provided in according to Ch 12, Sec 3, [2.4]. For the connection of supporting structures to inner bottom/hopper plating, partial or full penetration welding is to be provided in accordance with Ch 12, Sec 3, [2.4]. Partial or full penetration welding is also to be applied for the connection of in line brackets below corrugation web in accordance with Ch 12, Sec 3, [2.4] on minimum 300 mm from the corner.

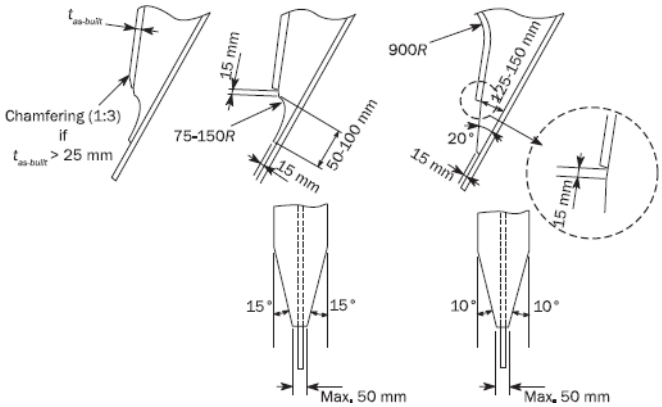
7 BULKHEAD CONNECTION TO INNER BOTTOM

7.1 Design standard M

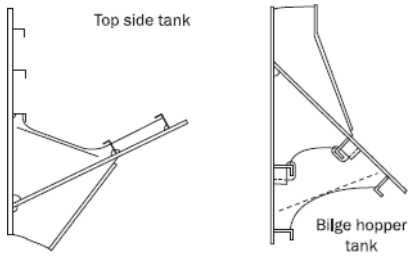
7.1.1

The connection of vertically corrugated bulkhead to inner bottom/hopper plating of cargo tanks and heavy ballast hold are to be designed according to the design standard M, as shown in Table 13.

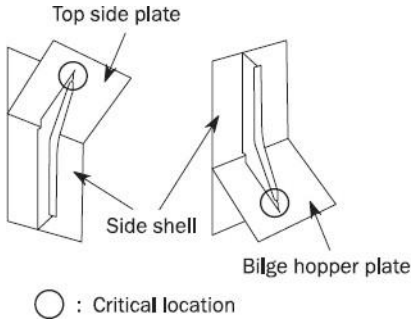




8 LOWER AND UPPER TOE OF HOLD FRAME



8.1 Design standard N



8.1.1

The welded connections of lower and upper bracket toes of hold frame of bulk carriers are to be designed according to design standard N, as shown in Table 14

Design standard N – lower and upper toe detail of hold frame - bulk carrier Table 14

<table>
<tr><td colspan="2">Lower and upper hold frame connections</td></tr>
<tr><td>Critical areas</td><td>Design standard N</td></tr>

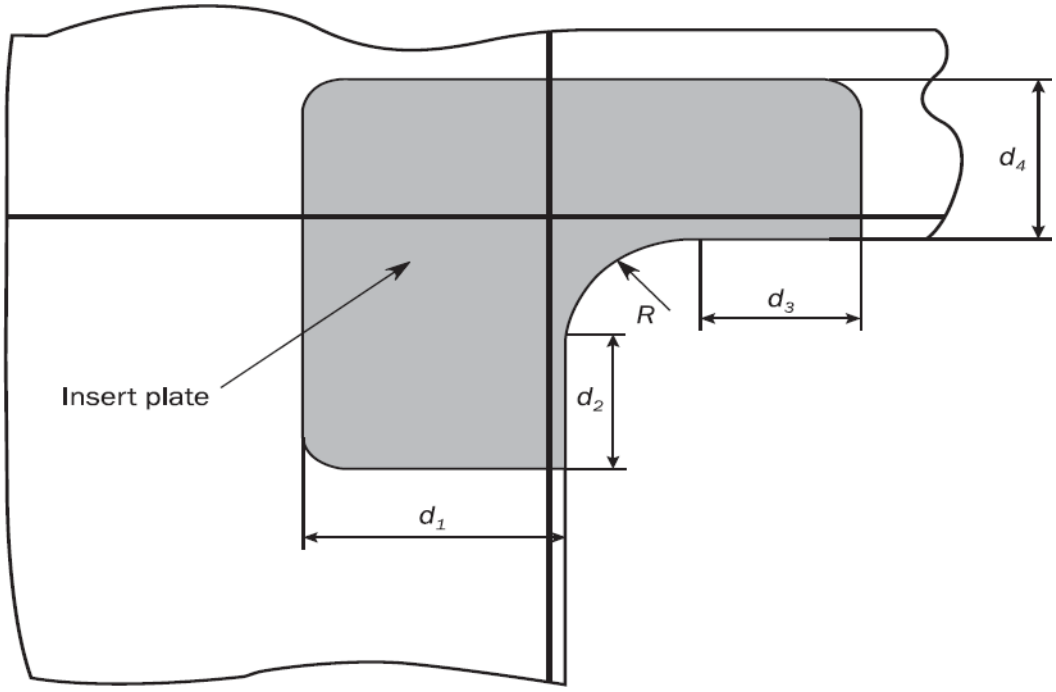
Connection of lower and upper end bracket of hold frame.</td></tr>
<tr><td>Critical locations</td></tr>
<tr><td> 
</td></tr>
<tr><td>Minimum requirement</td><td>As a minimum the detail design standard N is to be applied. Tapered extended toes are more effective and are to be considered for high tensile steel side shell frame.</td></tr>
<tr><td>Critical location</td><td>Toe connection of side shell frame lower and upper brackets to the hopper and topside sloping plates, including face plate terminations.</td></tr>
</table>

Lower and upper hold frame connections	
Detail design standard	Alternative geometries than stipulated above are permissible subject to demonstration of satisfactory fatigue performance. However, the maximum angles shown on the figures for thickness chamfering and face width tapering are not to be exceeded. Bracket toe height and the distance between the face plate termination and start of the toe radius (or toe taper) are to be kept to a minimum. The face plates of hold frames at lower or upper brackets are to be tapered and chamfered as shown. While chamfering may be dispensed with if the thickness of the face plates is less than 25 mm, it is nevertheless a recommended practice, with a larger gradient if necessary. Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft or elongated toes as shown. The side frame flange is to be curved (not knuckled) at the connection with the end brackets. Where the frame upper brackets are not positioned directly below a ring web, supporting brackets are to be provided. In the design ensure that if a topside tank stiffener is positioned above the end of frame upper bracket, the stiffener cut-out is avoided or closed with a full collar. Increasing the size of supporting brackets will reduce stress concentrations in the critical area. Where the frame lower brackets are not positioned directly above a ring web, supporting brackets are to be provided. In the design ensure that if a hopper tank stiffener is positioned below the end of the frame lower bracket, the stiffener cut-out is avoided or closed with a full collar. Increasing the size of supporting brackets will reduce stress concentrations in the critical area.
Building tolerances	Ensure alignment between side shell frame lower and upper bracket and transverse ring webs or supporting brackets according to IACS Recommendation No. 47. Maximum misalignment is to be not greater than $t_{as\text{-}built}$ /3 where $t_{as\text{-}built}$ is the thinner as-built thickness of the webs to be aligned and misalignment is the overhang of the as-built thinner thickness.
Welding requirement	Welding is to comply with Ch 12, Sec 3, [3]. In way of the wrap around weld at the face plate termination, care should be taken to ensure no over- run onto the radius part and the toe is free from notches and undercut.



9 HATCH CORNER

9.1 Design standard O

9.1.1

Hatch corners in the cargo hold region, located on the strength deck of bulk carriers are required to be designed according to design standard O, as shown in Table 15.

Design standard O – hatch corner of bulk carriers **Table 15**

Hatch corner (bulk carriers)		
Design standard O		
		
	without insert plate	with insert plate
Critical location	Hatch corner curve	Curved Radius Transition insert plate to deck plating
Detail design standard	Shape of hatch corner as required by Pt 2, Ch 1, Sec 2	Radius and insert plate dimensions and thickness as required by Pt 2, Ch 1, Sec 2. Insert plate has to be tapered for smooth thickness transition to deck plating, the transition taper length has to be not less than 3 times the offset.
Post-treatment	Grinding of cut edge within the radius	Grinding of cut edge within the radius

Chapter 10 OTHER STRUCTURES

Section 1 FORE PART

SYMBOLS

For symbols not defined in this section, refer to Ch1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as:

$$\alpha_p = 1.2 - \frac{b}{2.1a}$$ but not to be taken as greater than 1.0.

f_{bdg} : Bending moment factor taken as:

$$f_{bdg} = 8(1 + \frac{n_s}{2})$$

n_s : End fixation factor taken as:

n_s = 0 for both ends with low end fixity (simply supported).

n_s = 1 for one end fixed and one end simply supported.

n_s = 2 for continuous members or members with bracketed fitted at both ends

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the following structures of the fore part as defined in Ch 1, Sec 1, [2.4.2]:

- Fore peak structures.
- Stem.

In addition, the requirements of this section apply to structure subjected to impact loads:

- Flat bottom forward, according to [3.2].
- Bow area, according to [3.3].

2 STRUCTURAL ARRANGEMENT

2.1 Floors and bottom girders

2.1.1 Floors

In case of transverse framing, solid floors are to be fitted at each web frame location.

In case of longitudinal framing, the spacing of solid floors is not to be greater than 3.5 m or four transverse frame spaces, whichever is smaller.

The minimum depth of the floor at the centreline is not to be less than the required depth of the double bottom of the foremost cargo hold. See Ch 2, Sec 3, [2.3].

2.1.2 Bottom girders

A supporting structure is to be provided at the centreline either by extending the centreline girder to the stem or by providing a deep girder or centreline bulkhead.

Where a centreline girder is fitted, the minimum depth and thickness is not to be less than that required for the depth of the double bottom in the neighbouring cargo hold region, and the upper edge is to be stiffened.

In case of transverse framing, the spacing of bottom girders is not to exceed 2.5 m. In case of longitudinal framing, the spacing of bottom girders is not to exceed 3.5 m.

2.1.3 Alternative design verification

This spacing, defined in [2.1.1] and [2.1.2] may be increased, if the designer performs a verification of the bottom structure by means of grillage analysis or FE analysis and provides their full documentation. The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

2.2 Wash bulkheads

2.2.1
Where a centreline wash bulkhead is fitted, the lowest strake is to have thickness not less than required for a centreline girder.
Where a longitudinal wash bulkhead supports bottom transverses, the details and arrangements of openings in the bulkhead are to be configured to avoid areas of high stresses in way of the connection of the wash bulkhead with bottom transverses.

2.3 Side shell supporting structure

2.3.1 Web frames

The spacing of web frames, *S*, in m as defined in Ch 1, Sec 4, Table 5, is to be taken as:
$S = 2.6 + 0.005\,L$, but not to be taken greater than 3.5 m.
Perforated flats are to be fitted to limit the effective span of web frames to not greater than 10 m.

2.3.2 Stringers

The transverse framing forward of the collision bulkhead stringers are to be spaced approximately 3.5 m apart. Stringers are to have an effective span not greater than 10 m, and are to be adequately supported by web frame structures.

2.3.3 Alternative design verification

The spacing of web frames and stringers may be increased, if the designer performs a verification of the side shell supporting structure by means of beam analysis or FE analysis and provides their full documentation.
The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

2.4 Tripping brackets

2.4.1
For side shell and tank walls, located forward of the collision bulkhead and vertically framed, tripping brackets spaced not more than 2.6 m are to be fitted, according to Figure 1, between primary supporting members, decks and/or platforms.
The as-built thickness of the tripping brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.

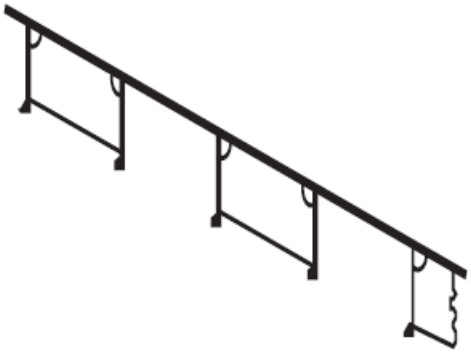


Figure 1 Tripping brackets

2.5 Bulbous bow

2.5.1 General

Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

2.5.2 Diaphragm plates

At the forward end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced about 1m apart in conjunction with a deep centreline web.
In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.

2.5.3 Special bulbous bow designs

In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is

generally to be fitted.
In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames is to be fitted.

2.5.4 Strengthening for anchor and chain cable contact

The shell plating is to be increased in thickness at the forward end of the bulb and also in areas likely to be subjected to contact with anchors and chain cables during anchor handling. The increased plate thickness is to be the same as that required for plated stems given in [4.1.1].

3 STRUCTURE SUBJECTED TO IMPACT LOADS

3.1 General

3.1.1 Application

The requirements of this sub-section cover the strengthening requirements for local impact loads that may occur in the forward structure. The impact loads to be applied in [3.2] and [3.3] are described in Ch 4, Sec 5, [3].

3.1.2 General scantling requirements

The requirements of [3.2] and [3.3] are to be applied in addition to applicable scantling requirements in Ch 6. Local scantling increases due to impact loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

3.2 Bottom slamming

3.2.1 Application

Where the minimum draughts forward, $T_{F\text{-}e}$ or $T_{F\text{-}f}$, as specified in Ch 4, Sec 5, [3.2.1], are less than 0.045 L, the bottom forward is to be additionally strengthened to resist bottom slamming pressures. The draughts for which the bottom has been strengthened are to be indicated on the shell expansion plan and loading guidance information, as required in Ch 1, Sec 5.
The load calculation point of the primary supporting members is specified in Ch 3, Sec 7, [4].

3.2.2 Extent of strengthening

The strengthening is to extend forward of 0.3 L from the FP over the flat of bottom and adjacent plating with attached stiffeners up to a height of 500 mm above the baseline, see Figure 2.

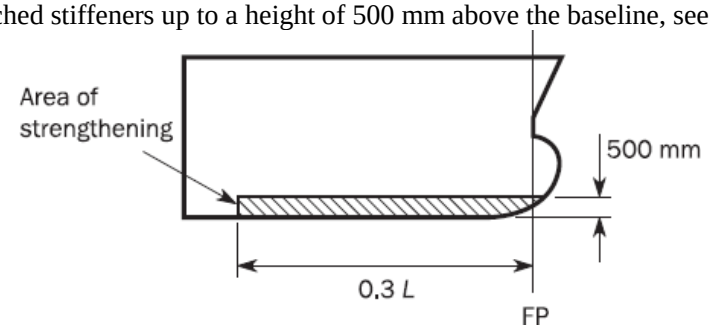

Figure 2 Extent of strengthening against bottom slamming

Outside the region strengthened to resist bottom slamming the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

3.2.3 Design to resist bottom slamming loads

The design of end connections of stiffeners in the bottom slamming region is to provide end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with Ch 3, Sec 6, [3.2]. Where it is not practical to comply with this requirement, the net plastic section modulus, *Zpl-alt*, in cm3, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt} = \frac{16 Z_{pl}}{f_{bdg}}$$

where:

Z_{pl}: Net plastic section modulus, in cm3, as required by [3.2.5].
Scantlings and arrangements of primary supporting members, including bulkheads in way of stiffeners, are to comply with [3.2.7].

3.2.4 Shell plating

The net thickness of the hull envelope plating, *t*, in mm, except for the transversely stiffened bilge plating within the cylindrical part of the ship, is not to be less than :

$$t = \frac{0.0158\alpha_p b}{C_d}\sqrt{\frac{P_{SL}}{C_a R_{eH}}}$$

where:

C_d :Plate capacity correction coefficient taken as:
C_d = 1.3.

C_a : Permissible bending stress coefficient taken as:
C_a = 1.0 for acceptance criteria set AC-I.

The transversely stiffened bilge plating within the cylindrical part of the ship is to comply with the requirement given in Pt 1, Ch 6, Sec 4, [2.2].

3.2.5 Shell stiffeners

The shell stiffeners within the strengthening area defined in [3.2.2] are to comply with the following criteria:

a) The net plastic section modulus, Z_{pl}, in cm^3, is not to be less than:

$$Z_{pl-alt} = \frac{P_{SL} s l_{bdg}^2}{f_{bdg} C_s R_{eH}}$$

where:
C_s : Permissible bending stress coefficient taken as:
C_s = 0.9 for acceptance criteria set AC-I.

b) The net web thickness, t_w, in mm, is not to be less than:

$$t_w = \frac{P_{SL} s l_{shr}}{2 d_{shr} C_t \tau_{eH}}$$

where:
C_t : Permissible shear stress coefficient taken as:
C_t = 1.0 for acceptance criteria set AC-I.

c) he slenderness ratio is to comply with Ch 8, Sec 2.

3.2.6 Bottom slamming load area for primary supporting members

The scantlings of primary supporting members according to [3.2.7] are based on the application of the slamming pressure defined in Ch 4, Sec 5, [3.2] to an idealised slamming load area of hull envelope plating, A_{SL} , in m^2, given by:

$$A_{SL} = \frac{1.1 \cdot L \cdot B \cdot C_b}{1000}$$

3.2.7 Primary supporting members

The size and number of openings in web plating of the floors and girders is to be minimised considering the required shear area as given in a):

a) Net shear area
The net shear area, $A_{shr\text{-}n50}$, in cm^2, of each primary supporting member web at any position along its span is not to be less than:

$$A_{shr-n50} \quad \frac{Q_{SL}}{C_t \tau_{eH}} = \frac{1}{0}$$

where:

Q_{SL} :The greatest shear force due to slamming for the position being considered, in kN, based on the application of a patch load, *FSL* to the most onerous location, as determined in accordance with b) or c).

C_t : Permissible shear stress coefficient taken as:
C_t = 0.9 for acceptance criteria set AC-I.

b) Simplified calculation of slamming shear force
For simple arrangements of primary supporting members, where the grillage effect may be ignored, the shear force, Q_{SL}, in kN, is given by:
$Q_{SL}=f_{pt}f_{dist}F_{SL}$
where:
f_{pt} : Correction factor for the proportion of patch load acting on a single primary supporting member, taken as

$$f_{pt} = 0.5(f_{SL}^3 - 2f_{SL}^2 + 2)$$

f_{SL} : Patch load modification factor taken as:

$$f_{SL} = 0.5\frac{b_{SL}}{S}$$

f_{dist} : Factor for the greatest shear force distribution along the span, according to Figure 3.
F_{SL} : Patch load, in kN, taken as:
$F_{SL}=P_{SL}l_{SL}b_{SL}$
l_{SL} : Extent of slamming load area along the span, in m, taken as:

$l_{SL} = \sqrt{A_{SL}}$ but not to be greater than $0.5l_{shr}$.

b_{SL} : Breadth of impact area supported by primary supporting member, in m, taken as:

$b_{SL} = \sqrt{A_{SL}}$ but not to be greater than S.

A_{SL} : Surface defined in [3.2.6].

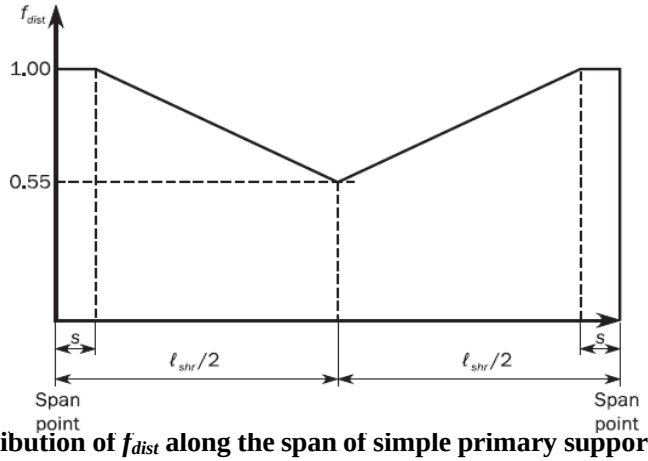

Figure 3 Distribution of f_{dist} along the span of simple primary supporting members

c) Direct calculation method for slamming shear force
For complex arrangements of primary supporting members, the greatest shear force, Q_{SL}, at any location along the span of each primary supporting member is to be derived by direct calculation in accordance with Table 1.

d) Web thickness of primary supporting member
The net web thickness, t_w, in mm, of primary supporting members adjacent to the shell is not to be less than:

$$t_w = \frac{s_W}{70}\sqrt{\frac{R_{eH}}{235}}$$

where:
s_W : Plate breadth, in mm, taken as the spacing between the web stiffening.

3.3 Bow impact

3.3.1 Application

The side structure in the ship forward area is to be strengthened against bow impact pressures. The strengthening is to extend forward of 0.1 L from the FP and vertically above the minimum design

ballast draught, T_{BAL}, defined in Ch 1, Sec 4, [3.1.5] and forecastle deck if any. See Figure 4.

Direct calculation methods for derivation of Q_{SL} **Table 1**

Type of analysis	Model extent	Assumed end fixity of floors
Beam theory	Overall span of member between effective bending supports.	Fixed at ends
Double bottom grillage	Longitudinal extent to be one cargo tank length. Transverse extent to be between inner hopper knuckle and centreline.	Floors and girders to be fixed at boundaries of the model.
Note1: The envelope of greatest shear force along each primary supporting member is to be derived by applying the load patch on a square area as defined in [3.2.6], to a number of locations along the span. Note2: A more extensive model in length and breadth can be considered.		

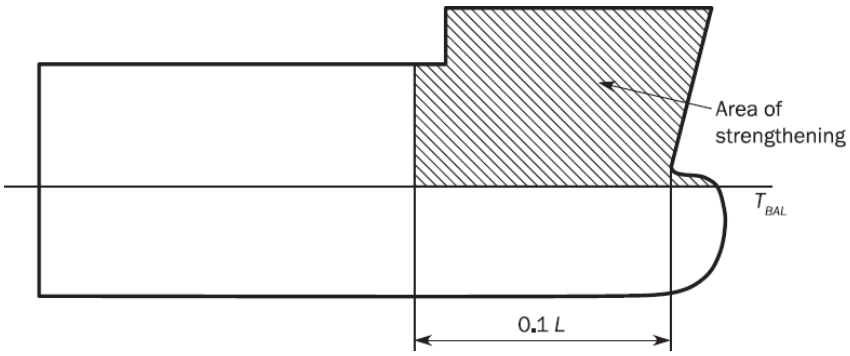

Figure 4 Extent of strengthening against bow impact

Outside the strengthening area the scantlings are to be tapered to maintain continuity of longitudinal and/or transverse strength.

3.3.2 Design to resist bow impact loads

a) In1 the bow impact strengthening area, longitudinal framing is to be carried as far forward as practicable.

The design of end connections of stiffeners in the bow impact region are to ensure end fixity, either by making the stiffeners continuous through supports or by providing end brackets complying with Ch 3, Sec 6, [3.2]. Where it is not practical to comply with this requirement, the net plastic section modulus, Z_{pl-alt} in cm^3, for alternative end fixity arrangements is not to be less than:

$$Z_{pl-alt} = \frac{16 Z_{pl}}{f_{bdg}}$$

where:

Z_{pl} : Effective net plastic section modulus, in cm^3, required by [3.3.4].

b) Scantlings and arrangements of primary supporting members, including decks and bulkheads, in way of the stiffeners, are to comply with [3.3.6]. In areas of the greatest bow impact load, the web stiffeners arranged perpendicular to the hull envelope plating and the double sided lug connections are to be provided.

The main stiffening direction of decks and bulkheads supporting shell framing is to be arranged parallel to the span direction of the supported shell frames, to protect against buckling.

3.3.3 Side shell plating

The net thickness of the side shell plating, t, in mm is not to be less than:

$$t = 0.0158 \alpha_p b \sqrt{\frac{P_{FB}}{C_a R_{eH}}}$$

where:

C_a : Permissible bending stress coefficient taken as:

C_a = 1.0 for acceptance criteria set AC-I.

3.3.4 Side shell stiffeners

The side shell stiffeners within the strengthening area defined in [3.3.1] are to comply with the following criteria:

a) The effective net plastic section modulus, Z_{pl}, in cm^3 in association with the effective plating to which it is attached, is not to be less than:

$$Z_{pl} = \frac{P_{FB} s l_{bdg}^2}{f_{bdg} C_s R_{eH}}$$

where:

C_s : Permissible bending stress coefficient taken as:

C_s = 0.9 for acceptance criteria set AC-I.

b) The net web thickness, t_w, in mm, is not to be less than:

$$t_w = \frac{P_{FB} s l_{shr}}{2 d_{shr} C_t \tau_{eH}}$$

where:

d_{shr}: Effective web depth of stiffener, in mm, as defined in Ch 3, Sec 7, [1.4.3].

C_t : Permissible shear stress coefficient taken as:

C_t = 1.0 for acceptance criteria set AC-I.

c) The slenderness ratio is to comply with Ch 8, Sec 2.

3.3.5 Bow impact load area for primary supporting members

The scantlings of primary supporting members according to [3.3.6] are based on the application of the bow impact pressure, as defined in Ch 4, Sec 5, [3.3.1], to an idealised bow impact load area of hull envelope plating, A_{BI}, in m^2, is given by:

$$A_{BI} = \frac{1.1 L B C_b}{1000}$$

3.3.6 Primary supporting members

a) The section modulus of the primary supporting member is to apply along the bending span clear of end brackets and cross sectional areas of the primary supporting member are to be applied at the ends/supports and may be gradually reduced along the span and clear of the ends/supports following the distribution of f_{dist} indicated in Figure 3.

b) Primary supporting members in the bow impact strengthening area are to be configured to provide effective continuity of strength and the avoidance of hard spots.

c) End brackets of primary supporting members are to be suitably stiffened along their edge. Consideration is to be given to the design of bracket toes to minimise abrupt changes of cross section.

d) Tripping arrangements are to comply with Ch 8, Sec 2, [5.1.1]. In addition, tripping brackets are to be fitted at the toes of end brackets and at locations where the primary supporting member flange is knuckled or curved.

e) The net section modulus of each primary supporting member, Z_{n50}, in cm^3, is not to be less than:

$$Z_{n50} = 1000 \frac{f_{bdg-pt} P_{FB} b_{BI} f_{BI} l_{bdg}^2}{f_{bdg} C_s R_{eH}}$$

where:

f_{bdg-pt} : Correction factor for the bending moment at the ends and considering the patch load taken as:

$$f_{bdg-pt} = 3f_{BI}^3 - 8f_{BI}^2 + 6f_{BI}$$

f_{BI} : Patch load modification factor taken as:

$$f_{BI} = \frac{l_{BI}}{l_{bdg}}$$

l_{BI} : Extent of bow impact load area, in m, along the span:

$l_{BI} = \sqrt{A_{BI}}$ but not to be taken as greater than l_{bdg}

b_{BI} : Breadth of impact load area, in m, supported by the primary supporting member, to be taken as the spacing between primary supporting members, S, as defined in Ch 1, Sec 4, Table 5, but not to be taken as greater than l_{BI}.

A_{BI} : Bow impact load area, in m^2, as defined in [3.3.5].

f_{bdg} : Bending moment factor taken as:

f_{bdg} = 12 for primary supporting members with end fixed continuous flange or where brackets at both ends are fitted in accordance with Ch3, Sec 6, [4.4].

C_s : Permissible bending stress coefficient taken as:

C_s = 0.8 for acceptance criteria set AC-I.

f) The net shear area of the web, $A_{shr-n50}$, in cm^2, of each primary supporting member at the support/toe of end brackets is not to be less than:

$$A_{shr-n50} = \frac{5 f_{PL} P_{FB} b_{BI} l_{shr}}{C_t \tau_{eH}}$$

where:

f_{PL} : Patch load modification factor taken as:

$$f_{PL} = \frac{l_{BI}}{l_{shr}}$$

l_{BI} : Extent of bow impact load area, in m, along the span taken as,

$l_{BI} = \sqrt{A_{BI}}$ but not greater than l_{shr}

C_t : Permissible shear stress coefficient taken as:

C_t = 0.75 for acceptance criteria set AC-I.

g) The net web thickness of each primary supporting member, t_w, in mm including decks/bulkheads directly welded to the side shell is not to be less than:

$$t_w = \frac{P_{FB} b_{BI}}{\sin\varphi_w \sigma_{cr}}$$

where:

φ_w : Angle, in deg, between the primary supporting member web and the shell plate, see Figure 5.

σ_{crb} : Critical buckling stress in compression of the web of the primary supporting member or deck/bulkhead panel in way of the applied load given by Ch 8, Sec 5, [2.2.3], in N/mm^2. In the calculation, both σ_x and σ_y given in Ch 8, Sec 5, [2.2.3] are to be considered and UP-B is to be applied.

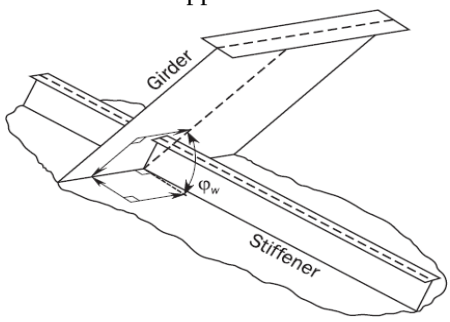

Figure 5 Angle between shell primary member and shell plate

4 ADDITIONAL SCANTLING REQUIREMENTS

4.1 Plate stem

4.1.1

The net thickness, t_{Stm} in mm, from keel line above to T_{SC} + 0.6 m is not to be less than:

$t_{Stm} = (0.6 + 0.4S_B)(0.08L + 2.7)\sqrt{k}$ but need not be greater than $22\sqrt{k} - 1$

where:

S_B: Spacing, in m, between horizontal stringers (partial or not), breasthooks, or equivalent horizontal stiffening members.

Starting from 0.6 m above the summer load waterline up to T_{SC} + C_w, the net thickness may gradually be reduced to $0.8t_{Stm}$.

4.1.2 Breasthooks and diaphragm plating

The net thickness of breasthooks/diaphragm plates in way of bow impact strengthening area defined in [3.3.1], t_w in mm, is not to be less than:

$$t_w = \frac{s}{70}\sqrt{\frac{R_{eH}}{235}}$$

where:

s : Spacing of stiffeners on the web, as defined in Ch 1, Sec 4, Table 5, in mm. Where no stiffeners are fitted, *s* is to be taken as the depth of the web.

4.2 Thruster tunnel

4.2.1

The net thickness of the tunnel plating, t_{tun}, in mm, is not to be less than the net required thickness for the shell plating in the vicinity of the bow thruster.

In addition, t_{tun} is not to be taken less than:

$t_{tun} = 0.008\, d_{tun} + 1.8$

where:

d_{tun} : Inside diameter of the tunnel, in mm, but not to be taken less than 970 mm.

Where the outboard ends of the tunnel are provided with bars or grids, the bars or grids are to be effectively secured.

Section 2 MACHINERY SPACE

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the scantlings and arrangement of structures located in the machinery space. It is the shipyard responsibility to design the ship in accordance with the machinery manufacturer's requirements.

2 MACHINERY SPACE ARRANGEMENT

2.1 Structural arrangement

2.1.1

Where openings in decks/bulkheads are provided in the machinery space, the arrangements are to support the deck, side, and bottom structure.

2.1.2

All parts of the machinery, shafting, etc, are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened.

2.1.3

Primary supporting members are to be positioned giving consideration to the provision of through stiffeners and in line pillar supports to achieve an efficient structural design.

2.1.4

The spacing of web frames in way of transversely framed machinery spaces is generally not to exceed five transverse frame spaces. Web frames are to be connected at the top and bottom to members of suitable stiffness, and supported by deck transverses.

2.1.5

End connections of side longitudinals at transverse bulkheads are to provide fixity, lateral support, and when not continuous are to be provided with soft-toe brackets. Brackets lapped onto the longitudinals are not to be fitted.

2.1.6

Where a transverse framing system is adopted, deck stiffeners are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Where fitted, deck transverses are to be arranged in line with web frames to provide end fixity and transverse continuity of strength.

Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in line with web frames in association with pillars or pillar bulkheads.

2.1.7

Machinery casings are to be supported by a suitable arrangement of deck transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required. These are to be arranged in line with deck transverses.

2.1.8

The foundations for main propulsion units, reduction gears, shaft and thrust bearings, and the structure supporting those foundations are to maintain the required alignment and rigidity under all anticipated conditions of loading. Consideration is to be given to the submittal of the following plans to the machinery manufacturer for review:

a) Foundations for main propulsion units.
b) Foundations for reduction gears.
c) Foundations for thrust bearings.
d) Structure supporting a), b) and c).

2.2 Double bottom

2.2.1 Double bottom height

The double bottom height at the centreline, irrespective of the location of the machinery space, is to be not less than the value defined in Ch 2, Sec 3, [2.3.1]. This depth may need to be considerably increased in relation to the type and depth of main machinery seatings.

The above height is to be increased by the shipyard where the machinery space is very large and where there is a considerable variation in draught between light ballast and full load conditions.

Where the double bottom height in the machinery space differs from that in adjacent spaces, structural continuity of longitudinal members is to be provided by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the sloped inner bottom are to be located in way of floors. Lesser double bottom height may be accepted in local areas provided that the overall strength of the double bottom structure is not thereby impaired.

2.2.2 Centreline girder

The double bottom is to be arranged with a centreline girder. In way of any openings for manholes on the centreline girder, permitted only where absolutely necessary for double bottom access and maintenance, local strengthening is to be arranged.

2.2.3 Side bottom girders

In the machinery space, the number of side bottom girders is to be adequately increased, with respect to the adjacent areas, to provide adequate rigidity of the structure. The side bottom girders in longitudinal stiffened double bottom, are to be a continuation of any bottom longitudinals in the areas adjacent to the machinery space and are generally to have a spacing not greater than 3 times that of longitudinals and in no case greater than 3 m.

2.2.4 Girders in way of machinery seatings

Additional side bottom girders are to be fitted in way of machinery seating.

2.2.5 Floors in longitudinally stiffened double bottom

Where the double bottom is longitudinally stiffened, plate floors are to be fitted at every frame under the main engine and thrust bearing. Outboard of the engine and bearing seatings, the floors may be fitted at alternate frames.

2.2.6 Floors in transversely framed double bottom

Where the double bottom in the machinery space is transversely stiffened, floors are to be arranged at every frame.

2.2.7 Manholes and wells

The number and size of manholes in floors located in way of seatings and adjacent areas are to be kept to the minimum necessary for double bottom access and maintenance.

In general, manhole edges are to be stiffened with flanges; failing this, the floor plate is to be adequately stiffened with flat bars at manhole sides.

Manholes with perforated portable plates are to be fitted in the inner bottom in the vicinity of wells arranged close to the aft bulkhead of the engine room.

Drainage of the tunnel is to be arranged through a well located at the aft end of the tunnel.

2.2.8 Inner bottom plating

Where main engines or thrust bearings are bolted directly to the inner bottom, the net thickness of the inner bottom plating is to be at least 19 mm. Hold-down bolts are to be arranged as close as possible to floors and longitudinal girders. Plating thickness and the arrangements of hold-down bolts are also to consider the manufacturer's recommendations.

2.2.9 Heavy equipment

Where heavy equipment is mounted directly on the inner bottom, the thickness of the floors and girders is to be suitably increased.

3 MACHINERY FOUNDATIONS

3.1 General

3.1.1

Main engines and thrust bearings are to be effectively secured to the hull structure by foundations of strength that is sufficient to resist the various gravitational, thrust, torque, dynamic, and vibratory forces which may be imposed on them.

3.1.2

In the case of higher power internal combustion engines or turbine installations, the foundations are generally to be integral with the double bottom structure. Consideration is to be given to substantially increase the inner bottom plating thickness in way of the engine foundation plate or the turbine gear case and the thrust bearing, see Type 1 of Figure 1.

3.1.3

For main machinery supported on foundations of Type 2, as shown in Figure 2, the forces from the engine into the adjacent structure are to be distributed as uniformly as possible. Longitudinal members supporting the foundation are to be aligned with girders in the double bottom, and transverse stiffening is to be arranged in line with the floors, see Type 2 of Figure 2.

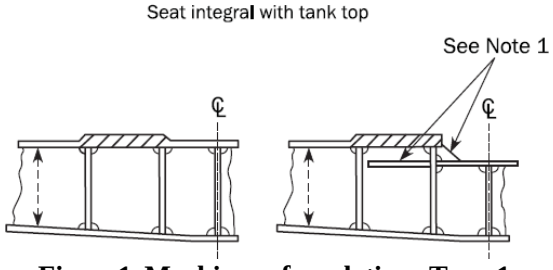

Figure1 Machinery foundations Type 1

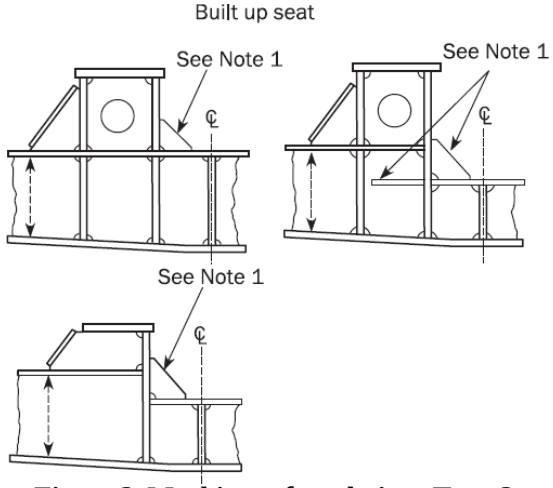

Figure 2 Machinery foundations Type 2

Note1: Brackets are to be as large as possible. Brackets may be omitted to avoid interference with the girders of the engine foundation, in accordance with recommendations of the engine manufacturer.

3.2 Foundations for internal combustion engines and thrust bearings

3.2.1

In determining the scantlings of foundations for internal combustion engines and thrust bearings, consideration is to be given to the general rigidity of the engine and to its design characteristics with regard to out of balance forces.

3.2.2

Generally, two girders are to be fitted in way of the foundation for internal combustion engines and thrust bearings.

3.3 Auxiliary foundations

3.3.1

Auxiliary machinery is to be secured on foundations that are of suitable size and arrangement to distribute the loads from the machinery evenly into the supporting structure.

Section 3 AFT PART

SYMBOLES
For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Application

1.1.1
The requirements of this section apply for the scantlings and arrangement of structures located aft of the aft peak bulkhead.

2 AFT PEAK

2.1 Structural arrangement

2.1.1 Floors

Floors are to be fitted at each frame space in the aft peak and carried to a height at least above the stern tube. Where floors do not extend to flats or decks, they are to be stiffened by flanges at their upper end.
Heavy plate floors are to be fitted in way of the aft face of the horn and in line with the webs in the rudder horn. They may be required to be carried up to the first deck or flat. In this area, cut outs, scallops or other openings are to be kept to a minimum.

2.1.2 Platforms and side girders

Platforms and side girders within the peak are to be arranged in line with those located in the area immediately forward.
Where this arrangement is not possible due to the shape of the hull and access needs, structural continuity between the peak and the structures of the area immediately forward is to be ensured by adopting wide tapering brackets.
Where the aft peak is adjacent to a machinery space whose side is longitudinally framed, the side girders in the aft peak are to be fitted with tapering brackets.
Where the depth from the peak tank top to the weather deck is greater than 2.6 m and the side is transversely framed, one or more side girders are to be fitted, preferably in line with similar structures existing forward.

2.1.3 Longitudinal bulkheads

A longitudinal non-tight bulkhead is to be fitted on the centreline of the ship, in general in the upper part of the peak, and stiffened at each frame spacing.
Where either the stern overhang is very large or the maximum breadth of the space divided by watertight and wash bulkheads is greater than 20 m, additional longitudinal wash bulkheads may be required.

2.1.4 Alternative design verification

The spacing and arrangement requirements, defined in [2.1.1], [2.1.2] and [2.1.3] may be increased, if the designer performs a verification by means of grillage analysis or FE analysis and provides their full documentation. The acceptance criteria to be applied are defined in Ch 6, Sec 6, [3]. A FE analysis is to be performed under consideration of the requirements provided in Ch 7.

2.2 Stiffening of floors and girders in aft peak

2.2.1
Stiffeners on the floors and girders in aft peak ballast or fresh water tanks above propeller are to be designed in accordance with [2.2.2] and [2.2.3]. This applies for stiffeners located in an area extending longitudinally between the forward edge of the rudder and the after end of the propeller boss and transversely within the diameter of the propeller.

2.2.2
The height of stiffeners, h_{stf} , in mm, on the floors and girders are not to be less than:
$h_{stf} = 80 l_{stf}$ for flat bar stiffeners.

$H_{stf} = 70 l_{stf}$ for bulb profiles and flanged stiffeners.
where:
l_{stf} : Length of stiffener, in m, as shown in Figure 1. Length need not be taken greater than 5 m.

2.2.3
End brackets are to be provided as follows:

- Brackets are to be fitted at the lower and upper ends when l_{stf-t} exceeds 4 m.
- Brackets are to be fitted at the lower end when l_{stf-t} exceeds 2.5 m.

where:
l_{stf-t} :Total length of stiffener, in m, as shown in Figure 1.

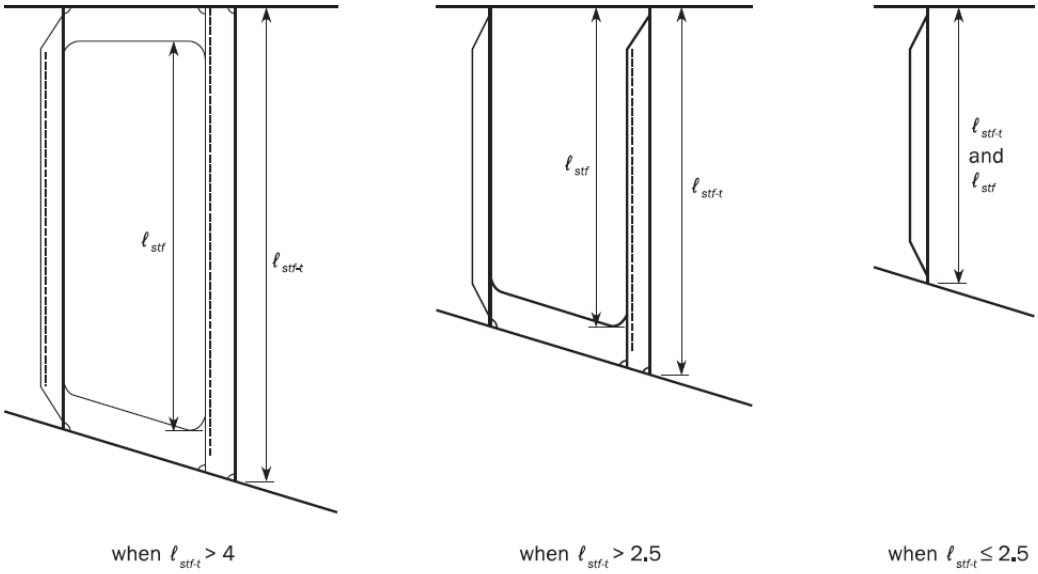

Figure 1 Stiffening of floors and girders in the aft peak tank

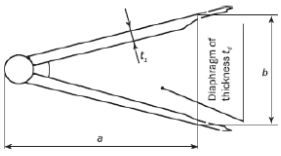
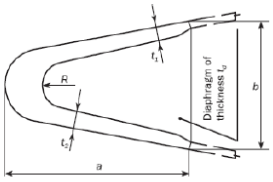
3 STERN FRAMES

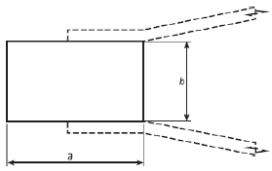
3.1 General

3.1.1
Stern frames may be fabricated from steel plates or made of cast steel with a hollow section. For applicable material specifications and steel grades, see Ch 3, Sec 1. Stern frames of other material or construction will be specially considered.

3.1.2
Cast steel and fabricated stern frames are to be strengthened by adequately spaced horizontal plates with gross thickness not less than 80% of required thickness for stern frames, t_1, as defined in Table 1 or Table 2. Abrupt changes of section are to be avoided in castings; all sections are to have adequate tapering radius.

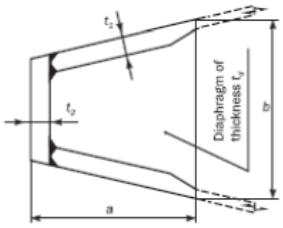


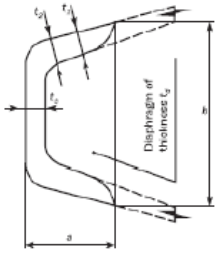


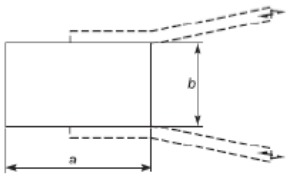


3.1.3
In the upper part of the propeller aperture, where the hull form is full and centreline supports are provided, the thickness of stern frames may be reduced to 80% of the applicable requirement in [3.2.1].

3.2 Propeller posts







3.2.1 Gross scantlings of propeller posts

The gross scantlings of propeller posts are not to be less than those obtained from the formulae in Table 1 for single screw ships and Table 2 for twin screw ships.
Scantlings and proportions of the propeller post which differ from Table 1 and Table 2 may be considered acceptable provided that the section modulus of the propeller post section about its longitudinal axis is not less than that calculated with the propeller post scantlings in Table 1 or Table 2, as applicable.

Single screw ships - Gross scantlings of propeller posts **Table 1**

Gross scantlings of propeller posts, in mm	Fabricated propeller post	Cast propeller post	Bar propeller post, cast or forged, having rectangular section
			
a	$50\ L_1^{1/2}$	$33\ L_1^{1/2}$	$10\sqrt{7.2L-256}$
b	$35\ L_1^{1/2}$	$23\ L_1^{1/2}$	$10\sqrt{4.6L-164}$
t_1	$2.5\ L_1^{1/2}$	$3.2\ L_1^{1/2}$	-
t_2	-	$4.4\ L_1^{1/2}$	-
t_d	$1.3\ L_1^{1/2}$	$2.0\ L_1^{1/2}$	-
R	-	50mm	-

Twin screw ships - Gross scantlings of propeller posts **Table 2**

Gross scantlings of propeller posts, in mm	Fabricated propeller post	Cast propeller post	Bar propeller post, cast or forged, having rectangular section
			
a	$25\ L_1^{1/2}$	$12.5\ L_1^{1/2}$	$2.4L+6$
b	$25\ L_1^{1/2}$	$25\ L_1^{1/2}$	$0.8L+2$
t_1	$2.5\ L_1^{1/2}$	$2.5\ L_1^{1/2}$	-
t_2	$3.2\ L_1^{1/2}$	$3.2\ L_1^{1/2}$	-
t_3	-	$4.4\ L_1^{1/2}$	-
t_d	$1.3\ L_1^{1/2}$	$2.0\ L_1^{1/2}$	-

3.2.2 Propeller shaft bossing

In single screw ships, the thickness of the propeller shaft bossing, included in the propeller post, is not to be less than 60% of the dimension b required in [3.2.1] for bar propeller posts with a rectangular section.

3.3 Connections

3.3.1 Connections with hull structure

Stern frames are to be effectively attached to the aft structure and the required scantling for the lower part of the propeller post is to be extended from the aft end of the propeller post, at the centerline of the propeller shaft, to a length not less than $1500 + 6L_2$ mm, in order to provide an effective connection with the keel. However, the stern frame need not extend beyond the aft peak bulkhead.

3.3.2 Connection with keel plate

The thickness of the lower part of the stern frames is to be gradually tapered to that of the solid bar keel or keel plate.

Where a keel plate is fitted, the lower part of the stern frame is to be designed to ensure an effective connection with the keel.

3.3.3 Connection with transom floors

Rudder posts and propeller posts are to be connected with transom floors having height not less than that of the double bottom height and a net thickness not less than that obtained, in mm, from the following formula:

$t = 9 + 0.023\ L_1$

3.3.4 Connection with centre girder

Where the stern frame is made of cast steel, the lower part of the stern frame is to be fitted, as far as practicable, with a longitudinal web for connection with the centre girder.

4 SPECIAL SCANTLING REQUIREMENTS FOR SHELL STRUCTURE

4.1 Shell plating

4.1.1 Shell plating connected with stern frame

The net thickness of shell plating connected with the stern frame is not to be less than that obtained, in mm, from the following formula:

$t = 0.094\ (L_2 - 43) + 0.009\ b$

In way of the boss and heel plate, the net thickness, t, of shell plating, in mm, is not to be less than:

$t = 0.105\ (L_2 - 47) + 0.011\ b$

where:

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.2.2].

4.1.2 Heavy shell plates

Heavy shell plates are to be fitted locally in way of the heavy plate floors as required by [2.1.1]. The net thickness of heavy shell plates is not to be less than the value given in [4.1.1]. Outboard of the heavy floors, the heavy shell plates may be reduced in thickness in as gradual a manner as practicable. Where the horn plating is radiused into the shell plating, the radius at the shell connection, r in mm, is not to be less than:

$r = 150 + 0.8L_2$

4.1.3 Thruster tunnel plating

The net thickness of the tunnel plating, t_{tun} in mm, is to comply with the requirements in Ch 10, Sec 1, [4.2.1].

Section 4 TANKS SUBJECT TO SLOSHING

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

α_p : Correction factor for the panel aspect ratio to be taken as:

$$\alpha_p = 1.2 - \frac{b}{2.1a}$$ but not to be taken as greater than 1.0.

a : Length of plate panel, in mm, as defined in Ch 3, Sec 7, [2.1.1].

b : Breadth of plate panel, in mm, as defined in Ch 3, Sec 7, [2.1.1].

l_{bdg} : Effective bending span, as defined in Ch 3, Sec 7, [1.1.2], in m.

l_{slh} : Effective sloshing length, in m, as defined in Ch 4, Sec 6, [6.3.2].

b_{slh} : Effective sloshing breadth, in m, as defined in Ch 4, Sec 6, [6.4.2].

$I_{y\text{-}n50}$: Net horizontal hull girder moment of inertia, at the longitudinal position being considered, as defined in Ch 5, Sec 1, [1.5], in m4.

M_{sw} : Permissible hull girder hogging and sagging still water bending moment for seagoing operation at the location being considered, in kNm, as defined in Ch 4, Sec 4, [2.2.2].

z_n : Distance from the baseline to the horizontal neutral axis, as defined in Ch 5, Sec 1, in m.

z : Vertical coordinate of the load calculation point or at the reference point under consideration, in m.

σ_{hg} : Hull girder bending stress, in N/mm^2, calculated at the load calculation point defined in Ch 3, Sec 7, [2.2] or in Ch 3, Sec 7, [3.2], as the case may be:

$$\sigma_{hg} = (\frac{(z - z_n)M_{sw}}{I_{y-n50}})10^{-3}$$

1 GENERAL

1.1 Application

1.1.1

The requirements of this section cover the strengthening requirements for localised sloshing loads that may occur in tanks carrying liquid.

Sloshing loads due to the free movement of liquid in tanks are given in Ch 4, Sec 6, [6].

1.2 General requirements

1.2.1 Filling heights of cargo and ballast tanks

The scantlings of all cargo and ballast tanks are to comply with the sloshing requirements given in this section for the following cases:

- Unrestricted filling height for ballast tanks,
- Unrestricted filling height for cargo tanks with cargo density equal to ρ_L, as defined in Ch 4, Sec 6,
- All filling levels up to h_{part} for cargo tanks with cargo density equal to ρ_{part} taken as:

$$h_{part} = \frac{h_{tk} \cdot \rho_L \cdot f_{cd}}{\rho_{part}}$$

where:

h_{part} : Maximum permissible filling height, in m, associated with a partial filling of the considered cargo tank with a high liquid density equal to ρ_{part}

h_{tk} : Maximum tank height, in m.

ρ_L : Cargo density as defined in Ch 4, Sec 6.

f_{cd} : Factor defined in Ch 4, Sec 6.

ρ_{part} : Maximum permissible high liquid density as defined in Ch 4, Sec 6.

1.2.2 Cargo holds of bulk carrier intended for the carriage of ballast water

Cargo holds of bulk carrier intended for the carriage of ballast water are assumed either full or empty in seagoing condition and are not required to be assessed for sloshing pressures.

1.2.3 Structural details

Local scantling increases due to sloshing loads are to be made with due consideration given to details and avoidance of hard spots, notches and other harmful stress concentrations.

1.3 Application of sloshing pressure

1.3.1 General

The structural members of the following tanks are to be assessed for the design sloshing pressures $P_{slh\text{-}lng}$ and $P_{slh\text{-}t}$ in accordance with [1.3.4] and [1.3.5].

a) Cargo and slop tanks of oil tankers.
b) Fore peak and aft peak ballast tanks.
c) Other tanks which allow free movement of liquid, e.g. ballast tanks, fuel oil bunkering tanks and fresh water tanks, etc.

Where the effective sloshing length, l_{slh} is less than 0.03 L, calculations involving $P_{slh\text{-}lng}$ are not required and where the effective sloshing breadth b_{slh} is less than 0.32 B, calculations involving $P_{slh\text{-}t}$ are not required.

1.3.2 Minimum sloshing pressure

The minimum sloshing pressure, $P_{slh\text{-}min}$, as defined in Ch 4, Sec 6, [6.2] is to apply to tanks in which the effective sloshing length, l_{slh} or breadth b_{slh}, is less than defined in [1.3.1].

1.3.3 Structural members to be assessed

The following structural members are to be assessed:

a) Plates and stiffeners forming boundaries of tanks.
b) Plates and stiffeners on wash bulkheads.
c) Web plates and web stiffeners of primary supporting members located in tanks.
d) Tripping brackets supporting primary supporting members in tanks.

1.3.4 Application of design sloshing pressure due to longitudinal liquid motion

The design sloshing pressure due to longitudinal liquid motion, $P_{slh\text{-}lng}$, as defined in Ch 4, Sec 6, [6.3.3] is to be applied to the following members as shown in Figure 1.

a) Transverse tight bulkheads.
b) Transverse wash bulkheads.
c) Stringers on transverse tight and wash bulkheads.
d) Plating and stiffeners on the longitudinal bulkheads, deck and inner hull within a distance from the transverse bulkhead taken as:
   - 0.25 l_{slh},
   - The distance between the transverse bulkhead and the first web frame if located inside the tank at the considered level,

   whichever is less.

In addition, the first web frame next to a transverse tight or wash bulkhead if the web frame is located within 0.25l_{slh} from the bulkhead, as shown in Figure 1, is to be assessed for the web frame reflected sloshing pressure, $P_{slh\text{-}wf}$, as defined in Ch 4, Sec 6, [6.3.4].

The minimum sloshing pressure, $P_{slh\text{-}min}$ as defined in Ch 4, Sec 6, [6.2] is to be applied to all other members.

1.3.5 Application of design sloshing pressure due to transverse liquid motion

The design sloshing pressure due to transverse liquid motion, $P_{slh\text{-}t}$, as defined in Ch 4, Sec 6, [6.4.3], is to be applied to the following members as shown in Figure 2.

a) Longitudinal tight bulkhead.
b) Longitudinal wash bulkhead.
c) Horizontal stringers on longitudinal tight and wash bulkheads.
d) Plating and stiffeners on the transverse tight bulkheads including stringers and deck within a distance from the longitudinal bulkhead taken as:
   - 0.25 b_{slh}
   - The distance between the longitudinal bulkhead and the first girder if located inside the tank at the considered level,

   whichever is less.

In addition, the first girder next to the longitudinal tight or wash bulkhead if the girder is located

within 0.25 b_{slh} from the longitudinal bulkhead, as shown in Figure 2, is to be assessed for the reflected sloshing pressure, $P_{slh\text{-}grd}$ as defined in Ch 4, Sec 6, [6.4.4].

The minimum sloshing pressure, $P_{slh\text{-}min}$, as defined in Ch 4, Sec 6, [6.2], is to be applied to all other members.

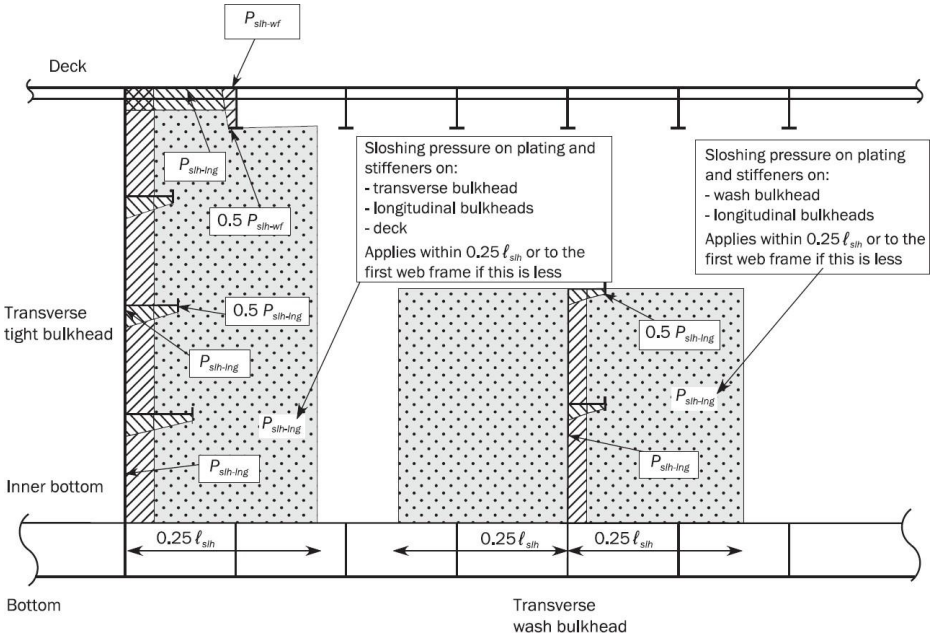


Figure 1 Application of sloshing loads due to longitudinal liquid motion

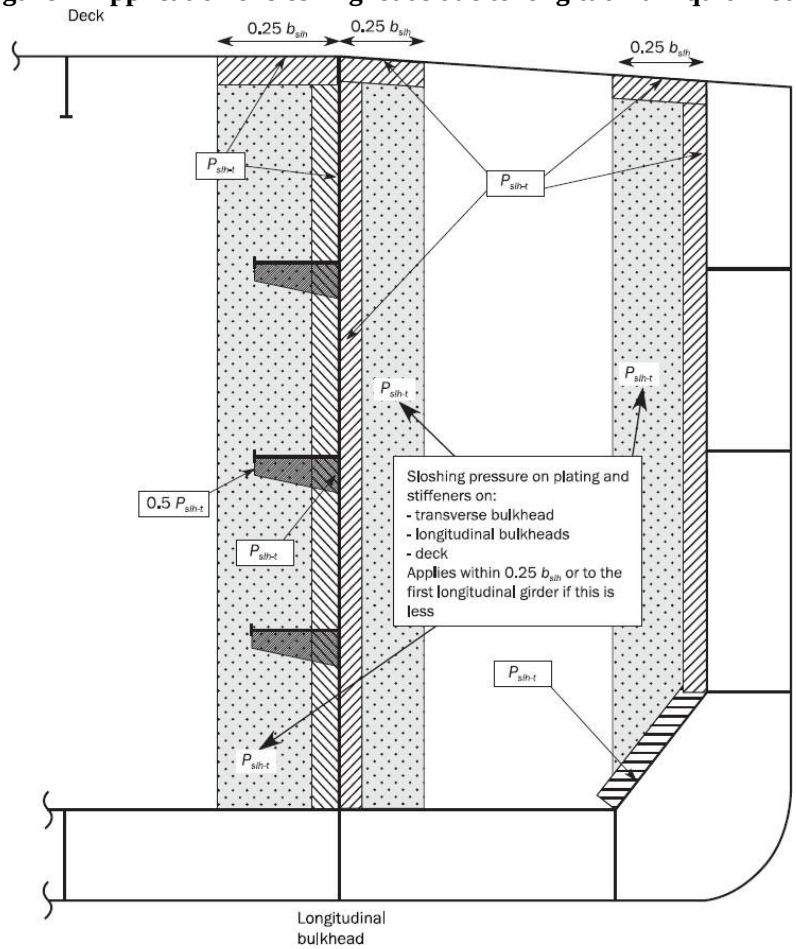

Figure 2 Application of sloshing loads due to transverse liquid motion

1.3.6 Combination of transverse and longitudinal fluid motion

The sloshing pressures due to transverse and longitudinal fluid motion are assumed to act independently. Structural members are therefore to be evaluated based on the greatest sloshing pressure due to longitudinal and transverse fluid motion.

1.3.7 Additional sloshing impact assessment

For tanks with effective sloshing breadth, b_{slh}, greater than 0.56B or effective sloshing length, l_{slh}, greater than 0.13L, an additional sloshing impact assessment is to be carried out in accordance with the individual Society's procedures

ISC 1.3.7a Where l_s>0.13L or b_s>0.56B for the tank, the structural strength assessment under level 3 sloshing loads is to be carried out in accordance with relevant requirements of Section 3 of ISC Guidelines for Assessment of Sloshing Loads and Structural Scantling of Tanks.

2 SCANTLING REQUIREMENTS

2.1 Plating

2.1.1 Net thickness

The net thickness of plating, t in mm, subjected to sloshing pressures is not to be less than:

$$t = 0.0158\alpha_p b\sqrt{\frac{P_{slh}}{C_a R_{eH}}}$$

where:

C_a : Permissible bending stress coefficient to be taken as:

$C_a = \beta_a - \alpha_a \frac{|\sigma_{hg}|}{R_{eH}}$ with coefficients defined in Table 1, but not to be taken greater than $C_{a\text{-}max}$.

σ_{hg} : Hull girder bending stress, in N/mm^2, corresponding to the greatest of the sagging and hogging bending moment in absolute value.

P_{slh} : The greater of $P_{slh\text{-}lng}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in [1.3].

Definition β_a, α_a and $C_{a\text{-}max}$ **Table 1**

Acceptance criteria set	Structural member		β_a	α_a	$C_{a\text{-}max}$
AC-S	Longitudinal strength members in the cargo hold region including but not limited to: • Deck. • Longitudinal plane bulkhead. • Horizontal corrugated longitudinal bulkhead. • Longitudinal girders and stringers.	Longitudinally stiffened plating	0.9	0.5	0.8
		Transversely or vertically stiffened plating	0.9	1.0	0.8
	Other strength members including: • Vertical corrugated longitudinal bulkhead. • Transverse plane bulkhead. • Transverse corrugated bulkhead. • Transverse stringers and web frames. • Plating of tank boundaries and primary supporting members outside the cargo hold region.		0.8	0	0.8

2.2 Stiffeners

2.2.1 Net section modulus

The net section modulus, Z in cm^3, of stiffeners subjected to sloshing pressures is not to be less than:

$$Z = \frac{P_{slh} s l_{bdg}^2}{f_{bdg} C_s R_{eH}}$$

where:

f_{bdg} : Bending moment factor:

f_{bdg} = 12 for stiffeners fixed against rotation at each end. This is generally to be applied for scantlings of all continuous stiffeners.

f_{bdg} = 8 for stiffeners with one or both ends not fixed against rotation. This is generally to be

applied to discontinuous stiffeners.

C_s : Permissible bending stress coefficient to be taken as:

- For members subject to hull girder stress: coefficient to be taken as defined in Table 2.
- $C_s = C_{s\text{-}max}$ for other cases.

P_{slh} : The greater of $P_{slh\text{-}ing}$, $P_{slh\text{-}t}$ or $P_{slh\text{-}min}$ as specified in [1.3].

$C_{s\text{-}max}$: Coefficient as defined in Table 3.

Permissible bending stress coefficient C_s **Table 2**

Sign of hull girder bending stress, σ_{hg} (1)	Lateral pressure acting on (2)	Stiffener boundary condition (3)	f_{bdg}	Coefficient C_s
Tension (positive)	Stiffener side	F - F	12	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		F - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		S - S	8	$C_s = C_{s\text{-}max}$
	Plate side	F - F	12	$C_s = C_{s\text{-}max}$
		F - S	8	$C_s = C_{s\text{-}max}$
		S - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
Compression (negative)	Stiffener side	F - F	12	$C_s = C_{s\text{-}max}$
		F - S	8	$C_s = C_{s\text{-}max}$
		S - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
	Plate side	F - F	12	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		F - S	8	$C_s = \beta_s - \alpha_s \frac{\lvert\sigma_{hg}\rvert}{R_{eH}}$ but not to be taken greater than $C_{s\text{-}max}$
		S - S	8	$C_s = C_{s\text{-}max}$

(1) σ_{hg} is to be considered for the hogging and sagging situations.
(2) For primary supporting members located inside the considered tank and for wash bulkheads, the sloshing pressure is to be applied both on stiffener and plate sides.
(3) F - F stands for both ends of the stiffener fixed against rotation
(4) F - S stands for one end of the stiffener fixed and the other not fixed against rotation
(5) S - S stands for both ends of the stiffener not fixed against rotation

Definition β_s , α_s and $C_{s\text{-}max}$ **Table 3**

Acceptance criteria set	Structural member		β_s	α_s	$C_{s\text{-}max}$
AC-S	Longitudinal strength members in the cargo hold region including but not limited to: • Deck stiffeners. • Stiffeners on longitudinal bulkheads. • Stiffeners on longitudinal girders and stringers.	Longitudinal stiffeners	0.85	1.0	0.75
		Transverse or vertical stiffeners	0.7	0	0.7
	Other strength members including: • Stiffeners on transverse bulkheads. • Stiffeners on transverse stringers and web frames. • Stiffeners on tank boundaries and primary supporting members outside the cargo hold region.		0.75	0	0.75

2.3 Primary supporting members

2.3.1 Web plating

The web plating net thickness of primary supporting members, t in mm, is not to be less than:

$$t = 0.0158\alpha_p b\sqrt{\frac{P_{slh}}{C_a R_{eH}}}$$

where:

P_{slh} : The greater of $P_{slh\text{-}Ing}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as specified in [1.3]. The pressure is to be calculated at the load application point, defined in Ch 3, Sec 7, [4.1], taking into account the distribution over the height of the member, as shown in Figure 1 and Figure 2.

C_a : Permissible plate bending stress coefficient, as given in [2.1.1].

2.3.2 Stiffeners on web plating

The net section modulus, Z in cm3, of each individual stiffener on the web plating of primary supporting members subjected to sloshing pressures is not to be less than:

$$Z = \frac{P_{slh} s l_{bdg}^2}{f_{bdg} C_s R_{eH}}$$

where:

P_{slh} : The greater of $P_{slh\text{-}Ing}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as specified in [1.3]. The pressure is to be calculated at the load application point, defined in Ch 3, Sec 7, [3.2], taking into account the distribution over the height of the member, as shown in Figure 1 and Figure 2.

C_s : Permissible bending stress coefficient as given in [2.2.1].

f_{bdg} : Bending moment factor as given in [2.2.1].

2.3.3 Tripping brackets supporting primary supporting members

The net section modulus, Z in cm^3 in way of the base within the effective length, d, of tripping brackets and net shear area, A_{shr} in cm^2, after deduction of cut-outs and slots, of tripping brackets supporting primary supporting members is not to be less than:

$$Z = \frac{1000 P_{slh} s_{trip} h^2}{2 C_s R_{eH}}$$

$$A = 10\frac{P_{slh} s_{trip} h}{C_t \tau_{eH}}$$

where:

P_{slh} : The greater of $P_{slh\text{-}Ing}$, $P_{slh\text{-}t}$, $P_{slh\text{-}wf}$, $P_{slh\text{-}grd}$ and $P_{slh\text{-}min}$ as specified in [1.3]. The average pressure may be calculated at mid point of the tripping bracket taking into account the distribution as shown Figure 1 and Figure 2.

s_{trip} : Mean spacing, between tripping brackets or other primary supporting members or bulkheads, in m.

h : Height of tripping bracket, see Figure 3, in m.
C_s : Permissible bending stress coefficient for tripping brackets to be taken as 0.75.
C_t : Permissible shear stress coefficient for tripping brackets to be taken as 0.75.
The effective breadth of the attached plate to be used for calculating the section modulus of the tripping bracket is to be taken as h/3.

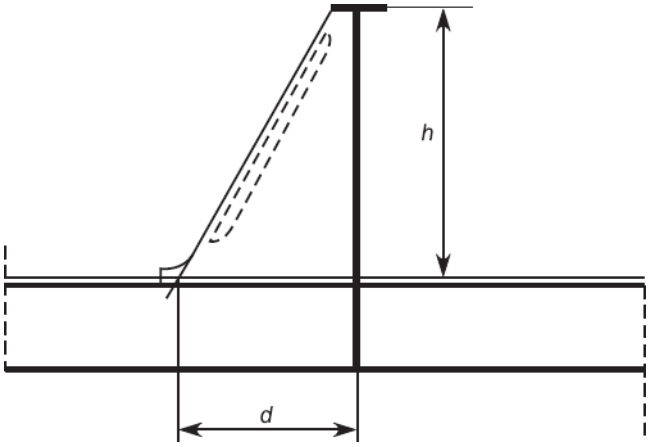

Figure 3 Effective length of tripping bracket

Chapter 11 SUPERSTRUCTURE, DECKHOUSES AND HULL OUTFITTING

Section 1 SUPERSTRUCTURES AND DECKHOUSES

SYMBOLS

For symbols not defined in this section, refer to Ch 1, Sec 4.

P : Pressure applied on the considered superstructure side or deck, in kN/m^2

$P = P_D$ for exposed decks,

$P = P_{dl}$ for unexposed deck,

$P = P_{SI}$ for superstructure side.

P_D : Lateral pressure for exposed decks, in kN/m^2, as defined in Ch 4, Sec 5, [2] and in Ch 4, Sec 5, [4.2].

P_{dl} : Lateral pressure for unexposed decks, in kN/m^2, as defined in Ch 4, Sec 6, [5].

P_{SI} : Lateral pressure for superstructure side, in kN/m^2, as defined in Ch 4, Sec 5, [4.3].

P_{FB}: Lateral pressure for side shell plating, in kN/m^2, affected by bow impact requirements according to Ch 4, Sec 5, [3.3.1].

P_A : External pressure for end bulkheads of superstructure and deckhouse walls, in kN/m^2 according to Ch 4, Sec 5, [4.4.1].

l_{bdg} : Effective bending span, in m, as defined in Ch 3, Sec 7.

l_{shr} : Effective shear span, in m, as defined in Ch 3, Sec 7.

c : Coefficient taken as:

$c = 0.75$ for beams, girders and transverses which are simply supported in one or both ends.

$c = 0.55$ in other cases.

m_a : Coefficient taken as:

$$m_a = 0.204 \frac{s}{1000 l_{bdg}} \left[4 - \left(\frac{s}{1000 l_{bdg}} \right)^2 \right] \text{ with } \frac{s}{1000 l_{bdg}} \leq 1$$

1 GENERAL

1.1 Application

1.1.1

The requirements of this section are applicable to superstructures and deckhouses made of steel. The scantling requirements are listed in Table 1.

Applicable requirements **Table 1**

Item	Superstructure	Deckhouse
Exposed decks	[3.1.1]	[3.2]
Unexposed decks	[3.2.2] to [3.2.5]	[3.2]
Side walls	[3.1.1]	[3.3]
End bulkheads (fore and aft)	[3.3]	[3.3]

1.1.2

For the application of this section, a superstructure is considered being located aft or forward 0.4L amidships or having a length of less than 0.15 L.

1.1.3

For the application of this section, the length of a deckhouse located within 0.4 L amidships is considered not exceeding 0.2 L.

1.2 Gross scantlings

1.2.1

With reference to Ch 3, Sec 2, [1.1.3], all scantlings and dimensions referred to in [3] are gross, unless otherwise specified.

2 STRUCTURAL ARRANGEMENT

2.1 Structural continuity

2.1.1 Bulkheads and sides of deckhouses

The aft, front and side bulkheads are to be effectively supported by under deck structures such as bulkheads, girders and pillars.

Sides and main longitudinal and transverse bulkheads are to be in line in the various tiers of deckhouses. Where such arrangement in line is not possible, other effective support is to be provided.

Arrangements are to be made to minimize the effect of discontinuities in erections. All openings cut in the sides are to be framed and have well-rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings.

2.1.2 Deckhouse corners

At the corners where the deckhouse is attached to the strength deck, attention is to be given to the arrangements to transmit load into the under deck supporting structure.

2.2 End connections

2.2.1 Deck stiffeners

Transverse beams are to be connected to side frames by brackets according to Ch 3, Sec 6, [3.2.1], [3.2.2] and [3.2.3]. Beams crossing longitudinal walls and girders may be attached to the stiffeners of longitudinal walls and the webs of girders respectively by welding without brackets.

2.2.2 Longitudinal and transverse deck girders

Face plates are to be stiffened by tripping brackets according to Ch 3, Sec 6, [4.3].

2.2.3 End connections of superstructure frames

Vertical frames are to be welded to the main frames below, or to the deck under provision of a sufficient supporting structure.

2.3 Local reinforcement on bulkheads

2.3.1

Local reinforcement is to be provided in way of large openings and areas supporting life saving appliances or high loads from other equipment, fittings, etc.

3 SCANTLINGS

3.1 Superstructures sides and decks

3.1.1 Exposed sides and exposed decks

When the side of superstructure is part of the side shell, the net scantlings of exposed sides and exposed decks plating, stiffeners and primary supporting members are to comply with the applicable requirements of Ch 6, Sec 3, Ch 6, Sec 4, Ch 6, Sec 5 and Ch 6, Sec 6, respectively, with the pressure P_D , P_{dl} and P_{SI} defined in this Section. The net scantling approach defined in Ch 3, Sec 2 and the corrosion additions defined in Ch 3, Sec 3, are to be considered.

When the side of superstructure is not part of the side shell, the exposed sides and exposed deck plating inclusive their supporting structure are to comply with the requirements given in [3.3], [3.2.1] and [3.2.3] to [3.2.5], respectively.

3.2 Deckhouses decks

3.2.1 Exposed deck plating

The gross thickness of the deckhouses exposed deck plating, $t_{gr\text{-}exp}$, in mm, is not to be less than

$$t_{gr-\exp} = 7.5\sqrt{\frac{ks}{s_{std}}}$$, on first tier

$t_{gr-\exp} = 7.0\sqrt{\frac{ks}{s_{std}}}$, on second tier.

$t_{gr\text{-}\exp} = 6.5\sqrt{\frac{ks}{s_{std}}}$, on third tier and above.

where:

s_{std} *:* Standard reference spacing of stiffeners or beams, in mm, taken as:

$s_{std} = 470 + 1.67\ L_1$

Where deck is protected by sheathing, the gross thickness of the deck plating may be reduced by 1.5 mm, without being less than 5 mm.

Where sheathing other than wood is used, attention is to be paid that the sheathing does not affect the steel. The sheathing is to be effectively fitted to the deck.

3.2.2 Unexposed deck plating

The gross thickness of the deckhouses unexposed deck plating, $t_{gr\text{-}unexp}$, in mm, is not to be less than the greater value of:

$t_{gr\text{-}unexp}=0.9t_{gr\text{-}exp}$, at the tier considered, and

$t_{gr\text{-}unexp} = (5.8\frac{s}{1000}+1)\sqrt{k}$, but not less than 5.5 mm.

3.2.3 Beams and stiffeners

The gross section modulus Z_{gr}, in cm^3, and the gross shear area $A_{gr\text{-}sh}$, in cm^2, of deckhouses deck transverse beams and of stiffeners are not to be less than:

$$Z_{gr} = ckP\frac{s}{1000}l_{bdg}{}^2$$

$$A_{gr-sh} = 0.05(1-0.817m_a)kP\frac{s}{1000}l_{shr}$$

3.2.4 Girders and transverses

The gross section modulus Z_{gr}, in cm^3, and the gross shear area $A_{gr\text{-}sh}$, in cm^2, of deckhouses deck girders and transverses are not to be less than:

$$Z_{gr} = ckPSl_{bdg}{}^2$$

$$A_{gr-sh} = 0.05kPSl_{shr}$$

The girder depth is not to be less than $l/25$. The web depth of girders scalloped for continuous deck beams is to be at least 1.5 times the depth of the deck beams.

3.2.5 Alternative grillage analysis for girders and transverses

Where arrangements of deck girders and transverses are such that these members act as a grillage structure, additional analysis may be carried out with a structural model based on the gross scantling. The resulting stresses are not to exceed the following permissible bending, shear and equivalent stresses, in N/mm^2, taken as:

$\sigma_b=150/k$

$\tau=100/k$

$\sigma_{eqv}=180/k$

3.3 Deckhouses walls and end bulkheads of superstructures

3.3.1 Application

The requirements in [3.3] apply to end bulkhead of superstructure and deckhouse walls forming the only protection for openings and for accommodations.

Special consideration may be given to the bulkhead scantlings of deckhouses which do not protect openings in the freeboard deck, superstructure deck or in the top of a lowest tier deckhouse. Special consideration may also be given to the bulkhead scantlings of deckhouses which do not

protect machinery casings, provided they do not contain accommodation or do not protect equipment essential to the operation of the ship.

ISC 3.3.1a The bulkheads scantling of deckhouses which do not protect openings in the freeboard deck, superstructure deck or in the top of a lowest tier deckhouse are to comply with the requirements of [3.3.2] and [3.3.3]. The bulkheads scantlings of deckhouses which do not protect machinery casings are also to comply with the requirements of [3.3.2] and [3.3.3].

3.3.2 Plate thickness

The gross thickness of the plating t_{gr}, in mm, is not to be less than the greater of:

$$t_{gr} = 0.9 \frac{s}{1000} \sqrt{kP_A} + 1.5$$

$t_{gr} = (5.0 + \frac{L_2}{100}) \sqrt{k}$, for the lowest tier.

$t_{gr} = (4.0 + \frac{L_2}{100}) \sqrt{k}$, for the upper tiers, without being less than 5.0 mm.

3.3.3 Stiffeners

The gross section modulus Z_{gr}, in cm^3, of the stiffeners is not to be less than:

$$Z_{gr} = 0.35 k P_A \frac{s}{1000} l^2$$

This requirement assumes the webs of lowest tier stiffeners to be efficiently welded to the decks. Scantlings for other types of end connections are to be specially considered.

The section modulus of deckhouse side stiffeners needs not to be greater than that of side frames on the deck situated directly below, taking account of spacing *s* and span *l*.

Section 2 BULWARK AND GUARD RAILS

1 GENERAL REQUIREMENTS

1.1 Application

1.1.1

Bulwarks or guard rails are to be provided at the boundaries of exposed freeboard and superstructure decks, at the boundary of first tier of deckhouses and at the ends of superstructures.

1.2 Minimum height

1.2.1

Bulwarks, or guard rails, are to be a minimum of 1.0 m in height, measured above sheathing, and are to be constructed as required in [2.2] and [3.2]. Where this height would interfere with the normal operation of the ship, a lesser height may be accepted, on the basis of justifying information to be submitted.

2 BULWARKS

2.1 General

2.1.1

Plate bulwarks are to be stiffened at the upper edge by a suitable rail and supported either by stays or plate brackets spaced not more than 2.0 m apart.

The free edge of the stay or the plate bracket is to be stiffened.

2.1.2

Within 0.6 *L* amidships, bulwarks are to be arranged to ensure that they are free from hull girder stresses.

2.1.3

Bulwarks are to be adequately strengthened and increased in thickness in way of mooring pipes.

Cut-outs in bulwarks for gangways or other openings are to be kept clear of breaks of superstructures.

2.1.4

Bulwark plating and stays are to be adequately strengthened in way of eye plates used for shrouds or other tackles in use for cargo gear operation, as well as in way of hawser holes or fairleads provided for mooring or towing.

2.1.5

Openings in bulwarks are to be arranged so that the protection of the crew is to be at least equivalent to that provided by the horizontal courses in [3.1.2].

For this purpose, vertical rails or bars spaced approximately 230 mm apart may be accepted in lieu of rails or bars arranged horizontally.

2.1.6

In the case of ships intended for the carriage of timber deck cargoes, the specific provisions of the freeboard regulations are to be complied with.

2.1.7

Where mooring fittings subject the bulwark to large forces, the stays are to be adequately strengthened.

2.2 Construction of bulwarks

2.2.1 Plating

The gross thickness of bulwark plating, at the boundaries of exposed freeboard and superstructure decks, is not to be less than that given in Table 1.

2.2.2 Stays

The gross section modulus of stays, $Z_{stay-gr}$, in cm^3, is not to be less than:

$$Z_{stay-gr} = 77 h_{blwk}{}^2 s_{stay}$$

where:

h_{blwk} : Height of bulwark from the top of the deck plating to the top of the rail, in m.

s_{stay} : Spacing of the stays, in m.

In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck. Where the bulwark plating is connected to the sheer strake, a width of attached plating, not exceeding 600 mm, may also be included.

Thickness of bulwark plates **Table 1**

Height of bulwark	Gross thickness
1.8 m or more	Thickness required for a superstructure side in the same position, obtained from Ch11, Sec 1 [3.2.1], but not to be less than 6.5 mm
1.0 m	6.5 mm
Intermediate height	To be determined by linear interpolation

2.2.3

Where bulwarks are cut completely, stays or plate brackets of increased strength are to be fitted at the ends of openings.

Bulwark stays are to be supported by, or are to be in line with, suitable under deck stiffening. The stiffening is to be connected by double continuous fillet welds in way of bulwark stay connections.

2.2.4

At the ends of superstructures and for the distance over which their side plating is tapered into the bulwark, the latter is to have the same thickness as the side plating. Where openings are cut in the bulwark at these positions, adequate compensation is to be provided either by increasing the thickness of the plating or by other suitable means.

3 GUARD RAILS

3.1 General

3.1.1

Where superstructures are connected by trunks, open rails are to be fitted for the whole length of the exposed parts of the freeboard deck.

3.1.2

In Type B-100 and Type A ships, open rails on the weather parts of the freeboard deck for at least half the length of the exposed parts are to be fitted.

Alternatively, freeing ports complying with ICLL are to be fitted.

3.2 Construction of guard rails

3.2.1

Stanchions of guard rails are to comply with the following requirements:

a) Fixed, removable or hinged stanchions are to be fitted approximately 1.5 m apart.
b) At least every third stanchion is to be supported by a bracket or stay.
c) Removable or hinged stanchions are to be capable of being locked in the upright position.
d) In the case of ships with rounded sheer strake, the stanchions are to be placed on the flat of the deck.
e) In the case of ships with welded sheer strake, the stanchions are not to be attached to the sheer strake, upstand or a continuous gutter bar.

3.2.2

The size of openings, below the lowest course of rails and the deck or upstand, is to be a maximum of 230 mm. The distance between other courses is not to be greater than 380 mm.

3.2.3
Wire ropes may be accepted, in lieu of guard rails, only in special circumstances and then only in limited lengths. In such cases, they are to be made taut by means of turnbuckles.

3.2.4
Chains may be accepted, in lieu of guard rails, only where they are fitted between two fixed stanchions and/or bulwarks. if the opening is wide, the chains are to be fitted with vertical courses to prevent the horizontal courses from spreading apart.

Section 3 EQUIPMENT

SYMBOLS
DELETED

1 GENERAL

1.1 Application

1.1.1
Anchoring equipment shall be considered by individual Society.

ISC 1.1.1a Anchoring equipment is to comply with the requirements of PART TWO, Ch 3, Sec 2 of ISC Rules for Classification of Sea-going Steel Ships.

Section 4 SUPPORTING STRUCTURE FOR DECK EQUIPMENT AND FITTINGS

SYMBOLS
DELETED

1 GENERAL

1.1 Application

1.1.1
The supporting structure and foundations for deck equipment and fittings shall be considered by individual Society in addition to the requirements in this section.

ISC 1.1.1a In addition to the requirements of this section, the supporting structure and foundations for deck equipment and fittings are to comply with the requirements of PART TWO, Ch 3, Sec 6 of ISC Rules for Classification of Sea-going Steel Ships. The corrosion addition shall comply with the requirements of Ch 3, Sec 3 of this part.

1.1.2
Where deck equipment is subject to multiple load cases, such as operational loads and green sea load, the loads are be applied independently for the evaluation of strength of foundations and support structure.

1.2 Documents to be submitted

1.2.1
The documents to be submitted are indicated in Ch 1, Sec 3.

2 ANCHORING WINDLASS AND CHAIN STOPPER

2.1 General

2.1.1
The windlass is to be efficiently bedded and secured to the deck.

2.1.2
The builder and the windlass manufacturer are to ensured that the foundation is suitable for the safe operation and maintenance of the windlass equipment.

2.1.3
The supporting structure is to be dimensioned to ensure that for each of the load scenarios specified in [2.1.5] and [2.1.6], the stresses do not exceed the permissible values given in [2.1.12] to [2.1.15].

ISC 2.1.3a For the strength check of supporting structure and foundation, a three-dimensional FE model may be applied in the analysis. The principles for extent, element types and boundary conditions of a three- dimensional model are as follows:

(1) Extent and boundary conditions: The structural model is a local three-dimensional one (hereinafter referred to as local model), centred on the centroid of a plane rectangle (a×b) for effects of the foundation and extending outwards for a distance respectively at least one time the length and width corresponding to the rectangle (3a ×3b). This extension reaches vertically from the foundation plane to the first platform (deck) under main deck or at least D/4 (D being moulded depth). Where there is no primary support member of the structure at the boundary taken in the above way, the model is to further extend until the boundary is at such support member. Free or fixed support may be taken into account for boundary conditions. Where the boundary conditions or the extent of the model is sensitive to calculation results of the centre area, the extent taken for the local model is to be suitably extended again, provided that calculation results of the centre area will not be affected.

(2) Idealization of local model: The principles for element selection, properties and model meshing etc. are as given in Section 1 of Chapter 7.

ISC 2.1.3b In accordance with the design load of 2.1.3, the allowable equivalent stress of plate

element $[\sigma_e] = 1.00R_{eH.}$
where:
R_{eH} *– yield stress of material, in N/mm*^{2}.

2.1.4
These requirements are to be assessed based on net scantlings.

2.1.5
The following load cases are to be examined for the anchoring operation, as appropriate:

a) Windlass where chain stoppers are fitted but not attached to the windlass is provided: 45% of BS.
b) Windlass where no chain stopper is fitted or the chain stopper is attached to the windlass: 80% of BS.
c) Chain stopper: 80% of BS.

where:
BS : Minimum breaking strength of the chain cable.

2.1.6
The following forces are to be applied in the independent load cases that are to be examined for the design loads due to green sea over the forward 0.25 *L*, see Figure 1:
$P_x = 200\,A_x$, in kN, acting normal to the shaft axis.
$P_y = 150\,A_y\,f$, in kN, acting parallel to the shaft axis (inboard and outboard directions to be examined separately).
where:
A_x : Projected frontal area, in m^2.
A_y : Projected side area, in m^2.
f : Coefficient taken as:
$f = 1 + B_w/H$, but not to be taken greater than 2.5.
B_w : Breadth of windlass measured parallel to the shaft axis, in m, see Figure 1.
H : Overall height of windlass, in m, see Figure 1.

2.1.7
Forces resulting from green sea design loads in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by a number of bolt groups, *N*, each containing one or more bolts. See Figure 2.

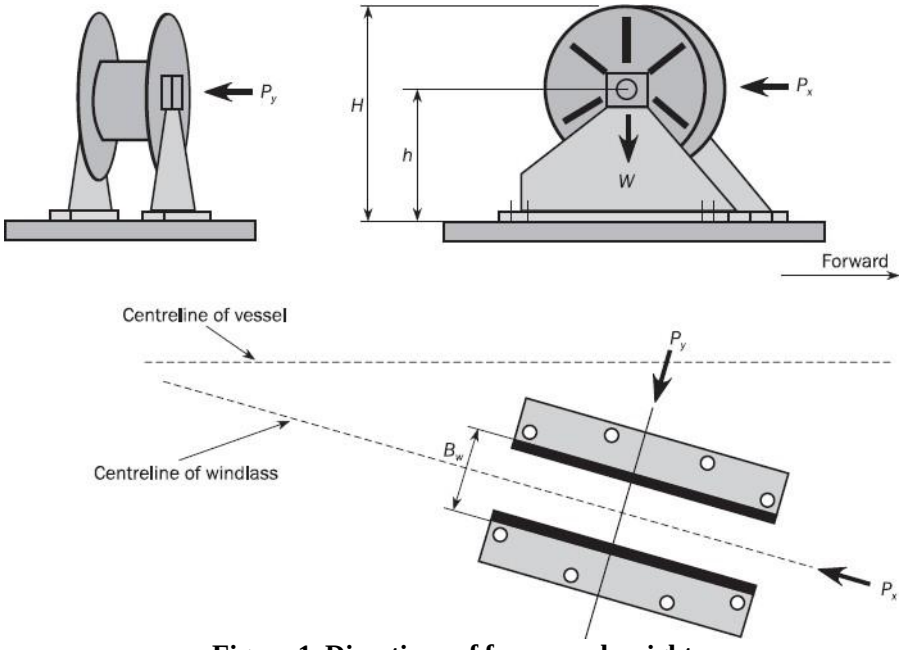

Figure 1 Directions of forces and weight

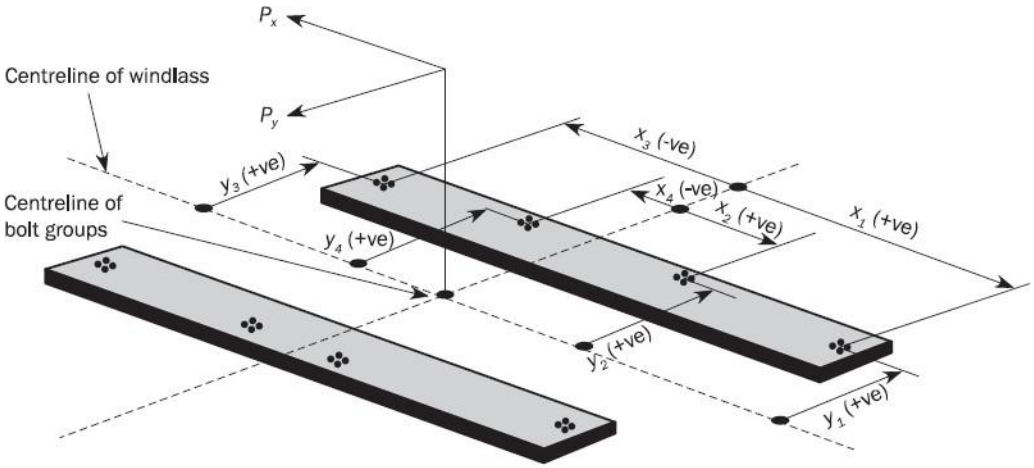

Figure 2 Bolting arrangements and sign conventions

2.1.8

The axial forces, *Rxi* and *Ryi*, in bolt group (or bolt) *i*, positive in tension, are given by:

$$R_{xi} = P_x hx_i A_i / I_x$$

$$R_{yi} = P_y hy_i A_i / I_y$$

$$R_i = R_{xi} + R_{yi} - R_{si}$$

where:

P_x : Force acting normal to the shaft axis, in kN.

P_y : Force acting parallel to the shaft axis, either inboard or outboard, whichever gives the greater force in bolt group *i*, in kN.

h : Shaft centre height above the windlass mounting, in cm, see Figure 1.

x_i, y : x and y coordinates of bolt group *i* from the centroid of all *N* bolt groups, in cm. Positive in the direction opposite to that of the applied force.

A_i : Cross sectional area of all bolts in group *i*, in cm^2.

I_x : Inertia in x direction for *N* bolt groups, in cm^4, taken as:

$I_x = \Sigma A_i x_i^2$

I_y : Inertia in y direction for *N* bolt groups, in cm^4, taken as:

$I_y = \Sigma A_i y_i^2$

R_{si} *:* Static reaction at bolt group *i*, due to the weight of windlass, in kN.

2.1.9

The shear forces, F_{xi} and F_{yi}, applied to the bolt group *i*, and the resultant combined force F_i, are given by:

$$F_{xi} = (P_x - C_1 mg) / N$$

$$F_{yi} = (P_y - C_1 mg) / N$$

$$F_i = \sqrt{F_{xi}^2 + F_{yi}^2}$$

where:

C_1 : Coefficient of friction, taken equal to 0.5.

m : Mass of windlass, in t.

g : Acceleration due to gravity, taken equal to 9.81 m/s^2.

N : Number of bolt groups.

2.1.10

The resultant forces from the application of the loads specified in [2.1.5] and [2.1.6] are to be considered in the design of the supporting structure.

2.1.11

Where a separate foundation is provided for the windlass brake, the distribution of resultant forces is to be calculated on the assumption that the brake is applied for load cases (a) and (b) defined in

[2.1.5].

2.1.12
The stresses resulting from anchoring design loads induced in the supporting structure are not to be greater than the following permissible values:

- Normal stress, 1.00 R_{eH}
- Shear stress, 0.6 R_{eH}

2.1.13
The tensile axial stresses resulting from green sea design loads in the individual bolts in each bolt group *i* are not to exceed 50% of the bolt proof strength. The load is to be applied in the direction of the chain cable. Where fitted bolts are designed to support shear forces in one or both directions, the von Mises equivalent stresses are not to exceed 50% of the bolt proof strength.

2.1.14
The horizontal forces resulting from the green sea design loads, F_{xi} and F_{yi} may be supported by shear chocks. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculation.

2.1.15
The stresses resulting from green sea design loads induced in the supporting structure are not to be greater than the following permissible values:

- Normal stress, 1.00 R_{eH}.
- Shear stress, 0.6 R_{eH}.

3 CRANES, DERRICKS, LIFTING MASTS AND LIFE SAVING APPLIANCES

3.1 General

3.1.1
Supporting structure of life saving appliances and supporting structures of cranes, derricks and lifting masts with a Safe Working Load greater than 30kN, or a maximum overturning moment to the supporting structure greater than 100kNm, are to comply with these requirements.

3.1.2
These requirements apply to the connection to the deck and the supporting structure of cranes, derricks and lifting masts. Where the crane, derrick or lifting mast is to be certified by the Society, additional requirements may be applied by the Society.

ISC 4.1.2a In addition to the requirements of 4.1.2, the applicable requirements of Section 10, Chapter 3 of ISC Rules for Lifting Appliances of Ships and Offshore Installations are also to be complied with.

3.1.3
These requirements do not cover the following items:

a) Supports of lifting appliances for personnel or passengers, except foundation for life saving appliances.
b) The structure of the lifting appliance pedestals or post above the area of the deck connection.
c) Holding down bolts and their arrangement, which are considered part of the lifting appliance. The term 'lifting appliance' is defined as a crane, derrick or lifting mast.

3.1.4 SWL Definition
The Safe Working Load (SWL) is defined as the maximum load which the lifting appliance is certified to lift at any specified outreach.

3.1.5 Self weight
The self weight is the calculated gross self weight of the lifting appliance, including the weight of

any lifting gear.

3.1.6 Overturning moment

The overturning moment is the maximum bending moment, calculated at the connection of the lifting appliance to the ship structure, due to the lifting appliance operating at Safe Working Load, taking into account outreach and self weight.

3.1.7

The crane pedestal and derrick mast are as defined in Figure 3.

3.1.8

Deck plating and under deck structure is to provide adequate support for derrick masts and crane pedestals against the loads and maximum overturning moment. Where the deck is penetrated, the deck plating is to be suitably strengthened.

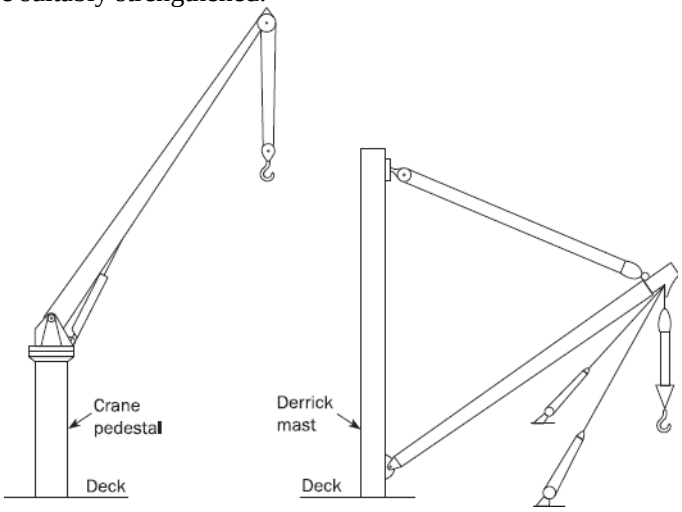

Figure 3 Crane pedestal and derrick mast

3.1.9

Structural continuity of the deck structure is to be maintained.

Under deck members are to be provided to support the crane pedestal and to comply with:

a) Where the pedestal is directly connected to the deck, without above deck brackets, adequate under deck structure directly in line with the crane pedestal is to be provided. Where the crane pedestal is attached to the deck without bracketing or where the crane pedestal is not continuous through the deck, welding to the deck of the crane pedestal and its under deck support structure is to be made by suitable full penetration welding. The design of the weld connection is to be adequate for the calculated stress in the welded connection, in accordance with [3.1.15].

b) Where the pedestal is directly connected to the deck with brackets, under deck support structure is to be fitted to ensure a satisfactory transmission of the load, and to avoid structural hard spots. Above deck brackets may be fitted inside or outside of the pedestal and are to be aligned with deck girders and webs. The design is to avoid stress concentrations caused by an abrupt change of section. Brackets and other direct load carrying structure and under deck support structure are to be welded to the deck by suitable full penetration welding. The design of the connection is to be adequate for the calculated stress, in accordance with [3.1.15].

3.1.10

Deck plating are to be of a material strength compatible with the crane pedestal. Where necessary, a thicker insert plate is to be fitted. In no case are doublers to be used where structures are subject to tension.

3.1.11

The supporting structure is to be dimensioned to ensure that for the load cases specified in [3.1.13] and [3.1.14], the stresses do not exceed those given in [3.1.15].

The capability of the supporting structure to resist buckling failure is to be assured.

ISC 4.1.11a In accordance with the design load of 4.1.11, a three-dimensional FE model may be applied in the analysis for the supporting structure in accordance with [ISC 2.1.3a]. The allowable equivalent stress, $[\sigma_e] = 0.8R_{eH}$, where: R_{eH} – yield stress of material, in N/mm^2.

3.1.12
These requirements are to be assessed based on gross scantlings.

3.1.13
For lifting appliances which are limited to use in harbour, design load is to be taken equal to 1.3 times SWL added to the lifting appliances self weight.

3.1.14
For life saving appliances, design load is to be taken as 2.2 times SWL.

3.1.15
The stresses induced in the supporting structure are not to exceed the following permissible values:

- Normal stress, 0.67 R_{eH}
- Shear stress, 0.39 R_{eH}

4 MISCELLANEOUS DECK FITTINGS

4.1 Support and attachment

4.1.1
The following requirements are to be considered in the design of the support and attachment of miscellaneous fittings which impose relatively small loads on the ship's structure. The arrangement of such details and their approval is considered on a case-by-case basis by the Society.

ISC 6.1.1a The strength assessment is carried out to the supporting structure of other deck equipment in accordance with the strength analysis method and criteria of this Section based on the design load submitted by the manufacturer.
ISC 6.1.1b For the connection structures of hull outfitting equipment to the deck, it is to be noted that:

(1) For the supporting structures of pipelines, open type sections (e.g. T, L, I, X etc.) are used and the corresponding supporting structures are strengthened by using web plates, collar plates and backing brackets. Ring support is used for large pipelines.
(2) Where pipelines pass through the deck, seamless casing pipes or those with welds ground are used to assist pipelines passing through the deck.
(3) Local transition is to be avoided in way of the backing strengthening under the deck. Transition is to made from the structure to the stiffener or frame.
(4) Stress concentration or high stress areas are to be avoided for cut-outs such as manholes/hatches. The watertight manhole covers are to be such that their strength is equivalent to the local strength of the associated deck. The edge of cut-outs is to be ground smooth.

4.1.2
Support positions are to be arranged so that the attachment to the ship structure is clear of deck openings and stress concentrations, such as the toes of end brackets. Design of supports is to be such that the attachment to the deck minimises the creation of hard points.

Section 5 SMALL HATCHWAYS

SYMBOLS
For symbols not defined in this section, refer to Ch 1, Sec 4.

1 GENERAL

1.1 Application

1.1.1
The requirements in [1.2] to [1.6] apply to small hatchways at weather deck in positions 1 and 2 as defined in Ch 1, Sec 4, [3.2]. The requirements in [2] apply to small hatchways fitted on the exposed fore deck over the forward 0.25 *L*.
Hatchways of bulk carriers not covered by the definition of small hatchways in [1.4.1] are to comply with applicable requirements in Pt 2, Ch 1.

1.2 Materials

1.2.1
Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

ISC 1.2.1a Materials used for the construction of small steel hatch covers are to comply with the applicable requirements of Chapter 3, PART ONE of ISC Rules for Materials and Welding.

1.2.2
The use of materials other than steel is considered by the Society on a case-by-case basis.

ISC 1.2.2a Small *hatch covers constructed of materials other than steel are to provide a strength equivalent to that of small steel hatch covers.*

1.3 Height of hatch coamings

1.3.1
The height above the deck of hatch coamings is not to be less than:

- 600 mm in position 1.
- 450 mm in position 2.

1.3.2
The height, given in [1.3.1], of hatch coamings closed by steel covers provided with gaskets and securing devices may be reduced or the coamings may be omitted entirely, on condition that the Flag Administration is satisfied that the safety of the ship is not thereby impaired in any sea conditions.
In such cases the scantlings of the covers, their gasketing, their securing arrangements and the drainage of recesses in the deck are considered by the Society on a case-by-case basis.

ISC 1.3.2a Subject to the agreement of the flag Administration, the height of hatch coamings may be appropriately reduced provided that the safety of the ship is not thereby impaired and that effective measures are taken. In this case, the scantlings of the hatch covers are to comply with the requirements of 2.2. The arrangement of sealing gasket and securing devices is to comply with the relevant requirements of this Section, taking into account the strength and arrangement of pressure head, stoppers and securing devices as well as factors such as the effectiveness of drainage and sealing materials.

1.4 Small hatchways

1.4.1
Small hatches are hatches designed for access to spaces below the deck and are capable to be closed weathertight or watertight, as applicable. Their opening is generally equal to or less than 2.5 m^2.
Hatch covers on exposed decks are to be weathertight.

Hatch covers fitted in way of ballast tanks, fuel oil tanks or other tanks are to be watertight.

1.4.2
Securing arrangements and stiffening of hatch cover edges are to be such that weathertightness can be maintained in any sea condition. At least one securing device is to be fitted at each side. Circular hole hinges are considered equivalent to securing devices.

1.4.3
Hatchways of special design are considered by the Society on a case-by-case basis.

ISC 1.4.3a The design of special securing arrangement and the rigidity of edge of hatch covers is to take into account the strength and arrangement of pressure head, stoppers and securing arrangement as well as factors such as the effectiveness of drainage measures and sealing materials.

1.4.4
The gross thickness of covers is to be not less than 8 mm. This thickness is to be increased or an efficient stiffening is to be fitted where the greatest horizontal dimension of the cover exceeds 0.6 m.

1.4.5
The gross thickness of coaming plate is not to be less than the lesser of the following values:

- The gross thickness for the deck in way of hatch coaming, assuming as spacing of stiffeners the lesser of the values of the height of the coaming and the distance between its stiffeners.
- 10 mm.

Coamings are to be strengthened where their height exceeds 0.8 m or their greatest horizontal dimension exceeds 1.2 m, unless their shape ensures an adequate rigidity.

1.5 Cargo tank access hatchways

1.5.1
Requirements given in [1.2] to [1.4] have to be considered as minimum requirements for cargo tank hatchways.
The requirements of [1.5.4] do not apply to dished covers or covers of other specially approved design.

1.5.2
Covers for access hatches, tank cleaning and other openings for cargo tanks and adjacent spaces are to be manufactured from the following material:

a) Normal strength steel in accordance with Ch 3, Sec 1.
b) Non-ferrous material may be considered, such as bronze or brass. Aluminium alloy is not to be used for covers of any opening to cargo tanks and spaces adjacent thereto.
c) Synthetic materials may be considered, taking into account their fire resistance and their physical and chemical properties in relation to the intended operating conditions. Details of the properties of the material, the design of the cover, and the method of manufacture are to be submitted for approval.

The hatch cover packing material is to be compatible with the cargoes that are intended to be carried and is to be effectively held in place.

1.5.3
The height of the hatch coaming above the upper surface of the freeboard deck is not to be less than 600 mm. Lower heights may be permitted by the Flag Administration. In addition, the top of the hatch coaming is not to be lower than the highest point of the tank over which it is fitted and is to be of sufficient height for the purpose of damage stability.
The gross thickness of the coaming plate is not to be less than 10 mm. Where the coaming height, as fitted, exceeds 600 mm, the thickness may be required to be increased or edge stiffening fitted. The scantlings of coaming plates of tank access coamings that enclose an area of 1.2 m^2 or more, and/or those that are not configured with a well rounded shape, may be subject to additional

requirements.

ISC 1.5.3a For the coaming plates of tank access small hatchways that enclose an area of 1.2 m^2 or more, and/or those that are not configured with a well rounded shape, stiffeners are to be fitted on the hatch coaming. The thickness of hatch coaming and the stiffeners on the coaming plate are to comply with the requirements of 6.3.1 and 6.3.2, Section 5, Chapter 1 of PART 9-2.

1.5.4
The gross thickness of unstiffened plate covers with an area less than 1.2 m^2 is not to be less than 12.5 mm. The gross thickness of covers of a larger area will need to be increased or the cover will require stiffening.
Flat and unstiffened covers on circular hatchways are to be secured by fastenings with a spacing of not more than 600 mm.
On rectangular hatchways, the spacing of fastenings is generally not to be greater than 450 mm and the distance between hatch corners and adjacent fastenings is not to be greater than 230 mm.
Where the cover is hinged, adequate stiffening of the coaming and cover in way of the hinge is to be provided. In general, hinges are not to be considered securing devices for the cover and are to be designed so as to prevent the gasket from being over-tightened.

1.6 Gaskets
1.6.1
The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness.

1.6.2
Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

2 SMALL HATCHWAYS FITTED ON THE EXPOSED FORE DECK

2.1 General
2.1.1
These requirements apply to small hatchways (generally openings 2.5 m^2 or less) on the exposed deck within 0.25 *L* from the FP and located at a height less than 0.1 *L* or 22 m, whichever is less, from the summer load water line at the location of the hatch.

2.1.2
Hatchways designed for emergency escape need not comply with the requirements [2.3.1] items (a) and (b), [2.4.3] and [2.5.1].

2.1.3
Securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g. one action wheel handles are provided as central locking devices for latching/unlatching of hatch cover) operable from both sides of the hatch cover.

2.2 Strength
2.2.1
For small rectangular steel hatch covers, the gross plate thickness, stiffener arrangement and scantlings are to be not less than those obtained, in mm, from Table 1 and Figure 2. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in [2.4.1] and shown in Figure 2. Primary stiffeners are to be continuous. All stiffeners are to be welded to the inner edge stiffener, see Figure 1.

Gross scantlings for small steel hatch covers on the fore deck **Table 1**

Nominal size, in mm	Cover plate thickness, in mm	Primary stiffeners	Secondary stiffeners
		Flat bar size, in mm ; number of stiffeners	
630 ×630	8	-	-
630 ×630	8	100 ×8 ; 1	-
830 ×630	8	100 ×8 ; 1	-
830 ×630	8	100 ×10 ; 1	-
1030 ×1030	8	120 ×12 ; 1	80 ×8 ; 2
1330 ×1330	8	150 ×12 ; 2	100 ×10 ; 2

2.2.2
The upper edge of the hatchway coaming is to be suitably reinforced by a horizontal member, normally not more than 190 mm from the upper edge of the coaming.

2.2.3
For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement is to provide strength and stiffness equivalent to the requirements for small rectangular hatches.

2.2.4
For small hatch covers constructed of materials other than normal strength steel, the required scantlings are to provide equivalent strength and stiffness.

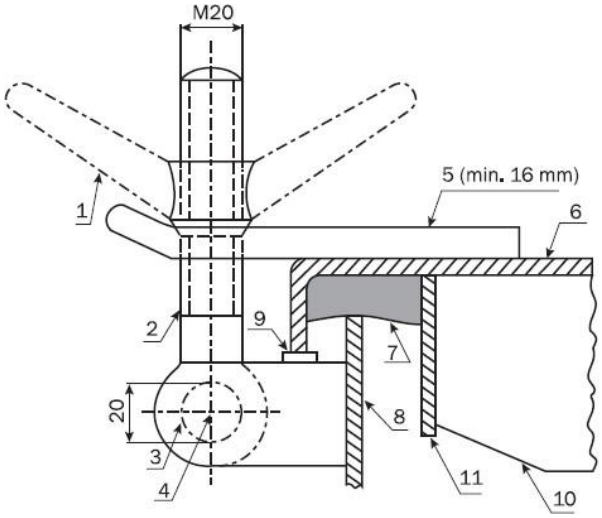
2.3 Primary securing devices
2.3.1
The primary securing devices are to be fitted such that the hatch cover can be secured in place and be made weathertight by means of a closing mechanism employing any one of the following methods:

a) Butterfly nuts tightening onto forks (clamps),
b) Quick acting cleats, or
c) A central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

2.4 Requirement to primary securing
2.4.1
The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Figure 2 and of sufficient capacity to withstand the bearing force.

2.4.2
The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.



2.4.3
For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimise the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is to be not less than 16 mm. An example arrangement is shown in Figure 1.

2.4.4
For small hatch covers located on the exposed deck forward of the foremost cargo hatch, the hinges are to be fitted such that the predominant direction of green seas will cause the cover to

close, which means that the hinges are normally to be located on the fore edge.

2.4.5
On small hatches located between the main hatches, for example between No. 1 and No. 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

2.5 Secondary securing devices
2.5.1
Small hatches on the fore deck are to be fitted with an independent secondary securing device, e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

1. Butterfly nut
2. Bolt
3. Pin
4. Centre of pin
5. Fork (clamp) plate
6. Hatch cover
7. Gasket
8. Hatch coaming
9. Bearing pad welded on the bracket of a toggle bolt for metal to metal contact
10. Stiffener
11. Inner edge stiffener

Chapter 12 CONSTRUCTION

Section 1 CONSTRUCTION AND FABRICATION

1 GENERAL

1.1 Workmanship

1.1.1

All workmanship is to be of commercial marine quality and acceptable to the surveyor. Welding is to be in accordance with the requirements of Ch 12, Sec 2. Any defect is to be rectified to the satisfaction of the surveyor before the material is covered with paint, cement or any other composition.

1.2 Fabrication standard

1.2.1

Structural fabrication is to be carried out in accordance with IACS Recommendation No. 47 or with a recognised fabrication standard which has been accepted by the Society prior to the commencement of fabrication /construction.

ISC 1.2.1a Where other standards are used by the shipyard, documents are to be provided by the shipyard to demonstrate that such standards are equivalent to IACS Recommendation No. 47.

1.2.2

The fabrication standard to be used during fabrication/construction is to be made available to the attending representative of the Society prior to the commencement of the fabrication/construction.

1.2.3

The fabrication standard is to include information, to establish the range and the tolerance limits, for the items specified as follows:

a) Cut edges: the slope of the cut edge and the roughness of the cut edges.
b) Flanged stiffeners and brackets and built-up sections: the breadth of flange and depth of web, angle between flange and web, and straightness in plane of flange or at the top of face plate.
c) Pillars: the straightness between decks and cylindrical structure diameter.
d) Brackets and flat bar stiffeners: the distortion at the free edge line of tripping brackets and flat bar stiffeners.
e) Sub-assembly stiffeners: details of sniped end of face plates and webs.
f) Plate assembly: for flat and curved blocks, the dimensions (length and breadth), distortion and squareness, and the deviation of interior members from the plate.
g) Cubic assembly: in addition to the criteria for plate assembly, twisting deviation between upper and lower plates, for flat and curved cubic blocks.
h) Special assembly: the distance between upper and lower gudgeons, distance between aft edge of propeller boss and aft peak bulkhead, twist of stern frame assembly, breadth and length of top plate of main engine bed. Where boring out of the propeller boss and stern frame, skeg or solepiece are to be carried out after completing the major part of the welding of the aft part of the ship. Where block boring is used, the shaft alignment is to be carried out using a method and sequence submitted to and recognised by the Society. The fit-up and alignment of the rudder, pintles and axles are to be carried out after completing the major parts of the welding of the aft part of the ship. The contacts between the conical surfaces of pintles, rudder stocks and rudder axles are to be checked before the final mounting.
i) Butt joints in plating: alignment of butt joint in plating.
j) Cruciform joints: alignment measured on the median line and measured on the heel line of cruciform joints.
k) Alignment of interior members: alignments of flange of T profiles, alignment of panel stiffeners, gaps in T joints and lap joints, and distance between scallop and cut-outs for

continuous stiffeners in assembly and in erection joints.

l) Keel and bottom sighting: deflections for whole length of the ship, and for the distance between two adjacent bulkheads, cocking-up of fore body and of aft body, and rise of floor amidships.
m) Dimensions: length between perpendiculars, moulded breadth and depth at midship, and length between aft edge of propeller boss and main engine.
n) Fairness of plating between frames: deflections between frames of shell, tank top, bulkhead, upper deck, superstructure deck, deckhouse deck and wall plating.
o) Fairness of plating in way of frames: deflections of shell, tank top, bulkhead, strength deck plating and other structures measured in way of frames.

ISC 1.2.3a Where block boring is used, the shaft alignment is to comply with the relevant requirements of Section 5, Chapter 12, PART THREE MACHINERY of ISC Rules for Classification of Sea-going Steel Ships

2 CUT-OUTS, PLATE EDGES

2.1 General

2.1.1

The free edges (cut surfaces) of cut-outs, hatch corners, etc are to be properly prepared and are to be free from notches. As a general rule, cutting draglines, etc are to be smoothly ground. All edges are to be broken or in cases of highly stressed parts, be rounded off.

Free edges on flame or machine cut plates or flanges are not to be sharp cornered and are to be finished off as specified above. This also applies to cutting drag lines, etc, in particular to the upper edge of sheer strake and analogously to weld joints, changes in sectional areas or similar discontinuities.

2.1.2

Corners in hatch opening are to be machine cut.

3 COLD FORMING

3.1 Special structural members

3.1.1

For highly stressed components of the hull girder where notch toughness is of particular concern (e.g. items required to be Class III in Ch 3, Sec 1, Table 3, such as radius gunwales (bent sheer plates) and bilge strakes), the inside bending radius, in cold formed plating, is not to be less than 10 times the as-built plate thickness for carbon-manganese steels (see Ch 3, Sec 1). The allowable inside bending radius may be reduced provided the requirements stated in [3.3] are complied with.

3.2 Corrugated bulkheads and hopper knuckles

3.2.1

For corrugated bulkheads and hopper knuckles, the inside bending radius, in cold formed plating, is not to be less than 4.5 times the as-built plate thickness for carbon-manganese steels (see Ch 3, Sec 1). The allowable inside bending radius may be reduced provided the requirements stated in [3.3] are complied with.

3.3 Low bending radius

3.3.1

When the inside bending radius is reduced below 10 times or 4.5 times the as-built plate thickness according to [3.1] and [3.2] respectively, supporting data is to be provided. The bending radius is in no case to be less than 2 times the as-built plate thickness. As a minimum, the following additional requirements are to be complied with:

a) or all bent plates:
   - 100% visual inspection of the bent area is to be carried out.
   - Random checks by magnetic particle testing are to be carried out.
b) In addition to a), for bent plates at boundaries to tanks or ballast holds:
   - The steel is to be of Grade D/DH or higher.

- The material is impact tested in the strain-aged condition and satisfies the requirements stated herein. The deformation is to be equal to the maximum deformation to be applied during production, calculated by the formula $t_{as\text{-}built} /(2r_{bdg} + t_{as\text{-}built})$, where $t_{as\text{-}built}$ is the as-built thickness of the plate material and r_{bdg} is the bending radius. One sample is to be plastically strained at the calculated deformation or 5%, whichever is greater and then artificially aged at 250°C for one hour then subject to Charpy V-notch testing. The average impact energy after strain ageing is to meet the impact requirements specified for the grade of steel used.

4 HOT FORMING

4.1 Temperature requirements

4.1.1

Steel is not to be formed between the upper and lower critical temperatures. If the forming temperature exceeds 650°C for as-rolled, controlled rolled, thermo-mechanical controlled rolled or normalised steels, or is not at least 28°C lower than the tempering temperature for quenched and tempered steels, mechanical tests are to be made to assure that these temperatures have not adversely affected both the tensile and impact properties of the steel. Where curve forming or fairing, by line or spot heating, is carried out in accordance with [4.2.1] these mechanical tests are not required.

4.1.2

After further heating, other than specified in [4.1.1], of Thermo-Mechanically Controlled Steels (TMCP plates) for forming and stress relieving, it is to be demonstrated that the mechanical properties meet the requirements specified by a procedure test using representative material.

4.2 Line or spot heating

4.2.1

Curve forming or fairing, by linear or spot heating, is to be carried out using approved procedures in order to ensure that the properties of the material are not adversely affected. Heating temperature on the surface is to be controlled so as not to exceed the maximum allowable limit applicable to the plate grade.

5 ASSEMBLY AND ALIGNMENT

5.1 General

5.1.1

The use of excessive force is to be avoided during the assembly of individual structural components or during the erection of sections. Major distortions of individual structural components are to be corrected before further assembly.

After completion of welding, straightening and aligning are to be carried out in such a manner that the material properties are not influenced significantly. In case of doubt, the Society may require a procedure test or a working test to be carried out.

5.1.2

Structural members are to be aligned following the provisions of IACS Recommendation No. 47, Tables 7 or according to the requirements of a recognised fabrication standard that has been accepted by the Society. In the case of critical components, control drillings are to be made where necessary, which are then to be welded up again on completion.

Section 2 FABRICATION BY WELDING

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the preparation, execution and inspection of welded connections in hull structures.

1.2 Limits of application to welding procedures

1.2.1 Weld type, size and materials

The requirements of this section for weld type, size and materials are based on the following considerations:

- Joint type.
- Criticality of the joint.
- Magnitude, type and direction of the stresses in the joint.
- Material properties of the parent and weld material.
- Weld gap size.

1.2.2 Preparation, execution and inspection

The requirements of this section are to be complemented by the general requirements relevant to fabrication by welding and qualification of welding procedures given by the Society when deemed appropriate by the Society.

ISC 1.2.2a Welding procedures are also to comply with the applicable requirements of Section 1, Chapter 5, PART THREE of ISC Rules for Materials and Welding.

2 WELDING PROCEDURES, WELDING CONSUMABLES AND WELDERS

2.1 General

2.1.1

All welding is to be carried out by approved welders, in accordance with approved welding procedures, using approved welding consumables, in compliance with the Rules of the Society. Personnel manning automatic welding machines and equipment are to be competent, sufficiently trained and certified by the Society as specified in Society Rules or Guidelines for welding.

ISC 2.1.1a The approval of welding consumables, welding procedures and qualification tests of welders are to comply with the requirements of Chapters 2,3 and 4 of PART THREE of ISC Rules for Materials and Welding.
ISC 2.1.1b The qualification tests of automatic submerged arc welding operators are to comply with the requirements of Section 3, Chapter 3 of ISC Guidelines for Inspection of Hull Welds.

3 WELD JOINTS

3.1 General

3.1.1

Welding of connections is to be executed according to the approved plans.

3.1.2

The quality standard adopted by the shipyard is to be submitted to the Society and it applies to all welded connections unless otherwise specified on a case-by-case basis.

ISC 3.1.2a The quality standard adopted by the shipyard is to be in accordance with paragraph 1.2.1, Section 1 of this Chapter. In special cases, equivalence or substitution is to be granted in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules.

3.1.3

Consideration is to be given to the assembly sequence and the effect of the overall shrinkage of plate panels, assemblies, etc, resulting from the welding processes employed. Welding is to

proceed systematically, with each welded joint being completed in correct sequence, without undue interruption. When practicable, welding is to commence at the centre of a joint and proceed outwards, or at the centre of assembly and progress outwards towards the perimeter so that each part has freedom to move in one or more directions.

3.1.4
Completed welded joints are to be to the satisfaction of the attending surveyor. Edge preparations and root gaps are to be in accordance with the approved welding procedure. The gap between the members being joined should not exceed the maximum values given in IACS Recommendation No. 47 or as specified in recognised fabrication standard approved by the Society. Where the gap between members being joined exceeds the specified values, corrective measures are to be taken in accordance with an approved welding procedure specification.

3.1.5
Where small fillets are used to attach heavy plates or sections, welding is to be based on approved welding procedure specifications. Special precautions, such as the use of preheating, low-hydrogen electrodes or low- hydrogen welding processes, are accepted.

3.1.6
When heavy structural members are attached to relatively light plating, the weld size and sequence may require modification.

3.1.7
Where quality control systems are in place which ensure that the grade of welding consumable used is higher than the minimum required for the particular strength steel being welded, the welding consumables that are used may have a weld deposit material yield strength that is greater than the minimum specified in Ch 12, Sec 3, [2.5.2] and the size of the weld may be determined based on the yield strength of the higher grade welding consumable.

3.1.8
In general, butt joints are to be welded from both sides. Before welding is carried out on the second side, unsound metal is to be removed at the root by a suitable method. Butt welding from one side will only be permitted for specific applications with an approved welding procedure specification.

3.1.9 Arrangements at junctions of welds
Welds are to be made flush in way of the faying surface where stiffening members, attached by continuous fillet welds, cross the completely finished butt or seam welds. Similarly, butt welds in webs of stiffening members are to be completed and made flush with the stiffening member before the fillet weld is made. The ends of the flush portion are to run out smoothly without notches or sudden changes of section. Where these conditions can not be complied with, a scallop is to be arranged in the web of the stiffening member. Scallops are to be of the size, and in a position, that a satisfactory return weld can be made.

3.1.10 Leak stoppers
Where structural members pass through the boundary of a tank, leakage into adjacent space could be hazardous or undesirable, and full penetration welding is to be adopted for the members for at least 150 mm on each side of the boundary. Alternatively, a small scallop of suitable shape may be cut in a member close to the boundary outside of the compartment, and carefully welded all around.

4 NON-DESTRUCTIVE EXAMINATION (NDE)

4.1 General

4.1.1
The NDE plan to be submitted for approval has to contain the necessary data relevant to the locations and number of examinations, welding procedures applied, method of NDE applied, etc. Visual inspection of finished welds is to be carried out by the shipyard to ensure that all welding

has been satisfactory completed. In addition to visual inspection, welded joints are to be examined using any one or a combination of ultrasonic, radiographic, magnetic particle, eddy current, dye penetrant or other acceptable methods appropriate to the configuration of the weld. Above inspections are to be carried out as per the requirements of the Society.

ISC 4.1.1a NDE is to be carried out in accordance with the applicable requirements of Section 3, Chapter 5,PART THREE of ISC Rules for Materials and Welding.

4.1.2

NDE of welding is to be carried out at the positions indicated by the NDE plan in order to ensure that the welds are free from cracks and unacceptable internal defects with regards to the requirements of the Society. NDE is to be carried out by qualified personnel certified by recognised bodies in compliance with recognised standards.

ISC 4.1.2a The acceptance standards of NDE of welds are to comply with the applicable requirements of Chapter 7 of ISC Guidelines for Inspection of Hull Welds.

Section 3 DESIGN OF WELD JOINTS

SYMBOLS

A_{weld} : Effective fillet weld area, in cm^2.
f : Root face, in mm.
f_{weld} : Weld factor.
f_{yd} : Correction factor taking into account the yield strength of the weld deposit as defined in [2.5.2].
l_{dep} : Total length of deposit of weld metal, in mm.
l_{leg} : Leg length of continuous, lapped or intermittent fillet weld, in mm.
l_{weld} : Length of the welded connection in mm.
R_{eH_weld} : Minimum yield stress of weld deposit, in N/mm^2.
$t_{as\text{-}built}$: As-built thickness of the member being joined, in mm.
t_{gap} : Allowance for fillet weld gap, is to be taken equal to 2.0 mm.
t_{throat} : Throat thickness of fillet weld in mm, as defined in [2.5.3].

1 GENERAL

1.1 Application

1.1.1

The requirements of this section apply to the design of welded connections in hull structures and are based on the considerations mentioned in Ch 12, Sec 2, [1.2.1].

1.1.2

Plans and/or specifications showing weld sizes and weld details are to be submitted for approval.

1.1.3

The leg length of welds is to comply with the minimum leg length given in Table 1.

1.2 Alternatives

1.2.1

The requirements given in this section are considered minimum for electric-arc welding in hull construction, but alternative methods, arrangements and details will be specially considered for approval.

ISC 1.2.1a The requirements given in this Section are considered minimum for electric-arc welding in hull construction, but alternative methods, arrangements and details are to be approved in accordance with paragraph 2.2.5, Section 2, Chapter 2, PART ONE of the Rules.

2 TEE OR CROSS JOINT

2.1 Application

2.1.1

The connection of primary supporting members, stiffener webs to plating as well as the plating abutting on another plating, are to be made by fillet or penetration welding, as shown on Figure 1.

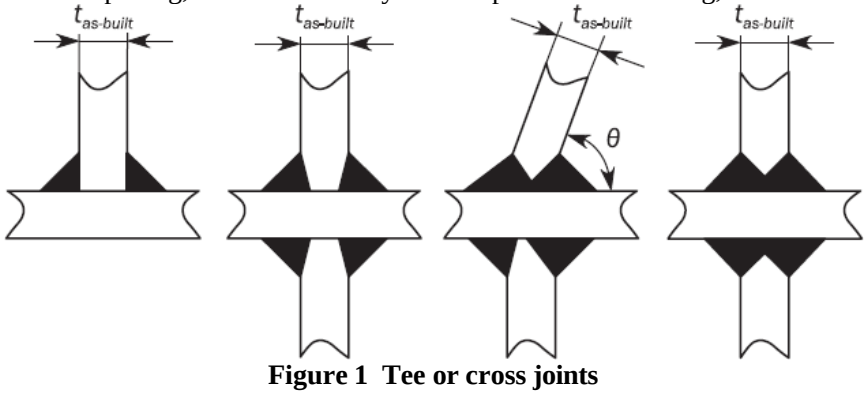

Figure 1 Tee or cross joints

$t_{as\text{-}built}$: As-built thickness of the member being attached, mm.

θ : Connecting angle, in deg.

2.1.2
Where the connection is highly stressed or otherwise considered critical, a partial or full penetration weld is to be achieved by bevelling the edge of the abutting plate.

2.2 Continuous fillet welds

2.2.1
Continuous welding is to be adopted in the following locations:

a) Connection of the web to the face plate for all members.
b) All fillet welds where higher strength steel is used.
c) Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.
d) Boundaries of tanks and watertight compartments.
e) All structures inside tanks and cargo holds.
f) Stiffeners and primary supporting members at tank boundaries.
g) All structures in the aft peak and stiffeners and primary supporting members of the aft peak bulkhead.
h) All structures in the fore peak.
i) Welding in way of all end connections of stiffeners and primary supporting members, including end brackets, lugs, scallops, and at orthogonal connections with other members.
j) All lap welds in the main hull.
k) Primary supporting members and stiffener members to bottom shell in the 0.3 L forward region.
l) Flat bar longitudinals to plating.
m) The attachment of minor fittings to higher strength steel plating and other connections or attachments.
n) Pillars to heads and heels.
o) Hatch coaming stay webs to deck plating, see [2.4.5].

2.3 Intermittent fillet welds

2.3.1
Where continuous welding is not required, intermittent welding may be applied.

2.3.2
Where beams, stiffeners, frames, etc, are intermittently welded and pass through slotted girders, shelves or stringers, there is to be a pair of matched intermittent welds on each side of every intersection. In addition, the beams, stiffeners and frames are to be efficiently attached to the girders, shelves and stringers.
Where intermittent welding or one side continuous welding is permitted, double continuous welds are to be applied for one-tenth of their shear span at each end, in accordance with [2.5.2] and [2.5.3].

2.3.3 Deckhouses
One side continuous fillet welding is acceptable in the dry spaces of deckhouses.

2.3.4 Size for one side continuous weld
The size for one side continuous weld is to be of fillet required by [2.5.2] for intermittent welding, where f_3 factor is to be taken as 2.0.

2.4 Partial or full penetration welds

2.4.1 High stress area definition
For the application of this section, high stress area means an area where fine mesh finite element analysis is to be carried out and the fine mesh yield utilisation factor in elements adjacent to the weld is more than 90% of the fine mesh permissible utilisation factor, as defined in Ch 7, Sec 3, [6.2].

2.4.2 Partial or full penetration welding

In areas with high tensile stresses or areas considered critical, full or partial penetration welds are to be used. In case of full penetration welding, the root face is to be removed, e.g. by gouging before welding of the back side.

For partial penetration welds the root face, *f*, is, to be taken between 3 mm and $t_{as\text{-}built}/3$.

The groove angle made to ensure welding bead penetrating up to the root of the groove, α, is usually from 40°to 60°.

The welding bead of the full/partial penetration welds is to cover root of the groove. Examples of partial penetration welds are given on Figure 2.

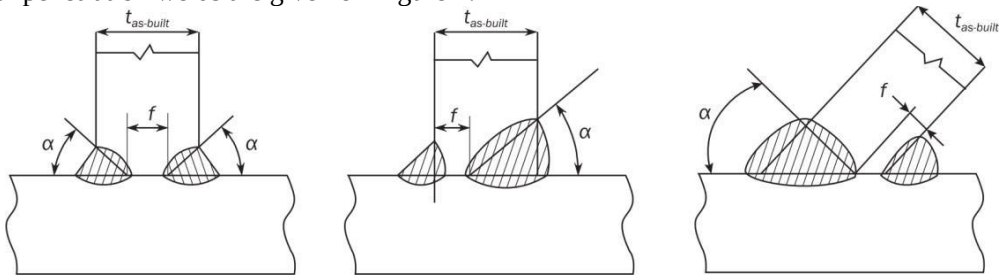

Figure 2 Partial penetration welds

2.4.3 One side partial penetration weld

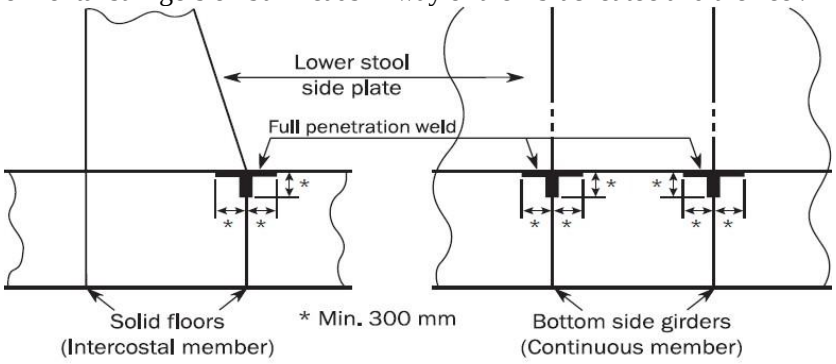
For partial penetration welds with one side bevelling the fillet weld at the opposite side of the bevel is to satisfy the requirements given in [2.5.2].

2.4.4 Extent of full or partial penetration welding

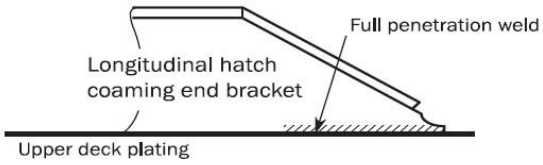
The extent of full or partial penetration welding in each particular location listed in [2.4.5] and [2.4.6] is to be approved by the Society. However, the minimum extent of full/partial penetration welding from the reference point (i.e. intersection point of structural members, end of bracket toe, etc.) is not to be taken less than 300 mm, unless otherwise specifically stated.

2.4.5 Locations required for full penetration welding

Full penetration welds are to be used in the following locations and elsewhere as required by the rules, see Figure 3:



a) Floors to hopper/inner bottom plating in way of radiused hopper knuckle.
b) Radiused hatch coaming plate at corners to deck.
c) Connection of vertical corrugated bulkhead to the lower hopper plate and to the inner bottom plate within the cargo hold region, when the vertical corrugated bulkhead is arranged without a lower stool.
d) Connection of structural elements in the double bottom in line with corrugated bulkhead flanges to the inner bottom plate, when the vertical corrugated bulkhead is arranged without a lower stool.
e) Connection of vertical corrugated bulkhead to the lower hopper plate, and connection of structural elements in the lower hopper area in line with corrugated bulkhead flanges to the lower hopper plate, where connections are clear of lower stools.
f) Connection of vertical corrugated bulkhead to top plating of lower stool.
g) Corrugated bulkhead lower stool side plating to lower stool top plate.
h) Corrugated bulkhead lower stool side plating to inner bottom.
i) Connection of structural elements in double bottom to the inner bottom plate in holds intended for the carriage of liquid at sea with a distance of 150300 mm from the side plating of the lower stool, see Figure3.
j) Edge reinforcement or pipe penetration both to strength deck, sheer strake and bottom plating within 0.6 *L* amidships, when the dimensions of the opening exceeds 300 mm.
k) Abutting plate panels with as-built thickness less than or equal to 12 mm, forming outer shell boundaries below the scantling draught, including but not limited to: sea chests, rudder trunks, and portions of transom. For as-built thickness greater than 12mm, partial penetration in accordance with [2.4.2].
l) Crane pedestals and associated bracketing and support structure.



m) For toe connections of longitudinal hatch coaming end bracket to the deck plating, full penetration weld for a distance of 0.15 H_c from toe of side coaming termination bracket is required, where H_c is the hatch coaming height.
n) Rudder horns and shaft brackets to shell structure.
o) Thick flanges of long transverse web frames to side web frames. Thick flanges of long longitudinal girder to bulkhead web frames.

2.4.6 Locations required for partial penetration welding

Partial penetration welding as defined in [2.4.2], is to be used in the following locations (see examples in Figure
3):

a) Connection of hopper sloping plate to longitudinal bulkhead (inner hull) or horizontal girder in double side space.
b) End connection of longitudinal/transverse bulkhead primary supporting member including buttress structure to the double bottom and both end connections of backing bracket, where it is fitted.
c) Corrugated bulkhead lower stool supporting floors to inner bottom.
d) Corrugated bulkhead gusset and shedder plates.
e) Lower 15% of the length of built-up corrugation of vertical corrugated bulkheads
f) Structural elements in double bottom below bulkhead primary supporting members and stool plates, except in way of [2.4.5] i).
g) Lower hopper plate to inner bottom.
h) Horizontal stringers on bulkheads in way of their bracket toe and the heel.

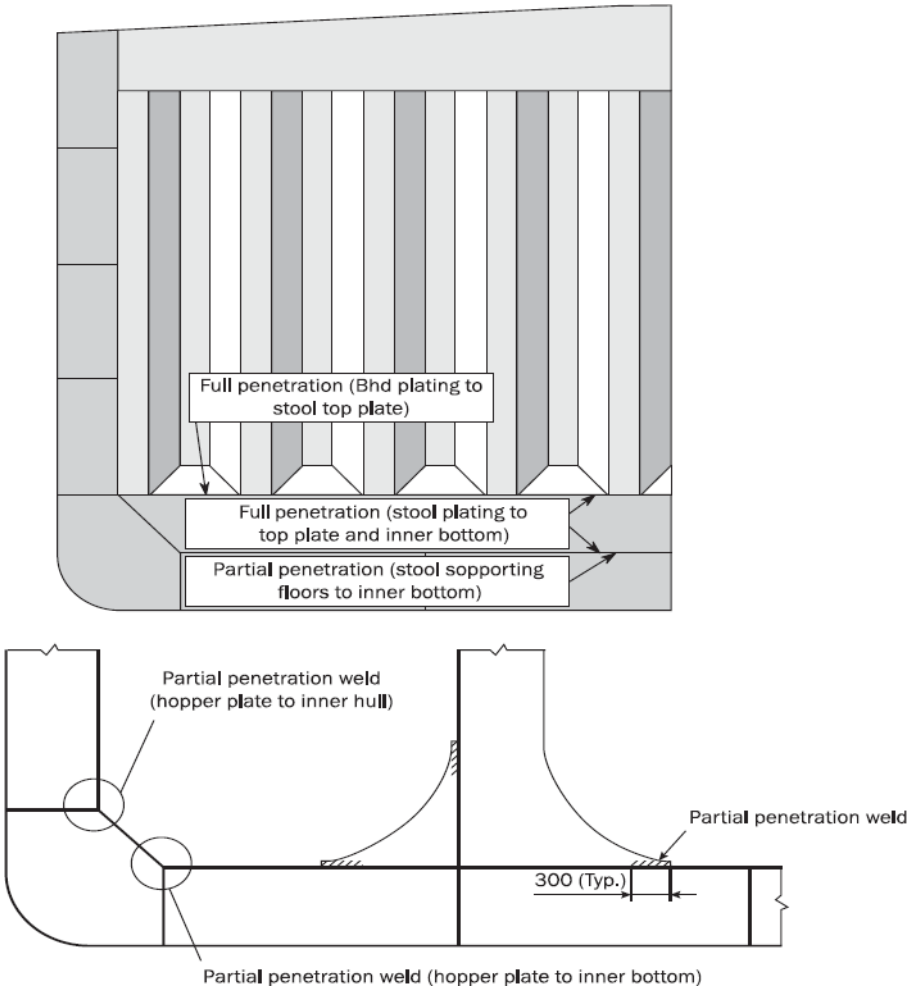


Figure 3 High stress areas welding (examples)

2.4.7 Fine mesh finite element analysis

In high stress area, at least partial penetration welds as defined in [2.4.2] are to be used. The minimum extent of full or partial penetration welding in that case is to be the greater of the following:

- 150 mm in either direction from the element with the highest yield utilisation factor.
- The extent covering all elements that exceed the above mentioned yield utilisation factor criteria.

2.4.8 Shedder plates

In case where shedder plates are fitted at the lower end of corrugated bulkhead, the shedder plates are to be welded to the corrugation and the top plate of the transverse lower stool by one side penetration welds.

2.5 Weld size criteria

2.5.1

The required weld sizes are to be rounded to the nearest half millimetre.

2.5.2

The leg length, *lleg* in mm, of continuous, lapped or intermittent fillet welds is not to be taken less than the greater of the following values:

$l_{leg} = f_1 f_2 t_{as\text{-}built}$

$l_{leg} = f_{yd} f_{weld} f_1 f_2 t_{as\text{-}built} + t_{gap}$

l_{leg} as given in Table 1

where

f_1: Coefficient depending on welding type:

f_1 = 0.30 for double continuous welding.
f_1= 0.38 for intermittent welding.

f_2 : Coefficient depending on the edge preparation:
f_2 = 1.0 for welds without bevelling.
f_2 = 0.70 for welds with one/both side bevelling and $f = t_{as\text{-}built}$ /3.

f_{yd}: Coefficient not to be taken less than the following:

$$f_{yd} = (\frac{1}{k})^{0.5} (\frac{235}{R_{eH_weld}})^{0.75}$$

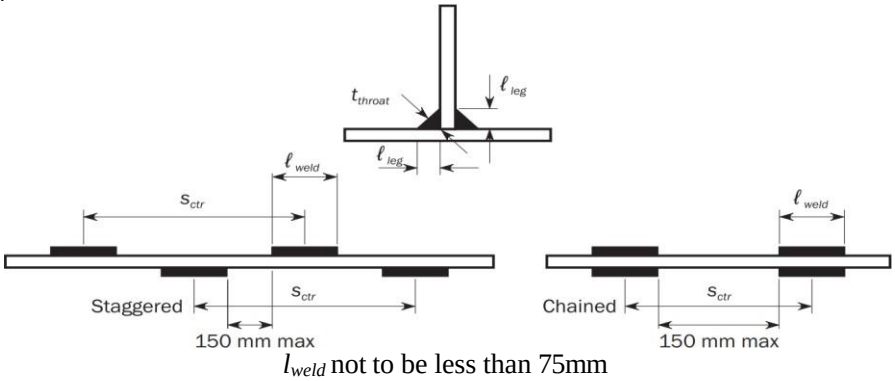
$f_{yd} = 0.71.$

R_{eH_weld} : Specified minimum yield stress for the weld deposit in N/mm^2, not to be less than:
: R_{eH_weld} = 305 N/mm^2 for welding of normal strength steel with R_{eH} = 235N/mm^2.
: R_{eH_weld} = 375 N/mm^2 for welding of higher strength steels with R_{eH} from 265 to 355 N/mm^2.
: R_{eH_weld} = 400 N/mm^2 for welding of higher strength steel with R_{eH} = 390N/mm^2.

f_{weld} : Weld factor dependent on the type of the structural member, see Table 2, Table 3 and Table 4.

k : Material factor of the abutting member.

f_3 : Correction factor for the type of weld:
f_3=1.0 for double continuous weld.
$f_3 = s_{ctr}/l_{weld}$ for intermittent or chain welding.



s_{ctr} : Distance between successive fillet welds, in mm.

Leg length for intermittent welding is not to exceed the greater of 6.5mm or 0.62 * $t_{as\text{-}built}$.

2.5.3

The throat size t_{throat}, in mm, as shown in Figure 4, is not to be less than:

$$t_{throat} = \frac{l_{leg}}{\sqrt{2}}$$

l_{weld} not to be less than 75mm

Figure 4 Weld scantlings definitions

2.5.4

For primary supporting members connections not listed in Table 2, and Table 3 the weld factors from Table 4 are to be used.

Minimum leg size **Table 1**

Area	Type of space		Minimum length, in mm
Cargo hold region	Cargo tanks and holds	Within 3m below top of tank(2)	6.5 (1)
		Elsewhere	6.0 (1)
	Water ballast tanks	Within 3m below top of tank(2)	6.5 (1)
		Elsewhere	6.0 (1)

Area	Type of space		Minimum length, in mm
	Dry spaces and voids		5.0
	Other tanks		6.0 (1)
Other areas	Water ballast tanks	Within 3m below top of tank(2)	6.0 (1)
		Elsewhere	5.5 (1)
	Fuel oil, diesel oil , fresh water and other tanks		4.5
	Dry spaces and voids		4.0
	Superstructures and deckhouses		3.5

(1) If the as-built thickness of the element is less than 12 mm, the minimum leg length may be reduced by 0.5 mm.

(2) Only applicable to cargo tanks and ballast tanks with weather deck as the tank top. The 3m distance is measured vertically from and parallel to the top of the tank.

Weld factors for different structural members **Table 2**

Hull area	Connection				f_{weld}
	Of		To		
General, unless otherwise specified in the table	Watertight plate		Boundary plating		0.48
	Oil-tight plate		Boundary plating		0.51
	Brackets at ends of members				0.48
	Ordinary stiffener and collar plates		Deep tank bulkheads		0.24
			Web of primary supporting members and collar plates		0.38
	Web of stiffener		Plating (except deep tank bulkhead)		0.20
			Face plates of built-up stiffeners	At ends (15% of span)	0.38
				Elsewhere	0.20
Bottom and double bottom	Ordinary stiffener		Bottom and inner bottom plating		0.24
	Centre girder		Shell plates		0.38
			Inner bottom plate		0.38
	Side girder including intercostal plates		Bottom and inner bottom plating		0.24
	Floor		Shell plates and inner bottom plates	At ends, on a length equal to two frame spaces	0.38
			Centre girder and side girders in way of hopper tanks		0.38
			Elsewhere		0.24
	Bracket on centre girder		Centre girder, inner bottom, floors and shell plates		0.38
	Web stiffener		Floor and girder		0.20
Side and inner side in double side structure	Web of primary supporting members		Side plating		0.30
			Inner side plating and web of primary supporting members	in way of deck transverse and end connections	0.43
				in way of cross tie	0.36
				elsewhere	0.30
Deck	Strength deck	$t_{as_built} \geqslant 13$	Side shell plating within 0.6L midship		PPW [3]
			Elsewhere		0.48
		$t_{as_built} < 13$	Side shell plating		0.48
	Other deck		Side shell plating		0.38
			Stiffeners		0.20
	Hatch coamings		Deck plating	Longitudinal hatch coaming at corners of hatchways on a length of 15% of the hatch coaming height	FPW [4] [1]
				Longitudinal hatch coaming on a length starting from 15% of the hatch coaming height from the corners of hatchways up to 15% of the hatch length	0.48
				Elsewhere	0.38
	Web stiffeners		Coaming webs		0.20 [2]
Bulkheads [5]	Non-watertight bulkhead structure		Boundaries	Swash bulkheads	0.24
	Stiffener		Bulkhead plating	At ends (25% of span), where no end brackets are fitted	0.48

Hull area	Connection		f_{weld}
	Of	To	
Aft peak	Internal members	Boundaries and each other: below waterline	0.38
		Above waterline	0.20
Fore peak	Internal members	Boundaries and each other	0.20
Machinery space	Centre girder	Keel and inner bottom	0.48
	Floor	Centre girder and engine foundation girder	0.48
	Engine foundation girders	Top plate of main engine bed and inner bottom plate, where applicable	PPW (3)
	Floors and girders	Inner bottom and shell plate	0.38
Superstructure and deckhouse	External bulkhead (first and second tier erections)	Deck, external bulkhead	0.48
	External bulkheads and internal bulkheads	Elsewhere	0.20

(1) f_{weld} =0.43 for hatch coaming other than in cargo holds.
(2) Continuous welding.
(3) PPW: Partial penetration welding in accordance with [2.4.2]. When one side partial penetration weld is adopted, f_{weld} = 0.48 is to be used for the fillet.
(4) FPW: Full penetration welding in accordance with [2.4.2].
(5) Bulkheads of superstructure and deckhouse are to be considered in the row corresponding to "Superstructure and deckhouse".

Weld factors for miscellaneous fittings and equipment **Table 3**

Item		Connection to	f_{weld}
Hatch cover	Primary supporting members	At ends (10% of span) of PSM	0.48(1)
		Elsewhere	0.24
	Stiffeners	At ends	0.38 (2)
		Elsewhere	0.20
Mast, derrick post, crane pedestal, etc.		Deck / Underdeck reinforced structure	0.43
Deck machinery seat		Deck	0.24
Mooring equipment seat		Deck	0.43
Ring for access hole type cover		Anywhere	0.43
Stiffening of side shell doors and weathertight doors		Anywhere	0.24
Frames of shell and weathertight doors		Anywhere	0.43
Coaming of ventilator and air pipe		Deck	0.43
Ventilators, etc., fittings		Anywhere	0.24
Scupper and discharge		Deck	0.55
Bulwark stay		Deck	0.24
Bulwark plating		Deck	0.43
Guard rail, stanchion		Deck	0.43
Cleats and fittings		Hatch coaming and hatch cover	0.24 (3)

(1) For bulk carrier hatch covers f_{weld} = 0.38.
(2) For bulk carrier hatch covers f_{weld} = 0.24 at ends of stiffeners.
(3) Minimum weld factor. Where $t_{as\text{-}built}$>11.5mm l_{leg} need not exceed 0.62$t_{as\text{-}built}$. Penetration welding may be required depending on design.

Weld factors for primary supporting members **Table4**

Hull structural member	Connection			f_{weld}
	Of	To		
Primary supporting member	Web plate	Shell plating, deck plating, inner bottom plating, bulkhead	Within end 15% of shear span and extending to end of member	0.48
			Elsewhere	0.38
		Face plate	In tanks/holds Members located within 0.125L from fore peak	0.38
			Elsewhere if cross section area of face plate exceeds 65 cm^2	0.38
			Elsewhere	0.24
	End connections		In way of boundaries of ballast and cargo tanks	0.48
			Elsewhere	0.38

2.5.5

Where the as-built web thickness of the abutting longitudinal stiffener is greater than 15 mm and exceeds the thickness of the attached plating, the welding is to be double continuous and the leg length of the weld is not to be less than the largest of the following:

a) $0.30t_{as\text{-}built}$, where $t_{as\text{-}built}$ is the as-built thickness of the attached plating without being taken greater than 30 mm.

b) $0.27t_{as\text{-}built} + 1$, where $t_{as\text{-}built}$ is the as-built thickness of the abutting member. The leg size resulting of this formula needs not to be taken greater than 8.0 mm.

c) Leg length given in the Table 1.

2.5.6

Where the minimum weld size is determined by the requirements of second formula shown in [2.5.2], the weld connections to shell, decks or bulkheads are to take account of the material lost in the cut out, where stiffeners pass through the member. In cases where the width of the cut-out exceeds 15 % of the stiffener spacing, the size of weld leg length is to be multiplied by:

$$\frac{0.85s}{l_w}$$

where:

s : Stiffener spacing in mm, as shown in Figure 5.

l_w : Length of web plating between notches, in mm, as shown in Figure 5.

2.5.7 Shear area of primary supporting member end connections

Welding of the end connections, inclusive 10% of shear span, of primary supporting members is to be such that the weld area is to be equivalent to the gross cross sectional area of the member. The weld leg length in mm, l_{leg}, is to be taken as:

$$l_{leg} = 1.41 f_{yd} \frac{h_w t_{gr-req}}{l_{weld}}$$

where:

h_w : Web height of primary supporting members, in mm.

t_{gr_req} : Required gross thickness of the web in way of the end connection, including 10% of shear span, based on the highest average usage factor for yield from cargo hold FE analysis or the shear area requirement for PSM outside cargo hold region, in mm.

l_{weld} : Length of the welded connection in mm, as shown in Figure 6.

l_{dep} : Total length of deposit of weld metal, in mm, see Figure 6 taken as:
$l_{dep} = 2\ l_{weld}$

The size of weld is not to be less than the value calculated in accordance with [2.5.2].

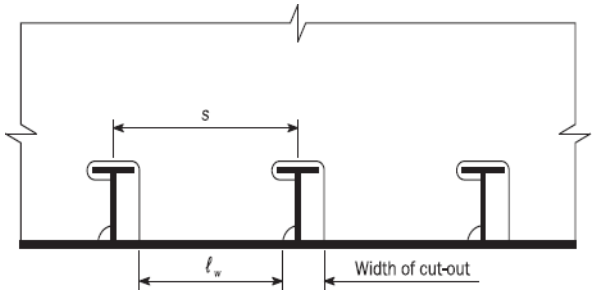


Figure 5 Effective material in web cut-outs for stiffeners

2.5.8 Longitudinals

Welding of longitudinals to plating is to be doubled continuous at the ends of the longitudinals at the extent of 15 % of shear span as defined in Ch 3, Sec 7, [1.1.3].

In way of primary supporting members, the length of the double continuous weld is to be equal to the depth of the longitudinal or the end bracket, whichever is greater.

2.5.9 Deck longitudinals

For deck longitudinals, a matched pair of welds is required at the intersection of longitudinals with primary supporting members.

2.5.10 Longitudinal continuity provided by brackets

Where a longitudinal strength member is to cut at a primary supporting structure and the continuity of strength is provided by brackets, the weld area A_{weld} is not to be less than the gross cross sectional area of the member. The weld area, A_{weld} in cm^2, is to be determined by the following formula:

$$A_{weld} = \frac{f_{yd} t_{throat} l_{dep}}{100}$$

2.5.11 Unbracketed stiffeners

Where intermittent welding is permitted, unbracketed stiffeners of shell, watertight and oil-tight bulkheads, and deckhouse fronts are to have double continuous welds for one-tenth of their length at each end. Unbracketed stiffeners of non-tight structural bulkheads, deckhouse sides and aft ends are to have a pair of matched intermittent welds at each end.

2.5.12 Reduced weld size

Where an approved automatic deep penetration procedure is used and quality control facilitates are working to a gap between members of 1 mm and less, the weld factors given in Table 2 may be reduced by 15% but not more than fillet weld leg size of 1.5 mm. Reductions of up to 20%, but not more than the fillet weld leg size of 1.5 mm, will be accepted provided that the shipyard is able to consistently meet the following requirements:

a) The welding is performed to a suitable process selection confirmed by welding procedure tests covering both minimum and maximum root gaps.
b) The penetration at the root is at least the same amount as the reduction into the members being attached.
c) Demonstrate that an established quality control system is in place.

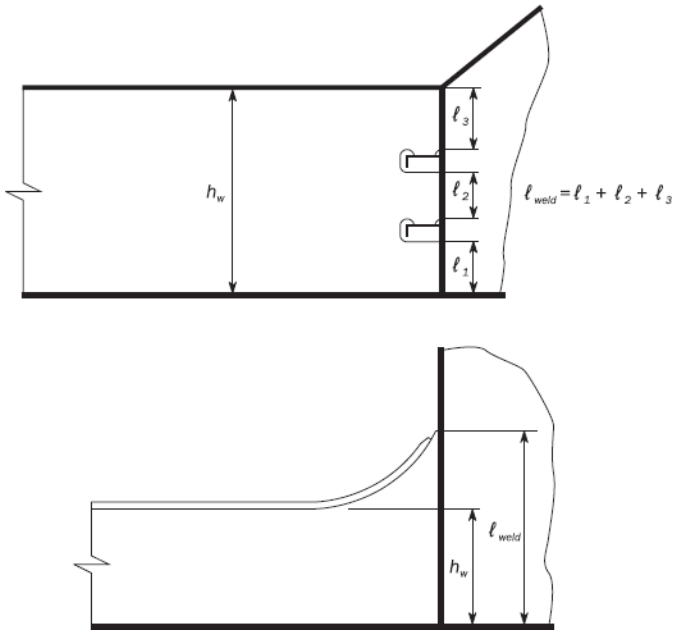

Figure 6 Shear area of primary supporting member

Note1: The length l_{weld} is the length of the welded connection. The total length of the weld deposit l_{dep} if welded with double continuous fillet welds is twice the length of the welded connection l_{weld}.

2.5.13 Reduced weld size justification

Where any of the methods for reduction of the weld size are adopted, the specific requirements giving justification for the reduction are to be indicated on the drawings. The drawings are to document the weld design and dimensioning requirements for the reduced weld length and the required weld leg length given by [2.5.2] without the leg length reduction. Also, notes are to be added to the drawings to describe the difference in the two leg lengths and the requirements for their application.

3 BUTT JOINT

3.1 General

3.1.1

Joints in the plate components of stiffened panel structures are generally to be joined by butt welds, see Figure 7.

3.2 Thickness difference

3.2.1 Taper

In the case of welding of plates with difference in as-built thickness greater than 4 mm, the thicker plate is normally to be tapered. The taper has to have a length of not less than 3 times the difference in as- built thickness. If the width of groove is not less than 3 times the difference the transition taper is to be avoided.

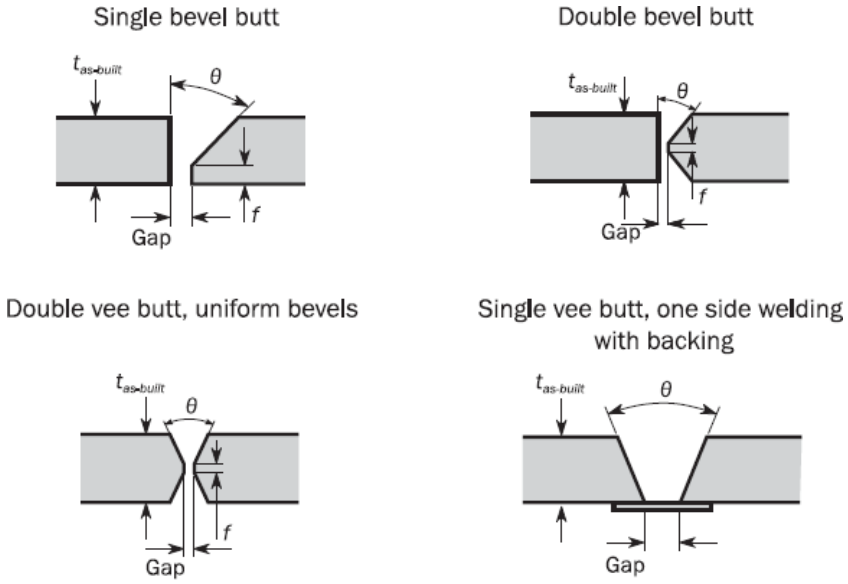

Figure 7 Typical butt welds

4 OTHER TYPES OF JOINTS

4.1 Lapped joints

4.1.1 Areas

Lap joint welds may be adopted in very specific cases subject to the approval of the Society. Lap joint welds may be adopted for the following:

- Peripheral connections of doublers.
- Internal structural elements subject to very low stresses.

4.1.2 Overlap width

Where overlaps are adopted, the width of the overlap is not to be less than three times, but not greater than four times the as-built thickness of the plates being joined, see Figure 8. Where the as-built thickness of the thinner plate being joined has a thickness of 25 mm or more, the overlap will be subject to special consideration.

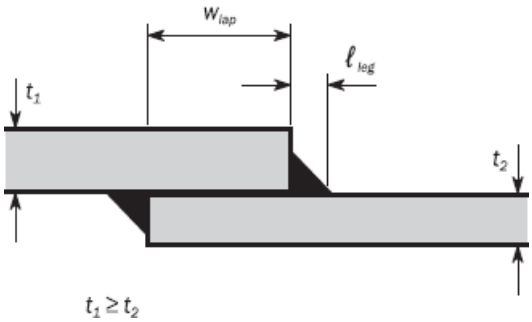

Figure 8 Fillet weld in lapped joint

4.1.3 Overlaps for lugs

The overlaps for lugs and collars in way of cut-outs for the passage of stiffeners through webs and bulkhead plating are not to be less than three times the thickness of the lug but need not be greater than 50 mm.

4.1.4 Lapped end connections

Lapped end connections are to have continuous welds on each edge with leg length, l_{leg} in mm, as shown on Figure 8 such that the sum of the two leg lengths is not less than 1.5 times the as-built thickness of the thinner plate.

4.1.5 Overlapped seams

Overlapped seams are to have continuous welds on both edges, of the sizes required by [2.5.2] for the boundaries of tank/hold or watertight bulkheads. Seams for plates with as-built thickness of

12.5 mm or less, which are clear of tanks/holds, may have one edge with intermittent welds in accordance with [2.5.2] for watertight bulkhead boundaries.

4.2 Slot welds

4.2.1

Slot welds may be adopted in very specific cases subject to the approval of the Society. However, slot welds of doublers on the outer shell and strength deck are not permitted within 0.6 L amidships.

ISC 4.2.1a Slot welds are not adopted in general. Where internal access for welding from the back side is not practicable, e.g. where direct application of fillet welding is not practicable for the connection of plating to internal webs, slot welds may be adopted. However, slot welds of doublers on the outer shell and strength deck are not permitted within 0.6 L amidships.

4.2.2

Slots are to be well-rounded and have a minimum slot length, l_{slot} of 75 mm and width, w_{slot} of twice the as- built plate thickness. Where used in the body of doublers and similar locations, such welds are in general to be spaced a distance, s_{slot} of $2l_{slo}$ to $3l_{slo}$ but not greater than 250 mm, see Figure 9. The size of the fillet welds is to be determined from second formula shown in [2.5.2] using $t_{as\text{-}built}$ of the thinner plate and a weld factor of 0.48.

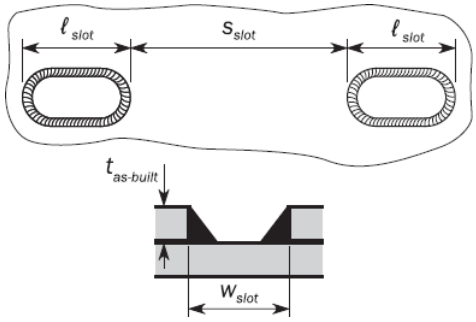

Figure 9 Slot welds

4.2.3 Closing plates

For the connection of plating to internal webs, where access for welding is not practicable, the closing plating may be attached by slot welds to face plates fitted to the webs.

4.2.4

Slots are to be well-rounded and have a minimum slot length, l_{slot} of 90 mm and a minimum width, w_{slot} of twice the as-built plate thickness. Slots cut in plating are to have smooth, clean and square edges and are in general to be spaced a distance, s_{slot} not greater than 140 mm. Slots are not to be filled with welding.

4.3 Stud and lifting lug welds

4.3.1

Where permanent or temporary studs or lifting lugs are to be attached by welding to main structural parts in areas subject to high stress, the proposed locations are to be submitted for approval.

5 CONNECTION DETAILS

5.1 Bilge keels

5.1.1

The ground bar is to be connected to the shell with a continuous fillet weld, and the bilge keel to the ground bar with a continuous fillet weld in accordance with Table 5.

Connections of bilge keels **Table 5**

Structural items being joined	Leg length of weld, in mm	
	At ends(1)	Elsewhere
Ground bar to the shell	0.62 t_{1as_built}	0.48 t_{1as_built}
Bilge keel web to ground bar	0.48 t_{2as_built}	0.30 t_{2as_built}

$t_{1as\text{-}built}$: As-built thickness of ground bar, in mm.
$t_{2as\text{-}built}$: As-built thickness of web of bilge keel, in mm.
(1): Zone "*b*" in Fig. 19 and Fig. 20 in Pt 1 Ch 3 Sec 6 for definition of "ends".

5.1.2
Butt welds, in the bilge keel and ground bar, are to be well clear of each other and of butts in the shell plating as shown in Figure 10. In general, shell butts are to be flush in way of the ground bar and ground bar butts are to be flush in way of the bilge keel. Direct connection between ground bar butt welds and shell plating is not permitted. This may be obtained by use of removable backing.

5.1.3
The ground bar is to be continuously fillet welded with a leg length as given in Table 4. At the ends of the ground bar, the leg length is to be increased as given in Table 4, without exceeding the as-built thickness of the ground bar as shown in Figure 10. The welded transition at the ends of the ground bar to the plating connection should be formed with the weld flank angle of 45 deg or less.

5.1.4
In general, scallops and cut-outs are not to be used. Crack arresting holes are to be drilled in the bilge keel butt welds as close as practicable to the ground bar. The diameter of the hole is to be greater than the width of the butt weld and is to be a minimum of 25 mm. Where the butt weld has been subject to non-destructive examination, the crack arresting hole may be omitted.

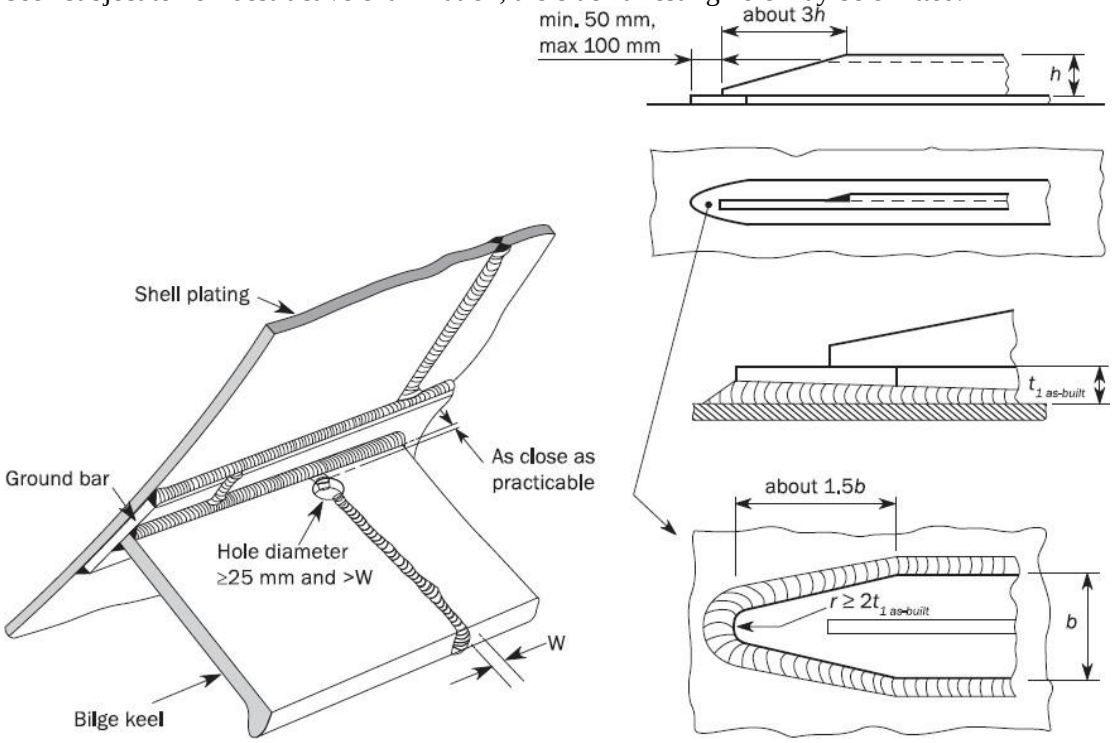

Figure 10 Bilge keel

5.2 Bulk carrier side frames
5.2.1

The following requirements are applicable to side frames, end brackets and tripping brackets of single side skin bulk carriers.

5.2.2

For zones 'a' and 'b' as shown in Figure 11, double continuous fillet welding should be used with leg lengths of $0.62t_{as\text{-}built}$ and $0.57t_{as\text{-}built}$ respectively where $t_{as\text{-}built}$ is the as-built thickness of the thinner of two connected members, in mm.

5.2.3

Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating. The leg length, l_{leg} in mm, for these connections should be taken as:

- $0.5t_{as\text{-}built} + 1.0$ if $t_{as\text{-}built} < 10$
- $0.4\ t_{as\text{-}built} + 1.0$ if $10 \leqslant t_{as\text{-}built} < 20$
- $0.3\ t_{as\text{-}built} + 1.0$ if $t_{as\text{-}built} \geqslant 20$

In these formulas $t_{as\text{-}built}$ is as-built thickness of the abutting plate.

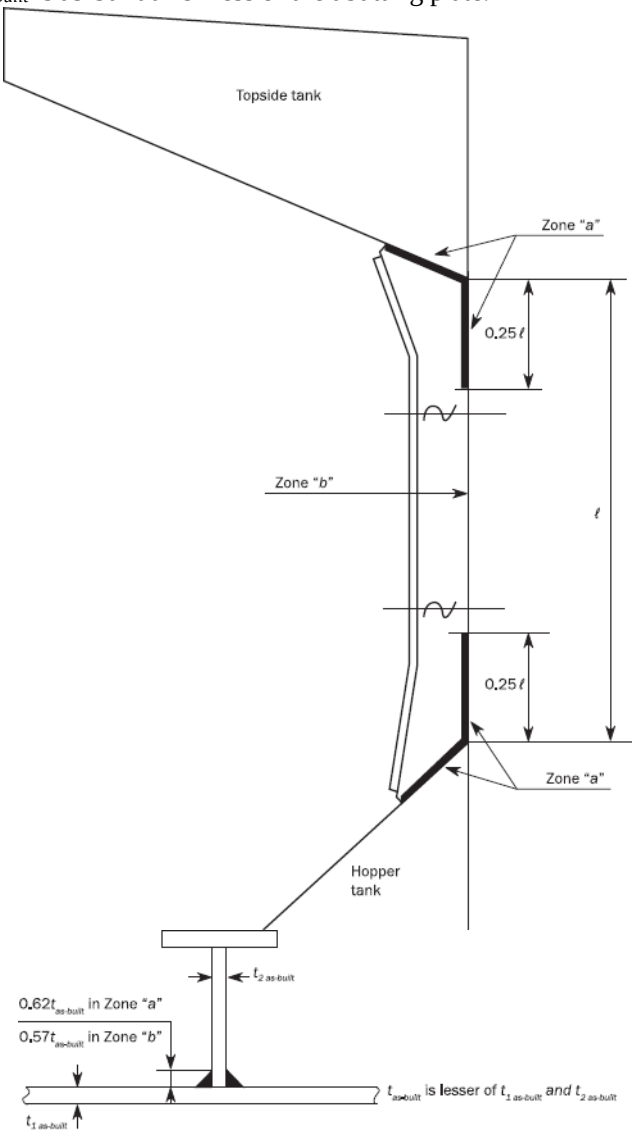

Figure 11 Bulk carrier side frames

5.3 End connections of pillars and cross ties

5.3.1

The end connections of pillars and cross ties are to have an effective fillet weld area, in cm^2, (weld throat multiplied by weld length) not less than:

$$A_{weld} = f_3(\frac{235}{R_{eH_weld}})^{0.75} F$$

where:

F : Design load, for the structure under consideration, in kN.
f_3 : Coefficient equal to:
f_3 = 0.05 when pillar or cross tie is in compression only.
f_3= 0.14 when pillar or cross tie is in tension.

5.4 Abutting plates with small angles

5.4.1

Where the angle θ between the abutting plate and the connected plate is less than 75 deg as shown in Figure 12, the size of fillet welds l_θ, in mm, for the side of larger angle is to be increased in accordance with:

$$l_\theta = \frac{l_{leg}}{\sqrt{2}\sin\frac{\theta}{2}}$$

where:

l_{leg} : Leg length of fillet weld, in mm, as defined in [2.5.2].
θ : Connecting angle, in deg, as shown in Figure 12.

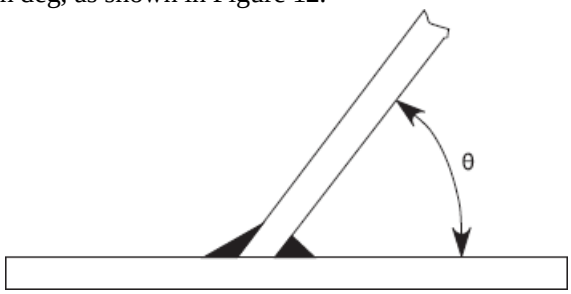

Figure 12 Connecting angle

5.4.2

Connections of main strength members where θ is less than 45 deg, see Figure 12, may be applied only in dry spaces and voids.

Chapter 13 SHIP IN OPERATION - RENEWAL CRITERIA

Section 1 PRINCIPLES AND SURVEY REQUIREMENTS

1 PRINCIPLES

1.1 Application

1.1.1

The purpose of this chapter is to provide criteria for the allowable thickness diminution of ships'hull structures.

1.1.2

The criteria apply only to ships in operation that are classed in accordance with these Rules.

1.1.3

Thickness measurement is to be used to assess ships' hull structures against the specified renewal criteria.

1.1.4

The hull survey requirements are those given, as applicable, in the Rules and/or documents of the individual Society which incorporate:

- UR Z10.2 for single side skin bulk carriers.
- UR Z10.4 for double hull oil tankers.
- UR Z10.5 for double side skin bulk carriers.

1.2 Corrosion allowance concept

1.2.1 Corrosion allowance

Corrosion allowance is comprised of two aspects: local and global corrosion, as defined in Ch 3, Sec 2, [1.1.2].

1.2.2 Assessment

Assessment against both local and global corrosion renewal criteria is required during the operational life of ships.

Assessment against the newbuilding requirements which incorporate corrosion additions, given in Ch 3, Sec 3, and which consider all relevant loads and limit states, e.g. yielding, buckling, and fatigue is not required during the operational life of ships, provided that the measured thickness of any structural members remain greater than the renewal thickness specified in Ch 13, Sec 2, [2].

1.2.3 Steel renewal

Steel renewal is required if either the local or global corrosion allowance is exceeded.

1.3 Requirements for documentation

1.3.1 Plans

The plans to be supplied onboard the ship, as required in Ch 1, Sec 3, are to include, for each structural element, both the as-built and renewal thickness as defined in Ch 13, Sec 2. Any thickness for voluntary addition is also to be clearly indicated on the plans.

For the list of plans and information to be supplied onboard the ship, reference is made to the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 or Z10.5 as applicable.

1.3.2 Hull girder sectional properties

The Midship section plan to be supplied onboard the ship is to include the minimum required hull girder sectional properties, as defined in Ch5, Sec 1, for the representative transverse sections of all cargo holds.

2 HULL SURVEY REQUIREMENTS

2.1 General

2.1.1 Minimum hull survey requirements

The minimum hull survey requirements including thickness measurements for the maintenance of class are given in the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 and Z10.5.

Section 2 ACCEPTANCE CRITERIA

SYMBOLS

$t_{as\text{-}built}$ *:* As built thickness, in mm.
t_c *:* Corrosion addition in mm, as defined in Ch 3, Sec 2.
t_{res} *:* Reserve thickness, taken equal to 0.5 mm.
t_{vol_add} *:* Thickness for voluntary addition, in mm.

1 GENERAL

1.1 Application

1.1.1

This section gives requirements for the application of the acceptance criteria.

1.2 Definition

1.2.1 Deck zone

The deck zone includes all the following items contributing to the hull girder strength:

- For bulk carriers: elements above or crossed by the 0.9 *D* level line above the baseline such as:
  - Strength deck plating.
  - Deck stringer.
  - Sheer strake.
  - Side shell plating.
  - Inner hull and other longitudinal bulkhead plating, if any.
  - Topside tank sloped plating, including horizontal and vertical strakes.
  - Longitudinal stiffeners, girders and stringers connected to the above mentioned plating.
- For oil tankers: elements above or crossed by the 0.9D level line above the baseline such as:
  - Strength deck plating.
  - Deck stringer.
  - Sheer strake.
  - Inner hull and other plane longitudinal bulkheads upper most strake.
  - Topside tank sloped plating, including horizontal and vertical strakes.
  - Longitudinal upper stool.
  - Longitudinal stiffeners, girders and stringers connected to the above mentioned plating.

1.2.2 Bottom zone

The bottom zone includes the following items contributing to the hull girder strength:

- For bulk carriers: elements up to the upper level of the hopper sloping plating or up to and including the inner bottom plating if there is no hopper tank:
  - Keel plate.
  - Bottom plating.
  - Bilge plating.
  - Bottom girders.
  - Inner bottom plating.
  - Hopper tank sloping plating, and horizontal plating, if any.
  - Side shell plating.
  - Plane longitudinal bulkheads lower strake.
  - Longitudinal stiffeners connected to the above mentioned plating.
- For oil tankers:
  - Keel plate.
  - Bottom plating.
  - Bilge plating.
  - Plane longitudinal bulkheads lower strake.
  - Bottom girders.

- Inner bottom plating.
- Hopper tank sloping plating, and horizontal plating, if any.
- Side shell plating.
- Longitudinal lower stool.
- Longitudinal stiffeners connected to the above mentioned plating.

1.2.3 Neutral axis zone

The neutral axis zone includes the following items between the deck zone and the bottom zone, as for example:

- Side shell plating.
- Inner hull plating and longitudinal bulkheads, if any.
- Topside tank sloped plating.

For the longitudinal strength members forming the web of the hull girder which are inclined to the vertical, the area of the member to be included in the zone area is to be based on the projected area onto the vertical plane.

2 RENEWAL CRITERIA

2.1 Local corrosion

2.1.1 Renewal thickness of local structural elements

Local structural elements include local supporting members and primary supporting members.
Steel renewal is required if the measured thickness, *tm* in mm, is less than the renewal thickness, t_{ren} defined as:

$$t_{ren} = t_{as-built} - t_c - t_{vol_add}$$

2.1.2 Renewed area

Areas which need to be renewed based on the renewal criteria in [2.1.1] are, in general, to be repaired with inserted material which is to have the same or greater grade and yield stress as the original, and to have a thickness, t_{repair} in mm, not less than:

$$t_{repair} = t_{as-built} - t_{vol_add}$$

2.1.3 Alternative solutions

Alternative solutions may be adopted in accordance with the requirements of the Rules and/or documents of the individual Society which incorporate IACS UR Z10.2, Z10.4 and Z10.5, where the measured thickness, t_m is such as:

$$t_{ren} \leqslant t_m < t_{ren} + t_{res}$$

2.2 Global corrosion

2.2.1 Application

The ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during special surveys, for ships over 10 years of age.

2.2.2 Renewal criteria

The hull girder strength criteria are given as detailed below.

a) Deck and bottom zones:
The current hull girder section modulus at deck and at bottom determined with the thickness measurements are not to be less than 90% of the section modulus calculated according to Ch 5, Sec 1 with the gross offered thickness.
Alternatively, the current sectional areas of the bottom zone and of the deck zone which are the sum of the measured item areas of the considered zones are not to be less than 90% of the sectional area of the corresponding zones determined with the gross offered thickness.

b) Neutral axis zone:
The current sectional area of the neutral axis zone, which is the sum of the measured plating areas of this zone, is not to be less than the sectional area of the neutral axis zone calculated with the gross offered thickness minus 0.5 t_c.

If the actual reduction of the gross offered thickness of all items, of a given transverse section, which contribute to the hull girder strength is less than 10% for the deck and bottom zones and $0.5t_c$ for the neutral axis zone, the hull girder strength criteria of this transverse section is satisfied and the calculations of the different zone areas with measured thicknesses need not be carried out.
The gross offered thickness is defined in Ch 3, Sec 2.

ISC Appendix A WAVE LOAD DIRECT CALCULATION METHOD BASED ON EQUIVALENT DESIGN WAVE METHOD

Symbols:

t : *Time, in s.*

V : *Ship speed under consideration, in m/s.*

x,y,z : *Coordinate X, Y and Z of the considered point in reference coordinate system as defined in [1.2], in m.*

x_G,y_G,z_G :*Coordinate X, Y and Z of ship gravity center corresponding to the considered loading condition in reference coordinate system as defined in [1.2], in m.*

L : *Rule length, in m.*

ω_e: *Encounter frequency.*

η_i (i=1,6)*: Ship motions displacements relative to the ship gravity center in six degrees of freedom as surge, sway, heavy, roll, pitch and yaw.*

θ *: Roll amplitude, in rad.*

φ *: Pitch amplitude, in rad.*

a_X, a_Y, a_Z *: Acceleration of any point.*

f_S : *Coefficient for symbol. For vertical bending moment, hogging is positive and sagging is negative. For horizontal bending moment, tension on the starboard side is positive and compression on the starboard side is negative.*

f_{ps} *: Coefficient for strength assessments which is dependent on the applicable design load scenario specified in Section 7, Chapter 4 of PART 9-1 and to be taken as :*

f_{ps} *= 1.0 for extreme design load scenario and fatigue assessment.*

f_{ps} *= 0.9 for fatigue assessment.*

f_{ps} *= 0.8 for the ballast water exchange design load scenario.*

f_{ps} *= 0.8 for the accidental flooded design load scenario at sea.*

f_{ps} *= 0.4 for the harbour/sheltered water design load scenario.*

f_β *: Heading correction factor, to be taken as :*

- *For strength assessment*

  f_β *= 0.8 for BSR and BSP load cases for the extreme sea loads design load scenario.*

  f_β *=1.0 for HSM, HSA, FSM, OST and OSA load cases for the extreme sea loads design load scenario.*

  f_β *=1.0 for ballast water exchange at sea, harbour/sheltered water and accidental flooded design load scenarios.*

- *For fatigue assessment*

  f_β *=1.0.*

f_m : *Distribution factor for vertical wave bending moment along the ship's length, see Figure 3-1.*

f_{nl} : *Coefficient considering nonlinear effects applied to vertical wave bending moment. For strength assessment, in hogging condition, it is taken as $f_{nl\text{-}vh}$; in sagging condition, it is taken as $f_{nl\text{-}vs}$. For fatigue assessment, f_{nl} is taken as 1.0.*

$f_{nl\text{-}vh}$ *: Taken as* $\dfrac{0.19C_B}{0.15C_B+0.0385}$

$f_{nl\text{-}vs}$*: Taken as* $\dfrac{0.11C_B+0.077}{0.15C_B+0.0385}$

M_{WV} *: Vertical wave bending moment in given loading and given equivalent design wave, in kNm.*

Q_{WV} *: Vertical wave shear force in given loading and given equivalent design wave, in kN.*

M_{WH} *: Horizontal wave bending moment in given loading and given equivalent design wave, in kNm.*

M_{WT} *: Wave torsional moment in given loading and given equivalent design wave, in kNm.*

P_{ex} *: Total sea pressure in given loading and given equivalent design wave, in kN/m^2.*

P_{es} *: Hydrostatic pressure in given loading and given equivalent design wave, in kN/m^2.*

P_{ed} *: Hydrodynamic pressure in given loading and given equivalent design wave, in kN/m^2.*

P_{in} *: Total internal pressure in given loading and given equivalent design wave, in kN/m^2.*

1 GENERAL PROVISIONS

1.1 Application

This Appendix is applicable to the wave load direct calculation of oil tankers and bulk carriers with unrestricted worldwide navigation and may also be used as a reference for the wave load direct calculation of oil tankers and bulk carriers of other service areas.

1.2 Reference coordinate system

The ship's geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system (see Figure 1-1) :

Origin : at the intersection among the longitudinal plane of symmetry of ship, the aft end of L and the baseline;

X axis : longitudinal axis, positive forwards;

Y axis : transverse axis, positive towards portside;

Z axis : vertical axis, positive upwards.

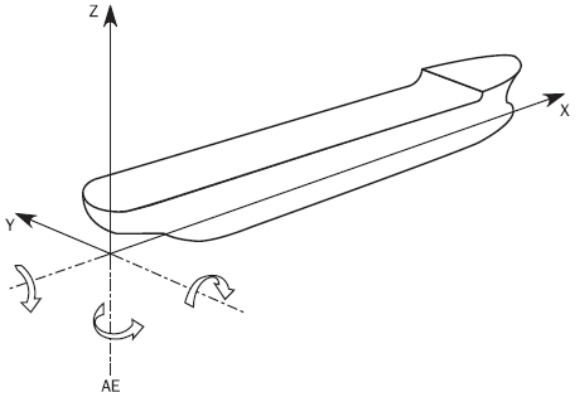

Figure 1-1 Reference Coordinate System

2 PRINCIPLE OF EQUIVALENT DESIGN WAVE METHOD

2.1 Wave load direct calculation method

Wave load direct calculation method is based on the three-dimensional linear potential flow theory. Once the fluid velocity potential at the junction of fluid and hull together with its partial derivative in relation to the space coordinate are obtained, the interacting forces between fluid and hull can be obtained, then hull motion responses and section loads will be obtained, based on the Bernoulli's equation.

The solution for velocity potential is mainly to solve a boundary integral equation for meeting definite conditions, i.e. the fluid domain condition, the free surface condition, the body surface condition, the bottom condition and the remote radiation condition. Current solving methods mainly include free surface Green function method in frequency domain or time domain and the simple Green function method.

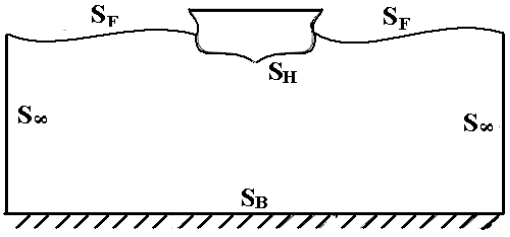

Figure 2-1 Boundary Condition for the Solution of Velocity Potential

Based on the Bernoulli's equation, the diffraction pressure response function and hydrodynamic coefficient will be obtained and then the ship's motions, accelerations and radiation pressure response function together with the response function of section loads will be obtained when the velocity potential is obtained.

2.2 Long term and short term prediction of linear wave loads

2.2.1 Short term prediction of linear wave loads

The short-term wave may be regarded as stationary random Gaussian process with average value of zero. Based on the random process theory, the response wave loads (output) subject to the wave

(input) will also be stationary random Gaussian process with average value of zero. The relationship between input wave spectrum S_ζ and output response spectrum S_w is expressed by the following formula:

$$S_W(\omega, H_{1/3}, T_Z, V, \beta+\theta) = H^2(\omega, V, \beta+\theta) S_\zeta(\omega, H_{1/3}, T_Z, \theta)$$

where:

ω is wave frequency, $H_{1/3}$ is significant wave height, T_Z is average zero-crossing period, V is ship speed, β is course and θ is heading angle.

For a stationary random Gaussian process with average value of zero, under the narrow spectrum assumption, the amplitude complies with Rayleigh distribution and the corresponding probability density is:

$$f_0(x) = \frac{2x}{E[(H_{1/3}, T_Z), V, \beta]} \exp[-\frac{x^2}{E[H_{1/3}, T_Z], V, \beta}]$$

where:

E is two times wave load variance, expressed as follows:

$$E[(H_{1/3}, T_Z), V, \beta] = 2\int_{-\pi/2}^{+\pi/2}\int_0^\infty S_W(\omega, H_{1/3}, T_Z, V, \beta+\theta)\,\mathrm{d}\omega\,\mathrm{d}\theta$$

The distribution function, 1/3 significant value and 1/10 significant value of loads are obtained in accordance with load response function and wave parameters.

2.2.2 Long term prediction of linear wave loads

Where it is assumed that short term conditions consisting of various different sea states and navigation conditions are independent from each other, the long term probability distribution will be the weighted combination of short term probability distribution, i.e. the exceedance probability of the wave load amplitude X greater than certain fixed value x is :

$$Q(x) = p\{X \geq x\} = \sum_i \sum_j \sum_k p_i(H_{1/3}, T_Z), p_i(H_{1/3}, T_Z), p_j(\beta), p_k(V) \exp\left\{\frac{-x^2}{E[(H_{1/3}, T_Z]_i, \beta_j, V_K}\right\}$$

The probability of occurrence of heading angle is assumed to be uniformly distributed between 0 and 2π. The probability of occurrence of sea state depends on the wave statistics of the navigation area of ship and at present the unrestricted service area is taken as the sea state of North Atlantic. After the navigation area of ship and probability level are determined, the maximum value of corresponding wave load characteristic may be obtained according to the above formula. Such value means the maximum wave load likely to occur once on average during the service period with number of cycles n.

2.3 Equivalent design wave method

2.3.1 General principle

For the structural strength assessment of ships and offshore engineering, the combination of load components is a complicated issue. The actual irregular wave is transformed to an equivalent regular wave by the equivalent design wave method, assuming that the maximum value of combined loads occurs when one of the variable loads reaches the maximum value during the service period and corresponding transient values are used for other variable loads. The method is also referred to as dynamic load method. The selected wave load components which have a deciding effect on structural strength generally include ship motion and acceleration, wave bending moment, torsional moment and shear force, sea pressure etc.

2.3.2 Determination of relevant parameters

The main steps of determination of parameters of equivalent design wave are as follows, see Figure 2-2 :

a) selection of target loads to carry out hydrodynamic analysis and calculate the response function of target loads under different headings and frequencies;

b) determination of predominant load and its probability level, carrying out spectrum analysis to solve the long-term distribution value of predominant load under the probability level;

c) determination of heading, frequency and phase of equivalent design wave in accordance with long-term statistics and response function, calculation of design wave height;

d) calculation of relevant load components of equivalent design wave in accordance with its heading, frequency, phase and wave height;
e) application of relevant loads of the equivalent design wave for structural analysis.

3 WAVE LOAD CALCULATION AND APPLICATION BASED ON EQUIVALENT DESIGN WAVE METHOD

3.1 Basic assumption and provision

3.1.1 *General*

This part specifies the basic assumption, basic calculation steps, calculation model requirements and calculation software requirements. Relevant calculation is to comply with the provisions of sub-sections.

3.1.2 *Relevant assumption*

The wave load calculation based on equivalent design wave method is based on the following assumptions:

a) based on the three-dimensional linear potential flow theory;
b) based on the wave environment of North Atlantic, and the wave scatter diagram and short-term and long-term prediction of wave loads are based on IACS Rec.34;
c) the two parameter P-M spectrum recommended by IACS Rec.34 is used as the wave spectrum;
d) the heading step is 30 deg. and the probability of occurrence of all headings are equal;
e) the calculation frequency is 0.2 rad/s to 1.2 rad/s and the frequency interval is 0.05 rad/s;
f) cos2is used as the energy transfer function of wave;
g) the strength assessment is based on 10-8 probability level and the speed is taken as 5 knots;
h) the fatigue assessment is based on 10-2 probability level and the speed is taken as 75% of the service speed.

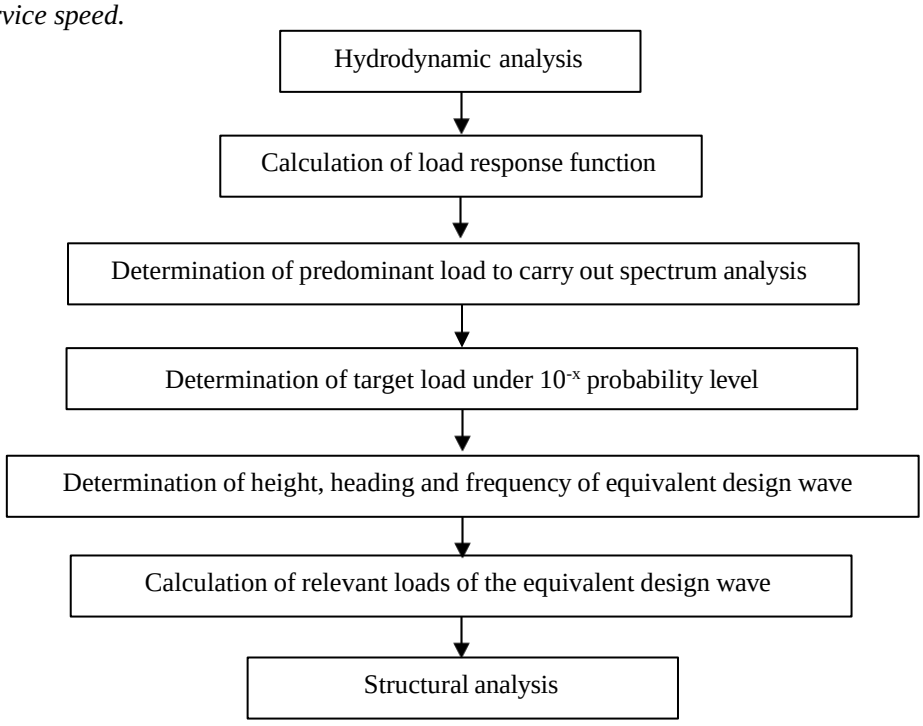

Figure 2-2 Flow Chart of Wave Load Calculation by Equivalent Design Wave Method

3.1.3 *Calculation steps*

The main steps of calculation of wave loads based on equivalent design wave method are as follows :

a) selection of loading pattern, establishment of hydrodynamic model and mass distribution model;
b) calculation of wave load response function of each heading;
c) selection of wave environment for long-term prediction of target wave load, in order to obtain the limit value and phase of relevant target load;

d) determination of parameters such as wave height, heading, frequency and phase of equivalent design wave;

e) calculation of hull girder loads, acceleration in way of ship's center of gravity and distribution of sea pressure of relevant equivalent design wave, calculation of internal pressure in accordance with position of compartment and loaded cargo.

3.1.4 ***Requirements for calculation model***

The calculation model of wave loads based on equivalent design wave method is to comply with the following requirements :

a) the mass model is to be fine enough in order to ensure that the error between mass of model and that of real ship is not greater than 0.1% and the error between position of center of gravity of model and that of real ship is not greater than 0.1%L;

b) the model of wetted surface is to simulate the shape of real ship in so far as practicable, the error between displacement of model and that of real ship is not greater than 0.1% and the error between position of center of buoyancy of model and that of real ship is not greater than 0.1%L;

c) the number of meshes of the wetted surface model is to be sufficient and the mesh length is generally not to be greater than0.01L.

3.1.5 ***Requirements for calculation software***

The calculation software of wave loads based on equivalent design wave method is to be based on the three-dimensional linear potential flow theory and approved by ISC.

3.2 Loading conditions

3.2.1 ***General requirements***

For the loading conditions for structural strength assessment, see relevant provisions of Section 8, Chapter 4 of PART 9-1.

For the loading conditions for fatigue strength assessment, see relevant provisions of Section 8, Chapter 4 of PART 9-1. Unless there is more accurate data, the time scale factor of corresponding loading condition is given in Section 1, Chapter 9 of PART 9-1.

3.2.2 ***Loading conditions to be considered in the strength assessment***

Loading conditions to be considered in the strength assessment prescriptive method

(1) The following loading conditions are to be considered for oil tankers:

- *a) homogeneous full load (departure);*
- *b) normal ballast condition (arrival);*
- *c) emergency ballast condition (arrival);*
- *d) other potential critical loading conditions in the loading manual.*

(2) The following loading conditions are to be considered for bulk carriers :

- *a) homogeneous heavy cargo full load (departure);*
- *b) homogeneous light cargo full load (departure);*
- *c) alternate heavy cargo full load (departure);*
- *d) alternate light cargo full load (departure);*
- *e) heavy ballast condition (arrival);*
- *f) normal ballast condition (arrival);*
- *g) other potential critical full load in the loading manual.*

Loading conditions to be considered in FE method

(1) The following loading conditions are to be considered for oil tankers fitted with one longitudinal bulkhead:

- *a) optional loading condition of 0.9 T_{SC};*
- *b) partial loading condition of 0.60 T_{SC};*
- *c) emergency ballast condition of $T_{BAL\text{-}EM}$.*

(2) The following loading conditions are to be considered for oil tankers fitted with two longitudinal bulkheads:

- *a) optional loading condition of 0.9 T_{SC};*
- *b) partial loading condition of 0.65 T_{SC};*
- *c) partial loading condition of 0.60 T_{SC};*

d) emergency ballast condition of T_{BAL-EM}.

(3) The following loading conditions are to be considered for bulk carriers:

a) homogeneous light cargo, homogeneous heavy cargo, alternate heavy cargo, alternate light cargo of T_{SC};

b) partial loading condition of $0.67T_{SC}$;

c) partial loading condition of $0.75T_{SC}$;

d) partial loading condition of $0.83T_{SC}$;

e) heavy ballast condition of T_{BAL-H}.

3.2.3 ***Loading conditions to be considered in the fatigue assessment***

Loading conditions to be considered for bulk carriers include:

a) homogeneous light cargo full load (departure);

b) homogeneous heavy cargo full load (departure);

c) heavy ballast condition (arrival);

d) normal ballast condition (arrival).

The following loading conditions are to be considered for oil tankers:

a) homogeneous full load (departure);

b) normal ballast condition (arrival).

3.3 Equivalent design wave

3.3.1 ***Introduction***

The equivalent design wave to be calculated is to represent the dynamic load cases corresponding to the most critical condition of relevant structures, mainly including the minimum and maximum of vertical bending moment of head sea and following sea amidships, the minimum and maximum of L/4 torsional moment, the minimum and maximum of pressure at waterline, the minimum and maximum of roll, the minimum and maximum of vertical acceleration of head sea and oblique sea, etc.

- *HSM load cases :*
  HSM-1 and HSM-2: Head sea EDWs that minimise and maximise the vertical wave bending moment amidships respectively.
- *HSA load cases:*
  HSA-1 and HSA-2: Head sea EDWs that maximise and minimise the head sea vertical acceleration at FP respectively.
- *FSM load cases :*
  FSM-1 and FSM-2: Following sea EDWs that minimise and maximise the vertical wave bending moment amidships respectively.
- *BSR load cases :*
  BSR-1P and BSR-2P: Beam sea EDWs that minimise and maximise the roll motion downward and upward on the port side respectively with waves from the port side.
  BSR-1S and BSR-2S: Beam Sea EDWs that maximise and minimise the roll motion downward and upward on the starboard side respectively with waves from the starboard side.
- *BSP load cases :*
  BSP-1P and BSP-2P: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the port side respectively.
  BSP-1S and BSP-2S: Beam sea EDWs that maximise and minimise the hydrodynamic pressure at the waterline amidships on the starboard side respectively.
- *OST load cases :*
  OST-1P and OST-2P: Oblique sea EDWs that minimise and maximise the torsional moment at 0.25Lfrom the AE with waves from the port side respectively.
  OST-1S and OST-2S: Oblique sea EDWs that maximise and minimise the torsional moment at 0.25Lfrom the AE with waves from the starboard side respectively.
- *OSA load cases :*
  OSA-1P and OSA-2P: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the port side respectively.
  OSA-1S and OSA-2S: Oblique sea EDWs that maximise and minimise the pitch acceleration with waves from the starboard side respectively.

3.3.2 *Application of equivalent design wave*

The equivalent design waves to be considered for strength assessment include 7 categories, i.e. HSM, HAS, FSM, BSR, BSP, OST and OSA.

The equivalent design waves to be considered for fatigue assessment include 5 categories, i.e. HSM, FSM, BSR, BSP and OST.

3.4 Load calculation

3.4.1 *Motion and acceleration*

The roll angle θ and pitch angle φ of hull are calculated in accordance with the following formulae:

$\theta = f_{ps}\mathrm{Re}(\eta_4)$, $\varphi = f_{ps}\mathrm{Re}(\eta_5)$

The acceleration response function of any point of hull is determined from the following formulae :

$a_X = -g\sin(\varphi)+a_{surge} + (z-z_G)\bullet a_{pitch} - (y-y_G)\bullet a_{yaw}$

$a_Y = g\sin(\theta)+a_{sway} + (x-x_G)\bullet a_{yaw} - (z-z_G)\bullet a_{roll}$

$a_z = a_{heave}+(y-y_G)\bullet a_{roll} - (x-x_G)\bullet a_{pitch}$

Where,η_i (i=1,6) denotes ship motions displacements relative to the ship gravity center in six degrees of freedom, where η_{Re} is real part, η_{Im} is imaginary part,

$a_{surge}=f_{ps}\mathrm{Re}(\ddot{\eta}_1)$, $a_{sway}=f_{ps}\mathrm{Re}(\ddot{\eta}_2)$, $a_{heave}=f_{ps}\mathrm{Re}(\ddot{\eta}_3)$, $a_{roll}=f_{ps}\mathrm{Re}(\ddot{\eta}_4)$, $a_{pitch}=f_{ps}\mathrm{Re}(\ddot{\eta}_5)$,

$a_{yaw}=f_{ps}\mathrm{Re}(\ddot{\eta}_6)$

The relationship between speed $\dot{\eta}_i$ of six degrees of freedom and motion is as follows:

$$\dot{\eta}_i = i\omega_e \cdot (\eta_{i,\mathrm{Re}} + i\eta_{i,\mathrm{Im}}) = -\omega_e\eta_{i,\mathrm{Im}} + i\omega_e\eta_{i,\mathrm{Re}}, \quad \mathrm{Re}(\eta_i) = -\omega_e\dot{\eta}_{i,\mathrm{Im}}$$

The relationship between acceleration $\ddot{\eta}_1$ of six degrees of freedom and motion is as follows:

$$\ddot{\eta}_i = -\omega_e^2 \cdot (\eta_{i,\mathrm{Re}} + i\eta_{i,\mathrm{Im}}) = -\omega_e^2\eta_{i,\mathrm{Re}} - \omega_e^2\eta_{i,\mathrm{Im}}, \quad \mathrm{Re}(\eta_i) = -\omega_e^2\ddot{\eta}_{i,\mathrm{Re}}$$

where : ω_e is encounter frequency.

3.4.2 *Hull girder loads*

3.4.2.1 Hull girder still water loads

The hull girder vertical still water bending moment and vertical shear force are to taken as the permissible still water bending moment and permissible still water shear force.

3.4.2.2 Hull girder vertical wave bending moment

The hull girder vertical wave bending moment under equivalent design wave specified by each loading condition is calculated in accordance with the following formula :

$M_{WV}=f_S f_{ps} f_\beta f_m f_{nl} M_{WV,MID,MAX}$

where:

$M_{WV,MID,MAX}$ *is taken as the maximum of vertical wave bending moment between 0.4L and 0.6L in corresponding condition.*

f_m *: Distribution factor of vertical wave bending moment along ship length, as shown in Figure 3-1.*

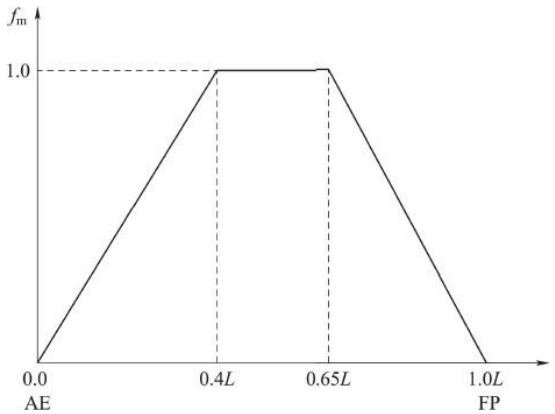

Figure 3-1 Distribution Factor f_m along the Ship's Length

The envelope of hull girder vertical wave bending moment is to be taken as the envelope of wave bending moment of all conditions.

3.4.2.3 Calculation of hull girder vertical wave shear force

For a given loading condition, the wave shear force at any section under any equivalent design wave is to be taken as:

$$Q_{WV} = f_{ps} f_{\beta} f_q f_{lp} Q_{WV,MAX}$$

where:

f_q *: distribution factor of vertical wave shear force, to be taken as* $f_{q\text{-}pos}$ *if it is greater than or equal to zero, see Figure 3-2 and* $f_{q\text{-}neg}$ *if it is less than zero, see Figure 3-3;*

f_{lp}*: coefficient for symbol of vertical wave shear force,* f_{lp} *=1.0 for hogging and* $x/L<0.5$*, or sagging and* $x/L \geqslant 0.5$*, otherwise* f_{lp} *=-1.0;*

$Q_{WV,MAX}$*: to be taken as* $MAX\left[\frac{MAX\left|Q_{WV,CAL,A,i}\right|}{0.92}, \frac{MAX\left|Q_{WV,CAL,F,i}\right|}{1.0}\right]$*, where* $Q_{WV,CAL,A,i}$ *is calculation value of wave shear force of each section when* $x/L<0.5$ *and* $Q_{WV,CAL,F,i}$ *is calculation value of wave shear force of each section when* $x/L \geqslant 0.5$*.*

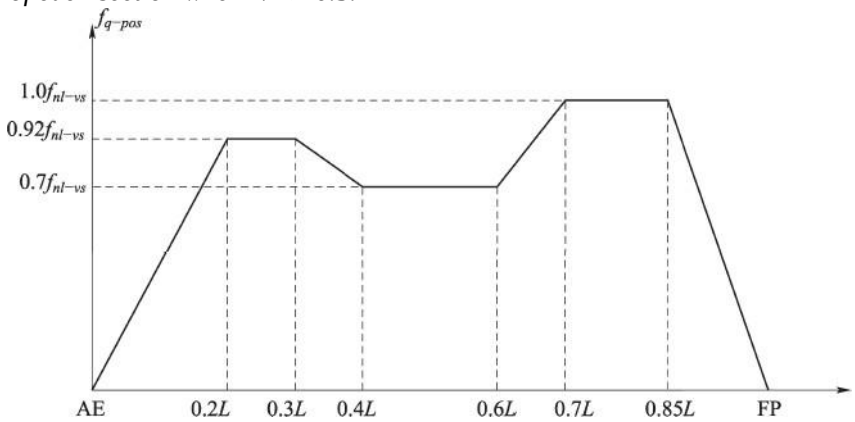

Figure 3-2 Distribution Factor $f_{q\text{-}pos}$ along the Ship's Length

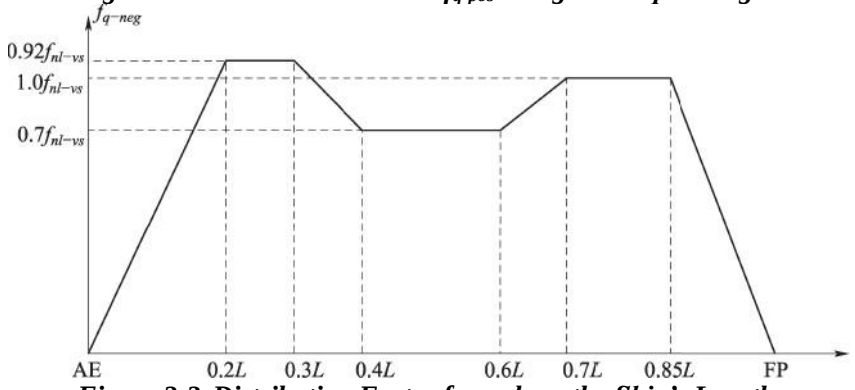

Figure 3-3 Distribution Factor $f_{q\text{-}neg}$ along the Ship's Length

3.4.2.4 Hull girder horizontal wave bending moment

The hull girder horizontal wave bending moment under equivalent design wave specified by each loading condition is calculated in accordance with the following formula :

$$M_{WH} = f_S f_{ps} f_b f_m f_{nlh} M_{WH,MID,MAX}$$

where:

f_{nlh}*: Coefficient considering nonlinear effect to be taken as:*

f_{nlh} *= 0.9* *for strength assessment*

f_{nlh} *= 1.0* *for fatigue assessment*

$M_{WH,MID,MAX}$ *is the maximum of horizontal wave bending moment between 0.4L and 0.6Lunder the equivalent design wave.*

3.4.2.5 Hull girder wave torsional moment

The hull girder torsional moment is considered for only OST and OSA cases for each loading condition and is to be taken as the fitted value of 20 calculation points uniformly distributed along the ship's length. The value between any two calculation points is obtained by linear interpolation, taking into account the correction of f_β *.*

$M_{WT} = f_{ps} f \ M_{WT,\,CAL}$

3.4.3 *Sea pressure*

3.4.3.1 Hydrostatic pressure

The hydrostatic pressure is calculated in accordance with the following formula, but not to be less than zero :

$P_{es}=\rho g(T_{LC} - z)$

3.4.3.2 Hydrodynamic pressure

The wave dynamic pressure of any point of section under equivalent design wave specified by each loading condition is to be taken as the linear fitted value of pressure of three points of bottom centre line point, bilge calculation point and water line point, but is not to be less than - $\rho g(T_{LC} - z)$ *below the water line and not less than zero above the water line, i.e. :*

$P_{ed} = f_{ps} f_{nl-p} [P_{ctr} + \frac{y}{y_{bilge}} (P_{bilge} - P_{ctr})]$, *between bottom centre line point and bilge calculation point;*

$P_{ed} = f_{ps} f_{nl-p} [P_{bilge} + \frac{z - z_{bilge}}{T_{LC} - z_{bilge}} (P_{WL} - P_{bilge})]$, *between bilge calculation point an water line point;*

$P_{ed} = f_{ps}\, f_{nl\text{-}p}\, [P_{WL}\text{-}10(z\text{-}T_{LC})]$, *above the water line, for strength assessment.*

$P_{ed} = f_{ps}\, f_{nl\text{-}p} [P_{WL}\text{-}5(z\text{-}T_{LC})]$, *above the water line, for fatigue assessment.*

Where,

y_{bilge} *and* z_{bilge} *: the coordinate Y and Z of the bilge calculation point as referring to the figure 3-4.*

$f_{nl\text{-}p}$ *:Coefficient considering nonlinear effects applied to hydrodynamic pressure. For strength assessment, see the definition in Part 9-1, Ch 4, Sec 5. For fatigue assessment, it is taken as 1.0.*

The pressure of three points of bottom centerline point, bilge calculation point and water line point is to be taken as the fitted value of 20 calculation points uniformly distributed along the ship's length. The interpolation function between any two section is to be taken as the cubic function determined by four calculation points nearby.

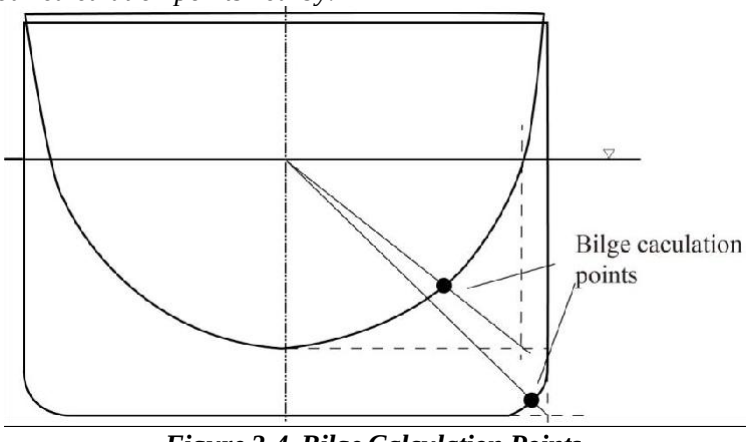

Figure 3-4 Bilge Calculation Points

3.4.3.3 Total sea pressure

The total sea pressure is calculated in accordance with the following formula, but not to be less than zero:

$P_{ex} = P_{es} + P_{ed}$

3.4.4 *Pressure in tanks*

3.4.4.1 Liquid pressure in tanks

The static liquid pressure in tanks P_{ls} is calculated in accordance with 1.2, Section 6, Chapter 4 of PART 9-1.
The dynamic liquid pressure in tanks P_{ld} is calculated in accordance with 1.3, Section 6, Chapter 4 of PART 9-1, where the acceleration of center of gravity of compartment a_X, a_Y and a_Z are taken as the results calculated in accordance with 3.4.1 of this Appendix.

3.4.4.2 Dry bulk cargo pressure in tanks
The calculation formulae of dry bulk cargo static pressure P_{bs}, dynamic pressure P_{bd}, static shear load $P_{bs\text{-}s}$ and dynamic shear loads $P_{bs\text{-}d}$, $P_{bs\text{-}dx}$, $P_{bs\text{-}dy}$ are given in 2, Section 6, Chapter 4 of PART 9-1, where the acceleration of center of gravity of compartment a_X, a_Y and a_Z are taken as the results calculated in accordance with 3.4.1 of this Appendix.

3.4.4.3 Total internal pressure
The total internal pressure P_{in} is to be taken as the sum of static and dynamic pressure of liquids or dry bulk cargoes in tanks, but not to be less than zero.

3.5.2 ***Application of relevant loads in prescriptive methods***

3.5.2.1 Hull girder strength

The still water bending moment and shear force for hull girder strength assessment are to use relevant permissible values.

The envelope of vertical wave bending moment and shear force for hull girder strength assessment is taken as the value calculated in accordance with 3.4.2.2 and 3.4.2.3 of this Appendix.

3.5.2.2 Yielding and buckling strength

The design load sets for assessment of yielding and buckling strength are given in Table 1, Section 2, Chapter 6 of PART 9-1, and relevant loads are given in this Appendix.

3.5.2.3 Fatigue strength of longitudinals

The assessment of fatigue strength of longitudinals is given in Section 4, Chapter 9 of PART 9-1, and relevant loads are given in this Appendix.

3.5.3 ***Application of relevant loads in FE methods***

3.5.3.1 Strength assessment

Loading conditions and dynamic load cases for FE strength assessment are given in 1 to 4, Section 8, Chapter 4 of PART 9-1, and relevant loads are given in this Appendix.

3.5.3.2 Fatigue assessment

Loading conditions and dynamic load cases for FE fatigue assessment are given in 5, Section 8, Chapter 4 of PART 9-1, and relevant loads are given in this Appendix.

ISC Appendix B SUPPLEMENTARY REQUIREMENTS FOR DIRECT CALCULATION LOAD CONDITIONS

1 GENERAL

1.1 General requirements

1.1.1

Direct calculation of load conditions for special structural arrangement in compliance with the requirements of 2.5.1 of Section 8, Chapter 4 of PART 9-1 is to be carried out according to the requirements of this Appendix.

1.1.2

This Appendix specifies the general principles for determining the direct calculation load conditions for the above mentioned special structural arrangement and direct calculation conditions for specific structural arrangement.

1.1.3

The structural FE model and boundary conditions, calculation and applying of loads, loads adjustment, calculation criteria included in this Appendix are to comply with the requirements for direct calculation in Chapter 7 of PART 9-1.

1.2 Application

1.2.1

This Appendix is applicable to double or single hull bulk carriers and oil tankers with one or two longitudinal bulkhead in compliance with the requirements of PART 9-1.

1.2.2

The direct calculation load conditions as specified in this Appendix are only applicable to structural strength assessment.

1.3 Symbols and definitions

1.3.1

The parameters and symbols used in this Appendix are those defined in Chapter 4 of PART 9-1.

2 GENERAL PRINCIPLES

2.1 General requirements

2.1.1

The types and density of dry bulk cargo, density of cargo oil, density of ballast water and fuel oil are to comply with the requirements of Chapter 4 of PART 9-1.

2.1.2

Typical loading patterns (departure, arrival, harbour, partially filled ballast tanks) are to comply with the requirements of Section 8, Chapter 4 of PART 9-1.

2.1.3

The loading condition and draught are to comply with the requirements of Section 8, Chapter 4 of PART 9-1 and the worst loading pattern is to be selected as the case to be checked according to the actual situation specified in the loading manual.

2.2 Principles for selection of loading condition

2.2.1

Oil tankers are to comply with the requirements for design loading condition as specified in Section 8, Chapter 4 of PART 9-1, including:

(1) heavy ballast condition where all ballast tanks may be full, partially full or empty, 100% filling of fore peak water ballast tanks;

(2) other seagoing conditions in loading manual where these differ significantly from the ballast conditions;

(3) any specified non-uniform distribution of loading.

2.2.2

Bulk carriers are to comply with the requirements for design loading condition as specified in Section 8, Chapter 4 of PART 9-1, including:

(1) homogeneous light and heavy cargo loading conditions
(2) alternate loading conditions;
(3) multiport loading conditions, where applicable;
(4) alt-block loading conditions, where applicable;
(5) load case where heavy ballast conditions of designated heavy ballast hold or normal ballast condition in case of no heavy ballast hold, including ballasting of fore peak tank.

2.2.3 Special structural arrangement loading conditions

(1) Loading pattern

In general, cargo tanks and dry bulk cargo holds in cargo tank/hold region are to comply with the requirements for typical structural arrangement as specified in PART 9-1. Where the arrangement of cargo hold or double hull mid hold (ballast tank or fuel oil tank) is inconsistent with the typical structure as specified in PART 9-1, the loading pattern is to be defined according to the requirements of Section4,Chapter 8 of PART 9-1 and the actual location of cargo hold or double hull mid hold.

(2) Draught

Draught of oil tanker in loading conditions is to comply with the requirements of Section 8, Chapter 4 of PART 9-1. For tankers with two oil-tight longitudinal bulkheads, where the cargo tank length is less than 0.15 L or tankers with one centreline oil-tight longitudinal bulkhead, where the cargo tank length is less than 0.11L. The load case draught is to be taken the draught as required by the Rules or the actual draught in loading manual. Generally, the draught which imposes more severe effect to the structural strength is to be selected.

Draught of bulk carriers in loading conditions is to comply with the requirements of Section 8, Chapter 4 of PART 9-1.

(3) Target location for hull girder shear force adjustment

The cargo hold region selected for direct calculation model is to be arranged with 3 cargo holds and 4 transverse bulkheads. The shear force is to be adjusted at target bulkhead in alternate loading conditions included in load cases in case of special structural arrangement.

3 TYPICAL ADDITIONAL LOADING CONDITIONS

3.1 Oil tankers

3.1.1

There are in general various forms of arrangement for the slop tank in the aftmost region of cargo tank in oil tankers. In addition to the general arrangement as given in Section 8, Chapter 4 of PART 9-1, typical arrangements for slop tank of oil tankers are shown in Figure 3.1.1(1) and Figure 3.1.1(2).

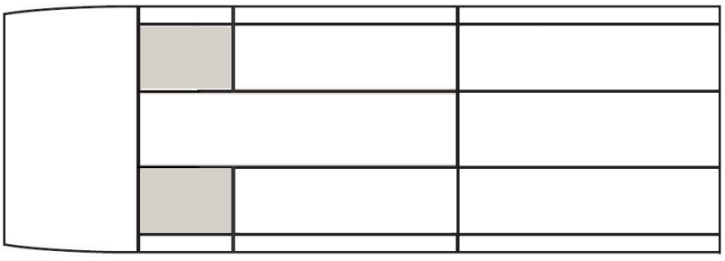

Figure 3.1.1(1) Typical arrangement for slop tank-1

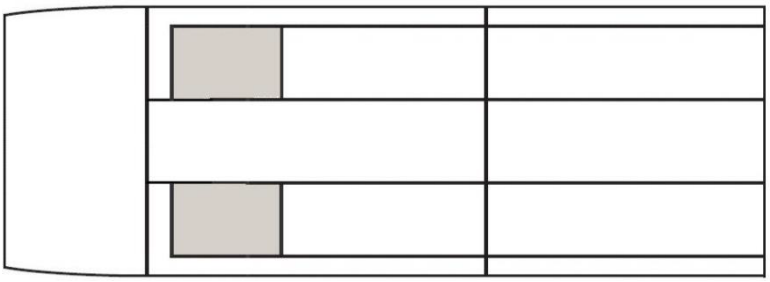

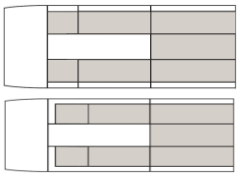

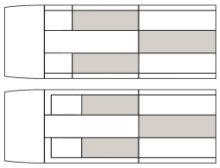

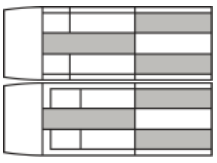

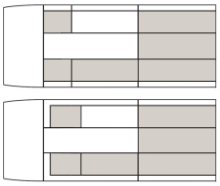

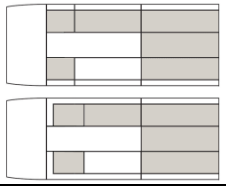

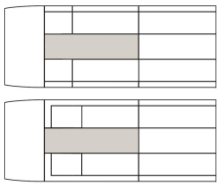

Figure 3.1.1(2) Typical arrangement for slop tank-2

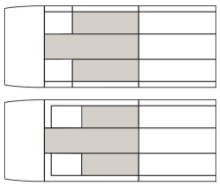

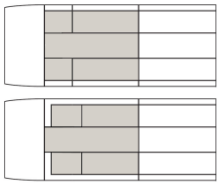

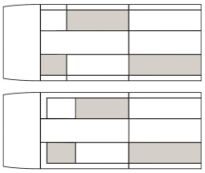

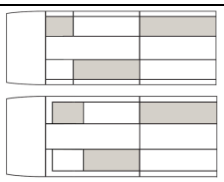

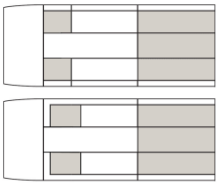

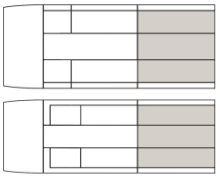

3.1.2

The load cases for the above mentioned arrangement for slop tank are shown in Table 3.1.2.

Load Cases ***Table 3.1.2***

Notes:

(1) 100% filling of fuel and water ballast tanks in engine room, with tank boundaries at the forward engine room bulkhead.

(2) "All LC" means: all the dynamic load cases as defined in Ch 4, Sec 2 for both sagging and hogging and both P and S.

(3) The required adjustment in shear force at aft bulkhead of the considered hold is to be done at forward slop tank bulkhead.

(4) The required adjustment in shear force at aft bulkhead of the considered hold is to be done at forward

machinery space bulkhead.

(5) The shear force and bending moment that results from the application of local loads are to be used for non-hull girder adjustment conditions.

(6) The shear force is to be adjusted to target value at forward machinery bulkhead.

(7) The shear force is to be adjusted to target value at forward bulkhead of the mid-hold.

(8) Group1 LC means: all Head sea LC in sagging, all Following sea LC in sagging, all Beam Sea LC and all Oblique Sea load cases.

(9) Group2 LC means: all Head sea LC in hogging, all Following sea LC in hogging, all Beam Sea LC and all Oblique Sea load cases.

3.1.3

In addition to the above mentioned typical tank arrangement, the general principles for determining the target location of shear force adjustment are as follows in cases there are other special arrangement for cargo tank, slop tank and ballast tank in the aftmost region of oil tanker.

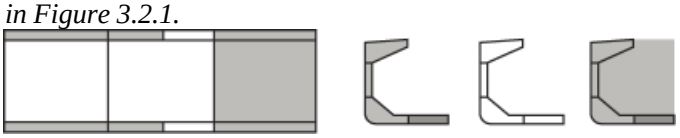
(1) in general, the forward machinery bulkhead is to be taken as the reference location;

(2) where alternate loading condition is taken for slop tank an adjacent cargo tank, forward bulkhead of slop tank is to be taken as the reference location.

3.2 Bulk carriers

3.2.1

Special arrangement for the double hull tanks (fuel oil tank, ballast tank, empty tank) of bulk carriers are shown in Figure 3.2.1.



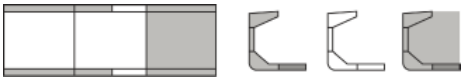


Figure 3.2.1 Special arrangement for bulk carriers

3.2.2

For special arrangement as shown in Figure 3.2.1, load cases are to be supplemented according to Table 3.2.2 for heavy ballast condition in addition to the load cases as required in Section 8 of Chapter 4.

Additional load cases in heavy ballast conditions ***Table 3.2.2***

No.	*Description*	*Loading pattern Aft Mid Fore*	*Draught*	*% of perm. SWBM*	*% of perm. SWSF*	*Dynamic load case*
Seagoing conditions						
1	*Deepest Ballast (4.2.1 of Section 8, Chapter 4 of PART 9-1)*		*THB*	*100% (hogging)*	*100%(1)*	*FSM-2 BSR-1P, BSR-1S OST-2P, OST-2S*
				100% (sagging)	*100%(1)*	*BSP-1P, BSP-1S BSR-1P, BSR-1S, OST-1P, OST-1S*

Note:

(1) The shear force is to be adjusted to target value at watertight transverse bulkhead of double hull ballast tank of the mid-hold.

ISC Appendix C ASSESSMENT OF ULTIMATE STRENGTH OF HULL GIRDERS USING NON-LINEAR FEM

1 GENERAL

1.1 Application

1.1.1

The non-linear finite element method for assessment of the ultimate strength of hull girders, as provided in this Appendix, is applicable to the assessment of the ultimate strength of intact hull girders and damaged hull girders after collision/grounding.

1.1.2

For the hull girder FE models in this Appendix, the relevant non-linear effects given in paragraph 3.1.1, Appendix 2, Chapter 5 of PART 9-1 of the Rules are to be taken into account.

2 SINGLE SPAN FE MODEL

2.1 Application

2.1.1

The longitudinal extent of the single span FE model is one span of transverse web frames, its transverse extent is the entire breadth of the ship and its vertical extent is the entire moulded depth.

2.1.2

The FE model is to cover all longitudinal continuous members and the stiffeners having an influence on local buckling.

2.1.3

The FE model is to take into account manholes and lightening holes in hull structures.

2.1.4

The FE model is to use net scantlings, i.e. the as-built scantlings deducted by half the corrosion addition. For corrosion addition, see Section 3, Chapter 3 of PART 9-1 of the Rules.

2.1.5

For the stress-strain curve of hull structural materials, a bilinear model is to be used taking into account the strain-hardening effects.

2.2 Finite element types and meshing

2.2.1

4-nodes shell elements are to be used for plates, stiffeners and primary supporting members, and beam elements may also be used for stiffener flanges and for web stiffeners of primary supporting members.

2.2.2

The mesh size of the FE model is to be such that local buckling deformations and stress redistribution after localized plastic collapse of structural members (including plating, stiffeners, primary supporting members, etc.) is sufficiently presented. Meshes are to be square as far as possible.

2.3 Initial geometric imperfections

2.3.1

For all longitudinal members of the FE model, the initial geometric imperfections, which may lead to the most critical failure of hull girders, are to be considered.

2.3.2

For the mode of initial geometric imperfections, the overall deformations of stiffened plates between web frames, local deformation of plating and sideways initial deformations of stiffeners

are to be considered.

2.3.3
For the amplitude of initial geometric imperfections, deformations from welding or assembly are to be taken into account.

2.4 Boundary conditions and loading
2.4.1
An independent point is to be established at the intersection of neutral axis of cross sections of fore and aft ends of the model respectively.

2.4.2
The two independent points are to be related to the nodes on fore end and aft end of the model respectively, and simply supported restraints are to be applied to the independent points.

2.4.3
An equal hogging/sagging bending moment (or rotation angle) is to be applied to the two independent points and the bending moment (or rotation angle) is to be increased gradually.

2.4.4
When the bending moment-curvature curve reaches its extreme value point and the hogging or sagging failure of the model is evident, the bending moment at this point is the ultimate load-carrying capacity of hull girders.

2.5 Damages due to collision and grounding
2.5.1
For assumptions regarding damage extents, see paragraph 2.2, Section 3, Chapter 5 of PART 9-1.

2.6 Checking criteria
2.6.1
When single span FE model is used to check the ultimate strength and residual strength of hull girders, the partial safety factors of the checking criteria need to be specially considered.

3 CARGO HOLD FE MODEL
3.1 General
3.1.1
The longitudinal extent of a cargo hold FE model is the length of one cargo compartment, its transverse extent is the entire breadth of the ship and its vertical extent is the entire moulded depth, taking into account the effects of lateral loads (including both internal and external loads).

3.1.2
The cargo hold FE model is to cover all transverse members other than transverse bulkheads, upper and lower stools.

3.1.3
Other requirements for the cargo hold FE model are given in paragraphs 2.1.3 to 2.1.6.

3.2 Finite element types and meshing
3.2.1
The requirements for meshing of the cargo hold FE model are given in paragraph 2.2.

3.3 Initial geometric imperfections
3.3.1
The requirements for initial geometric imperfections of the cargo hold FE model are given in paragraph 2.3.

3.4 Lateral loads

3.4.1
The lateral loads in both full load and ballast conditions are to be considered. For bulk carriers, the lateral loads in alternate loading conditions are also to be considered, if applicable.

3.5 Boundary conditions and loading
3.5.1
The boundary conditions for the cargo hold FE model are given in paragraphs 2.4.1and 2.4.2.

3.5.2
The lateral loads specified in paragraph 3.4.1 are to be applied to the FE model.

3.5.3
An equal hogging/sagging bending moment (or rotation angle)is to be applied to the two independent points and the bending moment (or rotation angle) is to be increased gradually.

3.5.4
When the bending moment-curvature curve reaches its extreme value point and the hogging or sagging failure of the model is evident, the bending moment at this point is the ultimate load-carrying capacity of hull girders.

3.6 Damages due to collision and grounding
3.6.1
For assumptions regarding vertical and transverse damage extents, see paragraph 2.2, Section 3, Chapter 5 of PART 9-1, and special consideration is to be given to the longitudinal damage extent.

3.7 Checking criteria
3.7.1
When the cargo hold FE model is used to check the ultimate strength and residual strength of hull girders, the partial safety factors of the checking criteria need to be specially considered.

ISC Appendix D RECOMMENDATION FOR ASSESSING DESIGN INSTANCES BASED ON APPLICATION OF ALTERNATIVE METHODS IN THE HULL STRUCTURAL DESIGN OF CSR SHIPS

1 GENERAL

1.1

This Appendix is applied to this PART of ISC Rules for Classification of Sea-going Steel Ship and gives recommendations for assessing alternative (novel) design instance and alternative (novel) design method (technology).

2 SCOPE

2.1

The scope of this Appendix is to provide guidance for the assessment of alternative (novel) design instances and designs in compliance with requirements of this PART of ISC Rules for Classification of Sea-going Steel Ship, based on the application of alternative (novel) design method (technology) or alternative design and calculation methods within the context of Goal Based Standards and this PART of ISC Rules for Classification of Sea-going Steel Ship.

3 DEFINITIONS

3.1 Alternative (novel) design instance

An alternative or a novel design instance is defined via ISC Rules for Classification of Sea-going Steel Ship, Part 9-1 Ch 1 Sec 3 [6.2.1] i.e. ship design of unusual form, proportions, speed and structural arrangements outside those specified in Part 9-1 Ch 1, Sec 2, [3.2].

Design instances covered by additional class notations or additional class requirements (e.g. strengthening for operation in ice) are not considered alternative or novel design instances.

For ships not complying with ISC Rules for Classification of Sea-going Steel Ship, Part 9-1 Ch1 Sec 2 [3.2], Part 9-1 Ch1 Sec 2 [ISC 3.2.1a] and ISC Appendix A of Part 9-1 are to be applied.

3.2 Alternative (novel) design method (technology)

An alternative design method or alternative design technology is a method or technology applied in the design process that has no/limited documented track record for application in this field. This means that there is no documentation that can be arranged by the designers to prove with confidence that the outcome or result of the method (or technology) e.g. scantlings of hull structural elements or fatigue assessment of structural details, will be equivalent to a design based on the requirements of this Part of ISC Rules for Classification of Sea-going Steel Ship.

4 APPLICATION

4.1

The scantlings determined by the prescriptive requirements are not to be reduced by any form of alternative calculations such as FE analysis, unless explicitly stated. (ISC Rules for Classification of Sea-going Steel Ship, Part 9-1 Ch 1 Sec 2 [5.5.4])

4.2

Where indicated in specific sections of the Rules, alternative calculation methods to those shown in the Rules may be accepted provided it is demonstrated that the scantling and arrangements are of at least equivalent strength to those derived using the Rules.

5 EQUIVALENCE PRINCIPLE

5.1

For the application of alternative methods in the design, the main principle is to get sufficient evidence, and verify such evidence, that the resulting alternative design instance is equivalent (i.e. has at least the same structural safety level) to a design instance compliant to this Part.

6 ASSESSMENT OF ALTERNATIVE(NOVEL) DESIGN INSTANCES

6.1 General

The handling of alternative(novel) design instances should follow as far as practicable the

procedures given in ISC Circular No.498 " The Notice on the approval of IMO MSC.1/Circ.1455"[(1)].
Deviations from this PART of ISC Rules for Classification of Sea-going Steel Ship and/or other requirements that are proven to be in compliance with IMO Goal Based Standards may have impact on the compliance of the design with SOLAS Reg II-1/3-10. Therefore, a flag Administration need to consider the statutory approval of an alternative (novel) design instance in this case.

6.2 Role of the Classification Society
ISC reviews the delivered documentation; states further requirements for documentation if necessary, can request verification of achieved results and eventually grants approval.
This means that ISC is to assess whether the design has been sufficiently examined and whether any risks have been reduced acceptably and to evaluate the adequacy of the delivered information and the assumptions made. ISC is to make the final decision for applying ISC Circular No.498 to approve equivalency to this Part of ISC Rules for Classification of Sea-going Steel Ship of the alternative (novel) design instance, and the final responsibility of class approval for the design instance rests with ISC.
The task and role of ISC is to verify that - based on submitted information from the designer / shipyard - the design instance is in compliance with this Part of ISC Rules for Classification of Sea-going Steel Ship or its structural safety level is at least equivalent to that ensured by the requirements given in this Part of ISC Rules for Classification of Sea-going Steel Ship.

7 DESCRIPTION OF ALTERNATIVE DESIGN AND CALCULATION METHODS USED IN THE HULL STRUCTURAL DESIGN

7.1 General
Alternative design and calculation methods may be applied to the extent specified in this Part of ISC Rules for Classification of Sea-going Steel Ship for:
(1) Improvement of the design process
(2) Optimization of the hull structure (weight of the structure, improvements in fabrication, etc.)
This Part allows explicitly the application of alternative design and calculation methods in the following paragraphs:

Procedure for alternative design or calculation methods ***Table 1***

Rule reference	*Details*	*Alternative design / calculation method*	*Detail procedure in this Part*
Pt 9-1, Ch 5, Appendix 2	*Hull girder ultimate capacity*	*Direct non-linear finite element analysis*	*Yes, Part 9-1, ISC Appendix C*
Pt 9-1, Ch 6, Sec 6, [2.2.2]	*Primary supporting members within cargo region for bulk carrier less than 150 m*	*FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-1, Ch 9, Sec 1, [4.5]	*Fatigue design standards for alternative design*	*FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-1, Ch 9, Sec 4, [5.3]	*Stress concentration factors for alternative design*	*FEA (Finite Element Analysis)*	*Yes, detail FEA procedure in [5.3.1]*
Pt 9-1, Ch 9, Sec 6, [2.2]	*Equivalent design of stiffener-frame connections*	*FEA (Finite Element Analysis)*	*Yes, detail FEA procedure in [2.2]*

[1] *Note (1): ISC Circular No.498 is the transformation of the International Maritime Organization "the Guidelines for the approval of alternatives and equivalents as provided for in various IMO instruments" (refer to IMO MSC.1/Circ.1455).*

Rule reference	*Details*	*Alternative design / calculation method*	*Detail procedure in this Part*
Pt 9-1, Ch 10, Sec 1, [2.3.3]	*The spacing of web frames and stringers iwo side shell*	*FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-1, Ch 10, Sec 3, [2.1.4]	*The spacing and arrangement requirements*	*FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-1, Ch 11, Sec 1, [3.2.5]	*Arrangements of deck girders and transverses*	*Grillage or FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-2, Ch 1, Sec 4, [4.1.2]	*Primary supporting members in cargo hold structures, subjected to lateral pressure for ships having a length L less than 150 m*	*Grillage or FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*
Pt 9-2, Ch 2, Sec 3, [1.5.4]	*Deck transverses fitted above the upper deck*	*FEA (Finite Element Analysis)*	*Yes, FEA procedure of this Rules can be applied.*

The application of alternative design and calculation methods should result in a design instance compliant with this Part of ISC Rules for Classification of Sea-going Steel Ship.
ISC should assess the resulting design instance with respect to compliance with the rules. Assessment of the alternative design and calculation method used for the design is not necessary.
The requirements in Section 6 and Section 8 of this Appendix should be followed only in case the application of alternative design method results in alternative (novel) design instance.

8 DUCUMENTATION

8.1

Documentation provided with an application for alternative (novel) design method (technology) used in the hull structural design as equivalency should identify the detail of the methods that have been undertaken, the equivalent safety level and the sufficient supporting information to validate assessments as well as the resulting scantlings, materials, etc.

8.2

In case of a ship where alternative methods are applied and an equivalency for the alternative (novel) design instance is considered by ISC, this should be noted in the relevant structural drawings and/or appropriate approval documents as required by ISC's procedures. The documentation on the application of alternative methods should be included in the Ship Construction Files (SCF) in accordance with the requirement in ISC Rules for Classification of Sea-going Steel Ships Part 1, Chapter 4, Appendix 1, Annex 2, [3.1.1], (3)[(2)].

[2] *Note (2): The requirement is incorporation of IACS Unified Requirement (UR) Z23.*

Chapter 1 BULK CARRIERS

Section 1 GENERAL ARRANGEMENT DESIGN

1 FORECASTLE

1.1 General

1.1.1

An enclosed forecastle is to be fitted on the freeboard deck.

The aft bulkhead of the enclosed forecastle is to be fitted in way or aft of the forward bulkhead of the foremost hold, as shown in Figure 1.However, if this requirement hinders hatch cover operation, the aft bulkhead of forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7% of ship length for freeboard as specified in Pt 1, Ch 1, Sec 4, [3.1.2] abaft the fore side of stem.

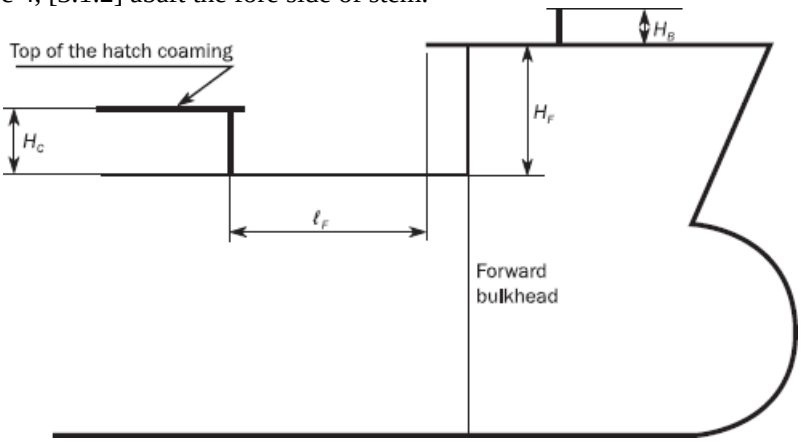

Figure 1 Forecastle arrangement

1.1.2

The forecastle height, *HF* above the main deck is not to be less than the greater of the following values:

- The standard height of a superstructure as specified in Pt 1, Ch 1, Sec 4, [3.3].
- H_C + 0.5 m, where H_C is the height of the forward transverse hatch coaming of the foremost cargo hold, i.e. cargo hold No. 1.

1.1.3

All points of the aft edge of the forecastle deck are to be located at a distance less than or equal to l_F, taken as:

$$l_F = 5\sqrt{H_F - H_C}$$

from the hatch coaming plate.

1.1.4

A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centreline is not less than H_B / tan 20°forward of the aft edge of the forecastle deck, where H_B is the height of the breakwater above the forecastle, see Figure 1.

2 ACCESS ARRANGEMENTS

2.1 Special arrangements for bulk carriers

2.1.1

Where a duct keel or pipe tunnel is fitted, provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other.

The aft access may lead from the engine room to the duct keel. Where an aft access is provided from the engine room to the duct keel, the access opening to the duct keel is to be provided with

watertight hatch cover, cover plate or door.
Ventilation may be aided by the use of mechanical means as required.

2.1.2
Where a watertight door is fitted for access to the duct keel, the scantlings of the watertight door are to comply with the requirements of the individual Society.

Section 2 STRUCTURAL DESIGN PRINCIPLES

SYMBOLS
For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

1 APPLICATION

1.1

1.1.1

This section applies to structures in all parts of bulk carriers, in addition to requirements given in Pt 1, Ch 3, Sec 6.

2 CORROSION PROTECTION

2.1 General

2.1.1 Void double side skin spaces

Void double side skin spaces are to have a corrosion protective system fitted in accordance with [2.2].

2.1.2 Cargo holds and ballast holds

Cargo holds and ballast holds are to have a corrosion protective system fitted in accordance with [2.3].

2.2 Protection of void double side skin spaces

2.2.1

Void double side skin spaces in the cargo area for ships having a freeboard length L_{LL} of not less than 150 m are to have an efficient corrosion prevention system, such as hard protective coatings or equivalent.

2.3 Protection of cargo hold spaces

2.3.1 Coating

It is the responsibility of the builder and of the owner to choose coatings suitable for the intended cargoes, in particular for the compatibility with the cargo.

2.3.2 Application

All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of cargo holds (side and transverse bulkheads), excluding the inner bottom area and part of the hopper tank sloping plate and lower stool sloping plate, are to have an efficient protective coating, of an epoxy type or equivalent, applied in accordance with the manufacturer's recommendation.
The side and transverse bulkhead areas to be coated are specified in [2.3.3] and [2.3.4] respectively.

2.3.3 Side areas to be coated

The areas to be coated are the internal surfaces of:

- The inner side plating.
- The internal surfaces of the topside tank sloping plates.
- The internal surfaces of the hopper tank sloping plates for a distance of 300 mm below the frame end bracket for holds of single side skin construction, or below the hopper tank upper end for holds of double side skin construction.

These areas are shown in Figure 1.

2.3.4 Transverse bulkhead areas to be coated

The areas of transverse bulkheads to be coated are all the areas located above an horizontal level located at a distance of 300 mm below the frame end bracket for holds of single side skin construction or below the hopper tank upper end for holds of double side skin construction.

3 STRUCTURAL DETAIL PRINCIPLES

3.1 Double bottom structure

3.1.1 Application

In addition to the requirements provided in Pt 1, Ch 2, Sec 3, [2], the requirements of this sub-article are applicable to the following ships:

- All bulk carriers with freeboard length L_{LL} less than 150 m,
- Bulk carriers having a freeboard length L_{LL} of 150 m or above, with one or more cargo holds arranged for carriage of water ballast.

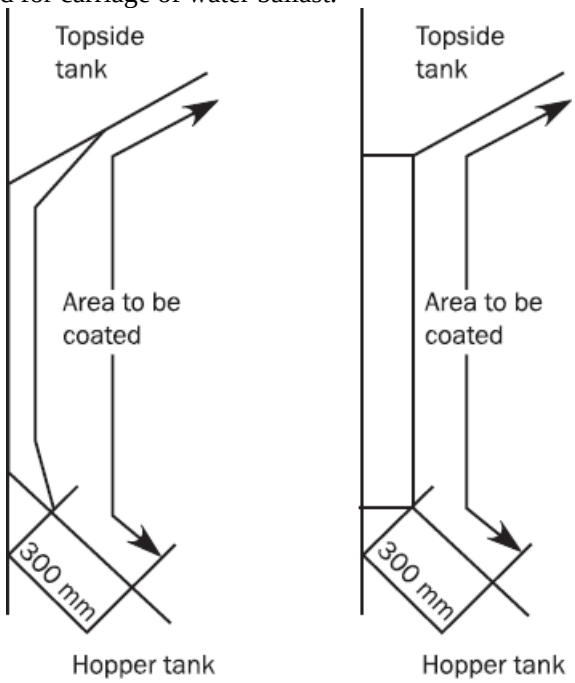

Figure 1 Side areas to be coated

3.1.2 Double bottom height

Height of double bottom in cargo area, d_{DB}, in m, measured from keel line at mid-length of each cargo hold is not to be less than:

$$d_{DB} = 32B + 190\sqrt{T_{SC}}$$

A lower double bottom height may be accepted, provided all of the following requirements are satisfied:

- The spacing of adjacent girders is not to be greater than 4.6 m or 5 times the spacing of bottom or inner bottom stiffeners, whichever is the smaller.
- The spacing of floors is not to be greater than 3.5 m or 4 times the side frame spacing, whichever is the smaller. Where side frames are not transverse, the nominal frame spacing as specified by the designer is to be used.

3.1.3 Girder spacing

The spacing of adjacent girders is generally not to be greater than 4.6 m or 5 times the spacing of bottom or inner bottom stiffeners, whichever is the smaller.

3.1.4 Floor spacing

The spacing of floors is generally not to be greater than 3.5 m or 4 times the side frame spacing, whichever is the smaller. Where side frames are not transverse, the nominal frame spacing as specified by the designer is to be used.

3.2 Single side structure

3.2.1 Application

This article applies to the single side structure with transverse framing of single side bulk carrier. If single side structure is supported by transverse or longitudinal primary supporting members, the requirements in Pt 1, Ch 3, Sec 6, [8] apply to these primary supporting members as regarded to ones in double side skin.

3.2.2 General arrangement

Side frames are to be arranged at every frame space.

If air pipes are passing through the cargo hold, they are to be protected by appropriate measures to avoid a mechanical damage.

3.2.3 Side frames

Frames are to be built-up symmetrical sections with integral upper and lower brackets and are to be arranged with soft toes.

The side frame flange is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature is not to be less than r, in mm, given by:

$$r = \frac{0.4 b_f^2}{t_f + t_c}$$

where:

t_c : Corrosion addition, in mm, specified in Pt 1, Ch 3, Sec 3.

b_f, t_f : Flange width and net thickness of the curved flange, in mm. The end of the flange is to be sniped.

In ships less than 190 m in length, mild steel frames may be asymmetric and fitted with separate brackets. The face plate or flange of the bracket is to be sniped at both ends. Brackets are to be arranged with soft toes.

The dimensions of side frames are defined in Figure 2.

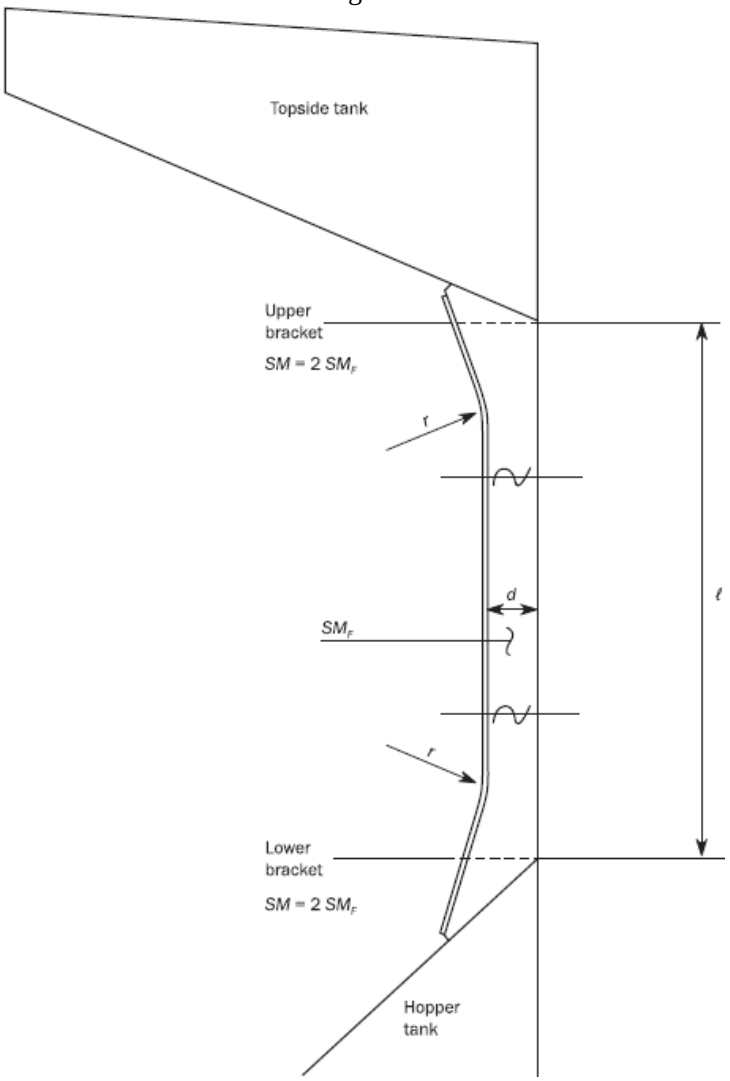

Figure 2 Dimensions of side frames

3.2.4 Upper and lower brackets

The face plates or flange of the brackets is to be sniped at both ends. Brackets are to be arranged with soft toes. The as-built thickness of the brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.
The dimensions (in particular the height and length) of the lower brackets and upper brackets are not to be less than those shown in Figure 3.

3.2.5 Tripping brackets

In way of the foremost hold and in the holds of BC-A ships, side frames of asymmetrical section are to be fitted with tripping brackets at every two frames, as shown in Figure 4.
The as-built thickness of the tripping brackets is not to be less than the as-built thickness of the side frame webs to which they are connected.
Double continuous welding is to be adopted for the connections of tripping brackets with side shell frames and plating.

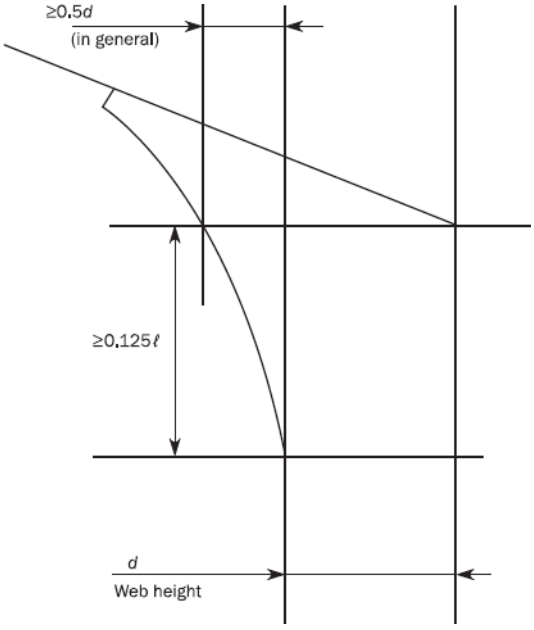

Figure 3 Dimensions of lower and upper bracket

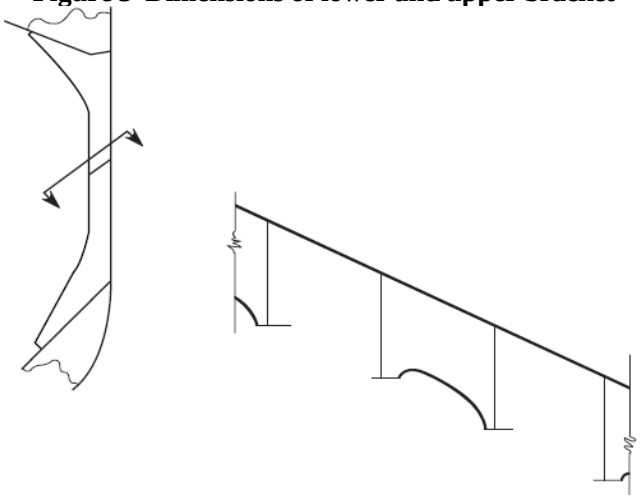

Figure 4 Tripping brackets to be fitted in way of foremost hold

3.2.6 Support structure

Structural continuity with the lower and upper end connections of side frames is to be ensured within hopper and topside tanks by connecting brackets as shown in Figure 5.

3.3 Deck structures

3.3.1 Web frame spacing in topside tanks

For bulk carriers with freeboard length L_{LL} less than 150 m, the spacing of web frames in topside

tanks is generally not to be greater than 6 frame spaces.

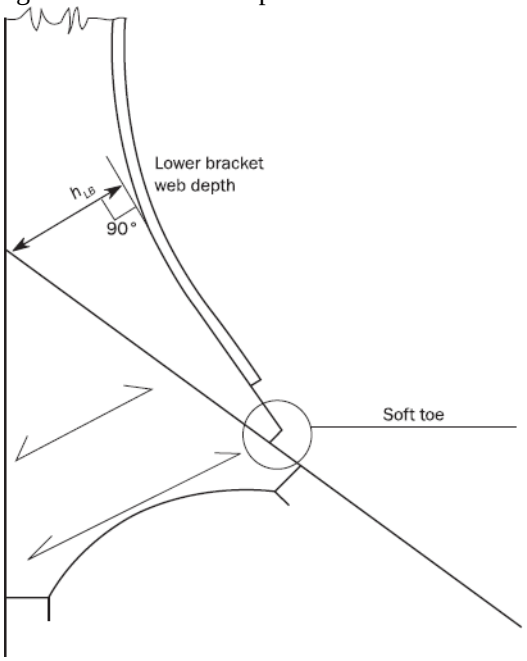

Figure 5 Example of support structure for lower end

3.3.2 Cross deck between hatches of bulk carriers

Inside the line of openings, where a transversely framed structure is adopted for the cross deck structures, hatch end beams and cross deck beams are to be adequately supported by girders and extended outward to the second longitudinal from the hatch side girders towards the deck side. Where the extension of girders outward is impracticable, intercostal stiffeners are to be fitted between the hatch side girder and the second longitudinal and checks of the structure are to be performed in compliance with the requirements in Pt 1, Ch 7 or by means deemed appropriate by the Society.

The transverse primary members supporting the cross deck are to be supported by side or topside tank primary supporting members.

Smooth connection of the strength deck at side with the transversely framed cross deck is to be ensured by a plate of intermediate thickness.

ISC 3.3.2a The structural strength is to be checked in compliance with the requirements in Chapter 7 of PART9-1.

3.3.3 Topside tank structures

The topside tank sloping plates are to be longitudinally framed.

Topside tank structures, where fitted, are to extend as far as possible within the machinery space and are to be adequately tapered.

Where a double side primary supporting member is fitted outside the plane of the topside tank web frame, special attention is to be paid to structural continuity.

3.3.4 Openings in strength deck - Corner of hatchways

a) Within the cargo hold region

For cargo hatchways located within the cargo hold region, insert plates, the thicknesses of which are to be determined according to the formula given after, are to be fitted in way of corners where the plating cut-out has a circular profile.

The radius of circular corners is not to be less than 5% of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming.

Corner radius, in the case of the arrangement of two or more hatchways athwartship, is considered by the Society on a case-by-case basis.

For hatchways located within the cargo hold region, insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile

and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

- 1/20 of the hatchway width or 600 mm, whichever is the lesser, in the transverse direction.
- Twice the transverse dimension, in the fore and aft direction.

Where insert plates are required, their net thickness is to be obtained, in mm, from the following formula:

$t_{INS} = (0.8+0.4l/b)t_{off}$

without being taken less than t_{off} or greater than 1.6 t_{off}.

where:

l : Width, in m, in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction, see Pt 1, Ch 3, Sec 6, Figure 15.

b: Width, in m, of the hatchway considered, measured in the transverse direction, see Pt 1, Ch 3, Sec 6, Figure 15.

t_{off} : Offered net thickness, in mm, of the deck at the side of the hatchways.

For the extreme corners of end hatchways, insert plates are required. The net thickness of these insert plates is to be 60% greater than the net offered thickness of the adjacent deck plating. A lower thickness may be accepted by the Society on the basis of calculations showing that stresses at hatch corners are lower than permissible values.

Where insert plates are required, the arrangement is shown in Pt 1, Ch 9, Sec 6, Table 15, in which d_1, d_2, d_3 and d_4 are to be greater than the stiffener spacing.

For ships having a freeboard length L_{LL} of 150 m or above, the corner radius, the thickness and the extent of insert plate may be determined by the results of a direct strength assessment according to Pt 1, Ch 7, including buckling check and fatigue strength assessment of hatch corners according to Pt 1, Ch 8 and Pt 1, Ch 9 respectively. For such type of ships it is recommended to arrange circular hatch corners.

b) Outside the cargo hold region
For hatchways located outside the cargo hold region, a reduction in the thickness of the insert plates in way of corners may be considered by the Society on a case-by-case basis.

ISC 3.3.4a Where two or more hatchways are arranged athwartships, the corner radius is not to be less than 5% of the total width of these hatchways.

3.3.5 Protection against wire rope

Wire rope grooving in way of cargo holds openings is to be prevented by fitting suitable protection such as half- round bar on the hatch side girders (i.e. upper portion of topside tank plates) or hatch end beams in cargo hold and upper portion of hatch coamings.

3.3.6 Protection of cargo hatch opening corners against mechanical damage

Specific measures are to be arranged to prevent the hatch opening corners from mechanical damage incurred by coming into direct contact with the vertical grab wire under normal operations.

Section 3 HULL LOCAL SCANTLINGS

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

C_{XG}, C_{YS}, C_{YR}, C_{YG}, C_{ZP}, C_{ZR} : Load combination factors, as defined in Pt 1, Ch 4, Sec 2.

d_{shr} : Effective shear depth of the stiffener as defined in Pt 1, Ch 3, Sec 7, [1.4.3].

F_R : Resultant force, in kN, as defined in Pt 1, Ch 4, Sec 6, Table 7.

$F_{sc\text{-}ib\text{-}s}$: Static load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.3.1].

$F_{sc\text{-}ib}$: Total load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.2.1].

$F_{sc\text{-}hs\text{-}s}$: Static load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.3.2].

$F_{sc\text{-}hs}$: Total load, in kN, as defined in Pt 1, Ch 4, Sec 6, [4.2.2].

l : Distance, in m, as defined in Pt 1, Ch 4, Sec 6.

l_p : Distance, in m, as defined in Pt 1, Ch 4, Sec 6.

l_{bdg} :Effective bending span, in m, as defined in Ch 3, Sec 7, [1.1.2].

l_{SF} : Side frame span l , in m, as defined in Ch 1, Sec 2, Figure 2, not to be taken less than 0.25 D.

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2] and calculated at the load calculation point defined in Pt 1, Ch 3, Sec 7, [3.2].

P_R : Resultant pressure, in kN/m^2, as defined in Pt 1, Ch 4, Sec 6, Table 7.

s_{cw} : Plate width, in mm, taken as the width of the corrugation flange $b_{f\text{-}cg}$ or the web $b_{w\text{-}cg}$, whichever is greater,see Pt 1, Ch 3, Sec 6, Figure 21.

s_{cg} : Half pitch, in mm, of the corrugation flange as defined in Pt 1, Ch 3, Sec 6, Figure 21.

1 CARGO HOLD SIDE FRAMES OF SINGLE SIDE BULK CARRIERS

1.1 Strength criteria

1.1.1 Net section modulus and net shear sectional area

The net section modulus Z, in cm^3, and the net shear sectional area A_{shr}, in cm^2, in the mid-span area of side frames subjected to lateral pressure are not to be taken less than:

$$Z = 1.125\alpha_m \frac{PSl_{SF}^2}{f_{bdg}C_sR_{eH}}$$

$$A_{shr} = 5.0\alpha_S \frac{PSl_{SF}}{C_t\tau_{eH}}\left(\frac{l_{SF}-2l_B}{l_{SF}}\right)10^{-3}$$

where:

α_m : Coefficient taken as:

α_m = 0.42 for BC-A ships.

α_m = 0.36 for other ships.

f_{bdg} : Bending coefficient taken as 10.

C_s : Permissible bending stress coefficient for the design load set being considered taken as:

C_s = 0.75 for acceptance criteria set AC-S.

C_s = 0.90 for acceptance criteria set AC-SD.

α_S : Coefficient taken as:

α_S = 1.1 for side frames of empty holds in alternate condition of BC-A ships.

α_S = 1.0 for other side frames.

l_B : Lower bracket length, in m, as defined in Figure 1.

P : Design pressures, in kN/m^2, for design load sets as defined in Pt 1, Ch 6, Sec 2, Table 1,

C_t : Permissible shear stress coefficient for the design load set being considered, taken as:

C_t = 0.75 for acceptance criteria set AC-S.

C_t = 0.90 for acceptance criteria set AC-SD.

1.1.2 Side frames in ballast holds

In addition to [1.1.1], for side frames in cargo holds designed to carry ballast water in heavy ballast condition, the net section modulus Z, in cm^3, and the net web thickness, t_w, in mm, all along the span are to be in accordance with Pt1, Ch 6, Sec 5 where the span of the side frame is l as defined in Pt 1, Ch 3, Sec 7, [1.1] with consideration to brackets at ends.

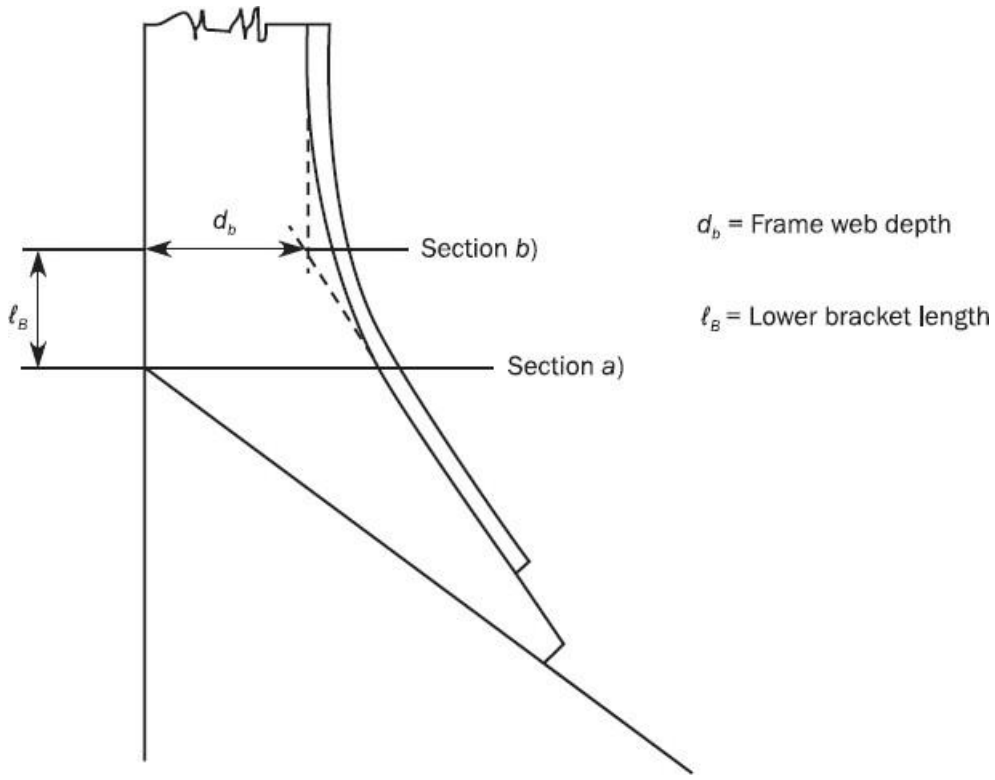

Figure 1 Side frame lower bracket length

1.1.3 Additional strength requirements

The net moment of inertia I, in cm^4, of the three side frames located immediately abaft the collision bulkhead is not to be taken less than:

$$I = 0.18\frac{Pl_{SF}^4}{n}$$

where:

n : Frame number of considered side frame counted from the collision bulkhead to the frame in question, taken equal to 1, 2 or 3.

As an alternative, supporting structures, such as horizontal stringers, are to be fitted between the collision bulkhead and a side frame which is in line with transverse webs fitted in both the topside tank and hopper tank, maintaining the continuity of the forepeak stringers within the foremost hold.

1.2 Lower bracket of side frame

1.2.1

At the level of the lower bracket as shown in Ch 1, Sec 2, Figure 2, the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is not to be taken less than twice the required net section modulus Z, in cm^3,for the frame mid-span area obtained from [1.1.1].

1.2.2

For holds intended to carry ballast water in heavy ballast condition, the net section modulus Z, in cm^3, at the level of the lower bracket is not to be taken less than twice the greater of the required net section moduli given in [1.1.1] and [1.1.2].

1.2.3

The net thickness t_{LB}, in mm, of the lower bracket is not to be taken less than:

$t_{LB} = t_w + 1.5$

where t_w is the net thickness of the side frame web, in mm.

1.2.4

The net thickness t_{LB} of the lower bracket is to comply with the following formula:

- For symmetrically flanged frames:
$$\frac{h_{LB}}{t_{LB}} \leq 87\sqrt{k}$$
- For asymmetrically flanged frames:
$$\frac{h_{LB}}{t_{LB}} \leq 73\sqrt{k}$$

The web depth h_{LB} of lower bracket is to be measured from the intersection between the hopper tank sloping plating and the side shell plate, perpendicularly to the face plate of the lower bracket as shown in Ch 1, Sec 2, Figure 5.

For the three side frames located immediately abaft the collision bulkhead, where the frames are strengthened in accordance with [1.1.3] and the offered t_{LB} is greater than 1.73 t_w, the t_{LB} applied in [1.2.4] may be taken as t'_{LB} given by:

$t'_{LB} = (t^2_{LB} t_W)^{1/3}$

where t_w is the net thickness of the side frame web, in mm, corresponding to A_{shr} determined in accordance to [1.1.1]

1.3 Upper bracket of side frame

1.3.1

At the level of the upper bracket as shown in Ch 1, Sec 2, Figure 2 the net section modulus of the frame and bracket, or integral bracket, with associated shell plating, is not to be taken less than twice the net section modulus Z required for the frame mid-span area obtained from [1.1.1].

1.3.2

For holds intended to carry ballast water in heavy ballast condition, the net section modulus Z, in cm^3, at the level of the upper bracket is not to be taken less than twice the greater of the required net sections modulus obtained from [1.1.1] and [1.1.2].

The net thickness t_{UB} of the upper bracket, in mm, is not to be less than the net thickness of the side frame web.

1.4 Provided support at upper and lower connections of side frames

1.4.1 Net section modulus

The net section modulus of the:

- Side shell and hopper tank longitudinals supporting the lower connecting brackets.
- Side shell and topside tank longitudinals supporting the upper connecting brackets.

is to comply with the following formula:

$$\sum_n Z_{pli} d_i \geq \alpha_T \frac{P l_{SF}^2 l_1^2}{16 R_{eH}}$$

where:

n : Number of the longitudinal stiffeners on the side shell and hopper/topside tank supporting the lower/upper end connecting bracket of the side frame, as applicable.

$Z_{pl\,i}$: Net plastic section modulus, in cm^3, of the i-th longitudinal stiffener on the side shell or hopper /topside tank supporting the lower/upper end connecting bracket of the side frame, as applicable.

d_i : Distance, in m, of the above i-th longitudinal stiffener from the intersection point of the side shell and hopper/topside tank.

l_1 : Spacing, in m, of transverse supporting webs in hopper/topside tank, as applicable.

R_{eH} : Lowest value of specified yield stress, in N/mm^2, among the materials of the longitudinal stiffeners of side shell and hopper/topside tanks that support the lower/upper end connecting bracket of the side frame.

α_T : Coefficient taken as:

α_T =150 for the longitudinal stiffeners supporting the lower connecting brackets.

α_T = 75 for the longitudinal stiffeners supporting the upper connecting brackets.

1.4.2 Net connection area of brackets

The net connection area of the lower or upper connecting bracket to the supporting longitudinal stiffener is to comply with the following formula:

$$\sum_i A_i d_i R_{eH,bkt-i} \geq 0.02 \alpha_T P s l_{SF}^2 10^{-3}$$

where:

A_i : The offered net connection area of the bracket connecting with the *i*-th longitudinal stiffener, in cm^2.

A_i , α_T : As defined in [1.4.1].

$R_{eH,bkt-i}$: The specified minimum yield stress of the bracket connecting with the *i*-th longitudinal stiffener, in N/mm^2.

s : The space of the side frame, in mm.

2 STRUCTURE LOADED BY STEEL COILS ON WOODEN DUNNAGE

2.1 General

2.1.1

The net thickness of inner bottom plating, hopper side plating and inner hull plating for ships intended to carry steel coils is to comply with [2.3.1] and [2.4.1] up to a height not less than the one corresponding to the top of upper tier in touch with hopper or inner hull plating.

The net section modulus and the net shear sectional area of longitudinal stiffeners on inner bottom, hopper tank top and inner hull for ships intended to carry steel coils are to comply with [2.3.2] and [2.4.2] up to a height not less than the one corresponding to the top of upper tier in touch with hopper or inner hull plating.

Standard terminology and means for securing of steel coils is described in Figure 2.

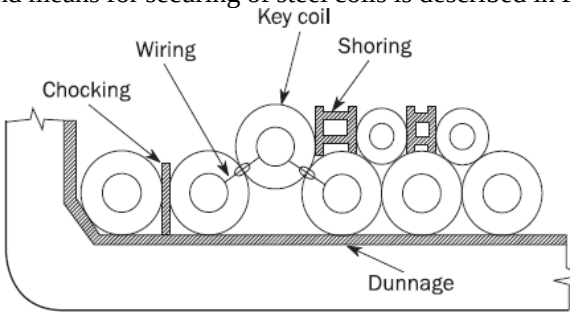

Figure 2 Inner bottom loaded by steel coils

2.2 Load application

2.2.1 Design load sets

The static and dynamic load components are to be determined in accordance with Pt 1, Ch 4, Sec 7, Table 1. Radius of gyration, k_r, and metacentric height, *GM*, are to be in accordance with Pt 1, Ch 4, Sec 3, Table 2 for the considered loading condition specified in the design load set. The design load sets for steel coil loading is given in Table 1.

Design load sets **Table 1**

Item	Design load set	Load component	Draught	Design load	Loading condition
Inner bottom, hopper sloping plate and inner hull	BC-9	$F_{sc\text{-}ib\text{-}s}$ or $F_{sc\text{-}hs\text{-}s}$	T_{SC}	S	Steel Coil condition
Inner bottom, hopper sloping plate and inner hull	BC-10	$F_{sc\text{-}ib}$ or $F_{sc\text{-}hs}$	T_{SC}	S+D	Steel Coil condition

2.3 Inner bottom

2.3.1 Inner bottom plating

The net thickness *t*, in mm, of plating of longitudinally framed inner bottom is not to be taken less than:

$$t = K_1 \sqrt{\frac{F_{sc-ib-s} \times 10^3}{C_a R_{eH}}}$$ for design load set BC-9

$$t = K_1\sqrt{\frac{F_{sc-ib}\times 10^3}{C_a R_{eH}}}$$ for design load set BC-10

where:

K_1 : Coefficient taken as:

$$K_1 = \sqrt{\frac{1.7\frac{s}{1000}lK_2 - 0.73(\frac{s}{1000})^2 K_2^2 - (l-l_{lp})^2}{2l_{lp}(2\frac{s}{1000}+2lK_2)}}$$

K_2 : Coefficient taken as:

$$K_2 = -\frac{s}{1000l} + \sqrt{(\frac{s}{1000l})^2 + 1.37(\frac{1000l}{s})^2(1-\frac{l_{lp}}{l})^2 + 2.33}$$

C_a : Permissible bending stress coefficient, as defined in Pt 1, Ch 6, Sec 4, [1.1.1].

2.3.2 Stiffeners of inner bottom plating

The net section modulus Z, in cm^3, and the net web thickness, t_w, in mm, of single span stiffeners located on inner bottom plating are not to be taken less than:

$$Z = K_3\frac{F_{sc-ib-s}}{8C_s R_{eH}}10^3 \text{ and } t_w = \frac{0.5F_{sc-ib-s}}{d_{shr}C_t\tau_{eH}}\times 10^3$$ for design load set BC-9.

$$Z = K_3\frac{F_{sc-ib}}{8C_s R_{eH}}10^3 \text{ and } t_w = \frac{0.5F_{sc-ib}}{d_{shr}C_t\tau_{eH}}\times 10^3$$ for design load set BC-10

where:

K_3 : Coefficient as defined in Table 2.

$K_3 = 2l_{bdg}/3$, when $n_2 > 10$.

C_s : Permissible bending stress coefficient, as defined in Pt 1, Ch 6, Sec 5, [1.1.2].

C_t: Permissible shear stress coefficient for the design load set being considered, to be taken as:

$C_t = 0.85$ for acceptance criteria set AC-S.

$C_t = 1.00$ for acceptance criteria set AC-SD.

n_2: Number of load points per EPP of the inner bottom, see Pt 1, Ch 4, Sec 6, [4.1.3].

Coefficient K_3 **Table 2**

n_2	1	2	3	4	5
K_3	l_{bdg}	$l_{bdg}-\frac{l_{lp}^2}{l_{bdg}}$	$l_{bdg}-\frac{2l_{lp}^2}{3l_{bdg}}$	$l_{bdg}-\frac{5l_{lp}^2}{9l_{bdg}}$	$l_{bdg}-\frac{l_{lp}^2}{2l_{bdg}}$

n_2	6	7	8	9	10
K_3	$l_{bdg}-\frac{7l_{lp}^2}{15l_{bdg}}$	$l_{bdg}-\frac{4l_{lp}^2}{9l_{bdg}}$	$l_{bdg}-\frac{3l_{lp}^2}{7l_{bdg}}$	$l_{bdg}-\frac{5l_{lp}^2}{12l_{bdg}}$	$l_{bdg}-\frac{11l_{lp}^2}{27l_{bdg}}$

2.4 Hopper tank and inner hull

2.4.1 Hopper sloping plating and inner hull plating

The net thickness t, in mm, of plating of longitudinally framed bilge hopper sloping plate and inner hull is not to be taken less than:

$$t = K_1\sqrt{\frac{F_{sc-hs-s}}{C_a R_{eH}}10^3}$$ applicable for design load set BC-9.

$$t = K_1\sqrt{\frac{F_{sc-hs}}{C_a R_{eH}}10^3}$$ applicable for design load set BC-10.

where:

K_1 : Coefficient as defined in [2.3.1].

C_a : As defined in [2.3.1].

2.4.2 Stiffeners of hopper sloping plating and inner hull plating

The net section modulus Z, in cm^3, and the net web thickness, t_w, in mm, of single span ordinary stiffeners located on bilge hopper sloping plate and inner hull plate are not to be taken less th

$$Z = K_3 \frac{F_{sc-hb-s}}{8C_s R_{eH}} 10^3 \text{ and } t_w = \frac{0.5F_{sc-hb-s}}{d_{shr} C_t \tau_{eH}} \times 10^3, \text{ applicable for design load set BC-9.}$$

$$Z = K_3 \frac{F_{sc-hb}}{8C_s R_{eH}} 10^3 \text{ and } t_w = \frac{0.5F_{sc-hb}}{d_{shr} C_t \tau_{eH}} \times 10^3, \text{ applicable for design load set BC-10.}$$

where:

K_3 : Coefficient as defined in Table 2.

$K_3 = 2l_{bdg}/3$, when $n_2 > 10$.

C_s, C_t : As defined in [2.3.2].

3 TRANSVERSE VERTICALLY CORRUGATED WATERTIGHT BULKHEADS SEPARATING CARGO HOLDS IN FLOODED CONDITION

3.1 Net thickness of corrugation

3.1.1 Cold formed corrugation

The net plate thickness t, in mm, of transverse vertically corrugated watertight bulkheads separating cargo holds is not to be taken less than:

$$t = 14.9 \cdot 10^{-3} s_{CW} \sqrt{\frac{1.05P_R}{R_{eH}}}$$

The net thicknesses is also to comply with the requirements given in Pt 1, Ch 6, Sec 4, [1.2.1].

3.1.2 Built-up corrugation

Where the thicknesses of the flange and web of built-up corrugations of transverse vertically corrugated watertight bulkheads separating cargo holds are different, the net plate thicknesses are not to be taken less than that obtained from the following formula.

The net thickness t_N, in mm, of the narrower plating is not to be taken less than:

$$t_N = 14.9 \cdot 10^{-3} s_N \sqrt{\frac{1.05P_R}{R_{eH}}}$$

s_N : Plate width, in mm, of the narrower plating.

The net thickness t_W, in mm, of the wider plating is not to be taken less than the greater of the following formulae:

$$t_W = 14.9 \cdot 10^{-3} s_{CW} \sqrt{\frac{1.05P_R}{R_{eH}}}$$

$$t_W = \sqrt{\frac{4.62 s_{CW}^2 P_R}{R_{eH} 10^4} - t_{NO}^2}$$

where:

t_{NO} : Net offered thickness of the narrower plating, in mm, not to be taken greater than:

$$t_{NO} = 14.9 \cdot 10^{-3} s_{CW} \sqrt{\frac{1.05P_R}{R_{eH}}}$$

The net thicknesses is also to comply with the requirements given in Pt 1, Ch 6, Sec 4, [1.2.2].

3.1.3 Lower part of corrugation

The net thickness of the lower part of corrugations is to be maintained for a distance of not less than $0.15l_C$ measured from the top of the lower stool, or from the inner bottom where no lower stool is fitted. The span of the corrugations l_C, in m, is to be taken as given in Pt 1, Ch 3, Sec 6, [10.4.5].

3.1.4 Middle part of corrugation

The net thickness of the middle part of corrugations is to be maintained for a distance not greater than 0.3 l_C from the bottom of the upper stool, or from the deck if no upper stool is fitted. The net thickness is also to com- ply with the requirements in [3.2.1] and Pt 1, Ch 6, Sec 4, [1.2].

3.2 Bending, shear and buckling check

3.2.1 Bending capacity and shear capacity

The bending capacity and the shear capacity of the corrugations of transverse watertight corrugated bulkheads separating cargo holds are to comply with the following formulae:

$$0.5W_{LE} + W_M \geq \frac{M}{0.95R_{eH}}10^3$$

where:

M : Bending moment in a corrugation, in kNm, taken as:

$$M = \frac{F_R l_C}{8}$$

F_R : Resultant force, in kN, given in Pt 1, Ch 4, Sec 6, [3.1.7].

l_C : Span of the corrugations, in m, as given in Pt 1, Ch 3, Sec 6, [10.4.5].

W_{LE} : Net section modulus, in cm3, of one half pitch corrugation, to be calculated at the lower end of the corrugations according to [3.3], not to be taken greater than:

$$W_{LE,M} = W_G + \frac{Qh_G 10^3 - 0.5h_G^2 s_C p_R}{R_{eH}}$$

W_G : Net section modulus, in cm^3, of one half pitch corrugation, to be calculated in way of the upper end of shedder or gusset plates, as applicable, according to [3.3].

Q : Shear force, in kN, at the lower end of a corrugation, to be taken as:
$Q = 0.8\, F_R$

h_G : Height, in m, of shedders or gusset plates, as applicable as shown in Figure 4 to Figure 6.

P_R : Resultant pressure, in kN/m^2, to be calculated in way of the middle of the shedders or gusset plates, as applicable, according to Pt 1, Ch 4, Sec 6, [3.1.7].

W_M : Net section modulus, in cm3, of one half pitch corrugation, to be calculated at the mid-span of corrugations according to [3.3] without being taken greater than 1.15 W_{LE}.

τ : Shear stress, in N/mm^2, in the corrugation to be taken as:

$$\tau = 10\frac{Q}{A_{shr}}$$

A_{shr} : Net shear area, in cm^2, of one half pitch corrugation. The calculated net shear area is to consider possible reduced shear efficiency due to non-straight angles between the corrugation webs and flanges. In general, the reduced shear area may be obtained by multiplying the web sectional area by $\sin\phi$.

ϕ : Angle between the web and the flange, see Pt 1, Ch 3, Sec 6, Figure 21.

The net section modulus of the corrugations in the upper part of the bulkhead, as defined in Figure 3, is not to be taken less than 75% of that of the middle part complying with this requirement and Pt 1, Ch 6, Sec 4, [1.2], corrected for different minimum yield stresses.

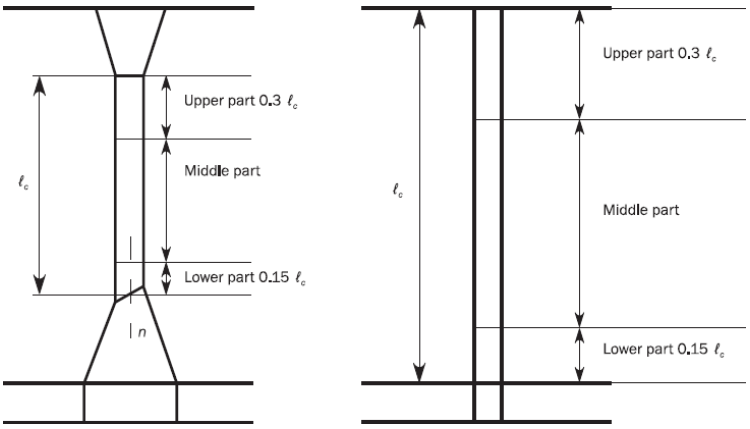

Figure 3 Parts of corrugation

3.2.2 Shear buckling check of the bulkhead corrugation webs

The shear stress τ , calculated according to [3.2.1], is to comply with the following formula:

$\tau \leq \tau_C$

where:

τ_C : Critical shear buckling stress, in N/mm^2, to be taken as:

$$\tau \leqslant \tau_C \text{ for } \tau_E \leq \frac{R_{eH}}{2\sqrt{3}}$$

$$\tau_c = \frac{R_{eH}}{\sqrt{3}}\left(1 - \frac{R_{eH}}{4\sqrt{3}\tau_E}\right) \text{ for } \tau_E > \frac{R_{eH}}{2\sqrt{3}}$$

τ_E : Euler shear buckling stress, in N/mm^2, to be taken as:

$$\tau_E = 0.9 k_t E \left(\frac{t_w}{b_{w-cg}}\right)^2$$

k_t : Coefficient, to be taken equal to 6.34.

t_w : Net thickness, in mm, of the corrugation webs.

b_{w-cg} : Width, in mm, of the corrugation webs as shown in Pt 1, Ch 3, Sec 6, Figure 21.

3.3 Net section modulus of the corrugations

3.3.1 Effective flange width

The net section modulus of the corrugations is to be calculated with the compression flange having an effective flange width b_{eff} not larger than the following formula:

$b_{eff} = C_E b_{f-cg}$

where:

C_E : Coefficient to be taken equal to:

$$C_E = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for } \beta > 1.25$$

$C_E = 1.0$ for $\beta \leq 1.25$

β : Coefficient to be taken equal to:

$$\beta = \frac{b_{f-cg}}{t_f}\sqrt{\frac{R_{eH}}{E}}$$

b_{f-cg} : Width, in mm, of the corrugation flange as shown in Pt 1, Ch 3, Sec 6, Figure 21.

t_f : Net flange thickness, in mm.

3.3.2 Webs not supported by local brackets

Unless welded to a sloping stool top plate as defined in [3.3.5], if the corrugation webs are not supported by local brackets below the stool top plate (or below the inner bottom) in the lower part, the section modulus of the corrugations is to be calculated considering the corrugation webs 30% effective.

3.3.3 Effective shedder plates

Provided that effective shedder plates are fitted as shown in Figure 4, when calculating the section modulus at the lower end of the corrugations (Sections '1' in Figure 4), the net area, in cm^2, of flange plates may be increased by I_{SH} to be taken as:

$I_{SH} = 2.5 \cdot 10^{-3} b_{f-cg} \sqrt{t_f t_{SH}}$ without being taken greater than $2.5 b_{f\text{-}cg}\, t_f\, 10^{-3}$

where:

$b_{f\text{-}cg}$: Width, in mm, of the corrugation flange as shown in Pt 1, Ch 3, Sec 6, Figure 21.

t_{SH} : Net shedder plate thickness, in mm.

t_f : Net flange thickness, in mm.

Effective shedder plates are those which:

- are not knuckled,
- are welded to the corrugations and the lower stool top plate according to Pt 1, Ch 12,
- are fitted with a minimum slope of 45°, their lower edge being in line with the lower stool side plating,
- have net thickness not less than 75% of the net required for the corrugation flanges,
- have material properties not less than those required for the flanges.

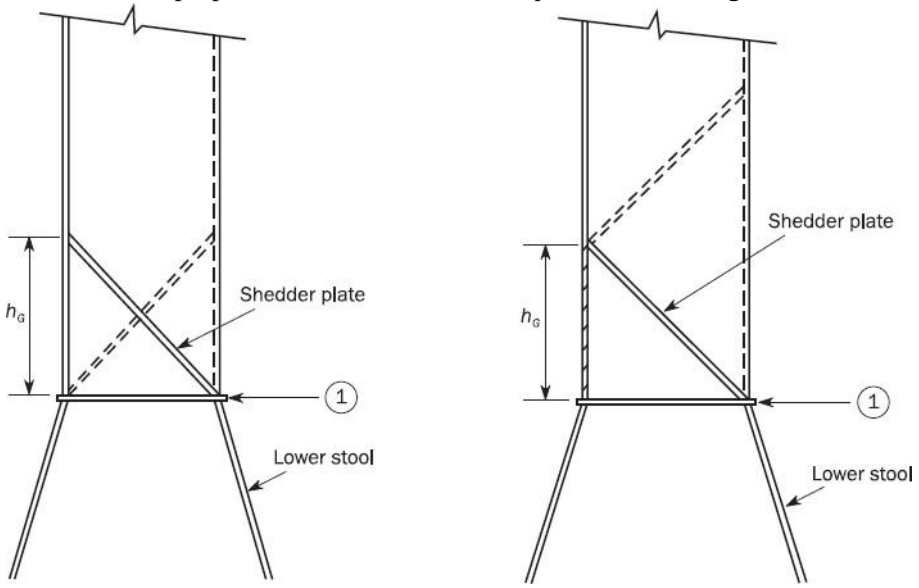

Figure 4 Symmetrical and unsymmetrical shedder plates

3.3.4 Effective gusset plates

Provided that effective gusset plates are fitted, when calculating the section modulus at the lower end of the corrugations (Sections '1' in Figure 5 and Figure 6), the net area, in cm^2, of flange plates may be increased by I_G to be taken as:

$I_G = 7\, h_G\, t_f$

h_G : Height, in m, of gusset plates as shown in Figure 5 and Figure 6 but not to be taken greater than:

$$\frac{10 S_{GU}}{7}$$

S_{GU} : Width, in m, of gusset plates.

t_f : Net flange thickness, in mm.

Effective gusset plates are those which:

- are in combination with shedder plates having thickness, material properties and welded connections as requested for shedder plates in [3.3.3],
- have a height not less than half of the flange width,
- are fitted in line with the lower stool side plating,
- are welded to the lower stool top plate, corrugations and shedder plates according to Pt1, Ch12, Sec 3, [2.4.6],
- have net thickness and material properties not less than those net required for the flanges.

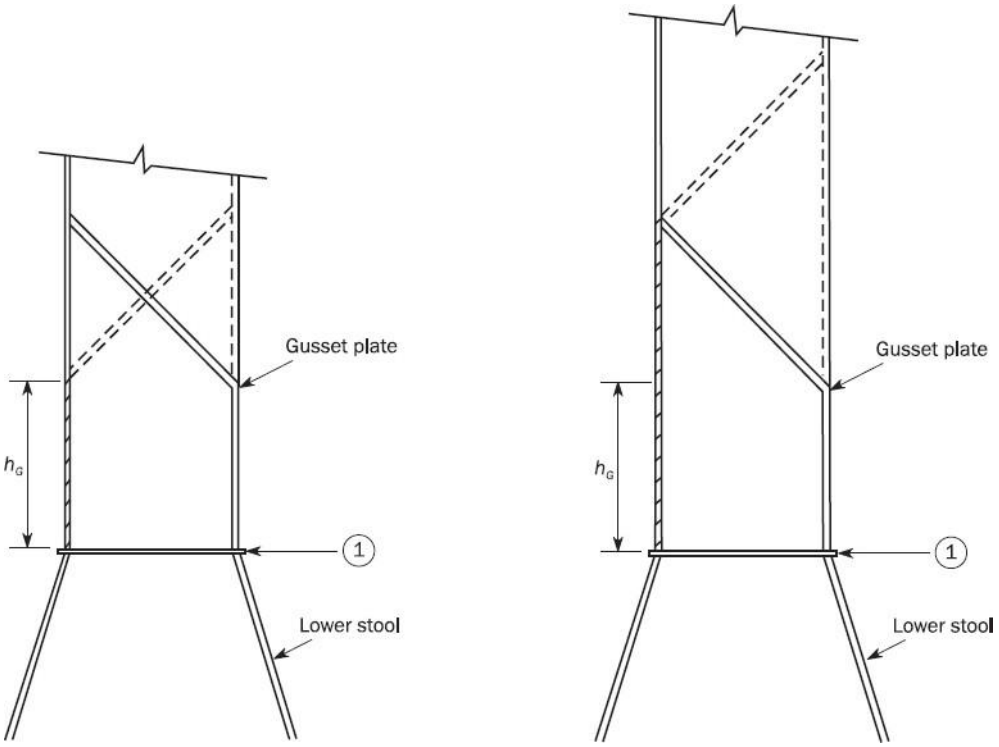

Figure 5 Symmetrical and unsymmetrical gusset / shedder plates

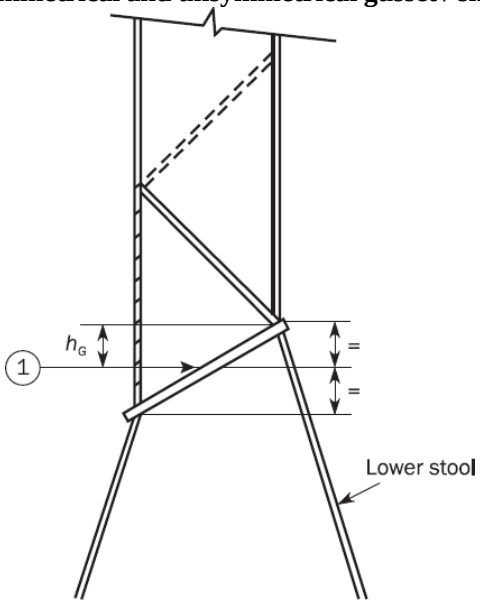

Figure 6 Asymmetrical gusset / shedder plates

3.3.5 Sloping stool top plate

Where the corrugation webs are welded to a sloping stool top plate which has an angle not less than 45ºwith the horizontal plane, the section modulus at the lower end of the corrugations may be calculated considering the corrugation webs fully effective. For angles less than 45º, the effectiveness of the web may be obtained by linear interpolation between 30% efficient for 0ºand 100% efficient for 45º.

Where effective gusset plates are fitted, when calculating the net section modulus of corrugations, the net area of flange plates may be increased as specified in [3.3.4] above. No credit may be given to shedder plates only.

4 ALLOWABLE HOLD LOADING FOR BC-A & BC-B SHIPS IN FLOODED CONDITIONS

4.1 Evaluation of double bottom capacity and allowable hold loading

4.1.1 Shear capacity of the double bottom

The shear capacity of the double bottom is to be calculated as the sum of the shear strength at each end of:

- Floors connected to hopper tanks, less one half of the shear strength of the two floors adjacent to each stool, or transverse bulkhead if no stool is fitted as shown in Figure 7. The shear strength of floors is to be calculated according to [4.1.2].
- Double bottom girders connected to stools, or transverse bulkheads if no stool is fitted. The shear strength of girders is to be calculated according to [4.1.3].

The floors and girders to be considered when calculating the shear capacity of the double bottom are those inside the hold boundaries formed by the hopper tanks and stools or transverse bulkheads if no stool is fitted. Where both ends of girders or floors are not directly connected to the hold boundaries, their strength is to be evaluated for the connected end only.

The hopper tank side girders and the floors directly below the connection of the stools or transverse bulkheads if no stool is fitted to the inner bottom may not be included.

For special double bottom designs, the shear capacity of the double bottom is to be calculated by means of direct calculations carried out in accordance with requirements specified in Pt 1, Ch 7, as applicable.

4.1.2 Floor shear strength

The floor shear strength, in kN, is to be taken as given in the following formulae:

- In way of the floor panel adjacent to the hopper tank:

$$S_{f1} = A_f \frac{\tau_A}{\eta_1} 10^{-3}$$

- In way of the openings in the outermost bay (i.e., that bay which is closer to the hopper tank):

$$S_{f1} = A_{f,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

where:

A_f : Net sectional area, in mm^2, of the floor panel adjacent to the hopper tank.

$A_{f,h}$: Net sectional area, in mm^2, of the floor panels in way of the openings in the outermost bay (i.e., the bay which is closer to the hopper tank).

τ_A : Allowable shear stress, in N/mm^2, to be taken as the lesser of:

$$\tau_A = 0.645 \frac{R_{eH}^{0.6}}{(s/t)^{0.8}} \text{ and } \tau_A = \frac{R_{eH}}{\sqrt{3}}$$

For floors adjacent to the stools or transverse bulkheads, τ_A is taken as:

$$\frac{R_{eH}}{\sqrt{3}}$$

t : Floor web net thickness, in mm.

s : Spacing, in m, of stiffening members of the panel considered.

η_1 : Coefficient to be taken equal to 1.1.

η_2 : Coefficient to be taken equal to 1.2. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the openings in the outermost bay, to be examined by the Society on a case-by-case basis.

ISC 4.1.2a Where appropriate reinforcements are fitted in way of the openings in the outermost bay, e.g. circular flat bars attached to the inner edge of an opening or stiffeners fitted around an opening, η_2 may be taken as 1.1.

4.1.3 Girder shear strength

The girder shear strength, in kN, is to be taken as given in the following formulae:

- In way of the girder panel adjacent to the stool or transverse bulkhead, if no stool is fitted:

$$S_{g1} = A_g \frac{\tau_A}{\eta_1} 10^{-3}$$

- In way of the largest opening in the outermost bay (i.e., that bay which is closer to the stool) or transverse bulk-head, if no stool is fitted:

$$S_{g2} = A_{g,h} \frac{\tau_A}{\eta_2} 10^{-3}$$

A_g : Net sectional area, in mm^2, of the girder panel adjacent to the stool (or transverse bulkhead, if no stool is fitted).

$A_{g,h}$: Net sectional area, in mm^2, of the girder panel in way of the largest opening in the outermost bay (i.e. that bay which is closer to the stool) or transverse bulkhead, if no stool is fitted.

τ_A : Allowable shear stress, in N/mm^2, as defined in [4.1.2] where t is the girder web net thickness.

η_1 : Coefficient to be taken equal to 1.1.

η_2 : Coefficient to be taken equal to 1.15. It may be reduced to 1.1 where appropriate reinforcements are fitted in way of the largest opening in the outermost bay, to be examined by the Society on a case-by- case basis.

ISC 4.1.3a Where appropriate reinforcements are fitted in way of the openings in the outermost bay, e.g. circular flat bars attached to the inner edge of an opening or stiffeners fitted around an opening, η2 may be taken as 1.1.

4.1.4 Allowable hold loading

The allowable hold loading, in t, is to be taken as:

$$W = \rho_C V \frac{1}{F}$$

where:

ρ_C : Density of the dry bulk cargo, in t/m^3, as defined Pt 1, Ch 4, Sec 6, [2.3.3].

V : Volume, in m^3, occupied by the cargo up to the level h_B.

F : Coefficient to be taken as:

F = 1.1 in general.

F = 1.05 for steel mill products.

h_B : Level of cargo, in m, to be taken as:

$$h_B = \frac{P}{\rho_C g}$$

P : Pressure, in kN/m^2, to be taken as:

- For dry bulk cargoes, the lesser of:

$$P = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 + \frac{\rho}{\rho_C}(perm - 1)}$$

$$P = Z + \rho g(z_F - 0.1D_1 - h_F perm)$$

- For steel mill products:

$$P = \frac{Z + \rho g(z_F - 0.1D_1 - h_F)}{1 - \frac{\rho}{\rho_{st}}}$$

D_1 : Distance, in m, from the baseline to the freeboard deck at side amidships.

h_F : Inner bottom flooded height, in m, measured vertically with the ship in the upright position, from the inner bottom to the flooded level z_F.

z_F : Flooded level, in m, as defined in Pt 1, Ch 4, Sec 6, [3.2.3].

perm : Permeability of cargo, which need not be taken greater than 0.3.

ρ_{ST} : Density of steel, in t/m^3, to be taken as 7.85.

Z : Pressure, in kN/m^2, to be taken as the lesser of:

$$Z = \frac{C_H}{A_{DB,H}}$$

$$Z = \frac{C_E}{A_{DB,E}}$$

C_H : Shear capacity of the double bottom, in kN, to be calculated according to [4.1.1], considering, for each floor, the lesser of the shear strengths S_{f1} and S_{f2} as defined in [4.1.2] and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} as defined in [4.1.3].

$A_{DB,H}$: Area, in m^2, taken as:

$$A_{DB,H} = \sum_{i=1}^{n} S_i B_{DB,i}$$

C_E : Shear capacity of the double bottom, in kN, to be calculated according to [4.1.1], considering, for each floor, the shear strength S_{f1} as defined in [4.1.2] and, for each girder, the lesser of the shear strengths S_{g1} and S_{g2} as defined in [4.1.3].

$A_{DB,E}$: Area, in m^2, taken as:

$$A_{DB,E} = \sum_{i=1}^{n} S_i (B_{DB} - s)$$

n : Number of floors between stools or transverse bulkheads, if no stool is fitted.

S_i : Space of i-th floor, in m.

$B_{DB,i}$: Length, in m, to be taken equal to:

$B_{DB,i} = B_{DB-s}$ for floors for which $S_{f1} < S_{f2}$.

$B_{DB,i} = B_{DB,h}$ for floors for which $S_{f1} \geqslant S_{f2}$.

B_{DB} : Breadth, in m, of double bottom between the hopper tanks as shown in Figure 8.

$B_{DB,h}$: Distance, in m, between the two openings considered as shown in Figure 8.

s : Spacing, in m, of inner bottom longitudinal ordinary stiffeners adjacent to the hopper tanks.

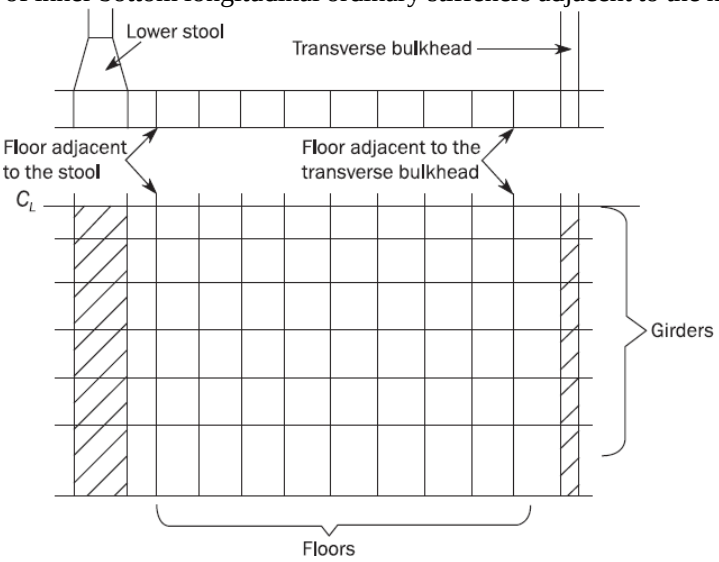

Figure 7 Double bottom structure

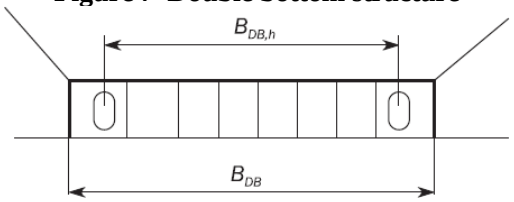

Figure 8 Dimensions B_{DB} and $B_{DB,h}$

Section 4 HULL LOCAL SCANTLINGS FOR BULK CARRIERS L<150M

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

$C_{t\text{-}pr}$: Permissible shear stress coefficient for primary supporting members taken equal to:

$C_{t\text{-}pr}$ = 0.70 for AC-S.

$C_{t\text{-}pr}$ = 0.85 for AC-SD.

l_{DB} : Length of the double bottom within hold under consideration, in m. Where stools are provided at transverse bulkheads, l_{DB} may be taken as the distance between the toes.

B_{DB} : Distance between the toes of hopper tanks at centre of B_{DB} within hold under consideration, in m.

x_c : X coordinate, in m, of the centre of double bottom structure under consideration with respect to the reference coordinate system, as defined in Pt 1, Ch 1, Sec 4, [3.6].

x, y, z : X, Y and Z coordinates, in m, of the evaluation point with respect to the reference coordinate system, as defined in Pt 1, Ch 1, Sec 4, [3.6].

ϕ : Depth of the openings in parallel to web depth of primary support members, in m.

α : The greater of a or S_1, in m.

1 GENERAL

1.1 Application

1.1.1

Unless otherwise defined, the requirements of this section define the strength criteria applicable to bulk carriers with freeboard length L_{LL} of less than 150 m.

2 STRUTS CONNECTING STIFFENERS

2.1 Scantling requirements

2.1.1 Net sectional area and moment of inertia

The net sectional area A_{SR}, in cm^2, and the net moment of inertia I_{SR} about the main axes, in cm^4, of struts connecting stiffeners are not to be less than the values obtained from the following formulae:

$$A_{SR} = \frac{P_{SR} s l}{20000}$$

$$I_{SR} = \frac{0.75 s l (P_{SR1} + P_{SR2}) A_{ASR} l_{SR}^2}{47200 A_{ASR} - s l (P_{SR1} + P_{SR2})}$$

where:

P_{SR} : Pressure to be taken as the greater of the following values, in kN/m^2:

P_{SR}=0.5(P_{SR1}+ P_{SR2}）

P_{SR}= P_{SR3}

P_{SR1} : External pressure in way of the strut, in kN/m^2, acting on one side, outside the compartment in which the strut is located.

P_{SR2} : External pressure in way of the strut, in kN/m^2, acting on the opposite side, outside the compartment in which the strut is located.

P_{SR3}: Internal pressure at mid-span of the strut, in kN/m2, in the compartment in which the strut is located.

s : Spacing, in mm, of stiffeners, measured at mid-span along the chord.

l : Span, in m, of stiffeners connected by the strut defined in Pt 1, Ch 3, Sec 7, [1.1.5].

l_{SR} : Length of the strut, in m.

A_{ASR} : Actual net sectional area of the strut, in cm^2.

3 TRANSVERSE CORRUGATED BULKHEADS OF BALLAST HOLDS

3.1 Plate thickness

3.1.1

The net thickness of web and flange plating is not to be less than the values obtained in Pt 1, Ch 6, Sec 3, [1.1.1] and Pt 1, Ch 6, Sec 4, [1.2].

3.2 Net section modulus

3.2.1

The net section modulus Z, in cm^3, of corrugated bulkhead of ballast holds, subjected to lateral pressure are not to be less than the values obtained from the following formula:

$$Z = K \frac{P s_{cg} l^2}{f_{bdg} C_s R_Y}$$

where:

K : Coefficient given in Table 1 and Table 2, according to the type of end connection. When $d_H < 2.5\ d_0$, both section modulus per half pitch of corrugated bulkhead and section modulus of lower stool at inner bottom are to be calculated.

P : Design pressure for the design load set as defined in Pt 1, Ch 6, Sec 2, Table 1 and calculated at the load calculation point defined in Pt 1, Ch 3, Sec 7, [3.2], in kN/m^2.

s_{cg} : Half pitch length, in mm, of the corrugation, as defined in Pt 1, Ch 3, Sec 6, Figure 21.

l : Length, in m, between the supports, as indicated in Figure 1.

C_s : Coefficient defined in Pt 1, Ch 6, Sec 5, [1.1.2].

f_{bdg}: Coefficient defined in Pt 1, Ch 6, Sec 5, [1.1.2].

The effective width of the corrugation flange in compression is to be considered according to Ch 1, Sec 3, [3.3.1] when the net section modulus of corrugated bulkhead is calculated.

Values of K, in case $d_H \geqslant 2.5\ d_0$ **Table 1**

Upper end support	
Welded directly to deck	Welded to stool efficiently supported by ship structure

	Connected to deck	Connected to stool
Corrugated bulkhead	0.71	0.65
Stool at bottom	1.25	1.13

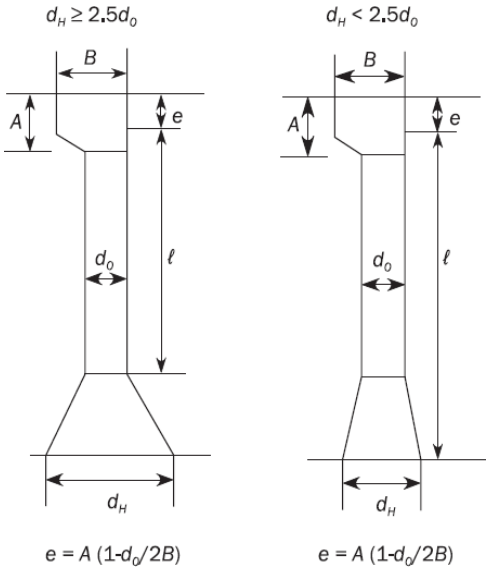

Figure 1 Measurement of l

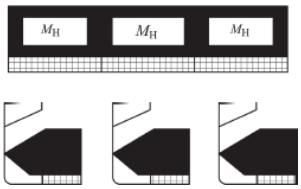
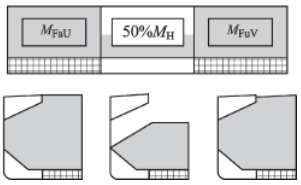
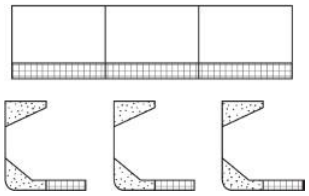
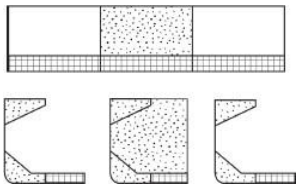
4 PRIMARY SUPPORTING MEMBERS

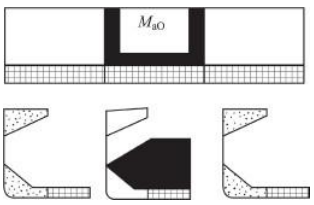
4.1 Application



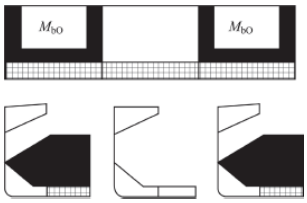


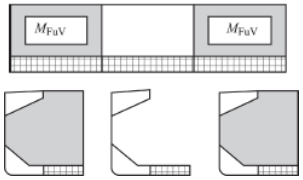


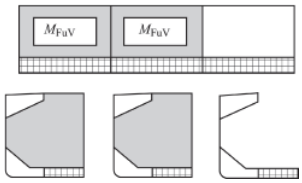


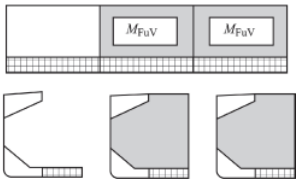


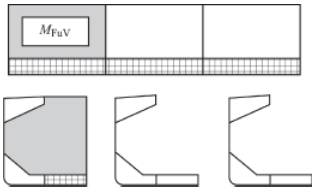
4.1.1



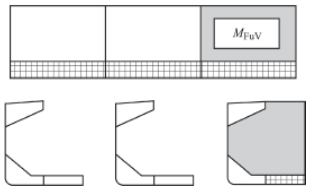


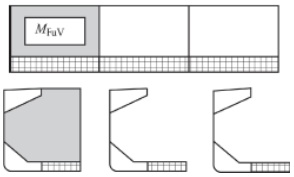


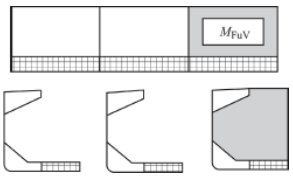


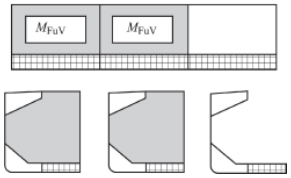


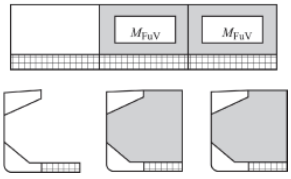
The requirements of this section apply to the strength check of primary supporting members in cargo hold structures, subjected to lateral pressure for ships having a freeboard length L_{LL} less than 150 m.

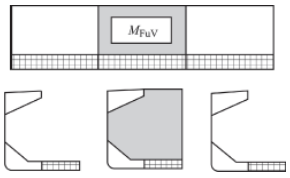












4.1.2
As an alternative to [4.1.1], the strength check may be verified by direct strength assessment deemed as appropriate by the Society.

ISC 4.1.2a As an alternative to 4.1.1, the scantlings of primary supporting members within the midship cargo hold region may be verified by direct strength assessment according to the requirements in Chapter 7 of PART 9-1 and the load combinations as given in Table ISC 4.1.2a.

					100% Max SFLC	*N/A*
				100% sag	*100% Max SFLC*	*N/A*
					100% Max SFLC	*N/A*

Other loading conditions from the Loading Manual, which are not covered in the above Table are also to be considered. In these cases, actual values of draught and hull girder static loads are to be used, and dynamic load cases corresponding to the loading patterns are to be applied. For example, while the still water bending moment corresponding to the loading pattern is positive, dynamic load cases with hogging wave bending moment are to be applied.

ISC 4.1.2b The scantlings of the primary supporting members in the midship cargo region are also to comply with the minimum thickness requirements in Section 3, Chapter 6 and the aspect ratio requirements in Section 2, Chapter 8 of PART 9-1.

4.2 Design load sets

4.2.1 Application

Design load sets as given in Table 3 are to be considered for primary supporting members on cargo hold boundaries of bulk carriers with freeboard length L_{LL} less than 150 m.

Design load sets for primary supporting members in cargo hold region Table 3

Item	Design load set	Load component	Draught	Design load	Loading condition
• Double bottom floors and girders • Stringers and transverse web frames in double side structures	WB-4 (1)	P_{in}-P_{ex}	T_{BAL-H}	S+D	Heavy ballast condition
	WB-6 (1)	P_{in}	-	S	Harbour/test condition
	BC-11	P_{in}-P_{ex}	T_{SC}	S+D	Full load condition
	BC-12	P_{in}-P_{ex}	T_{SC}	S	Harbour condition
	FD-1(2)	P_{in}	T_{SC}	S+D	Flooded condition
	FD-2(2)	P_{in}	-	S	Flooded condition
(1) Only applicable to holds assigned as ballast hold. (2) Not applicable to holds assigned as ballast hold.					

4.2.2 Loading conditions

The severest loading conditions from the loading manual or otherwise specified by the designer are to be considered for the calculation of *Pin* in design load sets BC-11 to BC-12.

For Primary supporting member in bilge hopper tanks and topside tanks, applicable design load sets in Pt 1, Ch 6, Sec 2, Table 1 are to be considered.

4.3 Centre girders and side girders

4.3.1 Net web thickness

The net thickness of girders in double bottom structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_1 \frac{|P|S|x - x_c|}{(d_0 - d_1)C_{t-pr}\tau_{eH}} \left\{1 - 4\left(\frac{y}{B_{DB}}\right)^2\right\}$$

where $|x - x_c|$ is less than $0.25 l_{DB}$, $|x - x_c|$ is to be taken as $0.25\ l_{DB}$.

$$t_2 = 1.75\sqrt[3]{\frac{H^2 a^2 C_{t-pr}\tau_{eH}}{C_1'}}\, t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at mid-point of a floor located midway between transverse bulkheads or transverse bulkhead and toe of stool, where fitted.

S : Distance between the centres of the two spaces adjacent to the centre or side girder under consideration, in m.

d_0 : Depth of the centre or side girder under consideration, in m.

d_1 : Depth of the opening, if any, at the point under consideration, in m.

C_1 : Coefficient given in Table 4 depending on B_{DB}/l_{DB}. For intermediate values of B_{DB}/l_{DB}, C_1 is to be obtained by linear interpolation.

a : Depth of girders at the point under consideration, in m. However, where horizontal stiffeners are fitted on the girder, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or inner bottom plating, or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of vertical stiffeners or floors.

C'_1: Coefficient given in Table 5 depending on S_1/a. For intermediate values of S_1/a, C'_1 is to be

determined by linear interpolation.

H : Value obtained from the following formulae:

- Where the girder is provided with an unreinforced opening:

$$H = 1 + 0.5\frac{\phi}{\alpha}$$

- In other cases:

H=1.0

Coefficient C_1 **Table 4**

B_{DB}/l_{DB}	0.4 and under	0.6	0.8	1.0	1.2	1.4	1.6 and over
C_1	0.5	0.71	0.83	0.88	0.95	0.98	1.00

Coefficient C'_1 **Table 5**

C'_1	64	38	25	19	15	12	10	9	8	7

4.4 Floors

4.4.1 Net web thickness

The net thickness of floors in the double bottom structure, in mm, is not to be less than the greatest of values t_1 and t_2 specified in the following according to each location:

$$t_1 = C_2 \frac{|P| SB_{DB}}{(d_0 - d_1) C_{t-pr} \tau_{eH}} \left(\frac{2|y|}{B'_{DB}}\right) \left\{1 - 2\left(\frac{x - x_c}{l_{DB}}\right)^2\right\}$$

where $|x - x_c|$ is less than $0.25 l_{DB}$, $|x - x_c|$ is to be taken as $0.25 l_{DB}$, and where $|y|$ is less than $B'_{DB}/4$, $|y|$ is to be taken as $B'_{DB}/4$.

$$t_2 = 1.75 \sqrt[3]{\frac{H^2 a^2 C_{t-pr} \tau_{eH}}{C'_2}} t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at mid-point of a floor located midway between transverse bulkheads or transverse bulkhead and toe of stool, where fitted.

S : Spacing of solid floors, in m.

d_0 : Depth of the solid floor at the point under consideration in m.

d_1 : Depth of the opening, if any, at the point under consideration in m.

B'_{DB} : Distance between toes of hopper tanks at the position of the solid floor under consideration, in m.

C_2 : Coefficient given in Table 6 depending on B_{DB}/l_{DB}. For intermediate values of B_{DB}/l_{DB}, C_2 is to be obtained by linear interpolation.

a : Depth of the solid floor at the point under consideration, in m. However, where horizontal stiffeners are fitted on the floor, a is the distance from the horizontal stiffener under consideration to the bottom shell plating or the inner bottom plating or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of vertical stiffeners or girders.

C'_2 : Coefficient given in Table 7 depending on S_1/d_0. For intermediate values of S_1/d_0, C'_2 is to be determined by linear interpolation.

H : Value obtained from the following formulae:

Where openings with reinforcement or no opening are provided on solid floors:

- Where slots without reinforcement are provided:

$$H = \sqrt{4.0\frac{d_2}{S_1} - 1.0}$$ without being taken less than 1.0.

- Where slots with reinforcement are provided:

H = 1.0

Where openings without reinforcement are provided on solid floors:

- Where slots without reinforcement are provided:

$$H = (1 + 0.5\frac{\phi}{d_0})\sqrt{4.0\frac{d_2}{S_1} - 1.0}$$ without being taken less than $1 + 0.5\frac{\phi}{d_0}$

- where slots with reinforcement are provided:

$$H = 1 + 0.5\frac{\phi}{d_0}$$

d_2 : Depth of slots without reinforcement provided at the upper and lower parts of solid floors, in m, whichever is greater.

Coefficient C_2 **Table 6**

B_{DB}/l_{DB}	0.4 and under	0.6	0.8	1.0	1.2	1.4	1.6 and over

4.5 Stringer of double side structure

4.5.1 Net web thickness

The net thickness of stringers in double side structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_3\frac{|P|S|x - x_c|}{(d_0 - d_1)C_{t-pr}\tau_{eH}}$$

where $|x - x_c|$ is under $0.25l_{DS}$, $|x - x_c|$ is to be taken as $0.25l_{DS}$.

$$t_2 = 1.75\sqrt[3]{\frac{H^2a^2C_{t-pr}\tau_{eH}}{C'_3}}t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], as measured vertically at the upper end of hopper tank, longitudinally at the centre of l_{DS}.

S : Breadth of part supported by stringer, in m.

d_0 : Depth of stringers, in m.

d_1 : Depth of opening, if any, at the point under consideration, in m.

l_{DS} : Length of the double side structure between the transverse bulkheads under consideration, in m.

h_{DS} : Height of the double side structure between the upper end of hopper tank and the lower end of topside tank located midway between transverse bulkheads of hold under consideration, in m.

C_3 : Coefficient given in Table 8 depending on h_{DS}/l_{DS}. For intermediate values of h_{DS}/l_{DS}. C_3 is to be obtained by linear interpolation.

a :Depth of stringers at the point under consideration, in m. However, where horizontal stiffeners are fitted on the stringer, a is the distance from the horizontal stiffener under consideration to the side shell plating or the longitudinal bulkhead of double side structure or the distance between the horizontal stiffeners under consideration.

S_1 : Spacing, in m, of transverse stiffeners or web frames.

C'_3 : Coefficient given in Table 9 depending on S_1/a. For intermediate values of S_1/a, C'_3 is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- Where the stringer is provided with an unreinforced opening:

$$H = 1 + 0.5\frac{\phi}{\alpha}$$

- In other cases:

H=1.0

Coefficient C_3 **Table 8**

h_{DS}/l_{DS}	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

4.6 Transverse web in double side structure

4.6.1 Net web thickness

The net thickness of transverse webs in double side structure, in mm, is not to be less than the greater of the value t_1 and t_2 specified in the followings according to each location:

$$t_1 = C_4 \frac{|P| S h_{DS}}{(d_0 - d_1) C_{t-pr} \tau_{eH}} (1 - 1.75 \frac{z - z_{BH}}{h'_{DS}})$$

where $z - z_{BH}$ is greater than $0.4h'_{DS}$, $z - z_{BH}$ is to be taken as $0.4h'_{DS}$.

$$t_2 = 1.75 \sqrt[3]{\frac{H^2 a^2 C_{t-pr} \tau_{eH}}{C'_4}} t_1$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], as measured vertically at the upper end of hopper tank, longitudinally at the centre of l_{DS}.

S : Breadth of part supported by transverses, in m.

d_0 : Depth of transverses, in m.

d_1 : Depth of opening at the point under consideration, in m.

C_4 : Coefficient given in Table 10 depending on h_{DS}/l_{DS}. For intermediate values of h_{DS}/l_{DS}, C_4 is to be obtained by linear interpolation.

z_{BH} : Z coordinate, in m, of the upper end of hopper tank with respect to the reference coordinate system defined in Pt 1, Ch 1, Sec 4, [3.6].

h_{DS} : As defined in the requirements of [4.5.1].

h'_{DS}: Height of the double side structure between the upper end of hopper tank and the lower end of topside tank at the position under consideration, in m.

l_{DS} : As defined in the requirements of [4.5.1].

a : Depth of transverses at the point under consideration, in m. However, where vertical stiffeners are fitted on the transverse, a is the distance from the vertical stiffener under consideration to the side shell or the longitudinal bulkhead of double side hull or the distance between the vertical stiffeners under consideration.

S_1 : Spacing, in m, of horizontal stiffeners or stringers.

C'_4 : Coefficient given in Table 11 depending on S_1/a. For intermediate values of S_1/a, C'_4 is to be obtained by linear interpolation.

H : Value obtained from the following formulae:

- Where the transverse is provided with an unreinforced opening:

$$H = 1 + 0.5 \frac{\phi}{\alpha}$$

- In other cases:
  H = 1.0.

α : The greater of a or S_1 in m.

Coefficient C_4 **Table 10**

h_{DS}/l_{DS}	0.5 and under	0.6	0.7	0.8	0.9	1.0	1.1	1.2	1.3 and over

4.7 Primary supporting member in bilge hopper tanks and topside tanks

4.7.1 Boundary conditions

The requirements of this sub-article apply to primary supporting members considered as clamped at both ends. For boundary conditions deviated from the above, the yielding check is to be considered on a case-by- case basis.

ISC 4.7.1a The requirements of this paragraph apply to the primary supporting members considered as clamped at both ends. For boundary conditions deviated significantly from the above, strength check is to be performed in accordance with ISC 4.1.2a.

4.7.2 Net section modulus, net shear sectional area and web thickness

The net section modulus Z, in cm^3, the net shear sectional area A_{shr}, in cm^2, and the net web thickness t_w, in mm, subjected to lateral pressure are not to be less than the values obtained from the following formulae:

$$Z = \frac{|P| Sl_{bdg}^2}{f_{bdg} C_{s-pr} R_{eH}} 10^3$$

$$A_{shr} = \frac{5|P| Sl_{shr}}{C_{t-pr} \tau_{eH}}$$

$$t_w = 1.75 \sqrt[3]{\frac{h_w C_{t-pr} \tau_{eH}}{10^4 C_5} A_{shr}}$$

where:

P : Design pressure in kN/m^2, for the design load set being considered according to Pt 1, Ch 6, Sec 2, [2.1.3], calculated at the mid-point of span l of a web frame located midway between transverse bulkheads of holds.

S : Spacing of primary supporting members, in m.

l_{bdg} : Effective bending span, in m, of primary supporting members, measured between the supporting members as defined in Pt 1, Ch 3, Sec 7, [1.1.6].

l_{shr} : Effective shear span, in m, of primary supporting members, measured between the supporting members as defined in Pt 1, Ch 3, Sec 7, [1.1.7].

f_{bdg} : Bending moment factor:

- For continuous primary supporting members and where end connections are fitted consistent with idealisation of the primary supporting members as having as fixed ends and is not to be taken higher than:
  $f_{bdg} = 10$
- For primary supporting members with reduced end fixity, the yield check is to be considered on a case-by-case basis.

C_{s-pr} : Permissible bending stress coefficient for primary supporting members taken equal to:
$C_{s-pr} = 0.70$ for AC-S.
$C_{s-pr} = 0.85$ for AC-SD.

h_w : Web height, in mm.

C_5 : Coefficient defined in Table 12 according to s_1 and d_0. For intermediate values of s_1 / d_0, coefficient C_5 is to be obtained by linear interpolation.

s_1 : Spacing of stiffeners or tripping brackets on web plate, in m.

d_0 : Spacing of stiffeners parallel to shell plate on web plate, in m.

ISC 4.7.2a For the primary supporting members with reduced end fixity, strength check is to be performed in accordance with ISC 4.1.2a.

Coefficient C_5 **Table 12**

s_1 / d_0	0.3 and less	0.4	0.5	0.6	0.7	0.8	0.9	1.0	1.5	2.0 and over
C_5	60.0	40.0	26.8	20.0	16.4	14.4	13.0	12.3	11.1	10.2

Section 5 CARGO HATCH COVERS

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

P_S : Still water pressure, in kN/m^2, as defined in [4.1].

P_W : Wave pressure, in kN/m^2, as defined in [4.1].

P_C : Pressure acting on the hatch coaming, in kN/m^2, as defined in [6.2].

F_S, F_W : Coefficients taken equal to:

F_S = 0 and F_W = 0.9 for ballast water loads on hatch covers of the ballast hold.

F_S = 1.0 and F_W = 1.0 in other cases.

b_p : Effective breadth, in mm, of the plating attached to the stiffener, as defined in [3].

A_{shr} : Net shear sectional area, in cm2, of the stiffener or primary supporting member.

f_{bc} : Boundary coefficient for stiffeners and primary supporting members, taken equal to:

f_{bc} = 8, in the case of stiffeners and primary supporting members simply supported at both ends or supported at one end and clamped at the other end.

f_{bc} = 12, in the case of stiffeners and primary supporting members clamped at both ends.

t_c : Total corrosion addition, in mm, as defined in [1.4].

σ_a,τ_a : Allowable stresses, in N/mm2, as defined in [1.5].

1 GENERAL

1.1 Application

1.1.1

The requirements in [1] to [8] apply to steel hatch covers in positions 1 and 2 on weather decks, as defined in Pt 1, Ch 1, Sec 4, [3.2].

1.2 Materials

1.2.1 Steel

The formulae for scantlings given in [5] are applicable to steel hatch covers.

Materials used for the construction of steel hatch covers are to comply with the applicable requirements of the Society.

ISC 1.2.1a Materials used for the construction of top plating, bottom plating and primary supporting members of steel hatch covers are to comply with the material grade requirements for class I as specified in Table 7 of 2.3 in Section 1, Chapter 3 of PART 9-1.

1.2.2 Other materials

The use of materials other than steel is to be considered by the Society on a case-by-case basis, by checking that criteria adopted for scantlings are such as to ensure strength and stiffness equivalent to those of steel hatch covers.

ISC 1.2.2a Where other materials are used, the corrosion additions of materials are to be determined in accordance with the submitted corrosion resistance information of materials. Such information is to include testing and/or historic data demonstrating that corrosion additions meet the design life of 25 years and is subject to the agreement of ISC.

1.3 Net scantlings

1.3.1

All scantlings referred to in this section are net, i.e. they do not include any margin for corrosion.

When calculating the stresses σ and τ in [5.3] and [5.4], the net scantlings are to be used.

The gross scantlings are obtained as specified in Pt 1, Ch 3, Sec 2.

The corrosion additions are given in [1.4].

1.4 Corrosion additions

1.4.1

The total corrosion addition for both sides to be considered for the plating and internal members of hatch covers is equal to the value specified in Table 1.

The corrosion addition for hatch coamings and coaming stays is defined according to Pt 1, Ch 3, Sec 3.

Corrosion addition t_c for hatch covers **Table 1**

Corrosion addition t_c, in mm, for both sides	
Plating and stiffeners of single skin hatch cover	2.0
Top and bottom plating of double skin hatch cover	2.0
Internal structures of double skin hatch cover	1.5

1.5 Allowable stresses

1.5.1

The allowable stresses σ_a, in N/mm^2, are to be obtained from Table 2.

Allowable stresses **Table 2**

Members of	Subjected to	σ_a, in N/mm^2
Weathertight hatch cover	External pressure, as defined in [4.1.2]	0.80 R_{eH}
Weathertight hatch cover	Other loads, as defined in [4.1.3] to [4.1.6]	0.90 R_{eH} for load combination: S+D 0.72R_{eH} for load combination: S

The allowable buckling utilisation factors are given in Table 3:

Allowable buckling utilisation factors **Table 3**

Structural component	Subject to	η_{all}, Allowable buckling utilisation factor
Plates and stiffeners Web of SM	External pressure, as defined in [4.1.2]	0.80 for load combination: S+D
	Other loads, as defined in [4.1.3] to [4.1.6]	0.90 for load combination: S+D 0.72 for load combination: S

2 ARRANGEMENTS

2.1 Hatch covers

2.1.1

The stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

2.1.2

The spacing of primary supporting members parallel to the direction of stiffeners is not to be greater than 1/3 of the span of primary supporting members.

2.1.3

The breadth of the primary supporting member face plate is not to be less than 40% of their depth for laterally unsupported spans greater than 3 m. Tripping brackets attached to the face plate may be considered as a lateral support for primary supporting members.

The face plate outstand is not to exceed 15 times the gross face plate thickness.

2.1.4

Efficient retaining arrangements are to be provided to prevent translation of the hatch cover under the action of the longitudinal and transverse forces exerted by cargoes on the cover, if any. These retaining arrangements are to be located in way of the hatch coaming side brackets.

2.1.5

The width of each bearing surface for hatch covers is to be at least 65 mm.

2.2 Hatch coamings

2.2.1

Coamings, stiffeners and brackets are to be capable of withstanding the local forces in way of the

clamping devices and handling facilities necessary for securing and moving the hatch covers as well as those due to cargo stowed on the latter.

2.2.2
Special attention is to be paid to the strength of the fore transverse coaming of the forward hatch and to the scantlings of the closing devices of the hatch cover on this coaming.

2.2.3
Longitudinal coamings are to be vertically extended at least to the lower edge of deck beams or hatch side girders below deck are to be fitted in line with longitudinal coamings. Extended coaming plates are to be flanged or fitted with face bars or half-round bars at the level of lower edge of the deck beams. Figure 1 gives an example.

- Where they are not part of continuous deck girders, the lower edge of longitudinal coamings including below deck structure as an extension measure above are to extend for at least two frame spaces beyond the end of the hatch openings.
- Where they are part of continuous deck girders, their scantlings are to be as required in Pt 1, Ch6, Sec 6 and Pt 1, Ch 8, Sec 3.

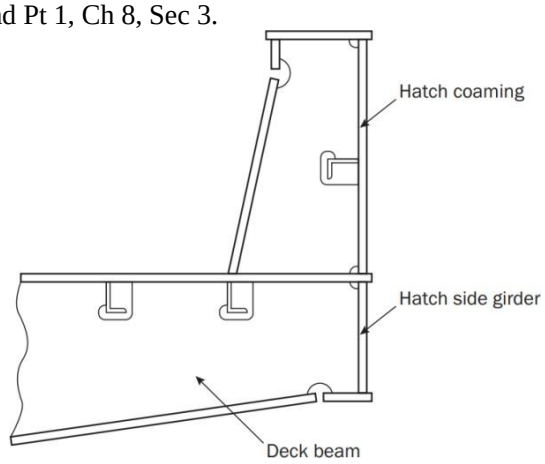

Figure 1 Example of extension to lower edge of deck beams of longitudinal coaming by fitting a hatch side girder

2.2.4
A web frame or a similar structure is to be provided below the deck in line with the transverse coaming. Transverse coamings are to extend below the deck and to be connected with the web frames.

3 WIDTH OF ATTACHED PLATING

3.1 Stiffeners

3.1.1
The width of the attached plating *bp*, in mm, to be considered for the check of stiffeners is to be taken as:

3.1.1 Where the attached plating extends on both sides of the stiffener:

$b_p = s$

3.1.2 Where the attached plating extends on one side of the stiffener:

$b_p = 0.5\ s$

4 LOAD MODEL

4.1 Lateral pressures and forces

4.1.1 General

The lateral pressures and forces to be considered as acting on hatch covers are given in [4.1.2] to [4.1.6]. When two or more panels are connected by hinges, each individual panel is to be considered separately.

In any case, the sea pressures defined in [4.1.2] are to be considered for hatch covers located on exposed decks.

Additionally, when the hatch cover is intended to carry uniform cargoes, special cargoes or

containers, the pressures and forces defined in [4.1.3] to [4.1.6] are to be considered independently from the sea pressures.

4.1.2 Sea pressures

The still water and wave lateral pressures are to be considered and are to be taken equal to:

- Still water pressure: $P_S = 0$.
- Wave pressure $P_W = P_{HC}$, as defined in Pt 1, Ch 4, Sec 5, [5.2].

4.1.3 Internal pressures due to ballast water

If applicable, the internal static and dynamic lateral pressures due to ballast water are to be considered and are defined in Pt 1, Ch 4, Sec 6, [1].

4.1.4 Pressures due to uniform cargoes

If applicable, the static and dynamic pressures due to uniform cargoes are to be considered and are defined in Pt 1, Ch 4, Sec 5, [5.3.1].

4.1.5 Pressures or forces due to special cargoes

In the case of carriage of special cargoes (e.g. pipes, etc) on the hatch covers which may temporarily retain water during navigation, the lateral pressures or forces to be applied are considered by the Society on a case- by-case basis.

ISC 4.1.5a In the case of carriage of special cargoes on the hatch covers which may temporarily retain water during navigation, lateral loads on the hatch covers shall be determined with the method specified in 4.1.4 taking into account the quality of the retained water.

4.1.6 Forces due to containers

In the case of carriage of containers on the hatch covers, the concentrated forces under the containers corners are to be determined in accordance with the applicable requirements of the Society.

ISC 4.1.6a In the case of carriage of containers on the hatch covers, the concentrated force P is to be determined by the following formula:

$P=P_S(1+a_Z)$

where:

P_S : *container stack weight, in kN;*

a_Z : *vertical acceleration, in* m/s^2, *see 3.2.4, Section 3, Chapter 4 of PART 9-1.*

4.1.7 Self weight

The effect of the hatch cover structure weight is to be included in the static loads but not in the dynamic loads.

4.2 Load point

4.2.1 Wave lateral pressure for hatch covers on exposed decks

The wave lateral pressure to be considered as acting on each hatch cover is to be calculated at a point located:

- Longitudinally, at the hatch cover mid-length.
- Transversely, on the longitudinal plane of symmetry of the ship.
- Vertically, at the top of the hatch cover.

4.2.2 Lateral pressures other than the wave pressure

The lateral pressure is to be calculated at the level of the tight boundary of the cover:

- In way of the geometrical centre of gravity of the plate panel, for plating.
- At mid-span, for stiffeners and primary supporting members.

5 STRENGTH CHECK

5.1 General

5.1.1 Application

The strength check is applicable to rectangular hatch covers subjected to lateral pressure and/or concentrated loads, designed with primary supporting members arranged in one direction or as a grillage of longitudinal and transverse primary supporting members.
It is also applicable for hatch covers fitted with U-type stiffeners as shown in Figure 1. The stresses in all structural members are to be determined by a finite element analysis with the modelling requirements as described in [5.6.1].
It is to be checked that stresses of all structural members comply with the yield strength assessment requirement in [5.6.2], and the buckling strength assessment requirements as described in [5.2.3], [5.3.4], [5.4.6], [5.6.3] and [5.6.4].

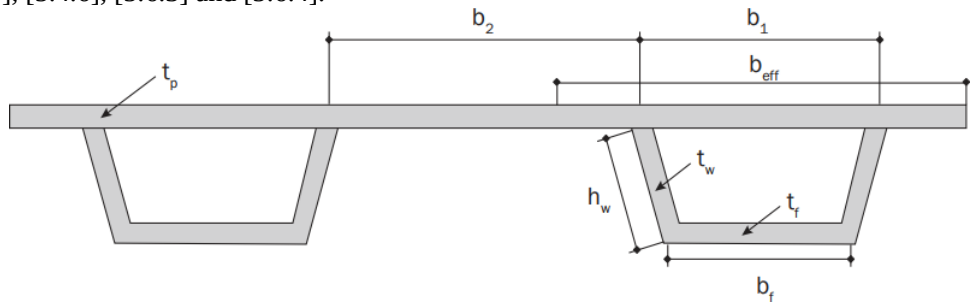

Figure 2 Example of hatch cover fitted with U type stiffener

ISC 5.1.1a When the hatch cover is arranged as a grillage of longitudinal and transverse primary supporting members, it is to be modeled as follows:

(1) The cover geometry is to be idealized as realistically as possible. Element size is to be appropriate to account for effective breadth. In way of force transfer points and cut-outs the mesh has to be refined where applicable. The ratio of element length to width is not to exceed 4.

The element height of webs of primary supporting members is not to exceed one third of the web height. Stiffeners and supporting plates against pressure loads have to be included in the idealization. Buckling stiffeners may be disregarded for the stress calculation.

(2) A right-hand coordinate system is to be used with:
the x-axis measured in the longitudinal direction, positive forward;
the y-axis measured in the transverse direction, positive to port from the centerline;
the z-axis measured in the vertical direction, positive upwards.

(3) Scantlings are to be based on net thicknesses for FE analysis.

(4) The extent of the FE model is to be determined as follows:

① For symmetry of the hatch cover girders, loads and boundary supporting conditions about only the x-axis or y-axis, it may be limited to a half of the hatch cover for check.

② For non-symmetry of hatch cover girders, loads and boundary supporting conditions about any of the axes, the whole hatch cover is to be taken for strength evaluation, see Figure ISC 5.1.1a (1).

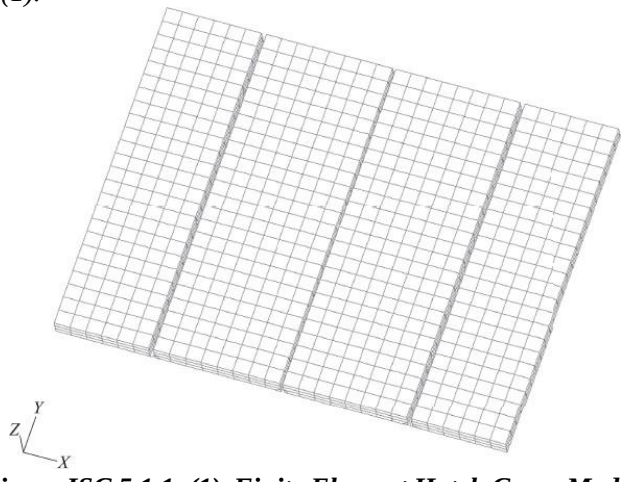

Figure ISC 5.1.1a(1) Finite Element Hatch Cover Model

(5) The model element is to comply with the following requirements:

① *All plating, including girders and stiffeners, is to be represented by the finite element model.*

② *All plating, such as top plates, bottom plates, brackets, and girder webs, face plates of primary supporting members is to modeled using plate elements, triangular elements are to be avoided where possible.*

③ *All stiffeners are to be modeled using beam, rod or plate elements.*

(6) The element mesh size is to be controlled as follows:

① *The mesh size is not to be greater than the spacing of stiffeners.*

② *The girders are to be represented by at least 3 elements in the depth.*

③ *Triangular and distorted quadrilateral elements with corner angles less than 60 degrees and greater than 120 degrees are to be avoided.*

(7) Boundary conditions are to be determined as follows:

① *For symmetry of the hatch cover girders and loads about the x-axis, the longitudinal displacement of nodes in the symmetric plane and the rotations about the y-and z-axes are to be taken as 0, respectively, i.e.* $\delta_x = \theta_y = \theta_z = 0$*, as shown in Figure ISC 5.1.1a(2).*

② *For symmetry of the hatch cover girders and loads about the y-axis, the transverse displacement of nodes in the symmetric plane and rotation about the x-and z-axes are to be taken as 0 respectively i.e.* $\delta_y = \theta_x = \theta_z = 0$*, as shown in Figure ISC 5.1.1a.*

③ *Boundary nodes in way of bearing pads on the hatch coamings are to be fixed against displacement in the z direction in general, i.e.* $\delta_y = 0$.

④ *Lifting stoppers are to be fixed against displacements in the direction determined by the stoppers.*

⑤ *Hinges in folding type hatch covers are to be represented as rigid links which tie together displacements in the z direction.*

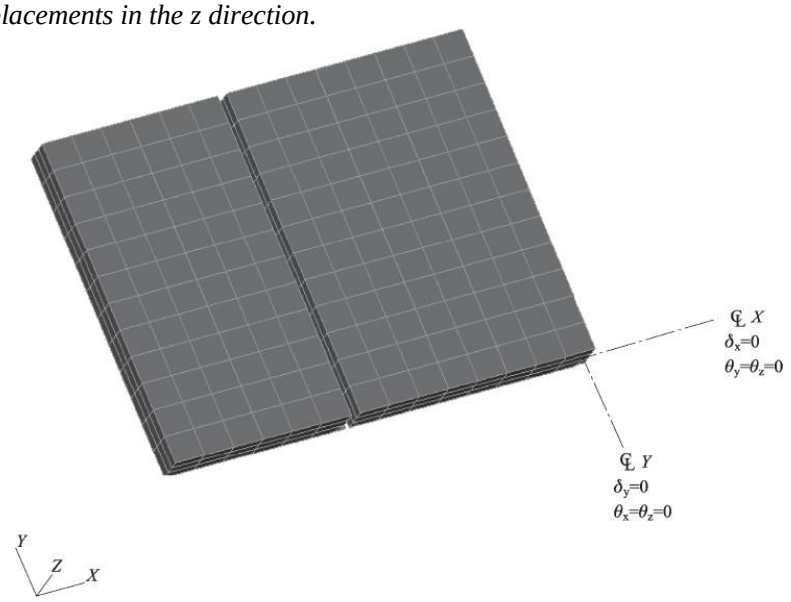

Figure ISC 5.1.1a(2) Boundary Conditions of Hatch Cover Model

5.1.2 Hatch covers supporting containers

The scantlings of hatch covers supporting containers are to comply with the applicable requirements of the Society.

ISC 5.1.2a The scantlings of hatch covers supporting containers are to comply with the requirements of 5 of this Section, taking into account the container loads in ISC 4.1.6a.

5.1.3 Hatch covers subjected to special cargoes

For hatch covers supporting special cargoes, stiffeners and primary supporting members are generally to be checked by direct calculations, taking into account the stiffener arrangements and

their relative inertia. It is to be checked that stresses induced by special cargoes are in accordance with the criteria in [5.4.4].

5.2 Plating

5.2.1 Net thickness

The net thickness, in mm, of steel hatch cover top plating is not to be taken less than:

$$t = 0.0158 F_p b \sqrt{\frac{F_S P_S + F_W P_W}{0.95 R_{eH}}}$$

where:

F_p : Factor for combined membrane and bending response, equal to:

F_p = 1.5 in general.

$F_p = 1.9\,\sigma/\sigma_a$, for $\sigma \geqslant 0.8\sigma_a$ for the attached plating of primary supporting members.

σ : Normal stress, in N/mm^2, in the attached plating of primary supporting members, calculated according to [5.4.3] or determined through a grillage analysis or a finite element analysis.

5.2.2 Minimum net thickness

In addition to [5.2.1], the net thickness, in mm, of the plating forming the top of the hatch cover is not to be taken less than the greater of the following values:

$t = b/100$

$t = 6$

5.2.3 Buckling strength

The buckling strength of the hatch cover plating subjected to loading conditions as defined in [4.1] is to comply with the requirements in [5.6.3].

For hatch covers fitted with U type stiffeners, it is to comply with the requirements in [5.6.4].

5.3 Stiffeners

5.3.1

Stiffeners are to comply with the applicable slenderness and proportion requirements given in Pt 1, Ch 8, Sec 2, [3.1.1] and [3.1.2].

5.3.2 Minimum net thickness of web

The net thickness, in mm, of the stiffener web is to be taken not less than 4 mm.

5.3.3 Net section modulus and net shear sectional area

The net section modulus Z, in cm^3, and the net shear sectional area A_{shr}, in cm^2, of a stiffener subject to lateral pressure are to be taken not less than given by the following formulae:

$$Z = \frac{(F_S P_S + F_W P_W) s l_s^2}{f_{bc} \sigma_a}$$

$$A_{shr} = \frac{5(F_S P_S + F_W P_W) s l_s}{\tau_a} 10^{-3}$$

where:

l_s : Stiffener span, in m, to be taken as the spacing, in m, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all stiffener spans, the stiffener span may be reduced by an amount equal to 2/3 of the minimum brackets arm length, but not greater than 10% of the gross span, for each bracket.

5.3.4 Buckling strength

The buckling strength of the hatch cover stiffeners subjected to loading conditions as defined in [4.1] is to comply with the requirements in [5.6.3].

The buckling strength of the hatch cover fitted with U type stiffeners subjected to loading conditions as defined in [4.1] is to comply with the requirements in [5.6.4].

5.4 Primary supporting members

5.4.1 Application

Primary supporting members are to be checked with the requirements in [5.4.2] to [5.4.5].

5.4.2 Minimum net thickness of web

The web net thickness of primary supporting members, in mm, is not to be less than 6 mm.

5.4.3 Deflection limit

The net moment of inertia of a primary supporting member, when loaded by sea pressure, excluding the self- weight of the structure, is to be such that the deflection does not exceed μl_{max}. where:

μ : Coefficient taken equal to:

μ= 0.0056 for weathertight hatch covers.

l_{max} : Greatest span, in m, of primary supporting members.

5.4.4 Buckling strength of the web panels of the primary supporting members

The web of primary supporting members subject to loading conditions as defined in [4.1] is to comply with the requirements in [5.6.3].

5.4.5 Slenderness criteria

For buckling stiffeners on webs of primary supporting members, the ratio h_w/t_w is to comply with the following formula:

$$\frac{h_w}{t_w} \le 15\sqrt{\frac{235}{R_{eH}}}$$

5.5 DELETED

5.5.1

DELETED

Figure 3 DELETED

5.6 Finite element model and buckling assessment

5.6.1 Finite element model

For the strength assessments of hatch covers subjected to loading conditions as defined in [4.1], by means of FE analysis, the hatch cover geometry shall be idealized as realistically as possible. In no case shall the element width be larger than stiffener spacing. In way of force transfer points and cutouts the mesh is to be refined where applicable. The ratio of element length to width shall not exceed 3.

The element size along the height of webs of primary supporting member is not to exceed one-third of the web height. Stiffeners, which support plates subjected to lateral pressure loads, are to be included in the FE model idealization. Stiffeners may be modelled by using beam elements, or shell/plate elements. Buckling stiffeners may be disregarded for the stress calculation.

Hatch covers fitted with U-type stiffeners as shown in Figure 1 are to be assessed by means of FE analysis. The geometry of the U-type stiffeners is to be accurately modelled using shell/plate elements. Nodal points are to be properly placed on the intersections between the webs of a U-type stiffener and the hatch cover plate, and between the webs and flange of the U-type stiffener.

5.6.2 Yield strength assessment

All hatch cover structural members are to comply with the following formula:

$\sigma_{vm} \le \sigma_a$ for shell elements in general.

$\sigma_{axial} \le \sigma_a$ for rod or beam elements in general.

where,

σ_a : Allowable stress as defined in [1.5.1], Table 2.

σ_{vm} :Von Mises stress, in N/mm^2, to be taken as follows:

$$\sigma_{vm} = \sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau_{xy}^2}$$

σ_x : Normal stress, in N/mm^2, in x-direction.
σ_y : Normal stress, in N/mm^2, in y-direction.
σ_{xy} : Shear stress, in N/mm^2, in the x-y plane.
σ_{axial}:Axial stress in rod or beam element, in N/mm^2.
Indices x and y are coordinates of a two-dimensional Cartesian system in the plane of the considered structural element.
In case of FEM calculations using shell (or plate) elements, the stresses are to be read from the centre of the individual element. It is to be observed that, in particular, at flanges of unsymmetrical girders, the evaluation of stress from element centre may lead to non-conservative results. Thus, a sufficiently fine mesh is to be applied in these cases or, the stress at the element edges shall not exceed the allowable stress. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.

5.6.3 Buckling strength assessment

The plate panel of a hatch cover structure is to be modelled as stiffened panel (SP) or unstiffened panel (UP). Assessment Method A (-A) and Method B (-B) as defined in Pt 1, Ch 8, Sec 1, [3] are to be used in accordance with Table 4, Figure 3 and Figure 4. For a web panel with opening, the procedure for opening should be used for its buckling assessment.
Wherever necessary, the following corresponding buckling requirements for direct strength anaslysis in Pt 1, Ch 8, Sec 4 can be referred to:

a) Average thickness of plate panel, in Pt 1, Ch 8, Sec 4, [2.1.2].
b) Irregular plate panel, in Pt 1, Ch 8, Sec 4, [2.3].
c) Reference stress, in Pt 1, Ch 8, Sec 4, [2.4].
d) Lateral pressure, in Pt 1, Ch 8, Sec 4, [2.5].
e) Buckling criteria, in Pt 1, Ch 8, Sec 4, [2.6], but using allowable buckling utilisation factors as defined in Pt 2, Ch 1, Sec 5, Table 3.

Structural members and assessment methods Table 4

Structural elements	Assessment method[1,2]	Normal panel definition
Hatch cover top/bottom plating structures, see Figure 3		
Hatch cover top/bottom plating	SP-A	Length: between transverse girders Width: between longitudinal girders
Irregularly stiffened panels	UP-B	Plate between local stiffeners/PSM
Hatch cover webs of primary supporting members, see Figure 4		
Web of transverse/longitudinal girder (single skin type)	UP-B	Plate between local stiffeners/face plate/PSM
Web of transverse/longitudinal girder (double skin type)	SP-B[3]	Length: between PSM Width: full web depth
Web panel with opening	Procedure for opening	Plate between local stiffeners/face plate/PSM
Irregularly stiffened panels	UP-B	Plate between local stiffeners/face plate/PSM

(1) SP and UP stand for stiffened and unstiffened panel respectively.
(2) A and B stand for Method A and Method B respectively.
(3) In case that the buckling carlings/brackets are irregularly arranged in the web of transverse/longitudinal girder, UP-B method may be used.

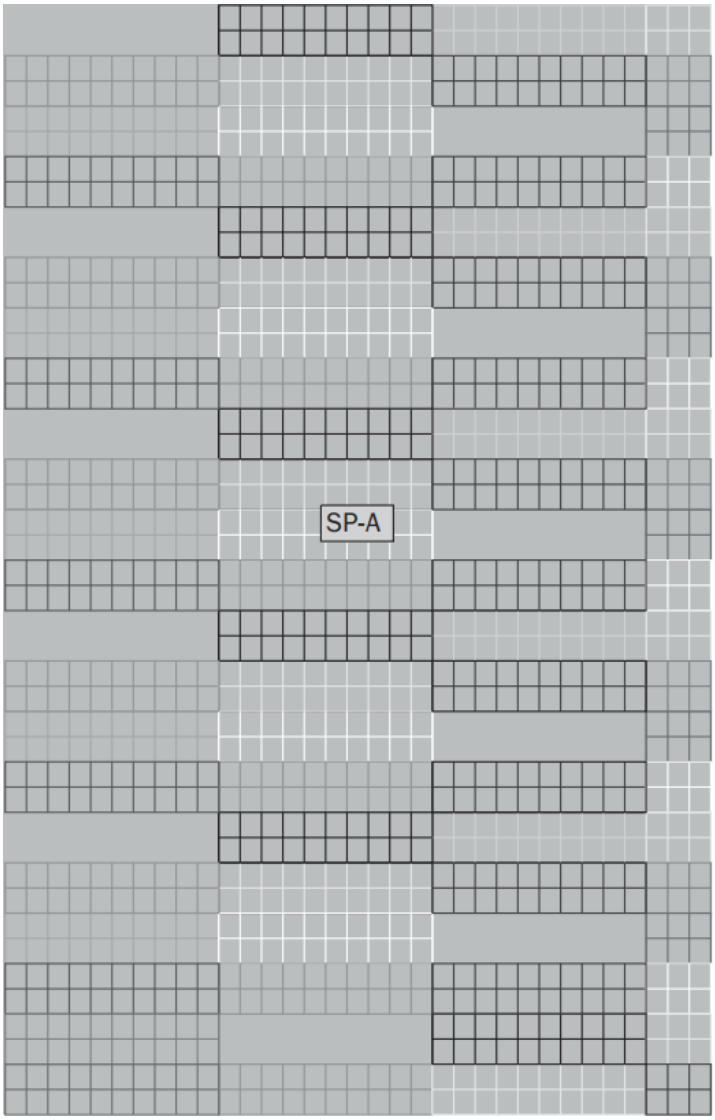

Figure 4 Hatch cover top/bottom plating structures

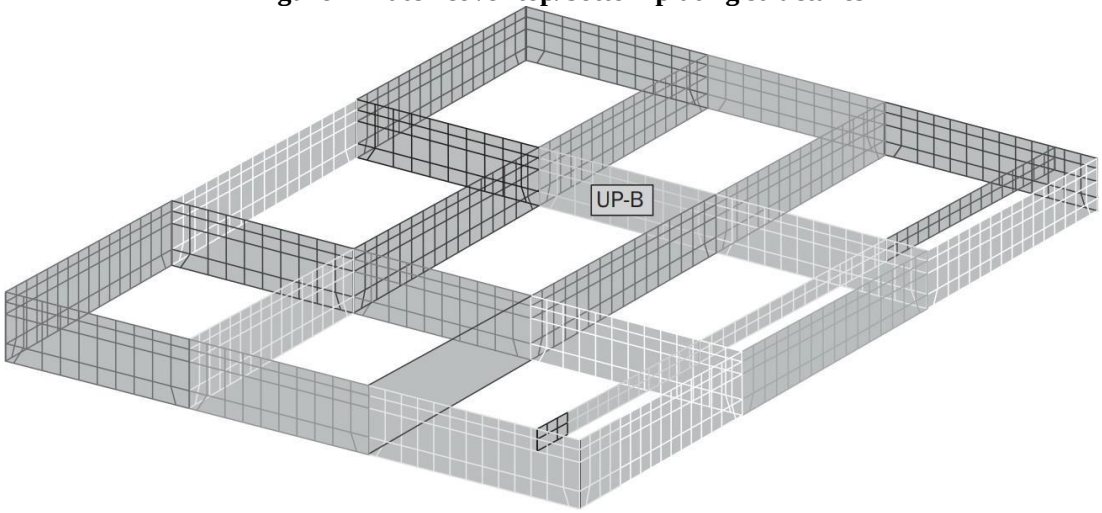

Figure 5 Hatch cover webs of primary supporting members

5.6.4 Buckling assessment of stiffened panels with U-type stiffeners

For hatch covers fitted with U-type stiffeners, local plate buckling is to be checked for each of the plate panels EPP b_1, b_2, b_f and h_w (see Figure 2) separately as follows:

- The attached plate panels EPP b_1 and b_2 are to be assessed using SP-A model, where in the calculation of buckling factors K_x as defined in Pt 1, Ch 8, Sec 5, Table 3, the correction factor F_{long} for U-type stiffeners as defined in Pt 1, Ch 8, Sec 5, Table 2 is to be used; and in the calculation of K_y as defined in Pt 1, Ch 8, Sec 5, Table 3, the F_{tran} for U-type stiffeners as defined in Pt 1, Ch 8, Sec 5, [2.2.5] is to be used.
- The face plate and web plate panels EPP b_f and h_w are to be assessed using UP-B model with F_{long}=1 and F_{tran}=1.

The overall stiffened panel capacity and ultimate capacity of stiffeners of the hatch cover fitted with U-type stiffeners are to be checked with warping stress σ_w = 0, and with bending moment of inertia including effective width of attached plating being calculated based on the following assumptions:

- The two web panels of a U-type stiffener are to be taken as perpendicular to the attached plate with thickness equal to t_w and height equal to the distance between the attached plate and the face plate of the stiffener.
- Effective width of the attached plating, b_{eff}, taken as the sum of the b_{eff} calculated for the EPP b_1 and b_2 respectively according to SP-A model.
- Effective width of the attached plating of a stiffener without the shear lag effect, b_{eff1}, taken as the sum of the b_{eff1} calculated for the EPP b_1 and b_2 respectively.

6 HATCH COAMINGS

6.1 Stiffening

6.1.1

The stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

6.1.2

Coamings are to be stiffened on their upper edges with a stiffener suitably shaped to fit the hatch cover closing appliances.

6.1.3

Where the height of the coaming exceeds 900 mm, additional strengthening may be required. However, reductions may be granted for transverse coamings in protected areas.

6.1.4

When two hatches are close to each other, under deck stiffeners are to be fitted to connect the longitudinal coamings in order to maintaining the continuity of their strength.
Similar stiffening is to be provided over 2 frame spacings at ends of hatches exceeding 9 frame spacings in length.
In some cases, the Society may require the continuity of coamings to be maintained above the deck.

6.1.5

Where watertight metallic hatch covers are fitted, other arrangements of equivalent strength may be adopted.

6.2 Load model

6.2.1

The wave lateral pressure, P_C in kN/m^2, to be considered as acting on the hatch coamings is defined in [6.2.2] and [6.2.3].

6.2.2

The wave lateral pressure, P_C in kN/m^2, on the No. 1 forward transverse hatch coaming is to be taken equal to:

- P_C = 220, when a forecastle is fitted in accordance with Ch 1, Sec 1, [1].
- P_C = 290, in the other cases.

6.2.3

The wave lateral pressure, P_C in kN/ m^2, on the hatch coamings other than the No. 1 forward transverse hatch coaming is to be taken equal to:
P_C = 220

6.2.4
For cargo holds intended for the carriage of ballast water, the liquid internal pressures applied on hatch coaming is also to be determined according to Pt 1, Ch 4, Sec 6.

6.3 Scantlings

6.3.1 Plating

The net thickness, in mm, of the hatch coaming plate is not to be taken less than the greater value given by the following formulae:

$$t = 0.016b\sqrt{\frac{p_c}{0.95R_{eH}}}$$

t = 9.5

6.3.2 Stiffeners

The net section modulus, Z, in cm^3, of longitudinal or transverse stiffeners fitted on hatch coamings is not to be taken less than:

$$Z = 1.21\frac{P_c s l^2}{f_{bc} c_p R_{eH}}$$

where:
f_{bc} : Coefficient taken equal to:
f_{bc} = 16 in general.
f_{bc} = 12 for the end span of stiffeners sniped at the coaming corners.
c_p : Ratio of the plastic section modulus to the elastic section modulus of the stiffeners with an attached plate breadth, in mm, equal to 40 t, where t is the plate net thickness.
c_p = 1.16 in the absence of more precise evaluation.

6.3.3 Coaming stays

At the connection with deck, the net section modulus Z, in cm^3, and the net thickness t_w, in mm, of the coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (examples shown in Figure 6 and Figure 7) are to be taken not less than:

$$Z = \frac{s_c P_c H_c^2}{1.9R_{eH}}$$

$$t_w = \frac{s_c P_c H_c}{0.5hR_{eH}}$$

where:
H_C : Stay height, in m.
s_C : Stay spacing, in mm.
h : Stay depth, in mm, at the connection with deck.

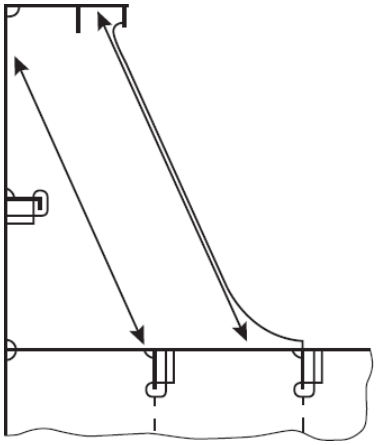

Figure 6 Coaming stay (example 1)

For calculating of offered section modulus of coaming stays, the face plate area may be taken into account only when it is welded with full penetration welds to the deck plating and provided with adequate under deck structure supporting the coaming stay in the deck structure.

For other designs of coaming stays, such as those shown in Figure 8 and Figure 9, the stress levels determined through a grillage analysis or finite element analysis, as the case may be, apply and are to be checked at the highest stressed locations. The stress levels are to comply with the following formulae:

$\sigma \leqslant 0.95\, R_{eH}$

$\tau \leqslant 0.5\, R_{eH}$

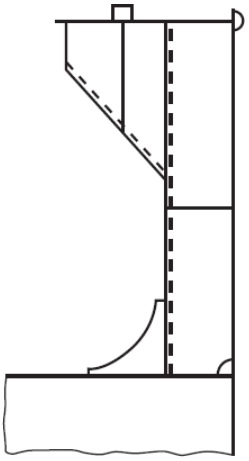

Figure 7 Coaming stay (example 2)

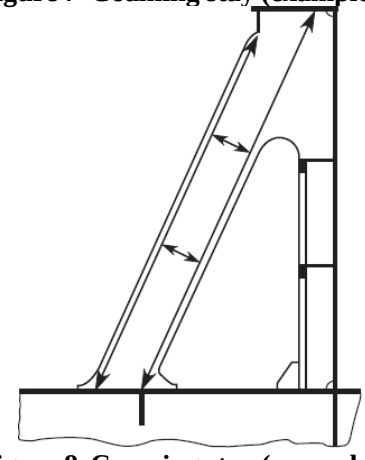

Figure 8 Coaming stay (example 3)

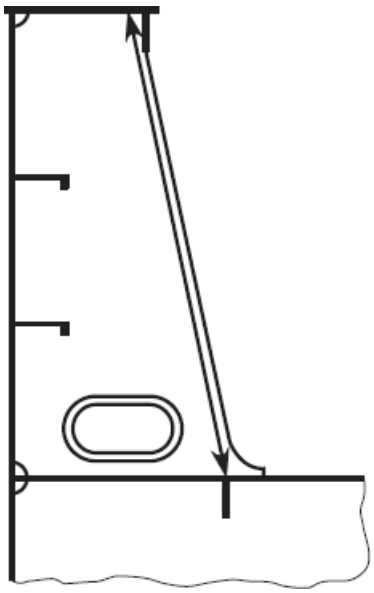

Figure 9 Coaming stay (example 4)

6.3.4 Local details

The design of local details is to comply with the requirements in this section ensuring adequate structural continuity from the hatch covers into the supporting deck structure.

Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

The normal stress σ and the shear stress γ, in N/mm^2, induced in the under deck structures by the loads transmitted by stays are to comply with the following formulae:

$\sigma \leqslant 0.95\ R_{eH}$

$\gamma \leqslant 0.5\ R_{eH}$

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the requirements of the Society.

Double continuous fillet welding is to be adopted for the connections of stay webs with deck plating and the weld leg length is not to be less than 0.62 t_w, where t_w is the gross thickness of the stay web. Toes of stay webs are to be connected to the deck plating with partial penetration double bevel welds extending over a distance not less than 15% of the stay width.

ISC 6.3.4a Unless otherwise stated in this Section, weld connections and materials are to be dimensioned and selected in accordance with the applicable requirements in Table 2.5.2 of Section 3, Chapter 12 and Section 1, Chapter 3 of PART 9-1.

7 WEATHERTIGHTNESS, CLOSING ARRANGEMENT, SECURING DEVICES AND STOPPERS

7.1 Weathertightness

7.1.1

Where the hatchway is exposed, the weathertightness is to be ensured by gaskets and clamping devices sufficient in number and quality.

7.1.2

In general, a minimum of two securing devices or equivalent is to be provided on each side of the hatch cover.

7.2 Gaskets

7.2.1

The weight of hatch covers and any cargo stowed thereon, together with inertia forces generated by ship motions, are to be transmitted to the ship's structure.

7.2.2
The sealing is to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements.
Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and to be made of a corrosion-resistant material.

7.2.3
The gasket and the securing arrangements are to maintain their efficiency when subjected to large relative movements between the hatch cover and the ship's structure or between hatch cover elements.
If necessary, suitable devices are to be fitted to limit such movements.

7.2.4
The gasket material is to be of a quality suitable for all environmental conditions likely to be encountered by the ship, and is to be compatible with the cargoes transported.
The material and form of gasket selected are to be considered in conjunction with the type of hatch cover, the securing arrangement and the expected relative movement between the hatch cover and the ship's structure.
The gasket is to be effectively secured to the hatch cover.

7.2.5
Coamings and steel parts of hatch covers in contact with gaskets are to have no sharp edges.

7.2.6
Metallic contact is required to ensure earthing connection between the hatch cover and the hull structures.

7.3 Closing arrangement, securing devices and stoppers

7.3.1 General

Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced along the coamings and between cover elements.
Hatch covers provided with special sealing devices, insulated hatch covers, flush hatch covers and those having coamings of a reduced height according to [2.1.2] are to be considered by the Society on a case-by- case basis.

ISC 7.3.1a The closing arrangements, securing devices and stoppers of hatch cover are to comply with the requirements of this Section taking into account the effectiveness of arrangement, spacing, structure, area of securing devices and moment of inertia for edges under situation of special design.

7.3.2 Arrangements

The securing and stopping devices are to be arranged so as to ensure sufficient compression on gaskets between hatch covers and coamings and between adjacent hatch covers.
Arrangement and spacing are to be determined with due attention to the effectiveness for weathertightness, depending on the type and the size of the hatch cover, as well as on the stiffness of the hatch cover edges between the securing devices.
At cross-joints of multi-panel covers, (male/female) vertical guides are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels.
The location of stoppers is to be compatible with the relative movements between hatch covers and the ship's structure in order to prevent damage to them. The number of stoppers is to be as small as possible.

7.3.3 Spacing

The spacing of the securing arrangements is not to be greater than 6 m.

7.3.4 Construction

Securing arrangements with reduced scantlings may be accepted provided it can be demonstrated that the possibility of water reaching the deck is negligible.
Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or hatch covers.
Individual securing devices on each hatch cover are to have approximately the same stiffness characteristics.

7.3.5 Area of securing devices
The gross cross area of each securing device is not to be less than the value obtained, in cm^2, from the following formula:

$$A = 1.4 S_S \left(\frac{235}{R_{eH}} \right)^{\alpha}$$

where:
S_S : Spacing, in m, of securing devices.
α : Coefficient taken equal to:
$\alpha = 0.75$ for $R_{eH} > 235$ N/mm^2.
$\alpha = 1.0$ for $R_{eH} \leqslant 235$ N/mm^2.
In the above calculations, R_{eH} may not be taken greater than 0.7 R_m.
Between hatch cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by securing devices. For packing line pressures exceeding 5 N/mm, the net cross area *A* is to be increased in direct proportion. The packing line pressure is to be specified.
In the case of securing arrangements which are particularly stressed due to the unusual width of the hatchway, the net cross area *A* of the above securing arrangements is to be determined through direct calculations.

ISC 7.3.5a The permissible stress criteria for securing devices of hatch cover is to be:
(1) For securing devices such as rods or bolts, the tensile stress is not to exceed 120/k, N/mm^2.
(2) *For other types of securing devices, the permissible stress is to be as follows:*
normal stress: $\sigma = 120 / k$ N/mm^2
equivalent stress: $\sigma_e = 150 / k$ N/mm^2
shear stress : $\tau = 80 / k$ N/mm^2.

7.3.6 Inertia of edges elements
The hatch cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices.
The moment of inertia of edge elements is not to be less than the value obtained, in cm4, from the following formula:

$$I = 6 p_L S_S^4$$

where:
P_L: Packing line pressure, in N/mm, to be taken not less than 5.
S_S: Spacing, in m, of securing devices.

7.3.7 Diameter of rods or bolts
Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 m2 in area.

7.3.8 Stoppers
Hatch covers are to be effectively secured, by means of stoppers, against the transverse forces arising from a pressure of 175 kN/m^2.
With the exclusion of No. 1 hatch cover, hatch covers are to be effectively secured, by means of stoppers, against the longitudinal forces acting on the forward end arising from a pressure of 175 kN/m^2.

No. 1 hatch cover is to be effectively secured, by means of stoppers, against the longitudinal

forces acting on the forward end arising from a pressure of 230 kN/m^2. This pressure may be reduced to 175 kN/m^2 if a forecastle is fitted in accordance with Ch 1, Sec 1, [1].

The equivalent stress in stoppers, their supporting structures and calculated in the throat of the stopper welds is to be equal to or less than the allowable value, equal to 0.8 R_{eH}.

7.4 Cleats

7.4.1

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

7.4.2

Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

8 DRAINAGE

8.1 Arrangement

8.1.1

Drainage is to be arranged inside the line of gaskets by means of a gutter bar or vertical extension of the hatch side and end coaming.

8.1.2

Drain openings are to be arranged at the ends of drain channels and are to be provided with efficient means for preventing ingress of water from outside, such as non-return valves or equivalent.

8.1.3

Cross-joints of multi-panel hatch covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

8.1.4

If a continuous outer steel contact is arranged between the cover and the ship’s structure, drainage from the space between the steel contact and the gasket is also to be provided.

Section 6 ADDITIONAL CLASS NOTATION GRAB

SYMBOLS

M_{GR} *:* Mass of unladen grab, in t.

1 GENERAL

1.1 Application

1.1.1

The additional class notation GRAB [X] is assigned, in accordance with Pt 1, Ch 1, Sec 1, [3.2.2], to ships with holds designed for loading/unloading by grabs having a maximum mass of unladen grab, in tons up to [X] tons, in compliance with the requirements of this section.

1.1.2

It is to be noted that this additional class notation does not negate the use of heavier grabs, but the owner and operators are to be made aware of the increased risk of local damage and possible early renewal of inner bottom plating if heavier grabs are used regularly or occasionally to discharge cargo.

2 SCANTLINGS

2.1 Plating

2.1.1 General

The net thickness of plating of inner bottom and vertical sloped cargo hold; excluding bilge wells, is to be taken as the greater of the following values:

- t, as obtained according to requirements in Pt 1, Ch 6 and Pt 1, Ch 7.
- t_{GR}, as defined in [2.1.2] and [2.1.3].

2.1.2 Inner bottom plating

The net thickness t_{GR}, in mm, of the inner bottom plating is to be obtained from the following formula:

$$t_{GR} = 0.62\sqrt{bk}\left(\frac{M_{GR}}{20}\right)^{0.25}$$

2.1.3 Vertical and sloped cargo hold boundaries

The net thickness t_{GR}, in mm, as defined in this sub-section apply to the following structural elements.

- Hopper tank sloped plating.
- Transverse lower stool plating.
- Transverse plane bulkhead plating.
- Face plates of transverse corrugated bulkheads without lower stool.
- Inner hull

Up to a height of 3.0 m above, the lowest point of the inner bottom is to be obtained from the following formula:

$$t_{GR} = 0.55\sqrt{bk}\left(\frac{M_{GR}}{20}\right)^{0.25}$$

Chapter 2 OIL TANKERS

SECTION 1 GENERAL ARRANGEMENT DESIGN

1 GENERAL

1.1 General

1.1.1

This section covers the general structural arrangement requirements for oil tankers, which are based on national and international regulations.

2 SEPARATION OF CARGO TANKS

2.1 General

2.1.1

The designer's attention is to be drawn on the arrangement of the cargo pump room, cargo tanks, slop tanks and cofferdams, main cargo control stations, control stations, accommodation and service spaces as well as on the need to separate the cargo tanks from the machinery space.

3 DOUBLE HULL ARRANGEMENT

3.1 General

3.1.1

All oil tankers are to be provided with double bottom tanks and spaces, and double side tanks and spaces, in accordance with Pt 1, Ch 2, Sec 3. The double bottom and double side tanks and spaces, protect the cargo tanks or spaces, and are not to be used for the carriage of oil cargoes.

3.1.2

Cargo tanks are to be of a size and arrangement that hypothetical oil outflow from side and bottom damage, anywhere in the length of the ship, is limited.

4 ACCESS ARRANGEMENTS

4.1 Special requirements for oil tankers

4.1.1

Where a duct keel or pipe tunnel is fitted, provision is to be made for at least two exits to the open deck arranged at a maximum distance from each other. The duct keel or pipe tunnel is not to pass into machinery spaces. The aft access may lead from the pump room to the duct keel. Where an aft access is provided from the pump room to the duct keel, the access opening from the pump room to the duct keel is to be provided with an oil-tight cover plate or a watertight door.

Mechanical ventilation is to be provided and such spaces are to be sufficiently ventilated prior to entry. A notice board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for a sufficient period. In addition, the atmosphere in the tunnel is to be sampled by a gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.

4.1.2

Where a watertight door is fitted in the pump room for access to the duct keel, the scantlings of the watertight door are to comply with the requirements of the individual Society and the following additional requirements:

a) The watertight door is to be capable of being manually closed from outside the main pump room entrance, in addition to bridge operation. A means of indicating whether the door is open or closed is to be provided locally and on the bridge.

b) A notice is to be affixed at each operating position to the effect that the watertight door is to be kept closed during normal operations of the ship, except when access to the pipe tunnel is required.

ISC 4.1.2a The strength of watertight doors is to be equivalent to that of the surrounding structure and to comply with the recognized standard.

4.1.3
Special consideration is to be given to any proposals to fit permanent repair/maintenance access openings with oil-tight covers in cargo tank bulkheads. Attention is drawn to the relevant national regulations concerning load line and oil outflow aspects of such arrangements.

SECTION 2 STRUCTURAL DESIGN PRINCIPLES

1 CORROSION PROTECTION

1.1 General

1.1.1 Cathodic protection systems in cargo tanks

Cathodic protection systems, if fitted in cargo tanks, are to comply with [1.2].

1.1.2 Paint containing aluminium

Paint containing aluminium, when used in cargo tanks, is to comply with [1.3].

1.2 Internal cathodic protection systems

1.2.1

When a cathodic protection system is to be fitted to steel structures in tanks used for liquid cargo with flash point below 60°C, a plan of the fitting arrangement is to be submitted for approval. The arrangements are to be considered for safety against fire and explosion. This approval also applies to adjacent tanks.

1.2.2

Permanent magnesium or magnesium alloy anodes in tanks are not acceptable, except in tanks solely intended for water ballast that are not adjacent to cargo tanks.

Impressed current systems are not to be used in cargo tanks due to the development of chlorine and hydrogen that can result in an explosion.

Aluminium anodes are accepted, however, in tanks with liquid cargo with flash point below 60°C and in adjacent ballast tanks, aluminium anodes are to be located so a kinetic energy of not more than 275 J is developed in the event of their loosening and becoming detached.

1.2.3

Aluminium anodes are to be located in such a way that they are protected from falling objects. They are not to be located under tank hatches or Butterworth openings unless protected by adjacent structure.

1.2.4

Tanks, in which anodes are installed, are to have sufficient holes for the circulation of air to prevent gas from collecting in pockets.

1.3 Paint containing aluminium

1.3.1

The use of aluminium coatings containing greater than 10% aluminium by weight in the dry film is prohibited in cargo tanks, cargo tank deck area, pump rooms, cofferdams or any other area where cargo vapour may accumulate

1.3.2

Aluminised pipes may be permitted in ballast tanks, in inerted cargo tanks and, provided the pipes are protected from accidental impact, in hazardous areas on open deck.

SECTION 3 HULL LOCAL SCANTLING

SYMBOLS

For symbols not defined in this section, refer to Pt 1, Ch 1, Sec 4.

S : Primary supporting member spacing as defined in Pt 1, Ch 3, Sec 7, [1.2.2], in m.

$C_{t\text{-}pr}$: Permissible shear stress coefficient for primary supporting members taken equal to:

$C_{t\text{-}pr}$ = 0.70 for AC-S.

$C_{t\text{-}pr}$ = 0.85 for AC-SD.

$C_{s\text{-}pr}$: Permissible bending stress coefficient for primary supporting members taken equal to:

$C_{s\text{-}pr}$ = 0.70 for AC-S.

$C_{s\text{-}pr}$ = 0.85 for AC-SD.

s_{cg} : Half pitch length of corrugation, in mm. See Figure 4.

l_{cg} : Length of corrugation, in m, which is defined as the distance between the lower stool and the upper stool. Where no lower or upper stool is fitted, l_{cg} is to be measured to lower or upper end as shown in Figure 4.

1 PRIMARY SUPPORTING MEMBERS IN CARGO HOLD REGION

1.1 General

1.1.1

The following requirements relate to the determination of scantlings of the primary supporting members within 0.4 L amidships and those outside 0.4 L amidships provided that the geometry and fixation of primary supporting member is similar with those amidships.

1.1.2

The section modulus and shear area criteria for primary supporting members contained in this sub-section apply to structural configurations shown in Pt 1, Ch 1, Sec 1, Figure 3 and are applicable to the following structural elements:

a) Floors and girders within the double bottom,
b) Deck transverses,
c) Side transverses within double side structure,
d) Vertical web frames on longitudinal bulkheads with or without cross ties,
e) Horizontal stringers on transverse bulkheads, except those fitted with buttresses or other intermediate supports,
f) Cross ties in wing cargo and centre cargo tanks.

1.1.3

Floors, horizontal stringers, side transverses and vertical webs adjacent to transverse bulkheads which get additional supports by horizontal stringers or buttresses are excluded from the application of this section.

1.1.4

Webs of the primary supporting members are to be stiffened in accordance with Pt 1, Ch 8, Sec 2, [4].

1.1.5

Webs of the primary supporting members are to have a depth of not less than given by the requirements of [1.5.1], [1.7.1] and [1.8.1], as applicable.

1.1.6

In any case, primary supporting members that have open slots for stiffeners are to have a depth not less than 2.5 times the depth of the slots if slots are not closed.

1.1.7

Where it is impracticable to fit a primary supporting member with the required web depth, then it is permissible to fit a member with reduced depth provided that the fitted member has equivalent moment of inertia or deflection to the required member. The required equivalent moment of

inertia is to be based on an equivalent section given by the effective width of plating at mid span with required plate thickness, web of required depth and thickness and face plate of sufficient width and thickness to satisfy the required mild steel section modulus.
The equivalent moment of inertia may be also demonstrated by an equivalent member having the same deflection as the required member.
All other rule requirements, such as minimum thicknesses, slenderness ratio, section modulus and shear area, are to be satisfied for the member of reduced depth.

1.2 Design load sets

1.2.1

The design load sets for the evaluation of primary supporting members are given in Table 1.

Design load sets for primary supporting members **Table 1**

Item	Design load set (1) (5) (6)	Load component	Draught	Design load	Loading condition
Double bottom floors and girders (3)	SEA-1	P_{ex}	$0.9T_{sc}$ (2)	S+D	Sea pressure only
	SEA-2	P_{ex}	T_{sc}	S	
	OT-4	$P_{in} - P_{ex}$	$0.6T_{sc}$	S+D	Net pressure difference between cargo pressure and sea pressure
	OT-5	$P_{in} - P_{ex}$	(4)	S	
Side transverses (3)	SEA-1	P_{ex}	$0.9T_{sc}$	S+D	Sea pressure only
	SEA-2	P_{ex}	T_{sc}	S	
	OT-1	P_{in}	T_{sc}	S+D	Cargo pressure only
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Deck transverses	SEA-1	P_{ex}	T_{sc}	S+D	Green sea pressure only or other loads on deck
	OT-1	P_{in}	T_{sc}	S+D	Cargo pressure only
	OT-2	P_{in}	$0.6\ T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Vertical web frames on longitudinal bulkheads	OT-1	P_{in}	T_{sc}	S+D	Pressure from one side only. Full cargo tank with adjacent cargo tank empty
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Horizontal stringers on transverse bulkhead	OT-1	P_{in}	T_{sc}	S+D	Pressure from one side only. Full cargo tank with adjacent forward or aft cargo tank empty.
	OT-2	P_{in}	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Cross ties in centre tanks	OT-1	$\frac{P_{in-pt}+P_{in-stb}}{2}$	T_{SC}	S+D	Full wing cargo tanks, centre tank empty.
	OT-2	$\frac{P_{in-pt}+P_{in-stb}}{2}$	$0.6T_{sc}$	S+D	
	OT-3	P_{in}	-	S	
Cross ties in wing tanks	OT-6	$\frac{P_{in}+P_{ex}}{2}$	T_{sc}	S+D	Full centre tank, wing cargo tanks

Item	Design load set (1) (5) (6)	Load component	Draught	Design load	Loading condition
	OT-7	$\frac{P_{in}+P_{ex}}{2}$	$0.6T_{sc}$	S+D	empty.
	OT-8	$\frac{P_{in}+P_{ex}}{2}$	T_{sc}	S	

where:

$P_{in\text{-}pt}$: Design pressure from port side wing cargo tank, in kN/m^2.

$P_{in\text{-}stb}$: Design pressure from starboard side wing cargo tank, in kN/m^2.

(1) The static and dynamic load components are to be determined in accordance with Pt 1, Ch 4, Sec 7, Table 1.

(2) If the loading condition where the combination of an empty cargo tank and a mean ship's draught greater than 0.9 T_{sc} is included in ship's loading manual, the maximum corresponding draught is to be considered.

(3) Draughts specified for bottom floors, girders and side transverses are based on operational limits specified in Pt 1, Ch 4, Sec 8, [2] and Pt 1, Ch 4, Sec 8, [3]. Where the optional loading conditions exceed the minimum Rule required loading conditions, the draughts will be subject to special consideration.

ISC (3) Where the optional loading conditions exceed the minimum Rule required loading conditions, the most unfavorable draught between the actual draught and the Rule required draught is to be taken if the minimum Rule required draught is exceeded.

(4) For tankers with two oil-tight longitudinal bulkheads, the draught is to be taken as 0.25 T_{sc}. For tankers with a centreline bulkhead, the draught is to be taken as 0.33 T_{sc}.

(5) When the ship's configuration cannot be described by the structural members or structural configurations identified above, then the applicable Design Load Sets to determine the scantling requirements of primary supporting member are to be selected so as to specify all applicable cases from the following:

- A full tank on one side of the member with the tank or space on the other side empty.
- A full tank on one side of the member with the external pressure minimised.
- External pressure maximised with the adjacent tank or space empty.

The boundary is to be evaluated for loading from both sides. Design Load Sets are to be selected based on the tank or space contents and are to maximise the net pressure on the structural boundary, the draught to use is to be taken in accordance with the Design Load Set and this table. Design Load Sets covering the S and S+D design load combinations are to be selected.

(6) For a void or dry space, the pressure component from the void side is to be ignored.

1.3 Floors in double bottom

1.3.1 Structural arrangement

Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

1.3.2 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the floors at any position in the floor is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\tau_{eH}}$$

where:

Q : Design shear force, in kN.

$Q = f_{shr}\, PSl_{shr}$

f_{shr} :Shear force distribution factor:

$$f_{shr} = f_{shr-i}\left(1-\frac{2y_i}{l_{shr}}\right) \text{ but not to be taken as less than } 0.2$$

$f_{shr\text{-}i}$: Shear force distribution factor at the end of the span, l_{shr}, as given in Table 2.

l_{shr} : Effective shear span, of the double bottom floor, in m, as shown in Figure 2. In way of bracket ends, the effective shear span is measured to the toes of the effective end bracket, as defined in Pt 1, Ch3, Sec 7, [1.1.7]. Where the floor ends on a girder at a hopper or stool structure, the effective shear span is measured to a point that is one-half of the distance from the girder to the adjacent bottom and inner-bottom longitudinal, as shown in Figure 2.

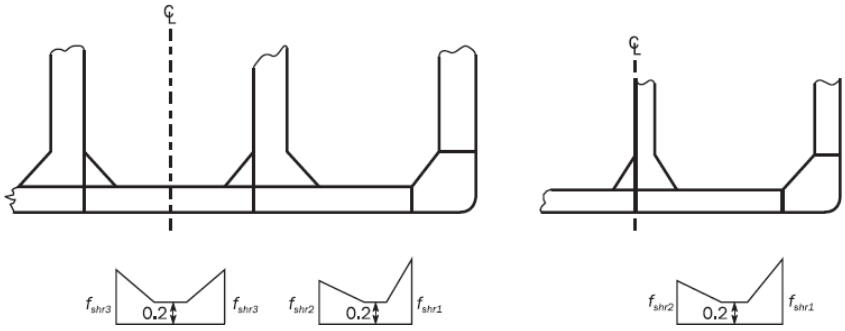
y_i : Distance from the considered cross section of the floor to the nearest end of the effective shear span, l_{shr} in m.

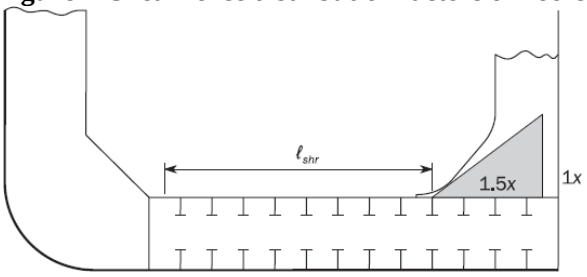
P : Design pressure given in Table 1 for the design load set being considered, calculated at mid point of effective shear span, l_{shr} of a floor located midway between transverse bulkheads or

transverse bulkhead and wash bulkhead, where fitted, in kN/m^2.

Shear force distribution factors of floors **Table 2**

Structural configuration	Centre tank (f_{shr3} in Figure 1)	Wing tank	
		At inboard end (f_{shr2} in Figure 1)	At hopper knuckle end (f_{shr1} in Figure 1)
Ships with centreline longitudinal bulkhead	-	0.40	0.60
Ships with two longitudinal bulkheads	0.5	0.50	0.65





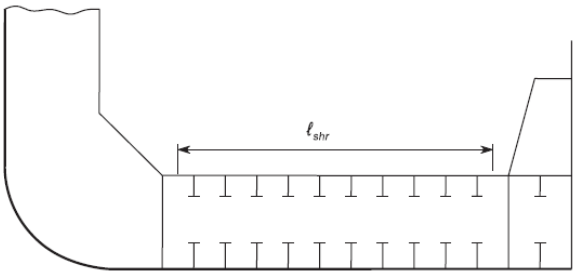


Figure 1 Shear force distribution factors of floors

Typical arrangement with hopper and end bracket

Typical arrangement with hopper and stool

Figure 2 Effective shear span of floors

1.4 Girders in double bottom

1.4.1 Structural arrangement

Continuous double bottom girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools.

1.4.2 Net shear area of centre girders

For double bottom centre girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr\text{-}n50}$ in cm^2, of the double bottom centre girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\tau_{eH}}$$

where:

Q : Design shear force, in kN, taken as:

$$Q = 0.21 n_1 n_2 P l^2_{shr}$$

l_{shr} : Effective shear span as defined in [1.3.2].

P : Design pressure, in kN/m^2, as defined in [1.3.2].

n_1 : Coefficient taken as:

$$n_1 = 0.00935\left(\frac{l_{shr}}{S}\right)^2 - 0.163\left(\frac{l_{shr}}{S}\right) + 1.289$$

n_2 : Coefficient taken as:

$$n_2 = 1.3 - \left(\frac{S}{12}\right)$$

S : Double bottom floor spacing, in m, as defined in Pt 1 Ch 3 Sec 7 [1.2.2].

1.4.3 Net shear area of side girders

For double bottom side girders where no longitudinal bulkhead is fitted above, the net shear area, $A_{shr-n50}$ in cm^2, of the double bottom side girder in way of the first bay from each transverse bulkhead and wash bulkhead, where fitted, is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\tau_{eH}}$$

where:

Q : Design shear force, in kN.

$$Q = 0.14 n_3 n_4 P l^2_{shr}$$

n_3 : Coefficient taken as:

$$n_3 = 1.072 - 0.0357\left(\frac{l_{shr}}{S}\right)$$

n_4 : Coefficient taken as:

$$n_4 = 1.2 - \left(\frac{S}{18}\right)$$

S : Double bottom floor spacing, in m, as defined in Pt 1 Ch 3 Sec 7 [1.2.2].

l_{shr} : Effective shear span as defined in [1.3.2].

P : Design pressure, in kN/m^2, as defined in [1.3.2].

1.5 Deck transverses

1.5.1 Web depth

The web depth of under deck transverses is not to be less than:

- 0.20 l_{bdg-dt} for deck transverses in the wing cargo tanks of ships with two longitudinal bulkheads.
- 0.13 l_{bdg-dt} for deck transverses in the centre cargo tanks of ships with two longitudinal bulkheads. The web depth of deck transverses in the centre cargo tank is not to be less than 90% of that of the deck transverses in the wing cargo tank.
- 0.10 l_{bdg-dt} for the deck transverses of ships with a centreline longitudinal bulkhead.
- The web height required in [1.1.6].

The web depth of above deck transverses is not to be less than:

- 0.10 l_{bdg-dt}
- The web height required in[1.1.6].

where:

l_{bdg-dt}: Effective bending span, in m, as defined in [1.5.2].

1.5.2 Net section modulus of deck transverses fitted below the upper deck

The net section modulus of deck transverses fitted below the upper deck, in cm^3, is not to be less than Z_{in-n50} and Z_{ex-n50} as given by the following formulae.

The net section modulus of the deck transverses fitted below the upper deck in the wing cargo tanks is also not to be less than required for the deck transverses fitted below the upper deck in the centre tanks.

$$Z_{in-n50} = \frac{850 M_{in}}{C_{s-pr} R_{eH}}$$

$$Z_{ex-n50} = \frac{850 M_{ex}}{C_{s-pr} R_{eH}}$$

where:

M_{in} : Design bending moment due to cargo pressure, in kNm, taken as:

- For deck transverses in wing cargo tanks of ships with two longitudinal bulkheads, and for deck transverses in cargo tanks of ships with a centreline longitudinal bulkhead: $M_{in} = 0.042 \varphi_t P_{in\text{-}dt} Sl^2_{\ bdg\text{-}dt} + M_{st}$ but is not to be taken as less than M_0.
- For deck transverses in centre cargo tank of ships with two longitudinal bulkheads: $M_{in} = 0.042 \varphi_t P_{in\text{-}dt} Sl^2_{\ bdg\text{-}dt} + M_{vw}$ but is not to be taken as less than M_0

M_{st} : Bending moment transferred from the side transverse, in kNm:

$M_{st} = c_{st} \beta_{st} P_{in\text{-}st} Sl^2_{\ bdg\text{-}dt}$

where a cross tie is fitted in a wing cargo tank and $l_{bdg\text{-}st\text{-}ct}$ is greater than 0.7 $l_{bdg\text{-}st}$, then $l_{bdg\text{-}st}$ in the above formula may be taken as $l_{bdg\text{-}st\text{-}ct}$.

M_{vw}: Bending moment transferred from the vertical web frame on the longitudinal bulkhead, in kNm:

$M_{st} = c_{vw} \beta_{vw} P_{in\text{-}vw} Sl^2_{\ bdg\text{-}vw}$

where $l_{bdg\text{-}vw\text{-}ct}$ is greater than 0.7 $l_{bdg\text{-}vw}$, then $l_{bdg\text{-}vw}$ in the above formula may be taken as $l_{bdg\text{-}vw\text{-}ct}$. For vertically corrugated bulkheads, M_{vw} is to be taken equal to bending moment in upper end of corrugation over the spacing between deck transverses.

M_0 : Minimum bending moment, in kNm.

$M_0 = 0.083 P_{in\text{-}dt} Sl^2_{\ bdg\text{-}dt}$

M_{ex} : Design bending moment due to green sea pressure, in kNm.

$M_{ex} = 0.067 P_{ex\text{-}dt} Sl^2_{\ bdg\text{-}dt}$

$P_{in\text{-}dt}$: Design cargo pressure given in Table 1 for the design load set being considered, calculated at mid- point of effective bending span, $l_{bdg\text{-}dt}$ of the deck transverse located at mid tank, in kN/m^2.

$P_{in\text{-}st}$: Corresponding design cargo pressure in wing cargo tank given in Table 1 for the design load set being considered, calculated at the mid-point of effective bending span, $l_{bdg\text{-}st}$ of the side transverse located at mid-tank, in kN/m^2.

$P_{in\text{-}vw}$: Corresponding design cargo pressure in the centre cargo tank of ships with two longitudinal bulkheads given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, $l_{bdg\text{-}vw}$ of the vertical web frame on the longitudinal bulkhead located at mid- tank, in kN/m^2.

$P_{ex\text{-}dt}$: Design green sea pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, $l_{bdg\text{-}dt}$ of the deck transverse located at mid tank, in kN/m^2.

φ_t : Coefficient taken as:

$$\varphi_t = 1 - 5\left(\frac{y_{toe}}{l_{bdg-dt}}\right) \text{ but not taken less than } 0.6.$$

y_{toe} : Distance from the end of effective bending span, $l_{bdg\text{-}dt}$ to the toe of the end bracket of the deck transverse, in m.

β_{st} : Coefficient taken as:

$$\beta_{st} = 0.9\left(\frac{l_{bdg-st}}{l_{bdg-dt}}\right)\left(\frac{I_{dt-n50}}{I_{st-n50}}\right) \text{ but not taken less than } 0.10 \text{ or greater than } 0.65.$$

β_{vw} : Coefficient taken as:

$$\beta_{vw} = 0.9\left(\frac{l_{bdg-vw}}{l_{bdg-dt}}\right)\left(\frac{I_{dt-n50}}{I_{vw-n50}}\right) \text{ but not taken less than } 0.10 \text{ or greater than } 0.50$$

$l_{bdg\text{-}dt}$: Effective bending span of the deck transverse, in m, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3, but is not to be taken as less than 60% of the breadth of the tank at the location being considered.

$l_{bdg\text{-}st}$: Effective bending span of the side transverse, in m, between the deck transverse and the bilge hopper, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3.

$l_{bdg\text{-}st\text{-}ct}$: Effective bending span of the side transverse, in m, between the deck transverse and the mid depth of the cross tie, where fitted in wing cargo tank, see Pt 1, Ch 3, Sec 7, [1.1.6].

$l_{bdg\text{-}vw}$: Effective bending span of the vertical web frame on the longitudinal bulkhead, in m, between the deck transverse and the bottom structure, see Pt 1, Ch 3, Sec 7, [1.1.6] and Figure 3.

$l_{bdg\text{-}vw\text{-}ct}$: Effective bending span of the vertical web frame on longitudinal bulkhead, in m, between the deck transverse and the mid depth of the cross tie, see Pt 1, Ch 3, Sec 7, [1.1.6].

$I_{dt\text{-}n50}$: Net moment of inertia of the deck transverse at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

$I_{st\text{-}n50}$: Net moment of inertia of the side transverse at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

$I_{vw\text{-}n50}$: Net moment of inertia of the longitudinal bulkhead vertical web frame at mid-span with an effective breadth of attached plating specified in Pt 1, Ch 3, Sec 7, [1.3.2], in cm^4.

c_{st} : Coefficient given in Table 3.

c_{vw} : Coefficient given in Table 3.

Values of c_{st} and c_{vw} for deck transverses **Table 3**

Structural configuration			c_{st}	c_{vw}
Ships with centreline longitudinal bulkhead			0.056	-
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M_{vw} based on $l_{bdg\text{-}vw\text{-}ct}$	-	0.044
		M_{st} based on $l_{bdg\text{-}st}$ or M_{vw} based on $l_{bdg\text{-}vw}$	0.044	0.016
	Cross ties in wing cargo tanks	M_{st} based on $l_{bdg\text{-}st\text{-}ct}$ or M_{vw} based on $l_{bdg\text{-}vw\text{-}ct}$	0.044	0.044
		M_{st} based on $l_{bdg\text{-}st}$ or M_{vw} based on $l_{bdg\text{-}vw}$	0.041	0.015

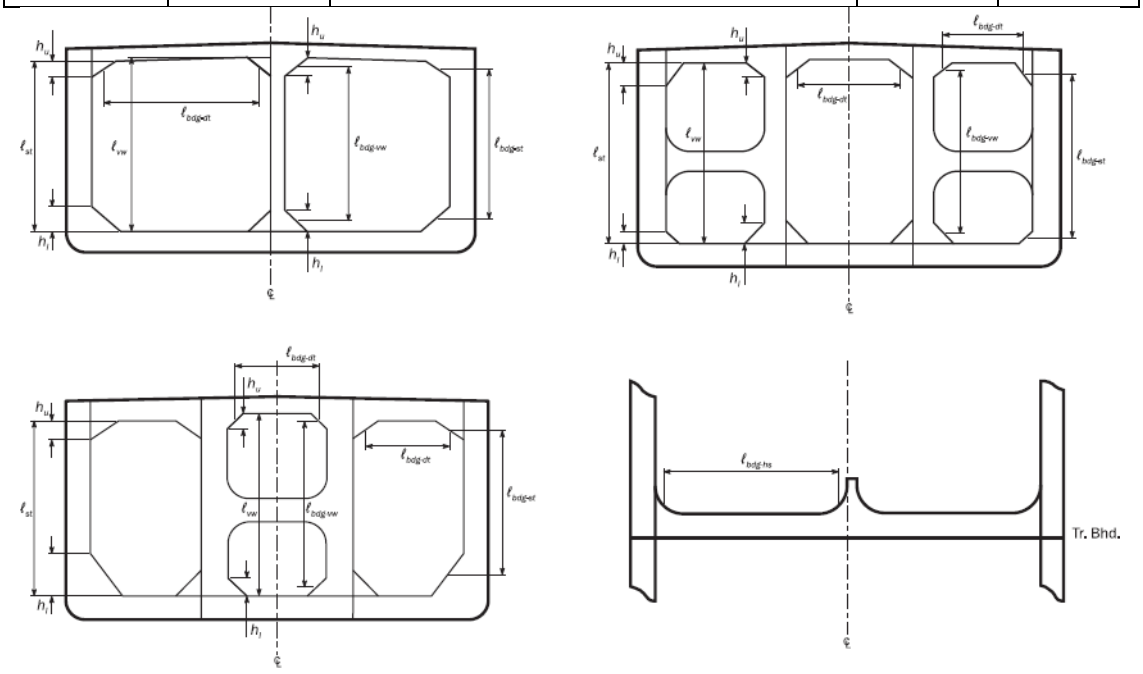

Figure 3 Definition of spans of deck, side transverses, vertical web frames on longitudinal bulkheads and horizontal stringers on transverse bulkheads

1.5.3 Net shear area of deck transverses fitted below the upper deck

The net shear area of deck transverses fitted below the upper deck, in cm^2, is not to be less than $A_{shr\text{-}in\text{-}n50}$ and $A_{shr\text{-}ex\text{-}n50}$ as given by:

$$A_{shr-in-n50} = \frac{8.5Q_{in}}{C_{t-pr}\tau_{eH}}$$

$$A_{shr-ex-n50} = \frac{8.5Q_{ex}}{C_{t-pr}\tau_{eH}}$$

where:

Q_{in} : Design shear force due to cargo pressure, in kN.

$Q_{in} = 0.65P_{in\text{-}dt}Sl_{shr} + c_1Db_{ctr}S\rho_L g$

Q_{ex} : Design shear force due to green sea pressure, in kN.

$Q_{ex}=0.65P_{ex\text{-}dt}Sl_{shr}$

$P_{in\text{-}dt}$: Design pressure in kN/m^2, defined in [1.5.2].

$P_{ex\text{-}dt}$: Design pressure in kN/m^2, defined in [1.5.2].

$l_{bdg\text{-}dt}$: Effective span, in m, defined in [1.5.2].

l_{shr} : Effective shear span, of the deck transverse, in m, see Pt 1, Ch 3, Sec 7, [1.1.7].

c_1 : Coefficient taken as:

- c_1 = 0.04 in way of wing cargo tanks of ships with two longitudinal bulkheads.
- c_1 = 0.00 in way of centre tank of ships with two longitudinal bulkheads.
- c_1 = 0.00 for ships with a centreline longitudinal bulkhead.

b_{ctr} : Breadth of the centre tank, in m.

1.5.4 Deck transverses fitted above the upper deck

When deck transverses are fitted above the upper deck, the net section modulus and shear area of deck transverses are not to be less than Z_{n50} and $A_{shr\text{-}n50}$, in cm^3 and cm^2 respectively, as given by the following formulae. The required section modulus and shear area are to be maintained over the full length of span.

$$Z_{n50} = \frac{850|P|Sl_{bdg}{}^2}{f_{bdg}C_{s-pr}R_{eH}}$$

$$A_{shr-n50} = \frac{8.5f_{shr}|P|Sl_{shr}}{C_{t-pr}\tau_{eH}}$$

where:

P : Design pressure given in Table 1 for the design load set being considered, calculated at midpoint of effective bending span, l_{bdg} of the deck transverse located at mid tank, in kN/m2.

f_{bdg} : Coefficient taken as:

f_{bdg} = 12 for design load set OT-1, OT-2 and OT-3 as defined in Table 1.

f_{bdg} = 15 for design load set SEA-1 as defined in Table 1.

f_{shr} : Coefficient taken as:

f_{shr} = 0.5

l_{bdg} : Effective bending span of the deck transverse fitted above upper deck, in m, measured from inner hull welded to deck to longitudinal bulkhead, or upper stool plating where upper stool is fitted

l_{shr} : Effective shear span of the deck transverse fitted above upper deck, in m, measured from inner hull welded to deck to longitudinal bulkhead, or upper stool plating where upper stool is fitted

As an alternative, the required section modulus and shear area may be obtained by finite element method in accordance with Pt 1, Ch 7 and with in consideration of loading patterns A1, A2 or B1, B2 as defined in Pt 1, Ch 4, Sec 8, [3.2.9] with draught equal to T_{sc} and cargo density of 1.025 t/m^3.

1.5.5 Deck transverse adjacent to transverse bulkhead

The scantling of deck transverse adjacent to the transverse bulkhead is to comply with the requirements of [1.5.2] to [1.5.4] for design green sea pressure only.

1.6 Side transverses

1.6.1 Net shear area

The net shear area, $A_{shr\text{-}n50}$, in cm^2, of side transverses is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{s-pr}\tau_{eH}}$$

where:

Q : Design shear force as follows, in kN:

$Q = Q_u$ for upper part of the side transverse.

$Q = Q_l$ for lower part of the side transverse.

Q_u : Shear force, in kN, taken as:

$Q_u = S[\, c_u\, l_{st}\, (P_u + P_l)\, - h_u P_u]$

where a cross tie is fitted in a wing cargo tank and $l_{st\text{-}ct}$ is greater than $0.7 l_{st}$, then l_{st} in the above formula is taken as $l_{st\text{-}ct}$.

Q_l : Shear force, in kN, taken as the greater of the following:

- $S[c_l l_{st}(P_u + P_l) - h_l P_l]$
- $0.35 c_l S l_{st}(P_u + P_l)$
- $1.2 Q_u$

where a cross tie is fitted in a wing cargo tank and $l_{st\text{-}ct}$ is greater than $0.7 l_{st}$, then l_{st} in the above formula is taken as $l_{st\text{-}ct}$.

P_u : Design pressure given in Table 1 for the design load set being considered, in kN/m^2, calculated at mid length of tank and at mid height of h_u.

P_l : Design pressure given in Table 1 for the design load set being considered, calculated at mid height h_l located at mid length of tank, in kN/m^2.

l_{st} : Length of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, l_{st} is the length between the flange of the deck transverse and the inner bottom, see Figure 3.
- Where deck transverses are fitted above deck, l_{st} is the length between the elevation of the deck at side and the inner bottom.

$l_{st\text{-}ct}$: Length of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, $l_{st\text{-}ct}$ is the length between the flange of the deck transverse and mid depth of cross tie, where fitted in wing cargo tank.
- Where deck transverses are fitted above deck, $l_{st\text{-}ct}$ is the length between the elevation of the deck at side and mid depth of the cross tie, where fitted in wing cargo tank.

h_u : Effective length of upper bracket of the side transverse, in m, taken as follows:

- Where deck transverses are fitted below deck, *hu* is as shown in Figure 3.
- Where deck transverses are fitted above deck:
  - When an inner hull longitudinal bulkhead is arranged with a top wing structure as follows, h_u is taken as the distance between the deck at side and the lower end of slope plate of the top wing structure:
    - The breadth at top of the wing structure is greater than 1.5 times the breadth of the double side and.
    - The angle along a line between the point at base of the slope plate at its intersection with the inner hull longitudinal bulkhead and the point at the intersection of top wing structure and deck is 30 deg or more to vertical.
  - In the other cases: *hu* is taken as 0.

h_l : Height of bilge hopper, in m, as shown in Figure 3.

c_u : Coefficient defined in Table 4.

c_l : Coefficient defined in Table 4.

Values of c_u and c_l for side transverses **Table 4**

Structural configuration			c_u		c_l	
Number of side stringers			Less than three	Equal to or greater than three	Less than three	Equal to or greater than three
Ships with a centreline longitudinal bulkhead			0.12	0.09	0.29	0.21
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank					
	Cross ties in wing cargo tanks	Q_u or Q_l based on l_{st-ct}				
		Q_u or Q_l based on l_{st}	0.08		0.20	

1.6.2 Shear area over the length of the side transverse

The shear area over the length of the side transverse is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required shear area for the upper part is to be maintained over the upper 0.2 l_{shr}.
b) The required shear area for the lower part is to be maintained over the lower 0.2 l_{shr}.
c) Where Q_u and Q_l are determined based on l_{st-ct}, the required shear area for the lower part is also to be maintained below the cross tie.
d) For ships without cross ties in the wing cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid- span.
e) For ships with cross ties in the wing cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts.

where:

l_{shr} : Effective shear span of the side transverse, in m.

$l_{shr} = l_{st} - h_u - h_l$ where Q_u and Q_l are determined based on l_{st}.

$l_{shr} = l_{st-ct} - h_u$ where Q_u and Q_l are determined based on l_{st-ct}.

l_{st}, l_{st-ct}, h_u, h_l, Q_u, Q_l : Parameters defined in [1.6.1].

1.7 Vertical web frames on longitudinal bulkhead

1.7.1 Web depth

The web depth of the vertical web frame on the longitudinal bulkhead is not to be less than:

- 0.14 l_{bdg-vw} for ships with a centreline longitudinal bulkhead.
- 0.09 l_{bdg-vw} for ships with two longitudinal bulkheads.
- The web height required in [1.1.6].

where:

l_{bdg-vw} : Effective bending span, in m, defined in [1.7.2].

1.7.2 Net section modulus

The net section modulus, Z_{n50} in cm^3, of the vertical web frame is not to be less than:

$$Z_{net\,50} = \frac{850M}{C_{s-pr}\sigma_{yd}}$$

where:

M : Design bending moment, in kNm, as follows:

$M = c_u P S l^2_{bdg-vw}$ for upper part of the web frame.

$M = c_l P S l^2_{bdg-vw}$ for lower part of the web frame.

where a cross tie is fitted and $l_{bdg-vw-ct}$ is greater than $0.7 l_{bdg-vw}$, then l_{bdg-vw} in the above formula is to be taken as $l_{bdg-vw-ct}$.

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of the effective bending span, l_{bdg-vw} of the vertical web frame located at mid tank, in kN/m^2.

l_{bdg-vw} : Effective bending span of the vertical web frame on the longitudinal bulkhead, between the deck transverse and the bottom structure, in m, see Figure 3.

$l_{bdg-vw-ct}$: Effective bending span of the vertical web frame on longitudinal bulkhead, between the

deck transverse and mid-depth of the cross tie on ships with two longitudinal bulkheads, in m.

c_u : Coefficient defined in Table 5.

c_l : Coefficient defined in Table 5.

Values of c_u and c_l for vertical web frame on longitudinal bulkheads Table 5

Structural configuration			c_u	c_l
Ships with a centreline longitudinal bulkhead			0.057	0.071
Ships with two longitudinal bulkheads	Cross tie in centre cargo tank	M based on $l_{bdg\text{-}vw\text{-}ct}$	0.057	0.071
		M based on $l_{bdg\text{-}vw}$	0.012	0.028
	Cross ties in wing cargo tanks	M based on $l_{bdg\text{-}vw\text{-}ct}$	0.057	0.071
		M based on $l_{bdg\text{-}vw}$	0.016	0.032

1.7.3 Section modulus over the length of the vertical web frame

The section modulus over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required section modulus for the upper part is to be maintained over the upper 0.2 $l_{bdg\text{-}vw}$ or 0.2 $l_{bdg\text{-}vw\text{-}ct}$ as applicable.

b) The required section modulus for the lower part is to be maintained over the lower 0.2 $l_{bdg\text{-}vw}$ or 0.2$l_{bdg\text{-}vw\text{-}ct}$ as applicable.

c) Where the required section modulus is determined based on $l_{bdg\text{-}vw\text{-}ct}$, the required section modulus for the lower part is also to be maintained below the cross tie.

d) The required section modulus between the upper and lower parts is to be reduced linearly to 70% of the required section modulus for the lower part at mid-span.

where:

$l_{bdg\text{-}vw}$, $l_{bdg\text{-}vw\text{-}ct}$: Effective bending span, in m, defined in [1.7.2].

1.7.4 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the vertical web frame is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\tau_{eH}}$$

where:

Q : Design shear force as follows, in kN:

$Q = Q_u$ for upper part of the web frame.

$Q = Q_l$ for lower part of the web frame.

Q_u : Shear force, in kN, taken as:

$Q_u = S[c_u l_{vw}(P_u + P_l) - h_u P_u]$

where a cross tie is fitted in a centre or wing cargo tank and $l_{vw\text{-}ct}$ is greater than $0.7l_{vw}$, then l_{vw} in the above formula is to be taken as $l_{vw\text{-}ct}$.

Q_l : Shear force, in kN, taken as the greater of the following:

- $S[c_l l_{vw}(P_u + P_l) - h_l P_l]$
- $c_w S c_l l_{st} (P_u + P_l)$
- $1.2\ Q_u$

where a cross tie is fitted in a centre or wing cargo tank and $l_{vw\text{-}ct}$ is greater than $0.7\ l_{vw}$, then l_{vw} in the above formula is to be taken as $l_{vw\text{-}ct}$.

P_u : Design pressure given in Table 1 for the design load set being considered, calculated at mid-height of upper bracket of the vertical web frame, *hu* located at mid tank, in kN/m^2.

P_l : Design pressure given in Table 1 for the design load set being considered, calculated at mid-height of lower bracket of the vertical web frame, *hl* located at mid tank, in kN/m^2.

l_{vw}: Length of the vertical web frame, in m, between the flange of the deck transverse and the inner bottom, see Figure 3.

$l_{vw\text{-}ct}$: Length of the vertical web frame, in m, between the flange of the deck transverse and mid-depth of the cross tie, where fitted.

h_u : Effective length of upper bracket of the vertical web frame, in m, as shown in Figure 3.

h_l : Effective length of lower bracket of the vertical web frame, in m, as shown in Figure 3.

c_u : Coefficient defined in Table 6.
c_l : Coefficient defined in Table 6.
c_w: Coefficient taken as:

- c_w = 0.57 for ships with a centreline longitudinal bulkhead,
- c_w = 0.50 for ships with two longitudinal bulkheads.

Values of c_u and c_l for vertical web frame on longitudinal bulkhead Table 6

Structural configuration		c_u	c_l
Ships with a centreline longitudinal bulkhead		0.17	0.28
Ships with two longitudinal bulkheads	Qu or Q_l based on l_{vw-ct}		
	Q_u or Q_l based on l_{vw}	0.075	0.18

1.7.5 Shear area over the length of the vertical web frame

The shear area over the length of the vertical web frame on the longitudinal bulkhead is to comply with the following. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

a) The required shear area for the upper part is to be maintained over the upper 0.2 l_{shr}.
b) The required shear area for the lower part is to be maintained over the lower 0.2 l_{shr}.
c) Where Q_u and Q_l are determined based on l_{vw-ct}, the required shear area for the lower part is also to be maintained below the cross tie.
d) For ships without cross ties in the wing or centre cargo tanks, the required shear area between the upper and lower parts is to be reduced linearly towards 50% of the required shear area for the lower part at mid-span.
e) For ships with cross ties in the wing or centre cargo tanks, the required shear area along the span is to be tapered linearly between the upper and lower parts.

where:
l_{shr} : Effective shear span of the vertical web frame, in m.
$l_{shr} = l_{vw} – h_u – h_l$ where Q_u and Q_l are determined based on l_{vw}.
$l_{shr} = l_{vw} – c_t – h_u$ where Q_u and Q_l are determined based on l_{vw-ct}.
l_{vw}, l_{vw-ct}, h_u, h_l, Q_u, Q_l: Parameters defined in [1.7.4].

1.8 Horizontal stringers on transverse bulkheads

1.8.1 Web depth

The web depth of horizontal stringers on transverse bulkhead is not to be less than:

- 0.28l_{bdg-hs} for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads.
- 0.20 l_{bdg-hs} for horizontal stringers in centre tanks of ships with two longitudinal bulkheads, but the web depth of horizontal stringers in centre tank is not to be less than required depth for a horizontal stringer in wing cargo tanks.
- 0.20 l_{bdg-hs} for horizontal stringers of ships with a centreline longitudinal bulkhead.
- The web height required in [1.1.6].

where:
l_{bdg-hs} : Effective bending span, in m, defined in [1.8.2].

1.8.2 Net section modulus

The net section modulus, Z_{n50} in cm^3, of the horizontal stringer over the end 0.2 l_{bdg-hs} is not to be less than:

$$Z_{n50} = \frac{850M}{C_{s-pr}R_{eH}}$$

where:
M : Design bending moment, in kNm.
P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, l_{bdg-hs} and at mid-point of the spacing, S of the horizontal stringer, in kN/m^2.
l_{bdg-hs} : Effective bending span of the horizontal stringer, in m, but is not to be taken as less than 50% of the breadth of the tank at the location being considered, see Figure 3.

c : Coefficient taken as:

- c = 0.073 for horizontal stringers in cargo tanks of ships with a centreline bulkhead.
- c = 0.083 for horizontal stringers in wing cargo tanks of ships with two longitudinal bulkheads.
- c = 0.063 for horizontal stringers in the centre tank of ships with two longitudinal bulkheads.

1.8.3 Section modulus over the length of horizontal stringers

The required section modulus at mid effective bending span is to be taken as 70% of that required at the ends , intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

1.8.4 Net shear area

The net shear area, $A_{shr\text{-}n50}$ in cm^2, of the horizontal stringer over the end 0.2 l_{shr} is not to be less than:

$$A_{shr-n50} = \frac{8.5Q}{C_{t-pr}\tau_{eH}}$$

where:

Q : Design shear force, in kN.

$Q = 0.5PS_{hs}\, l_{shr}$

P : Design pressure given in Table 1 for the design load set being considered, calculated at mid-point of effective bending span, $l_{bdg\text{-}hs}$ and at mid-point of the spacing, S of the horizontal stringer, in kN/m^2.

S_{hs} : Spacing, in m, defined in [1.8.2].

l_{shr} : Effective shear span of the horizontal stringer, in m.

1.8.5 Shear area at mid effective shear span

The required shear area at mid effective shear span is to be taken as 50% of that required in the ends, intermediate values are to be obtained by linear interpolation. When materials of different yield stress are employed, appropriate adjustments are to be made to account for differences in material yield stress.

1.9 Cross ties

1.9.1 Maximum applied design axial load

The maximum applied design axial load on cross ties, W_{ct} is to be less than or equal to the permissible load,

$W_{ct\text{-}perm}$ as given by:

$W_{ct} \leqslant W_{ct-perm}$

where:

W_{ct} : Applied axial load, in kN.

$W_{ct} = Pb_{ct}S$

$W_{ct\text{-}perm}$: Permissible load, in kN.

$W_{ct\text{-}perm}=0.12A_{ct\text{-}n50}\eta_{all}\sigma_{cr}$

P : Maximum design pressure for all the applicable design load sets being considered given in Table 1, calculated at centre of the area supported by the cross tie located at mid tank, in kN/m^2.

b_{ct} : Span, in m, taken as:

- Cross tie fitted in centre cargo tank: $b_{ct} = 0.5l_{bdg\text{-}vw}$
- Cross ties fitted in wing cargo tanks:
  - $b_{ct} = 0.5l_{bdg\text{-}vw}$ for design cargo pressure from the centre cargo tank.
  - $b_{ct} = 0.5\, l_{bdg\text{-}st}$ for design sea pressure.

$l_{bdg\text{-}vw}$: Effective bending span, in m, defined in [1.5.2].

$l_{bdg\text{-}st}$: Effective bending span, in m, defined in [1.5.2].

η_{all} : Allowable buckling utilisation factor as defined in Pt 1, Ch 8, Sec 1, [3.3].

σ_{cr} : Critical buckling stress in compression of the cross tie, in N/mm^2, as calculated using the

net sectional properties in accordance with Pt 1, Ch 8, Sec 5, [3.1.1].

$A_{ct\text{-}n50}$: Net cross sectional area of the cross tie, in cm^2.

1.9.2 Welded connections

Special attention is to be paid to the adequacy of the welded connections for the transmission of the forces, and also to the stiffening arrangements, in order to provide effective means for transmission of the compressive forces into the webs.

Particular attention is to be paid to the welding at the toes of all end brackets of the cross ties.

1.9.3 Horizontal stiffeners

Horizontal stiffeners are to be located in line with, and attached to, the longitudinals at the ends of the cross ties.

2 VERTICALLY CORRUGATED BULKHEADS

2.1 Application

2.1.1

In addition to the requirements of Pt 1, Ch 6, Sec 4, [1], vertically corrugated bulkheads of oil tankers are also to comply with the requirements of [2.2].

2.2 Scantling requirements

2.2.1 Net plate thickness over the height

The net plate thicknesses as required by [2.2.3] and [2.2.4] are to be maintained for two thirds of the corrugation length, l_{cg} from the lower end. Above that, the net plate thickness may be reduced by 20% from the net thickness required in [2.2.3] for the mid part of the corrugation provided that the net section modulus of the upper end of the corrugation complies with [2.2.4].

2.2.2 Net web plating thickness over the height

The net web plating thickness of the lower 15% of the corrugation, *tw* in mm, is to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2], and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool.

$$t_w = \frac{1000\left|Q_{cg}\right|}{d_{cg} C_{t-cg} \tau_{eH}}$$

where:

Q_{cg} : Design shear force imposed on the web plating at the lower end of the corrugation, in kN.

$$Q_{cg} = \frac{s_{cg} l_{cg} \left|3P_l + P_u\right|}{8000}$$

P_l : Design pressure given in Pt 1, Ch 6, Sec 2, Table 1 for the design load set being considered, calculated at the lower end of the corrugation, in kN/m^2.

P_u : Design pressures given in Pt 1, Ch 6, Sec 2,Table 1 for the design load set being considered, calculated at the upper end of the corrugation, in kN/m^2.

d_{cg} : Depth of corrugation, in mm, see Figure 4.

$C_{t\text{-}cg}$: Permissible shear stress coefficient:

$C_{t\text{-}cg}$ = 0.75 for acceptance criteria set AC-S.

$C_{t\text{-}cg}$ = 0.90 for acceptance criteria set AC-SD.

2.2.3 Net thicknesses of the flanges over the height

The net thicknesses of the flanges of corrugated bulkheads, *tf* in mm, for two thirds of the corrugation length from the lower end are to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2], and given by the following. This requirement is not applicable to corrugated bulkheads without a lower stool.

$$t_f = \frac{6.57\, b_{f-cg} \sqrt{\sigma_{bdg-max}}}{C_f} 10^{-3}$$

where:

$\sigma_{bdg\text{-}max}$: Maximum value of the vertical bending stresses in N/mm^2 in the flange. The bending stress is to be calculated at the lower end and at the mid span of the corrugation length.

$$\sigma_{bdg-\max} = \frac{M_{cg}}{Z_{cg-act}} 10^3$$

M_{cg} : Vertical bending moment, in kNm, as defined in [2.2.4].

$Z_{cg\text{-}act}$: Actual net section modulus at the lower end and at the mid length of the corrugation, in cm^3.

$b_{f\text{-}cg}$: Breadth of flange plating, in mm. See Figure 4.

$b_{w\text{-}cg}$: Breadth of web plating, in mm. See Figure 4.

C_f : Coefficient taken as:

$$C_f = 7.65 - 0.26(\frac{b_w}{b_f})^2$$

2.2.4 Net section modulus over the height

The net section modulus at the lower and upper ends and at the mid length of the corrugation (l_{cg} / 2) of a unit corrugation, Z_{cg} are to be taken as the greatest value calculated for all applicable design load sets, as given in Pt 1, Ch 6, Sec 2, [2] and given by the following.

$$Z_{cg} = \frac{1000 M_{cg}}{C_{s-cg} R_{eH}}$$

where:

M_{cg} : Vertical bending moment in kNm.

$$M_{cg} = \frac{C_i |P| s_{cg} l_0^2}{12000}$$

P : Averaged pressure in kN/m^2.

$$P = \frac{P_u + P_l}{2}$$

P_l, P_u : Design pressure given in Pt 1, Ch 6, Sec 2, Table 1 for the design load set being considered, calculated at the lower and upper ends of the corrugation, respectively, in kN/m^2:

- For transverse corrugated bulkheads, the pressures are to be calculated at a section located at b_{tk} / 2 from the longitudinal bulkheads of each tank.
- For longitudinal corrugated bulkheads, the pressures are to be calculated at the ends of the tank, i.e. the intersection of the forward and aft transverse bulkheads and the longitudinal bulkhead.

b_{tk} : Maximum breadth of tank under consideration measured at the bulkhead, in m.

l_o : Effective bending span of the corrugation, in m, measured from the mid depth of the lower stool to the mid depth of the upper stool. Where no lower or upper stool is fitted, l_o is to be measured to lower or upper end. See Figure 4.

C_i : Bending moment coefficient given in Table 7.

$C_{s\text{-}cg}$: Permissible bending stress coefficient at the mid-length of the corrugation length, l_{cg}:

$C_{s\text{-}cg} = c_e$ but not to be taken as greater than 0.75 for acceptance criteria set AC-S.

$C_{s\text{-}cg} = c_e$ but not to be taken as greater than 0.90 for acceptance criteria set AC-SD.

At the lower and upper ends of the corrugation length, l_{cg}:

$C_{s\text{-}cg} = 0.75$ for acceptance criteria set AC-S.

$C_{s\text{-}cg} = 0.90$ for acceptance criteria set AC-SD.

c_e : Coefficient taken as:

$$c_e = \frac{2.25}{\beta} - \frac{1.25}{\beta^2} \quad \text{for} \quad \geqslant 1.25$$

$$c_e = 1.0 \quad \text{for} \quad < 1.25$$

β : Coefficient taken as:

$$\beta = \frac{b_{f-cg}}{t_f} \sqrt{\frac{R_{eH}}{E}}$$

$b_{f\text{-}cg}$: Breadth of flange plating, in mm, see Figure 4.
t_f : Net thickness of the corrugation flange, in mm.

Values of C_i **Table 7**

Bulkhead	At lower end of l_{cg}	At mid-length of l_{cg}	At upper end of l_{cg}
Transverse bulkhead	C_1	C_{m1}	0.65 C_{m1}
Longitudinal bulkhead	C_3	C_{m3}	0.65 C_{m3}

where:
C_1 : Coefficient taken as:

$$C_1 = a_1 + b_1\sqrt{\frac{A_{dt}}{b_{dk}}}$$ but taken not less than 0.60.

$$C_1 = a_1 - b_1\sqrt{\frac{A_{dt}}{b_{dk}}}$$ for transverse bulkhead with no lower stool, but taken not less than 0.55.

a_1 : Coefficient taken as:

$$a_1 = 0.95 - \frac{0.41}{R_{bt}}$$

a_1 =1.0 for transverse bulkhead with no lower stool.
b_1 : Coefficient taken as:

$$b_1 = -0.20 + \frac{0.078}{R_{bt}}$$

b_1 = 0.13 for transverse bulkhead with no lower stool.
C_{m1} : Coefficient taken as:

$$C_{m1} = a_{m1} + b_{m1}\sqrt{\frac{A_{dt}}{b_{dk}}}$$ but not taken less than 0.55.

$$C_{m1} = a_{m1} - b_{m1}\sqrt{\frac{A_{dt}}{b_{dk}}}$$ for transverse bulkhead with no lower stool, but not taken less than 0.60

a_{m1} : Coefficient taken as:

$$a_{m1} = 0.63 + \frac{0.25}{R_{bt}}$$

$a_{m\,1}$ = 0.85 for transverse bulkhead with no lower stool.
b_{m1} : Coefficient taken as:

$$b_{m1} = -0.25 - \frac{0.11}{R_{bt}}$$

b_{m1} = 0.34 for transverse bulkhead with no lower stool.
C_3 : Coefficient taken as:

$$C_3 = a_3 + b_3\sqrt{\frac{A_{dl}}{l_{dk}}}$$ but not taken less than 0.60.

$$C_3 = a_3 - b_3\sqrt{\frac{A_{dl}}{l_{dk}}}$$ for longitudinal bulkhead with no lower stool, but not taken less than 0.55.

$a3$: Coefficient taken as:

$$a_3 = 0.86 - \frac{0.35}{R_{bl}}$$

a_3 =1.0 for longitudinal bulkhead with no lower stool.
b_3 : Coefficient taken as:

$$b_3 = -0.17 + \frac{0.10}{R_{bl}}$$

b_3 =0.13 for longitudinal bulkhead with no lower stool.
C_{m3} : Coefficient taken as:

$C_{m3} = a_{m3} + b_{m3}\sqrt{\frac{A_{dl}}{l_{dk}}}$ but not taken less than 0.55

$C_{m3} = a_{m3} - b_{m3}\sqrt{\frac{A_{dl}}{l_{dk}}}$ for longitudinal bulkhead with no lower stool, but not taken less than 0.60

a_{m3} : Coefficient taken as:

$$a_{m3} = 0.32 + \frac{0.24}{R_{bl}}$$

a_{m3} =0.85 for longitudinal bulkhead with no lower stool.

b_{m3} : Coefficient taken as:

$$b_{m3} = -0.12 - \frac{0.10}{R_{bl}}$$

b_{m3} =0.19 for longitudinal bulkhead with no lower stool.

R_{bt} : Coefficient taken as:

$$R_{bt} = \frac{A_{bt}}{b_{ib}}\left(1 + \frac{l_{ib}}{b_{ib}}\right)\left(1 - \frac{b_{av-t}}{h_{st}}\right) \text{ for transverse bulkheads}$$

R_{bl} : Coefficient taken as:

$$R_{bl} = \frac{A_{bl}}{I_{ib}}\left(1 + \frac{l_{ib}}{b_{ib}}\right)\left(1 - \frac{b_{av-l}}{h_{sl}}\right) \text{for longitudinal bulkheads.}$$

A_{dt} : Cross sectional area enclosed by the moulded lines of the transverse bulkhead upper stool, in m^2.
A_{dt} = 0 if no upper stool is fitted.

A_{dl} : Cross sectional area enclosed by the moulded lines of the longitudinal bulkhead upper stool, in m^2.
A_{dl} = 0 if no upper stool is fitted.

A_{bt} : Cross sectional area enclosed by the moulded lines of the transverse bulkhead lower stool, in m^2.

A_{bl} : Cross sectional area enclosed by the moulded lines of the longitudinal bulkhead lower stool, in m^2.

b_{av-t} : Average width of transverse bulkhead lower stool, in m. See Figure 4.

b_{av-l} : Average width of longitudinal bulkhead lower stool, in m. See Figure 4.

h_{st} : Height of transverse bulkhead lower stool, in m. See Figure 4.

h_{sl} : Height of longitudinal bulkhead lower stool, in m. See Figure 4.

b_{ib} : Breadth of cargo tank at the inner bottom level between hopper tanks, or between the hopper tank and centreline lower stool, in m. See Figure 4.

b_{dk} : Breadth of cargo tank at the deck level between upper wing tanks, or between the upper wing tank and centreline deck box or between the corrugation flanges if no upper stool is fitted, in m. See Figure 4.

l_{ib} : Length of cargo tank at the inner bottom level between transverse lower stools, in m. See Figure 4.

l_{dk} : Length of cargo tank at the deck level between transverse upper stools or between the corrugation flanges if no upper stool is fitted, in m. See Figure 4.

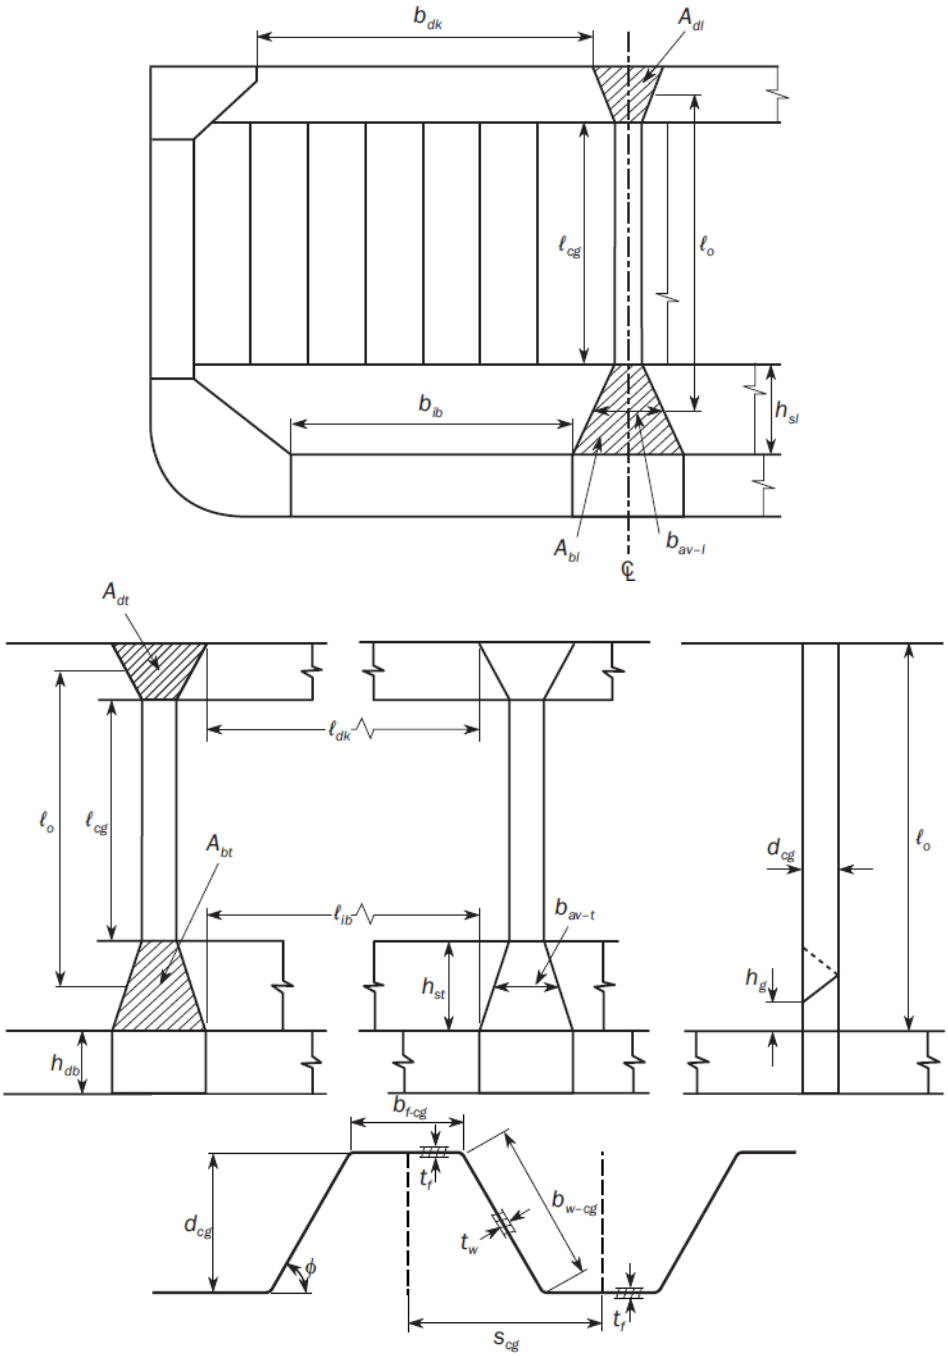

Figure 4 Definition of parameters for corrugated bulkhead (Tankers with longitudinal bulkhead at centreline)

SECTION 4 HULL OUTFITTING

1 SUPPORTING STRUCTURES FOR COMPONENTS USED IN EMERGENCY TOWING ARRANGEMENTS

1.1 General

1.1.1

It is the responsibility of the designer to provide emergency towing arrangements fitted at both the bow and stern of every tanker with a deadweight of 20,000 tonnes or more, as required by SOLAS, as amended.

1.1.2

The designer is reminded that design and construction of the towing arrangements are to be approved by the Flag Administration or the Society on their behalf.

1.2 Documents to be submitted

1.2.1

Plans showing details of the supporting structure for the emergency towing arrangement, including the connection to the deck, are to be provided for approval. Information on emergency towing arrangement showing sufficient detail to enable the position and direction of load actions to be ascertained is to be submitted for reference.

1.3 Structural arrangement

1.3.1 Continuity of strength

The structural arrangement is to provide continuity of strength.

1.3.2 Stress concentrations

The structural arrangement of the ship's structure in way of the emergency towing equipment is to be such that, abrupt changes of shape or section are to be avoided in order to minimise stress concentrations. Sharp corners and notches are to be avoided, especially in high stress areas.

1.4 Minimum thickness requirements

1.4.1 Deck plating

The deck in way of strong-points and fairleads is to have a minimum gross thickness of 15 mm.

1.5 Loads

1.5.1 Safe working loads

Safe working load of emergency towing arrangements is not to be taken less than:

- 1,000 kN for tankers having a deadweight greater than or equal to 20,000 t, but less than 50,000 t.
- 2,000 kN for tankers having a deadweight greater than or equal to 50,000 t.

1.5.2 Load case

The design load for the connection of the strong-point and fittings to the deck and its supporting structure is to be taken as twice the safe working load. Information on lines of action of the applied design load provided in emergency towing arrangement plan is to be taken into account.

1.6 Scantling requirements

1.6.1 General

The scantlings of the support structure are to be dimensioned to ensure that for the load cases specified in [1.5.2], the calculated stresses in the support structure do not exceed the permissible stress levels specified in [1.6.3].

The capacity of the structure to resist buckling failure is also to be assured.

1.6.2 Calculation procedure

These requirements are to be assessed using a simplified engineering analysis based on elastic beam theory, two dimensional grillage or finite element analysis using gross scantlings.

1.6.3 Permissible stresses

For the design load given in [1.5.2], the shear stresses and normal stresses, including bending stresses induced in the supporting structure and welds, in way of strong-points and fairleads, are not to be exceed the permissible values given below based on the gross thickness of the structure:

- Normal stress, 1.00 R_{eH}.
- Shear stress, 0.58 R_{eH} .

Allowable buckling utilization factor is to be used as given in Ch 8, Sec 1, Table 1, for static and dynamic load scenario, S+D. Buckling assessment method is to be used according to Pt 1, Ch 8, Sec 4, [2].

2 MISCELLANEOUS DECK ATTACHMENTS

2.1 Cargo manifolds

2.1.1 Cargo manifold support

The design of the cargo manifold support is to be such as to distribute the loads imposed on the pipework into the ship structure in seagoing or in harbour operations during loading and unloading. To achieve this, the connection of the cargo manifold support to the deck is to be arranged to align with stiffening members of the main hull structure or stiffening is to be fitted in order to avoid the creation of hard points. Attention is to be paid to the detail design of the structure forming the deck attachment in order to minimise the effects of change of section. The arrangement of such details and their approval is considered on a case-by-case basis by the Society.

ISC 2.1.1a The connection structures of hull outfitting equipment to the deck are to comply with the requirements of ISC 6.1.1b in Section 4, Chapter 11 of PART 9-1.

3 GUARD RAILS AND BULWARKS

3.1 General

3.1.1

Generally, open guard rails are to be fitted on the upper deck. Plate bulwarks, with a 230 mm high continuous opening, at the lower edge, may be accepted provided the arrangement allows for the acceptable handling of spillage on deck and minimises the possibility for accumulation of volatile gas.

3.1.2

Deck spills are to be prevented from spreading to the accommodation and service areas and from discharge into the sea by a permanent continuous coaming with a minimum height of 100 mm surrounding the cargo deck. Along the sides at the aft end of the cargo deck of oil tankers, the coaming is to have a minimum height of 300 mm extending a minimum of 4.5 m forward from each corner. At the aft end of the cargo deck, the coaming is to have a minimum height of 300 mm and is to extend from side to side of the ship.

3.1.3

Scupper plugs of mechanical type are to be provided. Means of draining or removing oil or oily water within the coaming are also to be provided.

ISC Appendix A IACS REC.14 - HATCH COVER SECURING AND TIGHTNESS

(CORR.1 OCT. 2005)

1 Application

1.1

The following recommendations apply to steel hatch covers that are fitted to hatch openings on weather decks.

1.2

The recommendations, when relevant, also apply to the non-weathertight hatch covers which are accepted on container ships in accordance with the UI LL 64.

1.3

Where large relative movements between cover and ship structure or between cover elements are expected for ships having comparatively long/wide hatch ways, the application of these arrangements specified in the Recommendations for the gasket and securing arrangements are to be specially considered.

2 Design and Weathertightness

2.1 General

2.1.1

The weight of covers and any cargo stowed thereon, together with inertial forces generated by ship motions, are to be transmitted to the ship structure through suitable contact, such as continuous steel to steel contact of the cover skirt plate with the ship's structure or by means of defined bearing pads.

2.2 Weathertight Hatch Covers

2.2.1

The arrangement of weathertight hatch covers is to be such that weathertightness can be maintained in all sea conditions.

2.2.2

Weathertight sealings are to be obtained by a continuous gasket of relatively soft elastic material compressed to achieve the necessary weathertightness. Similar sealing is to be arranged between cross-joint elements. Where fitted, compression flat bars or angles are to be well rounded where in contact with the gasket and are to be made of a corrosion-resistant material.

2.2.3

The gasket material is to be of a quality suitable for all environmental conditions likely to be experienced by the ship, and is to be compatible with the cargoes carried. The material and form of gasket selected is to be considered in conjunction with the type of cover, the securing arrangement and the expected relative movement between cover and ship structure. The gasket is to be effectively secured to the cover.

3 Drainage Arrangement

3.1 General

3.1.1

Drain openings are to be arranged at the ends of drain channels and are to be provided with effective means for preventing ingress of water from outside, such as non-return valves or equivalent.

3.2 Weather tight Hatch Covers

3.2.1

Drainage is to be arranged inside the line of gasket by means of a gutter bar or vertical extension

of the hatch side and end coaming.

3.2.2
Cross-joints of multi-panel covers are to be arranged with drainage of water from the space above the gasket and a drainage channel below the gasket.

3.2.3
If a continuous outer steel contact between cover and ship structure is arranged, drainage from the space between the steel contact and the gasket is also to be provided.

4 Securing Devices

4.1 General

4.1.1
Devices used to secure hatch covers, i.e. bolts, wedges or similar, are to be suitably spaced along the coamings and between cover elements.

4.1.2
The minimum gross sectional area of each securing device is not to be less than:

$$A = \frac{1.4\bar{a}}{f} \quad \text{cm}^2$$

where:

$\bar{a}$ = *half the distance between the two adjacent securing devices, measured along hatch cover periphery, see Fig. 1, m*

$$f = (\sigma_F/235)^m$$

σ_F = *minimum upper yield stress of the material, not to be taken greater than 70% of the ultimate tensile strength, N/mm²*

m = 0.75 for σ_F *>235 N/mm²*

m = 1.00 for σ_F *α235 N/mm²*

Where the packing line pressure (see 4.2.2) exceeds 5 N/mm, the cross-sectional area of the securing devices is to be increased in direct proportion.

Rods or bolts are to have a minimum gross diameter not less than 19 mm for hatchways exceeding 5 m² in area.

4.1.3
Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

4.1.4
Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4.1.5
Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

4.2 Weathertight Hatch Covers

4.2.1
Arrangement and spacing of securing devices are to be determined with due attention to the effectiveness for weathertightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

4.2.2
Between cover and coaming and at cross-joints, a packing line pressure sufficient to obtain weathertightness is to be maintained by the securing devices. The packing line pressure is to be specified.

4.2.3

The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The gross moment of inertia of edge elements is not to be less than:

$I = 6\,pa^4\ \ cm^4$

where:

p *= packing line pressure, with* $p \geqslant 5$ *N/mm*

a *= maximum of the distances,* a_i*, between two consecutive securing devices, measured along the hatch cover periphery (see Figure 1), not to be taken as less than 2.5* a_c*, m*

a_c *: max* $(a_{1.1}, a_{1.2})$ *, m*

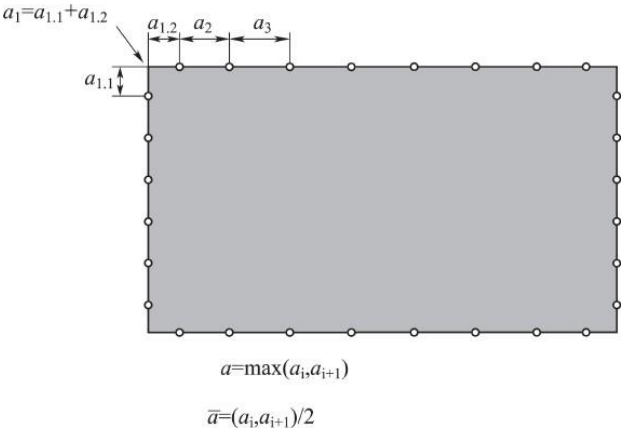

Figure 1 Distance between securing devices, measured along hatch cover periphery

When calculating the actual gross moment of inertia of the edge element, the effective breadth of the attached plating of the hatch cover, in m, is to be taken equal to the lesser of the following values:

- *0.165 a*
- *half the distance between the edge element and the adjacent primary member*

4.2.4

The angle section or equivalent section bearing the rubber seal is to be of adequate size and well integrated with the cover edge element structure to ensure uniform sealing pressure all along the line of contact

5 Securing Arrangement for Hatch Covers carrying Deck Cargo

5.1

In addition to the recommendations given in 4, all hatch covers, especially those carrying deck cargo are to be effectively secured against horizontal shifting due to the horizontal forces arising from ship motions.

5.2

To prevent damage to hatch covers and ship structure, the location of stoppers is to be compatible with the relative movements between hatch covers and ship structure. The number should be as small as practically possible.

5.3

Considerations are to be given for assessment of cargo loads that towards the end of the ship vertical acceleration forces may exceed the gravity force. The resulting lifting forces must be considered when dimensioning the securing devices according to 4. Also lifting forces from cargo secured on the hatch cover during rolling are to be taken into account.

5.4

Hatch coamings and supporting structure are to be adequately stiffened to accommodate the loading from hatch covers.

5.5

At cross-joints of multi-panel covers vertical guides (male/female) are to be fitted to prevent excessive relative vertical deflections between loaded/unloaded panels.

5.6

In the absence of hatch cover lifting under loads arising from the ship's rolling motion, securing devices for non-weathertight hatch covers may be omitted. In such cases, it is to be proven by means of grillage and/or finite element analyses that an equilibrium condition is achieved using compression-only boundary elements for the vertical hatch cover supports. If securing devices are omitted, transverse cover guides are to be effective up to a height h_E above the hatch cover supports, where h_E must not be less than:

$h_E = 1.75(2se + d^2)^{0.5} - 0.75d$ *mm*

$h_{E,min}$ *= height of the cover edge plate +150 mm*

where:

e = largest distance from the inner edges of the transverse cover guides to the ends of the cover edge plate, mm

s = total clearance within the transverse cover guide, with $10 \leqslant s \leqslant 40$*, mm*

d = distance between upper edge of transverse stopper and hatch cover supports, mm

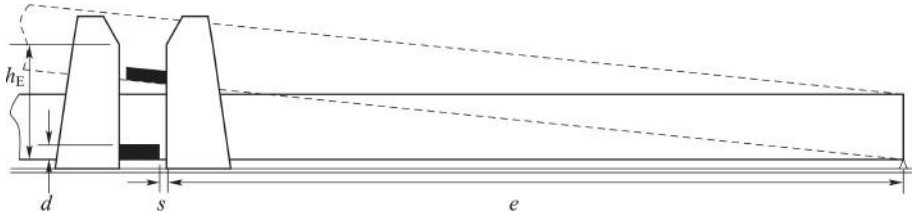

Figure 2 Height of transverse cover guides

The transverse cover guides and their substructure are to be dimensioned in accordance with the transverse loads acting at a height h_E and an allowable stress defined by each Classification Society.

6 Tightness Testing of Weathertight Hatch Covers

6.1

Upon completion of installation of hatch covers, a chalk test is to be carried out.

6.2

This is to be followed by a hose test with a pressure of water not less than 200 kN/m^2.

The following may be assumed for guidance:

Nozzle diameter: minimum 12 mm

Water pressure: sufficient for a free height of water with the stream directed upwards of 10 meters maximum

Distance to structure: maximum 1,5 meters

6.3

Alternative methods of tightness testing will be considered.

7 Operation Test

7.1

All hatch covers are to be operationally tested.

8 Operation and Maintenance

8.1

It is recommended that ships with steel hatch covers are supplied with an operation and maintenance manual including:

- *Operating and closing instructions*
- *Maintenance requirements for packings, securing devices and operating items*
- *Cleaning instructions for the drainage system*
- *Corrosion prevention instructions*
- *List of spare parts.*

ISC Appendix B IACS REC.34 - Standard Wave Data
(CORR. Nov. 2001)

1

This recommendation is valid for ships carrying goods at sea, excluding vessels that operate at a fixed location (for example FPSO s), specifically aiming at ships as covered by UR S11, and focusing on extreme wave loads.

2

Wave data as described by the scatter diagram given in TABLE 1, describe the wave data of the North Atlantic as defined in FIGURE 1, covering areas 8,9,15 and 16, as defined in Global Wave Statistics/1/ with changes according to /2/.

3

When calculating design wave bending moments, it is recommended to use a return period of at least 20 years, corresponding to about 10^{-8} probability of exceedance per cycle.

4

When calculating the pressure head from green seas on horizontal deck plates and hatch covers, the relative motion in the undisturbed wave at the centre line for the considered area, at a return period of 20 years, can be applied as a first approximation.

5

Combination of loads should be performed, preferably using simultaneous values, to ensure application of the design loads at a consistent probability level.

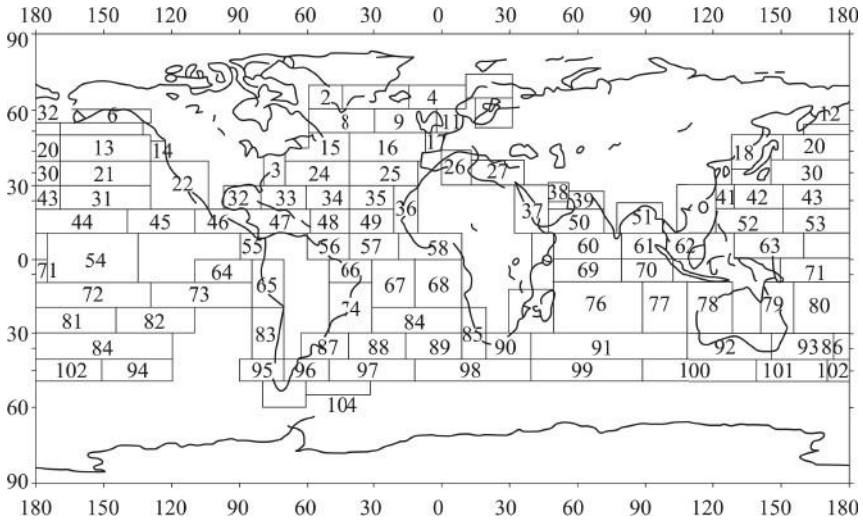

Figure 1 Definition of the extent of the North Atlantic

The Table 1 Probability of sea-states in the North Atlantic described as occurrence per 100000 observations.

The Hs and Tz values are class midpoints

6

For evaluation of extreme global bending moments it is recommended to use zero speed, provided the vessel does not have a service restriction, in which case the limitation should be checked as well. The effect of forward speed (2/3 of design speed) is recommended to be checked, especially for local dynamic pressures.

7

The Bretschneider or two parameter Pierson-Moskowitz spectrum is recommended for the North Atlantic, described by the following expression:

$$S(\omega) = \frac{H_S^2}{4\pi}(\frac{2\pi}{T_Z})^4 \omega^{-5} \exp(-\frac{1}{\pi}(\frac{2\pi}{T_Z})^4 \omega^{-4})$$

where:

H_s *= The significant wave height (m)*

ω *= Angular wave frequency (rad/s)*

T_Z *= The average zero up - crossing wave period (s)*

$$T_Z = 2\pi(\frac{m_2}{m_0})^{1/2}$$

The spectral moments of order n of the response process for a given heading may be described as

$$m_n = \int_\omega \sum_{\theta_0-90°}^{\theta_0+90°} f_s(\theta)\omega^n \cdot S(\omega / H_S, T_Z, \theta)\mathrm{d}\omega$$

using a spreading function usually defined as $f_s(\theta)=k\cos^2\theta$

where k is selected such that:

$$\sum_{\theta_0-90°}^{\theta_0+90°} f_s(\theta) = 1$$

where:

θ_0*=main wave heading*

θ*=relative spreading around the main wave heading*

8

In long term calculations, all wave headings (0-360°) can be assumed to have an equal probability of occurrence and at most 30°spacing between headings should be applied.

9

When calculating vertical bending moments (Sag and Hog) proper corrections for non-linear effects are to be applied.

10

The dynamic sea pressure can be derived above the mean waterline (WL) based on linear calculation methods by a reduction of 1-one meter pressure head per meter distance from the mean WL using a dynamic sea pressure at a return period of 20 years, corresponding to about 10^{-8} *probability per cycle. In case dynamic sea pressures at* 10^{-4} *probability per cycle are applied, a reduction of 1/2-half meter pressure head per meter distance above the mean WL should apply to ensure dynamic sea pressures at sufficient height above the mean WL.*

11

When calculating design sea pressures at ship ends, due consideration should be taken to the occurrence of non-linearity s such as slamming on the bottom and non-vertical ship sides.

CHAPTER 0 GENERAL

Section 1 GENERAL PROVISIONS

0.1.1 Scope of application

0.1.1.1 The provisions of this PART apply to ships navigating and/or operating in restricted service, including ships engaged on international and non-international (domestic or regional) voyages and/or operation.

0.1.1.2 Where not covered by this PART, the relevant provisions of PART ONE to PART EIGHT of the Rules are to be complied with.

0.1.1.3 Where relevant provisions for ships engaged on non-international voyages in this PART are not consistent with the requirements of the Administration of the flag State, the requirements of the Administration of the flag State are to be satisfied and relevant requirements of this PART may not be satisfied.

0.1.2 Definitions

0.1.2.1 Restricted service is a generic term of the service categories 1, 2 and 3. For limitation for navigation of each service category, see Table 2.1.3.1, Section 1, Chapter 2, PART ONE of the Rules.

0.1.3 Class notations

0.1.3.1 Ships complying with this PART, except for the provisions for ships engaged on non-international voyages in restricted service, will be asssigned one of the following notations:

(1) Service category 1: R1;

(2) Service category 2: R2;

(3) Service category 3: R3.

0.1.3.2 Ships complying with the provisions for ships engaged on non-international voyages in restricted service of this PART will be suffixed D after the corresponding service category notations: R1(D), R2(D), R3(D).

0.1.3.3 For ships assigned with notations R1, R2, R3, the survey after construction is to comply with the relevant requirements of PART ONE of the Rules; for ships assigned with notations R1(D), R2(D), R3(D), the survey after construction is to comply with the relevant requirements of Chapter 1 of this PART.

0.1.3.4 For engineering ships whose operation areas are different from transiting areas, the areas applicable for transiting and operation may be identified separately, e.g.: R2 for Transiting and R3 for Operation.

0.1.3.5 Other service restriction or limitaton notations are given in Table C, Appendix 1, Chapter 2, PART ONE of the Rules.

CHAPTER 1 SURVEYS AFTER CONSTRUCTION OF SHIPS ENGAGED ON NON-INTERNATIONAL VOYAGES

Section 1 GENERAL PROVISIONS

1.1.1 General requirements

1.1.1.1 For merchant ships rented or owned by the government and used for military purposes, special consideration may be given to the application of relevant requirements of this Chapter.

Section 2 HULL AND EQUIPMENT SURVEYS

1.2.1 General provisions

1.2.1.1 Unless provided otherwise, this Chapter applies to surveys of hull and equipment of all ships.

1.2.1.2 ISC will arrange an overall survey for the items related to the certificates, as appropriate, to confirm compliance with ISC rules.

1.2.1.3 Meetings for survey plans of oil tankers, bulk carriers and chemical tankers:

(1) The establishment of proper preparation and the close cooperation between the attending Surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

(2) Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance, the thickness measurement company operator (as applicable) and the master of the ship or an appropriately qualified representative appointed by the Company so as to ensure the safe and efficient conduct of the survey work to be carried out.

(3) The following is an indicative list of items that are to be addressed in the meeting:

① provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

② extent of the thickness measurements;

③ acceptance criteria;

④ extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

⑤ execution of thickness measurements;

⑥ taking representative readings in general and where uneven corrosion/pitting is found;

⑦ mapping of areas of substantial corrosion;

⑧ communication between attending Surveyor(s), the thickness measurement company operator(s) and owner's representative(s) concerning findings.

1.2.1.4 Documentation on board

(1) General requirements

① For oil tankers, bulk carriers and chemical tankers, the documentation specified in 1.2.1.4(2) is to be kept on board in the lifetime of the ship, which is to be readily available for the Surveyor.

② A thickness measurement report is to be a part of the documentation on board.

(2) Supporting documents

① The following additional documentation is to be available on board:

a. main structural plans of cargo oil and ballast tanks;

b. previous repair history;

c. cargo and ballast history;

d. inspection by ship's personnel with reference to:

i. structural deterioration in general;

ii. leakages in bulkheads and piping;

iii. condition of coating or corrosion protection, if any;

e. extent of use of inert gas plant and tank cleaning procedures (for oil tankers);

f. any other information that will help identify suspect areas requiring inspection.

1.2.1.5 The inspection of Watertight Cable Transits is to be carried out in accordance with Chapter 5,

PART ONE of the Rules.

1.2.2 Annual surveys

1.2.2.1 General requirements

(1) During the annual survey, conventional examinations are to be carried out by means of visual inspections and necessary tests to confirm whether the general condition of the ship is acceptable or whether the ship is under normal maintenance.

(2) Conventional external inspections and tests are specified so far as practicable in the items listed below.

1.2.2.2 The survey of all ships is to cover:

(1) Hull

① inspection of side shell and closing appliances above waterline;

② inspection of freeboard deck, weather deck and superstructure deck;

③ inspection and operational test of watertight doors on watertight bulkheads; Confirmation of closing appliance of shell plating opening below freeboard deck;

④ inspection of penetrations of watertight bulkheads, so far as practicable;

⑤ confirming, when appropriate and as far as is practicable when examining internal spaces on oil tankers and bulk carriers, that the means of access to cargo and other spaces remain in good condition;

⑥ examining cargo hold water level detectors and their audible and visual alarms on single skin &single-hold cargo ships;

⑦ confirming that no new installation of materials containing asbestos is on board.

(2) Protection of cargo hatches

① checking that no unapproved changes have been made to the hatch covers, hatch coamings and their securing and sealing devices since the last survey;

② examining exposed hatch covers to confirm the structural integrity and capability of maintaining watertightness. Where extensive areas of wastage and/or substantial corrosion of steel hatch covers are found, thickness measurements are to be carried out to confirm the extent of wastage or corrosion, and renewals or repairs are required where wastage exceeds allowable margins;

③ where mechanically operated steel covers are fitted, checking the satisfactory condition of:

a. hatch covers including plating and stiffeners;
b. weathertight devices of covers (gaskets, gasket slots, drainage channels);
c. clamping devices, including bolts, cleating, retaining bars;
d. track wheels, guide rails, chains (or wires) and guide devices;
e. operating systems, including hydraulic systems and power units (if fitted).

④ where portable covers, wooden or steel pontoons (plus tarpaulin) are fitted, checking the satisfactory condition of:

a. wooden covers (including metallic end sheathing) and portable beams, carriers or sockets for the portable beams, and their securing devices;
b. steel pontoons, including chocks;
c. waterproof hatch cover tarpaulin (of at least 2 layers);
d. hatch compression bars and wedges;
e. cleats.

⑤ checking hatch coamings including deck connection, stiffeners, pillars, dunnage, wooden wedges;

⑥ checking draining non-return devices on hatch coamings.

(3) Protection of other openings

① examining flush scuttles, manholes, skylights and other watertight closing appliances;

② examining the circular openings of engine room casings, boiler casings and funnels, skylights, companionways on freeboard deck and weather deck, and boundary bulkheads, openings and weathertight closing appliances of deckhouse;

③ examining cargo hold hatches and other openings on weather deck, and coaming, closing and securing means thereon;

④ examining side scuttles and deadlights, windows, other openings and their closing devices;

⑤ examining ventilators including their closing appliances and flame screens, and air pipes and vents;

⑥ examining ends of enclosed superstructures;

⑦ examining all weathertight doors and their closing appliances of above spaces, including stiffeners, hinges and sealing devices; confirming operational condition of weathertight doors and their closing appliances.

(4) Discharges

① scuppers and sewage discharges with valves and controls on their pipelines;

② freeing ports and their protective bars and dampers.

(5) Suspect areas

① Suspect areas of the hull are to be examined, including those suspect areas which were identified at previous intermediate and/or special surveys. Where extensive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs are required where wastage exceeds allowable margins.

(6) Steering gear

① general external examination of steering gear, accuracy of rudder angle indicator, and performance test.

(7) Anchoring equipment

① external examination of anchoring equipment for cracks, bending and twisting, loosening and detachment of stock, and secure connection to deck.

(8) Mooring equipment

① general external examination of mooring equipment.

(9) Fire safety

① confirming so far as practicable that no substantial change has been made to the fireproof structure and arrangement;

② operational test of manual and/or automatic fire doors (if fitted);

③ confirming that fire control plans are posted and kept as required;

④ testing of fire detectors and/or smoke detectors and alarms, so far as practicable;

⑤ examining fire pumps, hoses, nozzles and international shore connections, confirming that each fire pump, including the emergency fire pump, can by operated separately, and confirming that two jets of water are produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main;

⑥ checking the provision and randomly examining the condition of all portable and non-portable fire extinguishers, and checking appropriate maintenance information;

⑦ examining the fixed fire-fighting system for the machinery, cargo, vehicle, special category and ro-ro spaces, as appropriate, and confirming that its means of operation are clearly marked;

⑧ confirming that the fire fighter’s outfits and EEBDs are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged;

⑨ confirming that the firefighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition, that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged, and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and for ships the keels of which are laid on or after 12 November 2016, provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe;

⑩ examining closing means of ventilators, funnels, skylights, doorways and shaft tunnels (if fitted);

⑪ examining the fire protection arrangements in cargo, vehicle and ro-ro spaces and confirming, as far as practicable and as appropriate, the operation of the means for closing the various openings;

⑫ examining, where appropriate, the special arrangements for carrying dangerous goods, including checking of the electrical equipment and wiring, the ventilation, the provision of protective clothing and portable appliances, and the testing of water supply, bilge pumping and any water spray system.

(10) Securing of containers

① examining securing fittings and means of containers.

1.2.2.3 In addition to the applicable requirements in 1.2.2.2, the following items are to be added for passenger ships (including ro-ro passenger ships and passenger ferries):

(1) The survey of watertight bulkheads and their arrangements is to:

① examine, so far as practicable, collision bulkhead and watertight bulkheads and confirm that their watertight integrity is not damaged;

② examine whether the diagram in the navigation bridge correctly shows the location of each watertight door and the OPEN/CLOSE indicators;

③ test the operation of locally or remotely controlled watertight doors, giving particular attention to audible and visual alarms activated on each side of the bulkhead and their operating mechanisms (if required or fitted);

④ confirm the operation of watertight doors after cutoff of main and emergency sources of power;

⑤ confirm that notices are posted at the appropriate places.

(2) The examination of shell openings is to include:

① closing appliances of side scuttles and deadlights, discharges, sewage drainages and similar openings as well as other water inlets and outlets below the margin line of shell;

② confirmation that side shell doors, cargo ports below the margin line can be effectively closed, and that the inboard end of cinder and garbage discharge chute is fitted with watertight seal;

③ general inspection of valves and pipelines of cross-flooding fittings, and operational test of remote control system.

(3) Verification that the emergency escape routes including related stairways and stairs in passenger and crew spaces are free from obstruction.

1.2.2.4 In addition to the applicable requirements in 1.2.2.2, the following items are to be added for oil tankers (including ore/bulk/oil carriers and ore/oil carriers) and chemical tankers:

(1) The examination of weather deck is to include:

① cargo tank openings including gaskets, covers, coamings and flame screens

② ventilation arrangement of cargo tanks, including overpressure/low pressure alarm (if fitted) and pressure/vacuum valves and flame screens;

③ flame screens on vents to all bunker, oily ballast, oily slop tanks and void spaces, so far as practicable;

④ cargo oil, crude oil washing, bunker, ballast and vent piping systems, including vent masts and headers.

(2) The examination of cargo pump rooms and pipe tunnels (if fitted) is to include:

① confirmation that no potential sources of ignition such as loose gear, excessive bilge accumulation, excessive vapour, combustible materials, etc., are present in or near the cargo pump room and that access ladders are in good condition;

② pump room bulkheads for signs of leakage or fractures, and in particular, the sealing arrangements of all penetrations in these bulkheads;

③ performance test of bilge pumping system of pump room;

④ confirmation that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean.

1.2.2.5 In addition to the survey items in 1.2.2.2, the following items are to be added for ro-ro ships and other similar ships having bow doors (outer and inner doors), side shell doors and stern doors:

(1) verifying the doors and their surrounding structure;

(2) verifying the operation of doors and their dynamic devices;

(3) examination of sealing devices of doors, including airtight devices and related appliances;

(4) examination of locking and securing devices of doors;

(5) examination of local and/or remote controls of the locking/securing devices;

(6) examination of opening and closing of doors and associated securing attachments, such as wires, chains, track wheels, bars, guide plates and shackles;

(7) verifying tightness of doors;

(8) examination and testing of remote operating panel and associated indicator lights, television surveillance system, water leakage detectors, lighting and alarm system;

(9) examination of other necessary items and entries in logbook;

(10) verifying sewage disposal systems between inner and bow doors as well as in vehicle deck space;

(11) verifying that an approved operating and maintenance manual is available on board the ship.

1.2.3 Intermediate surveys

1.2.3.1 General requirements

(1) In addition to the applicable items specified for annual surveys in 1.2.2, intermediate surveys are to cover the structure of the ship to an extent sufficient for confirming good condition of the structure.

(2) Intermediate surveys are to be carried out in conjunction with surveys of the outside of the ship's bottom and related items in so far as practicable.

1.2.3.2 The scope of survey for all ships is to cover:

(1) Water ballast tanks

① For ships over 5 but less than or equal to 10 years of age, representative ballast tanks except for double bottom tanks are to be selected by the Surveyor for a general, internal examination. If there is no protective coating or any structural defect is found, the internal examination is to be extended to other water ballast tanks of the same type.

② For ships over 10 years of age, a general, internal examination of all salt water ballast tanks is to be carried out, and tightness test of inner bottom of cargo spaces within double bottom water ballast tanks is to be carried out.

(2) Cargo spaces

For ships over 15 years of age, at least 1 fore hold and 1 aft hold are to be selected by the Surveyor for internal examination.

(3) Thickness measurements

Where extensive areas of substantial corrosion are found, thickness measurements may be required and renewals are required where corrosion exceeds specified limits (see Appendix 1 of this Chapter).

(4) Examination of anchoring equipment

Partial test of slipping and hauling anchors by windlass.

(5) Fire-fighting equipment

Check of quantity and efficiency of medium of fixed fire-extinguishing arrangements, examination and testing of fire-extinguishing system.

1.2.3.3 In addition to the applicable requirements in 1.2.3.1 and 1.2.3.2, the following items are to be added for oil tankers (including ore/bulk/oil carriers and ore/oil carriers):

(1) The examination of weather deck is to include:

① cargo oil, crude oil washing, bunker, ballast, steam and vent piping systems, including vent masts and headers. Where deemed necessary by the Surveyor, pressure test or thickness measurement or both may be required for such piping systems.

(2) The examination of cargo piping is to include:

① cargo, crude oil washing, bunker, ballast, steam and vent piping systems on weather deck and in cargo pump room. If there is any doubt as to the condition of the piping, pressure test or thickness measurement or both may be required for such piping systems;

② cargo and stripping pumps including foundations, sealing, remote operation and quick-closing means;

③ confirmation that pressure gauges on cargo lines and level indicator systems are operational.

(3) Examination of cargo tanks

① For oil tankers of more than 10 years of age, the intermediate survey is also to include an internal examination of at least 3 cargo tanks located respectively at middle, port and starboard, if applicable.

② For oil tankers of more than 15 years of age, cargo tanks and ballast tanks may be pressure tested as appropriate.

1.2.4 Special surveys

1.2.4.1 General requirements

(1) Special surveys are to include examinations to an extent sufficient for confirming that the hull structure is in good condition and fit for the intended purpose.

(2) The examinations of the hull are to be supplemented by thickness measurements and testing as deemed necessary, to ensure that the structural integrity remains effective, and to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration.

(3) The owner is to provide the necessary facilities for a safe and efficient execution of the survey.

(4) The owner is to make preparations for survey according to the type and age of the ship and the items required for the special survey (including the extent of thickness measurements, necessary tests and compartments to be generally examined), and is to ensure:

① opening and cleaning of cargo holds, engine room, boiler room and other similar spaces including drainage channels, bilges and bilge wells, partial removal of wood sheathing (if required), derusting of steel plates and steel members;

② emptying, degassing and cleaning of double bottom tanks, topside tanks and deep tanks, derusting of rusted portions thereof and sufficient internal illumination therein.

(5) Special surveys are to include the items specified for intermediate and docking surveys in this Chapter. Docking surveys and relevant project surveys completed within the 15 months before the date due of special survey may be accepted as surveys simultaneous with special surveys.

1.2.4.2 The scope of survey for all ships is to cover:

(1) For all ships less than or equal to 5 years of age, the following items are to be additionally included:

① anchors and chain cables are to be pulled out, ranged and examined to verify their quantities and condition;

② all cargo holds, between decks, fore and aft peaks, engine and boiler rooms, cofferdams, decks and superstructures as well as other spaces are to be examined;

③ wood sheathing and other covering on deck and on inner bottom of holds are to be removed, as appropriate, to examine the steel structure thereunder;

④ examination of corners of large opening of holds, non-continuous structures, connection of stringer plates to sheer strakes;

⑤ thickness measurement of suspect areas, as required by the Surveyor;

⑥ masts, derrick posts, standing rigging, and derrick and windlass foundations are to be examined. Where extensive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs are required where wastage exceeds allowable margins;

⑦ examination of hatch covers and coamings of holds:

a. an overall examination, according to the annual survey items listed in this Section, for determining wastage of steel plates, structural members, gaskets and locking devices. Where extensive areas of wastage are found, thickness measurements may be required and renewals are required where wastage exceeds allowable margins (see Appendix 1 of this Chapter). For hatch covers of the ships with reduced freeboard, particular attention is to be given to weathertightness and strength of hatch covers;

b. hatch covers of all holds are to be subject to hose testing or equivalent[①] for confirming watertightness of the covers;

⑧ internal examination of tanks:

a. in respect to peak tanks, double bottom tanks, topside tanks and hopper tanks used for water ballast, at least 1 representative tank of each type is to be selected for internal examination. Where extensive breakdown of protective coating is found, or where protective coating was not applied from time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor;

b. overall examination of areas which are not coated or the coating of which has broken down, and no crack, excessive deformation and corrosion is allowed for structural skeleton, inner bottom, outer bottom, floors, girders and bulkheads. Attention is to be given to the plating of watertight bulkheads, floors, girders and the plating adjacent to heating coils in the fuel oil tank;

c. pipelines in tanks are to be examined, with attention being given to bent portions thereof. The wastage and technical condition of clamps, flanges, bolts, suctions and filters of pipelines and striking plate below all sounding pipes are also to be examined. Various valves of the pipelines are to be operationally tested, e.g. the collision bulkhead valve in fore peak. Attention is to be given to oil, water traces in cofferdams and if there are such traces, the cause of their existence is to be sought;

⑨ Tank test is to include:

a. boundaries of double-bottom tanks, deep tanks, water ballast tanks, and peak tanks used as liquid tanks and other tanks, including holds adapted for the carriage of salt water ballast, are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds;

b. boundaries of fuel oil, lube oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lube oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries by the surveyor, and a confirmation that the pressure testing has been carried out according to the requirements with satisfactory results.

c. tanks are to be subject to hydraulic test after structural repairs affecting integrity.

(2) For ships over 5 but less than or equal to 10 years of age, in addition to the items listed in 1.2.4.2(1), the following items are to be included:

① all cargo holds, cofferdams, decks and superstructures are to be examined. In cases where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is inspected, tested by beating and chipping,

---

① Small access opening covers may be verified by chalking.

and found sound and adhering satisfactorily to the steel;

② examination of anchoring equipment:

a. the anchors and chain cables are to be pulled out, cleaned, ranged and examined, and the weight of anchors is to be checked. Chain cables are to be gauged and if any length of chain cables is found to be reduced in mean diameter[①] at its most worn part by more than 15% from its nominal diameter as required, it is to be renewal;

b. the chain locker and its discharge means, holdfasts, hawse pipes, chain stoppers and windlass are to be examined and pumping arrangements of the chain locker are to be tested;

③ comprehensive internal examination of all water ballast spaces. Upon satisfactory completion of the above external examination, hydraulic test and internal examination, the internal examination of other tanks may be dispensed with.

(3) For ships over 10 years of age, in addition to the items listed in 1.2.4.2(1) and (2), the following items are to be included:

① the condition of air pipes, sounding pipes, steam pipes and other pipelines is to be examined;

② wood sheathing or other coverings on decks and linings of side scuttle are to be partially removed to inspect the steel plating thereunder;

③ examination of spaces used for water ballast:

a. for ships over 10 but less than or equal to 15 years of age, in addition to the requirements in (2) ③, at least 1 of the fuel oil tanks fitted with oil heating means is to be internally examined. Upon satisfactory completion of the above external examination, hydraulic test and internal examination, the internal examination of other tanks may be dispensed with;

b. for ships over 15 but less than or equal to 20 years of age, in addition to the requirements in (2) ③a, at least 2 of the fuel oil tanks fitted with oil heating means are to be internally examined. Upon satisfactory completion of the above external examination, hydraulic test and internal examination, the internal examination of other tanks may be dispensed with;

c. for ships over 20 years of age, all tanks (including oil tanks, water tanks and voids) are to be subject to external examination, hydraulic test and internal examination.

④ At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

(4) Extent of thickness measurement:

① Unless expressly provided otherwise, minimum requirements for thickness measurements of ships are given in Table 1.2.4.2(4)①.

Minimum Requirements for Thickness Measurements at Special Surveys of Ships Other Than Otherwise Expressly Provided Table 1.2.4.2(4)①)

Age ≤ 15	15 < Age ≤ 20	Age >20
a Suspect areas throughout the ship	a Suspect areas throughout the ship	a Suspect areas
	b Wind and water strakes at each side, and at least 2 points on each strake of strength deck beyond line of openings, within amidships 0.5L	b Wind and water strakes at each side, and at least 2 points on each strake of strength deck beyond line of openings, within amidships 0.5L
	c Shell and deck plating, longitudinal and transverse members in one transverse section, within amidships 0.5L	c Shell and deck plating, longitudinal and transverse members in two transverse sections of different holds, within amidships 0.5L; only 1 section to be measured for ships less than 100 m in length

② Thickness measurements are normally to be carried out by a ISC-approved company. The required thickness measurements, if not carried out by ISC itself, are to be witnessed by an attending Surveyor of ISC. The measurement is to be done by means of drilling or ultrasonic test equipment. The accuracy of the equipment is to be confirmed by the Surveyor as satisfactory. The test personnel are to hold a qualification certificate acceptable to ISC. A thickness measurement report is to be prepared to indicate measurement positions, thicknesses measured, corresponding initial thicknesses

① The mean diameter is half the value of the sum of the minimum diameter found in one cross section of the link and of the diameter measured in a perpendicular direction in the same cross section.

and maximum allowable diminution, and date of measurement, type of measurement equipment as well as expiry date of test, name of measurer and qualification. The surveyor is to review the final thickness measurement report and countersign on the cover. The surveyor may sample the measurement results.

③ Thickness measurements may be carried out at the commencement of the special survey, or the thickness measurement report prepared within 15 months before the due date of the special survey may be taken as the thickness measurement report of the special survey.

④ The Surveyor may extend the thickness measurements as deemed necessary. When thickness measurements indicate substantial corrosion, the extent of thickness measurements is to be increased to determine areas of substantial corrosion. Table 1.2.4.2(4)② may be used as guidance for the additional thickness measurements. These extended thickness measurements are to be carried out before the survey is credited as completed.

Guidance for Additional Thickness Measurements in Way of Substantial Corrosion

Table 1.2.4.2(4)②

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect area and adjacent plates	5-point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

1.2.4.3 The additional survey scope of passenger ships and ro-ro passenger ships may cover:

(1) Lightweight survey for verification of light displacement and the change of longitudinal centre of gravity. Where the deviation of lightweight exceeds 2% or the deviation of longitudinal center of gravity exceeds 1% L[①], the inclining test is to be carried out again.

(2) The extent of thickness measurements of passenger ships and ro-ro passenger ships is given in Table 1.2.4.3(2).

Minimum Requirements for Thickness Measurements at Special Surveys of Passenger Ships, Ro-Ro Passenger Ships

Table 1.2.4.3(2)

			g All keel plates, full length. Also, additional bottom plates in way of aft end of tanks and machinery space
			h Bow, stern and side shell doors used as vehicle ramps

1.2.4.4 Supplementary requirements for oil tankers (including double hull oil carriers):

(1) General requirements:

① Items of special surveys of "all ships" in this chapter are to be included.

② Cargo piping on deck, including crude oil washing (COW) piping, cargo and ballast piping within all cargo tanks, ballast tanks, including double bottom tanks, pump rooms, pipe tunnels, cofferdams and

① *L* refers to the length defined by regulation 3 of the Load Line Convention.

void spaces bounding cargo tanks are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally

③ A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions (lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.) of the cargo tanks and ballast tanks are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

(2) Tank protection:

① Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined.

② A ballast tank is to be examined at subsequent annual intervals where:

a. a hard protective coating has not been applied from the time of construction, or

b. a soft or semi-hard coating has been applied, or

c. substantial corrosion is found within the tank, or

d. the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

(3) Extent of overall surveys

① For oil carriers (including double hull oil carriers) of 12 years and more in age, an overall survey of all tanks and spaces is to be carried out at each special survey.

② The Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a. in particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information;

b. in tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

(4) Scope of thickness measurement

① At special surveys, the minimum requirements for thickness measurement are listed in Table 1.2.4.4(4) ①.

② The increased extent of thickness measurements for substantial corrosion is to be in accordance with the relevant requirements for "all ships". These extended thickness measurements are to be carried out before the survey is credited as complete. Suspect areas identified at previous surveys are to be examined; Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

③ The Surveyor may further extend the thickness measurements as deemed necessary.

④ For areas in tanks where hard protective coatings are found in a GOOD condition, the extent of thickness measurements according to Table 1.2.4.4(4) ① may be specially considered.

⑤ Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

⑥ In cases where two or three sections are to be measured, at least one is to include a ballast tank within 0.5*L* amidships.

Minimum Requirements for Thickness Measurements at Special Surveys of Oil Tankers (including double hull oil tankers), Ore/ Oil Ships, etc.

	3 Selected wind and water strakes outside the cargo area	3 For combination carriers, all hatch covers and hatch coamings (plate and stiffener) of all cargo holds

Age ≤ 10	10 < Age ≤ 15	Age > 15
		4 Internals in forepeak and afterpeak ballast tanks
		5 All exposed main deck full length
		6 Representative exposed superstructure deck (poop, bridge, and forecastle deck)
		7 Lowest strake and centre strake in way of all transverse bulkheads in cargo spaces together with internals in way
		8 All wind- and water strakes, port and starboard, full length
		9 All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
		10 Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

(5) Extent of tank testing

① The minimum requirements for ballast tank testing are given in ③ of this paragraph and Table 1.2.4.4(5)①; the minimum requirements for cargo tank testing are given in ④ of this paragraph and Table 1.2.4.4(5)①. Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

a. a tank testing procedure has been submitted by the Owner and reviewed by ISC prior to the testing being carried out;

b. there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

c. the cargo tank testing has been satisfactorily carried out within a special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed;

d. the satisfactory results of the testing is recorded in the ship's logbook;

e. the internal and external condition of the tanks and associated structure are found satisfactory by the Surveyor at the time of the overall and close-up survey.

② The Surveyor may extend the tank testing as deemed necessary.

③ Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

④ Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

⑤ For double hull oil tankers, the testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

⑥ Tanks may be pressure tested while the ship is afloat provided that their internal examination is also carried out while the ship is afloat.

Minimum Requirements for Tank Testing at Special Surveys of Oil Tankers (including double hull oil tankers), Ore/ Oil Ships, etc.

Table 1.2.4.4(5) ①

Special Survey No.1 Age ≤ 5	Special Survey No.2 and Subsequent Age > 5
1. All ballast tank boundaries 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	1. All ballast tank boundaries 2. All cargo tank bulkheads

(6) Examination of emergency towing arrangements (if fitted):

① Confirming that strong points, towing pennants, towing connection, pick-up gear, chafing gear and mark buoys are in good and efficient condition.

② Verifying that wear of towing pennant, pick-up gear and chafing gear is under permissible limits.

③ Verifying that fairleads are maintained in a normal condition as required.

(7) The availability and normal maintenance of bow and stern loading/unloading arrangements (if fitted) are to be verified.

1.2.4.5 Additional requirements for bulk carriers (including double skin bulk carriers):

(1) General requirements:

① Items of special surveys of "all ships" in this Chapter are to be included;

② All piping systems (or ballast piping systems in the case of double skin bulk carriers) within the above spaces are to be examined and operationally tested in working condition to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

③ The survey extent of ballast tanks converted to void spaces is to be specially considered in relation to the requirements for ballast tanks.

④ A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo holds and ballast tanks (Note: Lower portions of the cargo holds and ballast tanks are considered to be the parts below light ballast water line) are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

(2) Tank protection:

① Where provided, the condition of the corrosion prevention system of ballast tanks is to be examined. For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in POOR condition and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

② When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

③ Where a hard protective coating is provided in cargo holds also used as salt water ballast and is found in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

(3) Hatch covers and coamings:

① Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

a. stowage and securing in open condition;

b. proper fit and efficiency of sealing in closed condition;

c. operational testing of hydraulic and power components, wires, chains, and link drives.

② Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

③ Thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out for bulk carriers and double skin bulk carriers as given in Table 1.2.4.5(5)①.

(4) Extent of overall surveys

① For bulk carriers (including double skin bulk carriers) of 18 years and over in age, an overall survey of all tanks and spaces is to be carried out at each special survey.

② The Surveyor may carry out the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

(5) Extent of thickness measurement

① The minimum requirements for thickness measurement at special survey are given in Table 1.2.4.5(5)① for bulk carriers and double skin bulk carriers.

② Extended measurements for areas with substantial corrosion are in accordance with the relevant provisions for "all ships". These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

③ The Surveyor may further extend the thickness measurements as deemed necessary.

④ For areas in tanks where hard protective coatings are found in a GOOD condition, the extent of thickness measurement according to Table 1.2.4.5(5) ① may be specially considered.

⑤ Transverse sections are to be chosen where largest reductions are suspected to occur or are revealed from deck plating measurements.

Minimum Requirements for Thickness Measurements at Hull Special Surveys of Bulk Carriers (including double skin bulk carriers)

Table 1.2.4.5(5) ①

Age ⩽ 10	10 < Age ⩽ 15	Age > 15
1 Suspect areas throughout the ship	1 Suspect areas throughout the ship	1 Suspect areas throughout the ship
	2 Within the cargo length: a. Each deck plate outside line of cargo hatch openings. b. Two transverse sections, one in the amidship area, outside line of cargo hatch opening. c. All wind and water strakes	2 Within the cargo length: a. Each deck plate outside line of cargo hatch openings. b. Three transverse sections, one in the amidship area, outside line of cargo hatch opening. c. Each bottom plate
	3 Selected wind and water strakes outside the cargo length area	3 All hatch covers and hatch coamings (plate and stiffener) of all cargo holds
		4 Internals in forepeak and afterpeak ballast tanks
		5 All exposed main deck full length
		6 Representative exposed superstructure deck (poop, bridge, and forecastle deck)
		7 Lowest strake and centre strake in way of all transverse bulkheads in cargo spaces together with internals in way
		8 All wind- and water strakes, port and starboard, full length
		9 All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
		10 Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

(6) Extent of tank testing

① All boundaries of water ballast tanks, deep tanks and cargo holds used for water ballast within the cargo length area are to be pressure tested. For fuel oil tanks, only representative tanks are to be pressure tested.

② The Surveyor may extend the tank testing as deemed necessary.

③ Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

④ Boundaries of holds jointly used as sea water ballast are to be tested with a head of liquid to near to the top of hatches.

⑤ The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

1.2.4.6 Additional requirements for chemical tankers:

(1) General requirements:

① Items of special surveys of “all ships” in this Chapter are to be included.

② Cargo piping on deck and cargo and ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be

advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

③ A survey in dry dock is to be a part of the special survey. The overall and close-up surveys and thickness measurements, as applicable, of the lower portions of the cargo tanks and ballast tanks (Lower portions of the cargo and ballast tanks are considered to be the parts below light ballast water line.) are to be carried out in accordance with the applicable requirements for special surveys, if not already performed.

(2) Tank protection:

① Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined. A ballast tank is to be examined at subsequent annual intervals where:

a. a hard protective coating has not been applied from the time of construction, or
b. a soft or semi-hard coating has been applied, or
c. substantial corrosion is found within the tank, or
d. the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

Thickness measurements are to be carried out as deemed necessary by the Surveyor.

(3) Extent of overall surveys

① For chemical tankers of 12 years and over in age, an overall survey of all tanks and spaces is to be carried out at each special survey. The survey of stainless steel tanks may be carried out as an overall survey supplemented by close-up survey as deemed necessary by the surveyor..

② The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a. in particular, tanks having structural arrangements or details which have suffered defects in similar tanks or on similar ships according to available information;
b. in tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

(4) Extent of thickness measurement

① The minimum requirements for thickness measurement are given in Table 1.2.4.6(4) ①. Thickness measurement of stainless steel hull structure and piping may be waived, except for clad steel plating.

Minimum Requirements for Thickness Measurements at Special Surveys of Chemical Tankers

Table 1.2.4.6(4) ①

Age ⩽ 10	10 < Age ⩽ 15	Age > 15
1 Suspect areas throughout the ship	1 Suspect areas throughout the ship	1 Suspect areas throughout the ship
	2 Within the cargo area: a) each deck plate; b) two transverse sections; c) all wind and water strakes	2 Within the cargo area: a) each deck plate; b) three transverse sections; c) each bottom plate
	3 Selected wind and water strakes outside the cargo area	3 Internals in forepeak and afterpeak ballast tanks
		4 All exposed main deck full length
		5 Representative exposed superstructure deck (poop, bridge, and forecastle deck)
		6 Lowest strake and centre strake in way of all transverse bulkheads in cargo spaces together with internals in way
		7 All wind- and water strakes, port and starboard, full length
		8 All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks
		9 Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor

② Extended measurements for areas with substantial corrosion are in accordance with the relevant provisions for "all ships". These extended thickness measurements are to be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

③ The Surveyor may further extend the thickness measurements as deemed necessary.

④ For areas in tanks where hard protective coatings are found in a GOOD condition, the extent of thickness measurement according to Table 1.2.4.6(4) ① may be specially considered.

⑤ Transverse sections are to be chosen where largest reductions are suspected to occur or are revealed from deck plating measurements.

⑥ In cases where two or three sections are to be measured, at least one is to include a ballast tank within 0.5*L* amidships.

(5) Extent of tank testing

① The minimum requirements for ballast tank testing are given in ③ of this paragraph and Table 1.2.4.6(5)①; the minimum requirements for cargo tank testing are given in ④ of this paragraph and Table 1.2.4.6(5) ① . Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the Surveyor provided the following conditions are complied with:

a. a tank testing procedure has been submitted by the Owner and reviewed by ISC prior to the testing being carried out;

b. there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

c. the tank testing has been satisfactorily carried out within a special survey window not more than 3 months prior to the date of the survey on which the overall or close-up survey is completed;

d. the satisfactory results of the testing is recorded in the ship's logbook;

e. the internal and external condition of the tanks and associated structure are found satisfactory by the Surveyor at the time of the overall and close-up survey.

② The Surveyor may extend the tank testing as deemed necessary.

③ Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes.

④ Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

⑤ The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

⑥ Tanks may be pressure tested while the ship is afloat provided that their internal examination is also carried out while the ship is afloat.

Minimum Requirements to Tank Testing at Special Survey of Chemical Tankers

Table 1.2.4.6(5) ①

Special Survey No.1 Age ≤ 5	Special Survey No.2 and Subsequent Age > 5
1. All ballast tank boundaries. 2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	1. All ballast tank boundaries. 2. All cargo tank bulkheads

(6) Chemical tankers over 10 years in age

① Selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:

a. thickness measured at random or selected pipe lengths to be opened for internal inspection;

b. pressure tested to the maximum working pressure.

Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

1.2.4.7 Additional thickness measurement requirements for ships of 35 years and over in age:

(1) Ship length L≥65m: measure 3 transverse sections, among which one is within amidships 0.5L; ship length L＜65m: measure 2 transverse sections;

(2) Internals in forepeak and afterpeak tanks;

(3) All exposed main deck full length;

(4) Representative exposed superstructure deck;

(5) All wind- and water strakes, port and starboard, full length;

(6) All keel plates full length. Also, additional bottom plates in way of cofferdams, machinery space, and aft end of tanks;
(7) Plating of sea chests. Shell plating in way of overboard discharges as considered necessary by the attending Surveyor.

Section 3 SURVEYS OF MACHINERY

1.3.1 General provisions

1.3.1.1 Unless provided otherwise, the requirements of this Section apply to machinery surveys of all ships after construction.
1.3.1.2 For ships with machinery automation notations, the machinery installations are to comply with the requirements of 5.9.4.4, Chapter 5, PART ONE of the Rules.
1.3.1.3 The owner or manager of the ship is to make preparations for survey according to the type and items of survey, e.g. cleaning of parts to be dismantled, availability of drawings, information, certificates and reports needed for survey, safe access to survey location and safety facilities.
1.3.1.4 Machinery surveys are generally to be carried out in conjunction with corresponding hull surveys.

1.3.2 Annual surveys

1.3.2.1 General requirements
(1) Machineries and boilers are normally not required to be opened up during annual surveys, and sufficient items may be examined in working condition. Locations of machinery and shafting are to be examined to confirm their satisfactory condition, including interview of related crew members on service of main machineries and if necessary, check of engine room logbook and measurement records, etc.
1.3.2.2 Survey items
(1) General examination of machinery and boiler spaces, in particular examining the means for the operation of the main and auxiliary machinery essential for the propulsion and the safety of the ship, including, when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge (including the control, monitoring, reporting, alert and safety actions) and the arrangements to operate the main and other machinery from a machinery control room, confirming that there is no existence of any fire and explosion hazards, particularly in way of inner bottom and bilge wells and that moving parts and hot surfaces will not injure personnel.
(2) Verification that escape routes in machinery spaces are free from obstruction.
(3) Testing of the means of communication between the navigation bridge and machinery control rooms, steering gear compartment and where fitted, emergency steering positions.
(4) Examination of the bilge pumping systems and bilge wells, including operation of pumps and where fitted, level alarms, as far as practicable; operational testing of emergency bilge pumping systems of passenger ships.
(5) External examination of all accessible parts of the main and auxiliary steering gears.
(6) Action test of remote closing valves of fuel oil and lubricating oil tanks.
(7) Performance test and closing and shutoff tests are to be carried out from outside the machinery space for fans, remote oil pump cutoff devices in the engine room.
(8) General examination of dynamic positioning system or side thrust system onboard.
(9) Confirmation of implementation of planned maintenance scheme, if applicable.
1.3.2.3 For oil tankers, in addition to the requirements of 1.3.2.2, cargo oil pump room, pump room bilge system, ventilation system of cargo oil pump room and associated equipment are to be generally inspected and safety alarm system, if fitted, operationally tested.

1.3.3 Intermediate surveys

1.3.3.1 Survey items
(1) The items in 1.3.2.2 of this Chapter applicable to the ship.
(2) Prime movers of driving generators are to be operationally tested under working conditions to verify that they are in a good working condition.
(3) When the ship is in dock, all openings and valves of machinery spaces and pump rooms at the ship's side together with their fasteners connected to the shell plating are to be examined.

1.3.4 Special surveys

1.3.4.1 Survey items

(1) The items in 1.3.3.1 of this Chapter applicable to the ship.
(2) When the ship is in dock, all sea connection openings, including sewage discharges and other overboard discharges, together with valves and fasteners on the shell plating, are to be examined internally and externally.
(3) Pumps and pumping systems, including valves, cocks, pipes and filters, are to be examined. Nonmetallic hose expansion pieces of the main circulating system are to be examined. Bilge system is to be confirmed in good condition and if deemed necessary, other systems are to be operationally tested.
(4) Thrust shaft and intermediate shaft and their bearings are to be opened up for examination.
(5) Foundations (including foundation bolts and packing blocks) of main and auxiliary engines are to be examined.
(6) All shafts (excluding screwshaft, tubeshaft, directional propeller and water jet propulsion arrangements) and bearings of the main propulsion system are to be examined. The lower half of the bearings may be sampled if crankshaft deflection of the main engine and wear of bearings are found in order.
(7) Heat exchangers and other non-burner pressure vessels with working pressures over 0.7 MPa are to be opened up and examined and where deemed necessary, pressure tested, and associated relief valves are to be checked; the evaporator of the casing need not be opened up and acceptance may be based on satisfactory external examination and operation record review.
(8) Air compressors, air receivers with associated pipes are to be examined; if the internal examination of air receivers is impracticable, this may be replaced by hydraulic test; the working condition of relief valves and safety devices is to be examined.
(9) Examination of steering arrangements, including operational test and check of relief valve setting, is to be carried out. A hydraulic test may be performed by using the power of the steering system to set the relief valve.
(10) Where necessary, gearboxes are to be opened up and examined to confirm the condition of pinions and wheels, shafts, bearings, and lubricating system. For conventional gear units of 1,120 kW and below and all epicyclic gear units, where the shipowner can provide satisfactory operation records, then they may not necessarily be opened for examination.
(11) Examination of windlass, including operational check, check of the brake and testing of safety devices, is to be carried out.
(12) For diesel engines including main and auxiliary engines, the following parts (if fitted) are to be disassembled or opened up for examination:

① cylinders, cylinder liners, cylinder covers, valves and their transmitting gear;
② high pressure oil pumps, scavenging pumps and superchargers;
③ pistons, crossheads, connecting rods;
④ crankshafts including crankpins and bearings, main journals and associated bearings;
⑤ reverse gears, air compressors and intercoolers;
⑥ retightening of stay bolts as necessary, tightness check of bolts of frames and entablatures;
⑦ measurement of crankshaft deflection of engines having a speed of 300 r/m or below;
⑧ examination of all parts. However, those parts which need not be re-examined in 15 months may be specially considered;
⑨ the survey of diesel engines with bores of 300 mm or below may be replaced by review of maintenance records, including records of lubrication servicing, provided that such engines are maintained according to the manufacturer’s scheduled maintenance program;
⑩ essential components of the oil fuel system of diesel engines, including oil separator, oil fuel servicing pump and heater are to be opened up and examined.

(13) Electric propulsion plant: see relevant requirements of Section 4 of this Chapter.
(14) For steam turbines including main and auxiliary turbines, the following parts are to be opened out for examination:

① rotor with blading and shrouding and bearings;
② nozzles, stationary blading, interstage packing and gland seals with oil barriers;
③ bleed controls and foundation expansion arrangements;
④ throttle valves are to be operationally tested and opened up for examination as deemed necessary.

In general, lifting of the main propulsion turbine casing may be waived for new-installed ones within 5 years, provided the turbines are fitted with rotor position indicators and vibration indicators of an approved type, as well as steam pressure measuring equipment at appropriate locations in the steam flow path. Rotor bearings, thrust bearings and the flexible coupling are to be opened and examined. The low pressure turbine

exhaust trunk is to be opened for examination of the last row of low pressure and astern wheels. Turbine operating records are to be reviewed. The arrangements for changeover in case of emergency operation of the plant are to be readily available. The turbines are to be operationally tested.

Turbine casings are to be lifted for confirming the effectiveness of the maintenance arrangement at the special survey after 10 years. However, the lifting of main propulsion turbine casings may be waived at the special survey after 15 years and subsequent special surveys, provided that:

a. an approved preventative maintenance arrangement has been established, including vibration monitoring, lubricating oil analysis and rotor position checks;
b. the rotor journal bearings, thrust bearings and flexible couplings are opened up for examination, the low-pressure turbine exhaust trunk is opened for examination of the last row of low pressure and astern wheels;
c. the turbine operating records are reviewed and all considered satisfactory by the Surveyor, at least in compliance with the manufacturere recommendations;
d. the turbines are to be operationally tested.

(15) For gas turbines, the followings are to be opened out for examination:

① Gas turbines are to be opened up and maintained in accordance with the manufacturer's recommendations. For each type of turbines, the owner is to submit maintenance schedules for checking combustion, hot-gas-path and other items as specified in proposed service intervals.

② For units in continuous service, at least one hot-gas-path examination is to be scheduled each survey period, including examining turbine rotors, nozzles (fixed blading), combustors, inlet casings, exhaust casings, air control valves and protective apparatus. Other parts and associated equipment are to be examined as necessary.

③ Opening of compressor sections can be scheduled in conjunction with other items, provided that examination of the blades visible from the inlet plenum during the hot-gas-path examination reveals no evidence of defects.

④ The required examinations of auxiliary gas turbine units, at least once each period, are to be based on manufacturer's recommendations, as appropriate for the actual operating hours and conditions, together with an operation test including protective apparatus.

Where units are arranged such that the unit is removed from the vessel and dismantled at another facility, the internal examination may be carried out at the facility. The reinstallation is to be carried out to the satisfaction of the Surveyor.

Upon reassembly/reinstallation, all fuel lines, lube oil piping, the unit itself and exhaust system are to be checked under full speed operational conditions for leakage. All shielding and fuel oil double wall piping is to be examined.

⑤ Cylinders, pistons, end covers, valves and valve gear, pumps and fittings, synchronizing and control gear, cooling system, explosion relief devices including bypass arrangements of free piston gas generators are to be opened out and examined.

⑥ Air compressors of gas generator in combustion chamber, including rotors and casings, combustion chambers, burners, intercoolers, heat exchangers, gas and air piping of gas turbines are to be opened out and examined.

1.3.4.2 As part of the Special Survey of Machinery, a dock trial is to be carried out to attending Surveyors' satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration should be given to carrying out a sea trial to attending Surveyors' satisfaction.

1.3.4.3 If the significant repairs as stated in 1.3.4.2, is considered by ISC to have any impact on response characteristics of the propulsion systems, then the scope of sea trial is also to include a test plan for astern response characteristics based on those required for such an equipment or systems when fitted to the new ship. Refer to 1.2.4, Chapter 1, PART THREE of the Rules for astern testing requirements.

The tests are to demonstrate the satisfactory operation of the equipment or system under realistic service conditions at least over the manoeuvring range of the propulsion plant, for both ahead and astern directions. Depending on the actual extent of the repair, ISC may accept a reduction of the test plan.

1.3.5 Surveys of propeller shafts and tube shafts

1.3.5.1 Relevant requirements for surveys of propeller shafts and tube shafts are given in Section 12, Chapter 5, PART ONE of the rules.

Section 4 SURVEYS OF ELECTRICAL INSTALLATIONS

1.4.1 General requirements

1.4.1.1 This Section applies to surveys of electrical installations for all ships after construction.

1.4.2 Annual surveys

1.4.2.1 Survey items

(1) Operational test of the means of communication between the navigation bridge and machinery control stations, steering gear compartment and where fitted, emergency steering positions.

(2) General examination of the electrical equipment and cables forming the main and emergency electrical installations in working condition, so far as practicable.

(3) Confirming that main power source, emergency power source (including the standby power source equivalent to the emergency power source), the electrical equipment essential to safety in an emergency, e.g. emergency lighting, general emergency alarm system, are in good working condition. Where these power sources are automatically controlled, the test is to be carried out in automatic mode.

(4) Examination of bonding straps for the control of static electricity and earthing arrangements where fitted.

(5) General examination of control systems and associated machinery of electric propulsion plant, dynamic positioning system and/or auxiliary thrusters of position-keeping mooring system.

(6) Confirming that motors driving the pumps serving main propulsion machinery and auxiliary machineries together with controls are in good condition.

(7) Confirming voyage repairs made by crew.

(8) Confirming that the electrical equipment installed in areas where flammable gas or vapour and/or flammable dust may accumulate is in good condition and well maintained.

(9) Confirming that no potential sources of ignition (e.g. no loose gear, excessive bilge oil or oily vapour) exist in cargo oil pump rooms of oil tankers.

(10) Where the electrical distribution system on board a ship includes harmonic filters, the total harmonic distortion (THD) recorded onboard the ship is to be checked.

1.4.3 Intermediate surveys

1.4.3.1 Survey items

(1) The applicable items in 1.4.2 of this Chapter;

(2) For oil tankers:

① electrical equipment an cables in dangerous zones are to be examined to confirm that there are no defective, improperly installed equipment and dead end wiring;

② insulation resistance of electrical circuits terminated in or passing through dangerous zones is to be tested (see Appendix 2 of this Chapter). Where spaces are not gas-freed, the existing record of testing may be accepted.

1.4.4 Special surveys

1.4.4.1 General requirements

(1) The owner is to provide the necessary conditions and safety facilities for the survey, e.g. disassembling or opening and cleaning, safe access to and illumination for survey items.

1.4.4.2 Survey and test items

(1) The applicable items in 1.4.3 of this Chapter.

(2) Insulation resistance of electrical equipment and circuits are to be tested.

(3) The fittings on the main switchboard, emergency switchboard (including emergency battery charging and discharging panel), section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

(4) Circuit breakers of generators are to be tested, so far as possible, to confirm that protective devices including preferential trip relay (if fitted) are in good working condition.

(5) Cables are to be examined without damaging their fasteners or protective casings so far as possible, except when they are to be opened up as deemed necessary upon examination or test results of (2).

(6) Motors and their auxiliary control and switch gear for essential services are to be examined, and tested operationally in working condition so far as possible. All generators and steering motors are to be examined and tested in working condition. However, they need not be tested at the rated load test or simultaneously.

(7) Where transformers of essential power supply are of wet type, the owner is to submit the liquid sample to an authoritative institution for testing its breakdown voltage, acidity and moisture. The report of test results is to be submitted to the Surveyor.
(8) Emergency power source (including the standby power source equivalent to the emergency power source) together with its automatic control gear and associated circuits are to be tested.
(9) Emergency lighting, temporary emergency lighting, supplementary emergency lighting (if fitted) and general emergency alarm system are to be tested in so far as practicable.
(10) For electrically propelled ships, the propulsion motors, generators, cables and all ancillary electrical equipment, exciters and associated ventilators (including coolers) are to be examined and their insulation resistance relative to earth tested. Particular attention is to be given to examination of windings, commutators and slip rings. Protective devices and alarms are to be operationally examined as far as possible. Where insulating oil is used, the test is to comply with provisions of (7). Interlocks fitted to prevent unsafe operation or unauthorized use are to be checked for normal function.
(11) The electrical equipment and cables installed in areas possibly containing flammable gas and vapour and/or flammable dust are to be examined as follows:

① the integrity of explosion-proof electrical equipment will not be damaged due to corrosion, fallen bolts, etc.;
② no excessive dust accumulation exists in or on dust explosion proof equipment;
③ cables are to be examined so far as possible to confirm that they are perfectly sheathed and armoured and that their fasteners are in good condition;
④ bonding straps for the control of static electricity are to be tested to confirm their effectiveness;
⑤ alarms and interlocks corresponding to spaces under pressurized protection and their pressurizing equipment are to be tested to confirm their proper working condition.

Section 5 INITIAL CLASSIFICATION SURVEY

1.5.1 Initial classification of existing ships

1.5.1.1 General requirements
(1) For the purpose of this Section, existing ships include the following ships in service:

① ships which have been surveyed by classification societies and other survey organizations accepted by ISC;
② ships which have been surveyed by other classification societies not accepted by ISC;
③ ships which have been surveyed by ISC.

(2) The classification stated in this paragraph covers also class notations.
1.5.1.2 Initial classification of ships which have been surveyed by classification societies and other survey organizations accepted by ISC
(1) Initial classification of ships under construction

① Submission of plans
ISC requirements for surveys of ships under construction are to be complied with, i.e. all plans, calculations and other technical documents for construction (approved by other survey organizations according to their rules) are to be submitted to ISC for check. The construction of these ships may, in general, continue in accordance with the approved plans.
② In addition to the normal items for newbuildings, the following items are to be checked (unless they have been checked and relevant records made by classification societies accepted by ISC):
a. the shipyard is to submit records of the checked or confirmed items for review;
b. the Surveyor is to carry out an overall survey of the compartments, spaces and installations which have been inspected and confirm that materials, scantlings, workmanship and arrangements are in compliance with the approved plans;
c. the information on the attended inspections and tests of compartments is to be accepted when such information is confirmed as authentic. When some of the compartments are to be tested again, e.g. functional tests during sea trial and in particular the inspection and testing of cargo holds and ballast tanks, the new tests are to be attended;
d. the records of NDTs are to be checked and sampled. Any NDT is to comply with the rule provisions;
e. the materials (including forgings and castings) used for construction, and manufacturing and

testing of anchors and anchor chains are to meet the requirements of the accepted standards;

f. main propulsion machinery and essential auxiliaries are to be manufactured, installed and tested in accordance with ISC rules or the standards acceptable to ISC;

g. the anchors and anchor chains are to be inspected and certified in accordance with ISC rules, if they have not been delivered to the shipyard;

h. all outstanding recommendations are to be completed.

(2) Initial classification of ships of which the construction has been completed but which have not been put into service

① Submission of plans

a. The owner applying for an initial survey of a ship which has been certified by another survey organization, is to submit at least one copy each of the plans, calculations and other technical documents to ISC for check:

(a) general arrangement;
(b) capacity plan;
(c) hydrostatic curves;
(d) loading manual (if required);
(e) transverse midship section;
(f) construction profile, including longitudinal section, decks, inner bottom structure, superstructure and upper deck structure;
(g) transverse bulkhead;
(h) shell expansion;
(i) rudder and rudder stock;
(j) hatch covers;
(k) engine room arrangement;
(l) intermediate shaft, thrust shaft and propeller shaft;
(m) propeller;
(n) main engine, propulsion machinery and clutch systems (or manufacturer, model and specifications);
(o) in addition, main boiler, superheater and economizer (or manufacturer, model and specifications) and steam piping for steam turbine ships;
(p) bilge and ballast piping diagram;
(q) electrical system;
(r) steering gear piping system and arrangement, manufacturer and model;
(s) torsional vibration calculations;
(t) elastic coupling of propulsion shafting and/or shaft torque limiter (or manufacturer, model and specifications) additionally required for ships with ice class notation;
(u) additional plans required for oil tankers:
i) pumping arrangement at the forward and after ends and drainage of cofferdams and pump rooms;
(v) additional plans required for periodically unattended machinery spaces:
i) measuring instruments and checklist of alarms;
ii) arrangement of fixed fire detection and alarm system;
iii) diagram of automatic safety function tests;
(w) any other information requested by the Flag State Administration;
(x) calculations of damage stability, if required;
(y) approval documents of alternative design and arrangement, if any.

b. For ships which have not been certified by other survey organizations, plans and information are to be submitted in accordance with 1.5.1.2(2)①a.

② Scope of surveys

a. The scope of surveys and examinations of ships which have been certified by other survey organizations are to cover at least the following (unless they have been checked and relevant records made by other survey organizations):

(a) main engines and essential auxiliary machineries, including steering gear, are to be examined under working conditions, and essential automatic controls and alarms are to be subject to functional test;
(b) main boilers, auxiliary boilers for essential services, economizers and steam generators are to be internally examined, safety valves and main attachments opened up and examined;
(c) if the propeller shaft is fitted with oil seal, the aft end and bearings of the shaft are to be

examined;

(d) pumping systems, in particular bilge pumps, are to be tested;

(e) insulation resistance of electrical installations is to be tested;

(f) when the duration exceeds 12 months from the date of the ship's launching, a docking survey is to be carried out;

(g) essential equipment is to be subject to function test and the machinery opened for examination when the Surveyor considers it necessary;

(h) compliance of all pressure vessels with the drawings and certificates provided is to be confirmed.

b. The scope of surveys and examinations of ships which have not been certified by classification societies accepted by ISC are to cover at least the following:

(a) the scope of surveys and examinations is to be in accordance with 1.5.1.2(2)②a;

(b) the owner is to submit records and reports related to surveys, testing and measurement during original construction as well as certificates, test information, etc. for main marine products;

(c) the Surveyors are to examine main structural dimensions to confirm compliance with relevant provisions of the Regulations;

(d) if necessary, test and/or survey for confirmation are to be carried out.

(3) Initial classification of ships which have been put into service

① Submission of plans

a. When applying for an initial survey, the owner is to submit at least one copy each of the plans, calculations and other technical documents specified in 1.5.1.2(2) ① a to ISC for check. However, the submission of torsional vibration calculations may be exempted for ships over 2 years of age.

b. Where the plans and documents can not be submitted according to (a) above, ISC may accept other relevant information as equivalent.

c. Where the information on stability including intact, subdivision and damage stability and the loading manual have been approved by the Flag State Administration or an organization authorized by it and compliance of the arrangement on board the ship with the approved information has been confirmed by ISC, ISC may accept the approved information as the basis for assigning class or issuing certificates.

② Scope of surveys

a. In addition to the items corresponding to ship's age and losing class/survey organizations status, the scope of surveys is to cover the following:

(a) Hull:

a) for ships of less than 5 years of age, an annual survey is to be carried out;

b) for ships 5 years and over but less than 10 years of age, an annual survey and an inspection of an appropriate number of representative ballast tanks, including fore peak tank, after peak tank, top side tank, bottom side tank and double bottom tank, are to be carried out;

c) for ships of 10 years and over but less than 20 years of age, an annual survey and an inspection of an appropriate number of representative ballast tanks and cargo spaces are to be carried out;

d) for ships of 15 years and over but less than 20 years of age, the requirements for special or intermediate surveys (whichever is due) are to be complied with;

e) for ships of 20 years and over, the requirements for special surveys are to be complied with;

f) the latest dry-dock survey report of the losing classification society/survey organization may be accepted if found in compliance with ISC rules upon review.

(b) Machinery (including electrical installations):

a) for ships of less than 10 years of age, an annual survey is to be carried out;

b) for ships of 10 and over but less than 15 years of age, in addition to the requirement under a) above, representative cylinders of main and auxiliary engines are to be lifted and examined;

c) for ships of 15 and over but less than 20 years of age, the requirements for special or intermediate surveys (whichever is due) are to be complied with;

d) for ships of 20 years and over, the requirements for special surveys are to be complied with.

(c) Any conditions of class or recommendations and overdue items previously issued by the losing society/survey organization are to be completed, unless not required by the Regulations.

③ After the plan check and surveys stated in 1.5.1.2(3)① and ②, the interval between surveys may be corresponding to that of the losing society/survey organization.

1.5.1.3 Initial classification of ships which have been surveyed by classification societies not accepted by ISC

(1) Ships under construction

① Submission of plans

ISC requirements for surveys of ships under construction are to be complied with, i.e. all plans, calculations and other technical documents for construction are to be submitted to ISC for approval. Where any change is made in the originally approved plans as the result of the examination, the construction is to be rectified in accordance with the re-approved plans.

② Surveys

a. In addition to the normal items for newbuildings, the following items are to be checked:

a) the shipyard is to submit records of the checked or confirmed items for review; ISC will sample a certain portion of such items, depending on their respective importance levels;

b) the Surveyor is to carry out an overall survey of the compartments, spaces and installations which have been inspected and confirm that materials, scantlings, workmanship and arrangements are in compliance with the approved plans;

c) the information on the attended inspections and tests of compartments is to be accepted when such information is confirmed as authentic. When some of the compartments are to be tested again, e.g. functional tests during sea trial and in particular the inspection and testing of cargo holds and ballast tanks, the new tests are to be attended;

d) the records of NDTs are to be checked and sampled. Any NDT is to comply with the rule provisions;

e) the materials (including forgings and castings) used for construction, and manufacturing and testing of anchors and anchor chains are to meet the requirements of the accepted standards;

f) main propulsion machinery and essential auxiliaries are to be manufactured, installed and tested in accordance with ISC rules or the standards acceptable to ISC;

g) the anchors and anchor chains are to be inspected and certified in accordance with ISC rules, if they have not been delivered to the shipyard;

h) all outstanding recommendations are to be completed.

(2) Initial classification of ships of which the construction has been completed but which have not been put into service

① Submission of plans

When applying for an initial survey, the owner is to submit one copy each of the plans, calculations and other technical documents specified in 1.5.1.2(2)①a to ISC for approval. In general, such ships are to comply with the present rules of ISC, at least with ISC rules effective during construction of the ships.

② Scope of surveys

Survey items are to be in accordance with 1.5.1.2(2)②.

(3) Initial classification of ships which have been put into service

① Submission of plans

When applying for an initial survey, the owner is to submit one copy each of the plans and documents specified in 1.5.1.2(2) ① a to ISC for check. Where ISC is authorized to issue statutory certificates, the stability information including intact, subdivision and damage stability and the loading manual are to be examined and approved by ISC.

② Scope of surveys

The scope of surveys in accordance with the requirements of the Regulations for ships of the same type and age, is to include special survey, dry-dock survey and surveys of screwshaft, stern tube shaft and boilers.

1.5.1.4 Initial classification of ships which have been surveyed by ISC

(1) Ships are to be inspected for compliance with the requested characters of classification and class notations and upon confirmation of such compliance, classification certificates may be issued.

(2) Where a new class notation or a change of the service category is intended for the ship, relevant drawings and documents are to be provided by the owner for approval. When the ship is inspected and

found to be in compliance with relevant requirements, the classification certificate may be issued.
(3) Where any outstanding item affecting classification exists, an occasional survey is to be carried out and upon confirmation of completion of such item, the classification certificate may be issued.

Appendix 1 CORROSION AND WASTAGE CONTROL OF HULL STRUCTURE

1 Criteria for longitudinal strength

1.1 For ships of 65 m and over in length, the hull girder section modulus at deck and bottom within 0.4L amidships is not to be less than 0.9 times the hull girder section modulus required for ships of each service category in Rules for Construction of Sea-Going Ships Engaged on Domestic Voyages, unless provided otherwise.

1.2 For bulk carriers, passenger ships, container ships of 65 m and over in length and of 20 year of age or over, oil tanker of 15 years of age or over and dry cargo ships and other ships of 25 years of age or over, the minimum midship section modulus of corroded members is to be calculated according to thickness measurement results and checked according to the above criteria, at special surveys. Where any limit is exceeded, repairs are to be made to strengthen the structure in compliance with the requirements for longitudinal strength. In the case of excessively corroded members, the minimum midship section modulus is to be calculated and the longitudinal strength checked, regardless of the ages specified above.

2 Criteria for local strength

2.1 For ships constructed in accordance with ISC Rules for Construction of Sea-Going Steel Ships Engaged on Domestic Voyages and ISC Rules for the Construction and Classification of Sea-Going Steel Ships of versions 1996 and 2001, the renewal thickness of hull plating and structural members is not to be less than the value obtained by multiplying their as-built thickness by the relevant percentage shown in Table 2.1 below.

2.2 For ships constructed in accordance with ISC Rules for the Construction and Classification of Sea-Going Steel Ships published before 1996, the renewal thickness of hull plating and structural members is not to be less than the value obtained by multiplying their as-built thickness by the relevant percentage shown in Table 2.2 below.

2.3 For ships constructed in accordance with ISC Rules for the Construction and Classification of Sea-Going Steel Ships published of versions 2006 and later, relevant provisions in PART ONE of the Rules are to be complied with.

Table 2.1

Structural member	Minimum renewal thickness	
	L ⩾ 90 m	L < 90 m
① Strength deck plating, side shell, top strake, bilge strake, bottom shell, flat plate keel, inner bottom, continuous longitudinal bulkhead, hopper tank and topside tank plating. ② Main longitudinal continuous members, e.g. deck girders, hatch side girders, side girders, bottom girders, bulkhead girders, continuous hatch coamings. ③ Main transverse members, e.g. side frame webs, deck transverses, double plate floors, bulkhead webs, watertight and oiltight transverse bracket plates. ④ Transverse bulkhead plating in holds, upper and lower bulkhead stool sloping plating, watertight bulkhead plating in deep tanks	80%	75%
Other plating and structural members, e.g. deck within line of openings, deck longitudinals, side longitudinals, bottom longitudinals, inner bottom longitudinals, bulkhead longitudinals, face plates of side frames, brackets of structural members, hatch covers, non-continuous hatch coamings, sea chests	75%	70%
Note: For bulk carriers designed in accordance with the Rules for Construction of Sea-Going Ships Engaged on Domestic Voyages and assigned the class notations of "Strengthened for Heavy Cargoes", the minimum renewal thickness of inner bottom may be taken as the value obtained by multiplying the as-built thickness and 75%		

Table 2.2

Structural member	Minimum renewal thickness		
	Service category beyond service category 1	Service category 1	Service categories 2 and 3
Strength deck plating, side and bottom shell;	75%	70%	65%
Continuous longitudinal strength members and web frames;	75%	70%	65%
Foundations of main engines, cranes and windlasses	75%	75%	75%
Other structural members defined in the Rules for the Construction and Classification of Sea-Going Steel Ships	70%	60%	55%

2.3 The thickness reduction of hull plating and structural members caused by corrosion and wastage is not to be more than required by ISC rules.

2.4 For bulk carriers contracted for construction on or after 1 July 2017 and complying with Section 8, Chapter 8, PART TWO of ISC Rules for Construction of Sea-Going Steel Ships Engaged on Domestic Voyages, corrosion allowance and renewal requirements for the hatch covers and coamings are as follows:

2.4.1 Hatch cover:

For single skin hatch covers, the corrosion allowance t_s for all structures (plate and frame) is 2.0mm;

For double skin hatch covers, the corrosion allowance t_s for top or bottom plating is 2.0mm and the corrosion allowance t_s for internal structure is 1.5mm.

For plating of double skin hatch covers and single skin hatch covers, renewal is required where the gauged thickness is less than t_{net} + 0.5 mm. Where the gauged thickness is t_{net} +0.5mm and over but less than t_{net} +1.0mm, coating or annual gauging may be adopted as an alternative to renewal. The coating is to be maintained in "GOOD" condition, which refers to condition with only minor spot rusting.

For the internal structure of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when deemed necessary, at the discretion of ISC Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, renewal for the internal structures is required where the gauged thickness is less than t_{net}.

2.4.2 Hatch coaming

Corrosion allowance t_s for hatch coaming structure and coaming stay is 1.5mm.

Renewal is required where the gauged thickness is less than t_{net} + 0.5 mm. Where the gauged thickness is t_{net} +0.5 mm and over but less than t_{net} +1.0 mm, coating or annual gauging may be adopted as an alternative to renewal. The coating is to be maintained in "GOOD" condition.

2.5 For ships other than bulk carriers, ore carriers and combination carriers, contracted for construction on or after 1 July 2017 and complying with Section 20, Chapter 2, PART TWO of the Rules for Construction of Sea-Going Ships Engaged on Domestic Voyages, and for all weathertight steel cargo hatch covers on exposed decks, steel renewal is required where the gauged thickness of the plating of double skin hatch covers, single skin hatch covers, hatch coamings, coaming stays and stiffeners is less than t_{net} + 0.5 mm. Where the gauged thickness is within the range t_{net} + 0.5 mm and t_{net} + 1.0 mm, coating (the coating is to be maintained in "GOOD" condition, meaning condition with only minor spot rusting) or annual gauging may be adopted as an alternative to steel renewal. For the internal structure of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when deemed necessary, at the discretion of ISC Surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}. For corrosion addition t_s = 1.0 mm, the thickness for steel renewal is t_{net}, and when gauged thickness is between t_{net} and t_{net} + 0.5 mm, coating or annual gauging may be adopted as an alternative to steel renewal, where t_{net} being the net thickness, to be calculated in accordance with 2.20.2, Section 20, Chapter 2, PART TWO of the Rules for Construction of Sea-Going Ships Engaged on Domestic Voyages.

Appendix 2 MINIMUM INSULATION RESISTANCE OF ELECTRICAL EQUIPMENT AND CIRCUITS IN HOT CONDITION

The test results of insulation resistance of electrical equipment and circuits, as required by 1.4.3.1(2)② and 1.4.4.2(2) are in general not to be less than the following values.

Item	Insulation resistance in hot condition(MΩ)	
	Working voltage ≤ 100 V	Working voltage > 100 V
Motor	—	0.5
Propulsion motor	—	3U/(1000 + P)
Exciters, excitation winding and control gear for electrical propulsion	—	1.0
Various switchboards	—	0.5
Final sub-circuit of lighting distribution boards (except for fan and small electrical appliance)	0.2	0.5
Transformers	—	1.0
Control gear	0.2	0.5
Internal communication and alarm systems	0.3	0.5
Heating appliances	—	0.5
Circuits of navigation lights	—	1.0

Notes:

① *U* is the rated working voltage (V) and *P* the rated capacity in kW or kVA.

② For working voltage of 100 V or over, the insulation resistance is to be measured with a D.C. 500 V megger at least. For working voltage less than 100 V, the insulation resistance is to be measured with a D.C. 250 V megger.

③ The insulation resistance of electrical equipment may be measured only between polarity (phase) and earth.

④ The resistance of turbo-generator rotors is to be measured at the rated speed.

Appendix 3 MARKING OF LOAD LINES

1 Application

1.1 The requirements of this Appendix apply to classed ships engaged on non-international voyages.

2 Load line marks

2.1 The load line mark for ships not carrying timber deck cargoes is shown in Figure 2.1.

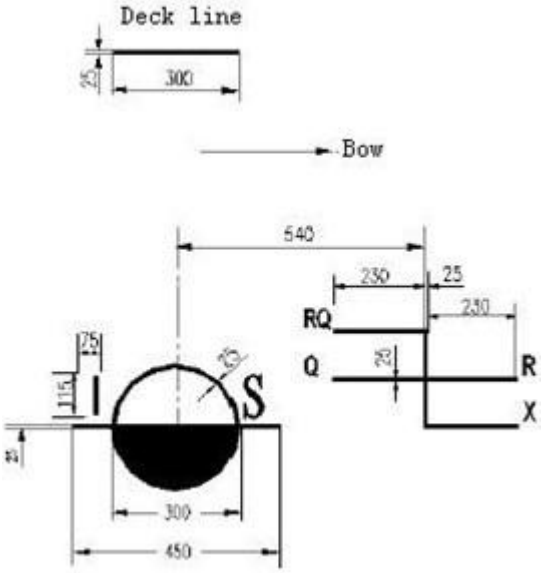

Figure 2.1 Freeboard Mark for Ships not Carrying Timber Deck Cargoes (in mm)

2.2 The load line mark for ships carrying timber deck cargoes is shown in Figure 2.2.

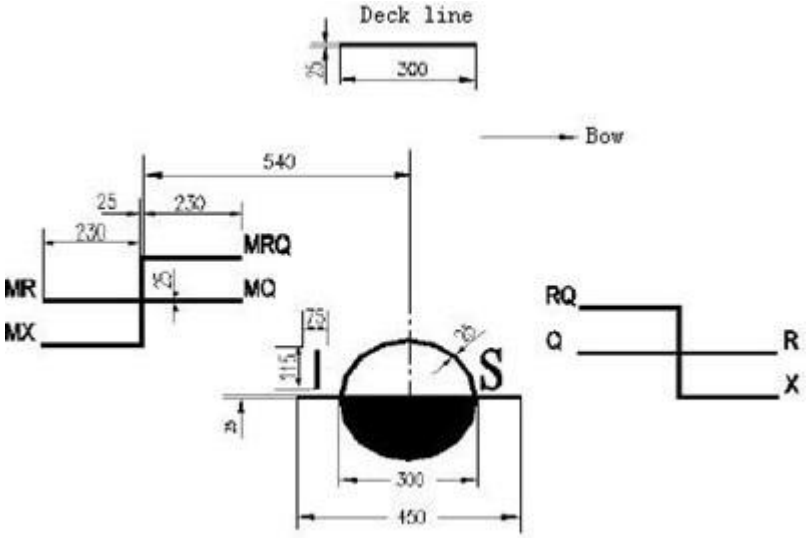

Figure 2.2 Freeboard Mark for Ships Carrying Timber Deck Cargoes (in mm)

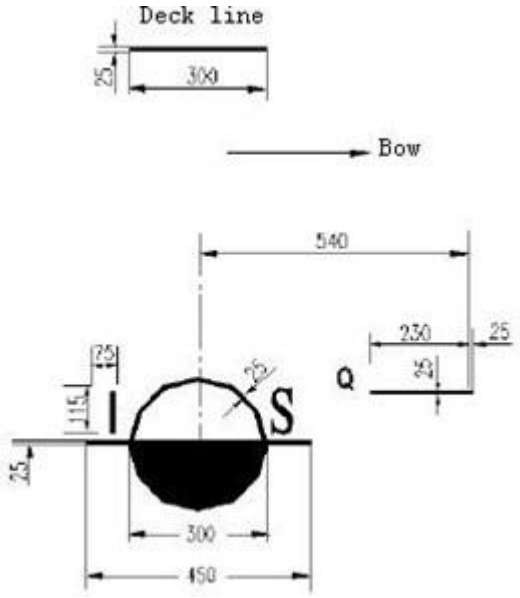
2.3 Where a ship is assigned a greater than minimum freeboard so that the load line is marked at a position corresponding to, or lower than, the lowest seasonal load line assigned at minimum freeboard as specified in the LL Convention, only the Fresh Water Load Line need be marked. In such a case, the load line mark is as shown in Figure 2.3 and may also be marked in accordance with Figure 2.1.



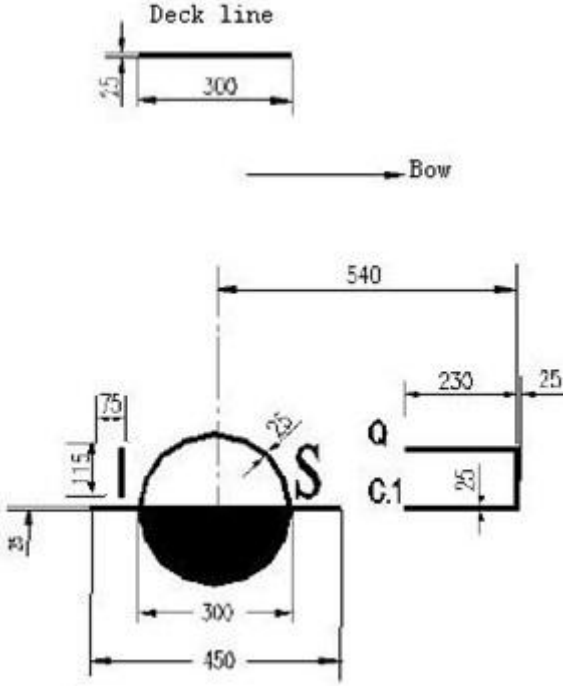


Figure 2.3 Fresh Water Load Line Only (in mm)

2.4 The subdivision load line mark for passenger ships is shown in Figure 2.4.

Figure 2.4 Subdivision Load Line Mark for Passenger Ships (in mm)

The symbols in Figures 2.1 to 2.4 are defined as follows:
IS — International Ship Classification;
RQ — Tropical Fresh Water Load Line;
Q — Summer Fresh Water Load Line;
R — Tropical Load Line;
X — Summer Load Line;
MRQ — Tropical Fresh Water Timber Load Line;
MQ — Summer Fresh Water Timber Load Line;
MR — Tropical Timber Load Line;
MX — Summer Timber Load Line;

C.1 — Passenger Ship Subdivision Load Line.

3 Marking

3.1 The Load line mark is to consist of a ring 300 mm in outside diameter and 25 mm wide which is intersected by a horizontal line 450 mm in length and 25 mm in breadth; the upper edge of horizontal line passes through the center of the ring. The center of the ring is to be placed on each side of the ship at the middle of the length as defined in LL Convention, and the vertical distance from the upper edge of the deck line to the center of the ring is equal to the assigned summer freeboard. The ring, lines and letters are to be painted in white or yellow on a dark ground or in black on a light ground. They are to be permanently marked on both sides of the ship and clearly visible.

CHAPTER 2 HULL

Section 1 GENERAL PROVISIONS

2.1.1 General requirements

2.1.1.1 The definition of restricted service is given in Section 1, Chapter 0 of this PART.

2.1.1.2 The environmental conditions corresponding to restricted services are given in Table 2.1.1.2.

Table 2.1.1.2

Restricted service	Significant wave height
Service category 1	0.78*C*
Service category 2	0.74*C*
Service category 3	0.69*C*

C —coefficient to be obtained from the following formulae:

$C = 0.0412L + 4$ for $L<90$ m;

$C = 10.75 - \left(\frac{300 - L}{100}\right)^{3/2}$ for $90 \le L \le 300$ m;

$C = 10.75$ for $300 < L < 350$ m;

$C = 10.75 - \left(\frac{L - 350}{150}\right)^{3/2}$ for $350 \le L \le 500$ m.

L— length of ship, in m, see 1.1.2.1, Section 1, Chapter 1, PART TWO of the Rules.

2.1.2 Longitudinal strength

2.1.2.1 The values of the minimum midship section modulus W_0 for the calculation of longitudinal strength in accordance with the requirements of Section 2, Chapter 2, PART TWO of the Rules may be reduced by:

(1) 5% for ships intended for service category 1;

(2) 10% for ships intended for service category 2;

(3) 15% for ships intended for service category 3.

2.1.2.2 For the check of longitudinal strength of ships in accordance with the requirements of Section 2, Chapter 2 or Sections 2 and 10, Chapter 7 of PART TWO of the Rules, the wave bending moment and wave shear force may be reduced by:

(1) 10% for ships intended for service category 1;

(2) 15% for ships intended for service category 2;

(3) 20% for ships intended for service category 3.

2.1.2.3 For engineering ships assigned with different notations for transiting and operation, the wave bending moment and wave shear force reduction requirements of the corresponding area are to be used in different conditions to check longitudinal strength of ships.

2.1.3 Reduction of rule scantlings of structural members

2.1.3.1 For ships intended for navigating in restricted service, the scantlings of structural members, as calculated in accordance with the requirements of PART TWO of the Rules other than those of 2.1.3.2 and 2.1.3.3 of this Section, refer only to the Rule plate thickness, sectional area and section modulus of structural members, and may be reduced by:

(1) 5% for ships intended for service category 1;

(2) 10% for ships intended for service category 2;

(3) 15% for ships intended for service category 3.

The scantlings of structures after reduction are to comply with the requirements of 2.1.3.4 of this Section.

2.1.3.2 For ships equal to or greater than 65 m in length, where the values of the reduction factors F_d and/or F_b required in Section 2 of Chapter 2 of PART TWO are less than 1, the following requirements are to be complied with when calculating the thickness of shell plating and main deck within 0.4*L* amidships:

(1) where the value of F_d is less than 1, the thickness of main deck and sheer strake is not to be reduced in accordance with the requirements of 2.1.3.1 of this Section;

(2) where the value of F_b is less than 1, the thickness of bottom plating and bilge strake is not to be reduced in accordance with the requirements of 2.1.3.1 of this Section;

(3) where the value of F_d or F_b is less than 1, the thickness of side shell plating is not to be reduced in accordance with the requirements of 2.1.3.1 of this Section.

2.1.3.3 The rule scantlings in the following conditions are not to be reduced in accordance with the requirements in 2.1.3.1: the rule minimum thickness, scantlings of structural members for which ice strengthening and strengthening of bottom forward are required, and bulkhead, structural members of deep tanks and cargo tanks, inner bottom plating and framing for loading heavy cargoes, cargo deck framing, vehicle decks, pillars, stems, stern frames, propeller shaft brackets, main engine seating structures, rudders, etc.

2.1.3.4 The requirements for thickness of plating after reduction

(1) For ships of less than 65 m in length, the thickness of shell plating is to be not less than 5 mm.

(2) For ships of less than 65 m in length, the thickness of strength deck is to be not less than 5 mm and the thickness of other decks is to be not less than 4 mm.

(3) For ships of less than 65 m in length, the thickness of inner bottom plating in double bottom is to be not less than 5 mm.

(4) For ships of less than 65 m in length, the thickness of weather tight steel hatch covers is to be not less than 5 mm.

2.1.3.5 For ships of less than 40 m in length, the spacing *s* of frames may be taken as the full-scale spacing of frames when calculating the thickness of transversely framed bottom plating.

2.1.3.6 The thickness of the plate keels is not to be less than the calculated value of rule required thickness of the bottom plating plus 1.5 mm, and in no case less than that of the adjacent bottom plating.

2.1.3.7 Ships intended for service category 2 or 3 need not meet the requirements of fore deck fittings in Section 7, Chapter 1, PART TWO of the Rules.

2.1.3.8 Ships intended for service category 2 or 3 need not meet the requirements for strengthening of bottom forward in Section 15, Chapter 2, PART TWO of the Rules.

2.1.3.9 Ships engaged on non-international voyages need not meet the requirements for strengthening of grabs in Section 23, Chapter 2, PART TWO of the Rules depending on a voluntary basis by the shipowner.

2.1.3.10 Bulk carriers engaged on non-international voyages need not meet the requirements of Sections 8, 9, 10, 12, 13 and 15, Chapter 8, PART TWO of the Rules.

2.1.4 Anchoring equipment

2.1.4.1 The number of pieces of the anchoring equipment required in Section 2, Chapter 3, PART TWO of the Rules may be reduced in accordance with the following requirements:

(1) Except as required in (2) of this paragraph, the anchoring equipment of ships intended for service category 2 may be selected one grade lower than required by the equipment number *N*. For traffic boats or ferry boats less than 30 m in length, one single bower anchor and one half of the required length of chain cable will be acceptable.

(2) For floating cranes, floating pile drivers or other similar working ships and trailing suction dredgers intended for service category 2, the anchoring equipment may be selected two grades lower than required by the equipment number *N*.

(3) For ships intended for service category 3, the anchoring equipment may be selected two grades lower than required by the equipment number *N*. For traffic boats or ferry boats of less than 30 m in length, one single bower anchor and one half of the required length of chain cable will be acceptable.

(4) For ships intended for operations in harbours with breakwater, the anchoring equipment may be selected a half grade lower than required by the equipment number *N* and one half of the required length of chain cable will be acceptable.

2.1.4.2 The ultra high holding power anchors may be used as bower anchors for ships navigating in restricted service. The mass of each ultra high holding power anchor may be 50% of that of an ordinary stockless bower anchor as specified in Table 3.2.1.1(2), Chapter 3, PART TWO of the Rules. The mass of each ultra high holding power anchor is generally not to exceed 1,500 kg, for details see Section 1, Chapter 10 of PART ONE of ISC Rules for Materials and Welding.

2.1.5 Stability, load line and structural arrangement

2.1.5.1 The stability, load line and structural arrangement of ships engaged on non-international voyages are to comply with the relevant provisions of the flag State Administration.

2.1.6 Loading manual and loading instrument

2.1.6.1 Ships of service category 2 and service category 3 may not be provided with a loading instrument.

2.1.6.2 For ships engaged on non-international voyages, the loading manual, output results of loading instrument and operation manual are to use the language that users can understand. Where this language is not English, English translation may not be required.

2.1.7 Direct calculations

2.1.7.1 When the requirements of Section 5 Direct strength calculations, Chapter 1, PART TWO of the Rules are applicable to ships in restricted service, the requirements of 2.1.7.2 are to be satisfied.

2.1.7.2 The service coefficient f_r , is to be taken as follows:

f_r=0.90, for service category 1;

f_r=0.85, for service category 2;

f_r=0.80, for service category 3.

2.1.7.3 When the requirements of 2.2.9 Direct calculation of wave loads, Section 2, Chapter 2, PART TWO of the Rules are applicable to ships in restricted service,the prediction of wave loads is required to be based on wave statistics of the sea areas in which such ships operate and where there are more than one set of wave statistics, the most severe one is to be used.

Section 2 SHIP TYPE REQUIREMENTS

2.2.1 Ro-ro ships, passenger ships, ro-ro passenger ships and ferries

2.2.1.1 When the requirements of Section 4 Bow doors and inner doors, Section 5 Side shell and stern doors of Chapter 9 of PART TWO of the Rules are applicable to ships in restricted service, the requirements of 2.2.1.2 are to be satisfied.

2.2.1.2 The design load coefficient λ is to be determined in accordance with the following requirements:

λ=1.0, for ships intended for service category 1;

λ=0.8, for ships intended for service category 2;

λ=0.5, for ships intended for service category 3.

2.2.1.3 For passenger ships intended for service category 2 or 3, and of less than 65 m in length, the superstructure and deckhouse of tier 2 and above and not participating in hull girder longitudinal bending may use aluminium alloy reinforced plate. For passenger ships of 65 m and more in length, special consideration may be given to the superstructure and deckhouse not participating in hull girder longitudinal bending.

2.2.1.4 Where aluminium alloy reinforced plate is used in the superstructures and deckhouses mentioned in 2.2.1.3 above, the thickness of the plate may be determined in accordance with the principle of strength equivalence as specified in Section 17, Chapter 2 and Section 2, Chapter 9, PART TWO of the Rules, but not less than 5 mm.

2.2.2 Barges

2.2.2.1 When the requirements of Appendix Method of checking transverse strength of pontoon barges of Chapter 12 of PART TWO of the Rules are applicable to ships in restricted service, the requirements of 2.2.2.2 are to be satisfied.

2.2.2.2 For pontoon barges navigating only in restricted service, the value C used for the load due to external water pressuremay be reduced in accordance with the following provisions:

(1) for service category 1: 0.90;

(2) for service category 2: 0.85;

(3) for service category 3: 0.80.

2.2.3 Floating cranes

2.2.3.1 For floating cranes operating in restricted service, the following class notations are to be assigned:

(1) Operating in Service category 1: Lifting Within R1;

(2) Operating in Service category 2: Lifting Within R2;

(3) Operating in Service category 3: Lifting Within R3;

(4) Operating only within harbour: Lifting Within Harbour.

2.2.3.2 For the check of longitudinal strength of floating cranes under operating conditions in accordance with the requirements of Chapter 13 of PART TWO of the Rules, the wave bending moment and wave shear force may be reduced as follows:

(1) 15% for ships intended for service category 1;

(2) 30% for ships intended for service category 2;
(3) 45% for ships intended for service category 3;
(4) 70% for floating cranes intended for operations in harbours only.

2.2.4 Dredgers

2.2.4.1 Dredgers operating in restricted service are to be assigned one of the following class notations:
(1) Operating in service category 3: Dredging Within R3;
(2) Operating in service category 2: Dredging Within R2;
(3) Operating in service category 1: Dredging Within R1;
(4) Operating only within harbour: Dredging Within Harbour.
2.2.4.2 For the check of longitudinal strength of dredgers under operating conditions in accordance with the requirements of Chapter 14 of PART TWO of the Rules, the wave bending moment and wave shear force may be reduced as follows:
(1) 15% for ships intended for service category 1;
(2) 30% for ships intended for service category 2;
(3) 45% for ships intended for service category 3;
(4) 70% for dredgers intended for operations in harbours only.

2.2.5 Semi-submersible barges

2.2.5.1 For non-self-propelled semi-submersible barges designed for operation in service category 3 or in harbour, loads and calculation conditions of longitudinal strength under the operating condition may be calculated in accordance with relevant requirements of ISC Rules for Classification of Floating Docks.

2.2.6 Twin-hull craft

2.2.6.1 Where Section 3 Total load, Chapter 18, PART TWO of the Rules is applicable to ships in restricted service, the requirements of 2.2.6.2 are to be satisfied.
2.2.6.2 For twin-hull craft only intended for the restricted service, the service coefficient C_3 of calculation of loads may be reduced as follows:
(1) 0.8 for service category 1;
(2) 0.6 for service category 2;
(3) 0.5 for service category 3.
.

CHAPTER 3 MACHINERY INSTALLATIONS

Section 1 GENERAL PROVISIONS

3.1.1 Scope of application

3.1.1.1 The provisions of this Chapter apply to machinery installations of ships in restricted service, which can replace relevant provisions in PART THREE of the Rules.

3.1.2 Ambient conditions

3.1.2.1 For machinery installations of ships in restricted service related to ship classification, the ambient temperature required in Table 1.2.1.2 of PART THREE of the Rules may be selected in accordance with the practical condition of service area.

3.1.2.2 In the case of ships for restricted service, the ambient conditions used for determining the rating of main and auxiliary diesel engines as required by 1.2.1.3 of PART THREE of the Rules are to be suitable for the geographical limits of the restricted service.

3.1.3 Fuel

3.1.3.1 With regard to the flash point required by 1.2.9.1 of PART THREE of the Rules, in ships engaged on non-international voyages, where additional precautions are taken so that the ambient temperature of the space in which oil fuel is stored or used will not be allowed to rise to within 10℃ below the flashpoint of the oil fuel, the use of oil fuel having a flashpoint of less than 60 ℃ but not less than 43 ℃ may be permitted.

Section 2 MACHINERY INSTALLATIONS

3.2.1 Dead ship starting

3.2.1.1 For cargo ships with service category 2 and lower than category 2 and passenger ships with service category 3 engaged on non-international voyages, dead ship starting in 1.2.6 of PART THREE of the Rules is not required.

3.2.2 Bilge suction arrangement in machinery spaces

3.2.2.1 For cargo ships with service category 2 and lower than category 2, the number of direct bilge suctions in Table 3.3.2.1 of PART THREE of the Rules may be 1.

3.2.2.2 For passenger ships engaged on non-international voyages of less than 100 gross tonnage or passenger ships with service category 3 and of less than 500 gross tonnage engaged on non-international voyages, emergency bilge suction as required in 3.3.3.1 of PART THREE of the Rules may be dispensed with.

3.2.3 Bilge pumps and bilge piping

3.2.3.1 With regard to the number of power bilge pumps and drive modes for each ship as specified in Table 3.4.1.1 of PART THREE of the Rules, for ships engaged on non-international voyages of less than 100 gross tonnage, carrying not more than 100 passengers, 2 independent bilge pumps may be provided if navigation period is less than 4 h.

3.2.4 Oil tank air pipes

3.2.4.1 Paragraph 3.10.2.5 of Chapter 3 of PART THREE of the Rules does not apply to ships with service category 2 and lower than category 2 engaged on non-international voyages,

3.2.5 Oil tank short sounding pipes

3.2.5.1 For ships engaged on non-international voyages, if high-level alarms are fitted in fuel oil tanks, when the sounding pipes are terminated in machinery spaces, only requirements of 3.10.10.1(2) and (3) of Chapter 3 of PART THREE of the Rules are to be met.

3.2.5.2 For fuel oil tanks in double bottom tanks, when the sounding pipes are terminated in machinery spaces, only requirements of 3.10.10.1(2) and (3) of Chapter 3 of PART THREE of the Rules are to be met for ships with service category 2 and lower than category 2 engaged on non-international voyages.

3.2.6 Fuel oil daily tank

3.2.6.1 For ships intended for navigating in restricted service engaged on non-international voyages, the capacity of each fuel oil daily tank required in 4.2.1.8 of Chapter 4 of PART THREE of the Rules may be reduced depending on different conditions but not less than 4 h.

3.2.6.2 The requirements of 4.2.1.8 of Chapter 4 of PART THREE of the Rules may not apply to ships with service category 3.

3.2.7 Oil burning units of boilers

3.2.7.1 For cargo ships with service category 1 and lower than category 1 and passenger ships with service category 3, for auxiliary boilers for essential services or auxiliary boilers supplying steam for heating heavy fuel oil as specified in 4.2.2.2 of PART THREE of the Rules, one oil supply unit will be accepted provided that one complete spare oil burning pump is carried on board and capable of being easily installed and connected.

3.2.8 Oil fuel booster pumps

3.2.8.1 For cargo ships with service category 1 and lower than category 1 and passenger ships with service category 3, for oil fuel booster pumps as required in 4.2.3.1 of PART THREE of the Rules, where one complete spare pump capable of being easily installed and connected or a suitable pump connecting to the system is provided, a standby pump may be dispensed with.

3.2.9 Feed water pumps for boilers

3.2.9.1 For cargo ships with service category 1 and lower than category 1 and passenger ships with service category 3, for auxiliary boilers for essential services or auxiliary boilers supplying steam for heating heavy fuel oil and cargo oil as specified in 4.4.1.1 of PART THREE of the Rules, where one feed water pump capable of being easily installed and connected is provided, only one feed water pump fitted is acceptable.

3.2.10 Feed water systems for boilers

3.2.10.1 For auxiliary boilers fitted with only one feed water pump as required in 3.2.9.1 of this Section, the requirements for provision of two independent feed water systems in 4.4.2.1 of Chapter 4 of PART THREE of the Rules may not be applied.

3.2.11 Condensate pumps

3.2.11.1 For cargo ships with service category 1 and lower than category 1 and passenger ships with service category 3, if not propelled by steam, the standby pump within condensate pumps required by 4.4.4.1 of PART THREE of the Rules may be one spare pump capable of being easily installed and connected.

3.2.12 Cooling water pumps

3.2.12.1 For cargo ships with service category 1 and lower than category 1 and passenger ships with service category 3, the standby cooling water pump as required in 4.5.1.1 of PART THREE of the Rules may be substituted by other pump with sufficient discharge capacity or a complete spare pump capable of being easily installed and connected.

3.2.13 Lubricating oil pumps

3.2.13.1 For ships intended for navigating in restricted service, where the power of single main engine is less than 440 kW, the standby pump as required in 4.6.1.1 of Chapter 4 of PART THREE of the Rules may be dispensed with.

3.2.14 Alternative power supply for steering gear

3.2.14.1 The requirements in 13.1.8.6 of Chapter 13 of PART THREE of the Rules may not apply to ships with service category 3 engaged on non-international voyages.

CHAPTER 4 ELECTRICAL INSTALLATIONS

Section 1 MAIN SOURCE OF ELECTRICAL POWER

4.1.1 Generating sets

4.1.1.1 Ships engaged on non-international voyages with the total capacity of the main generating sets of 500 kVA or less need not comply with the provisions in 2.1.1.1(4)② of Chapter 2, PART FOUR of the Rules.

4.1.1.2 At least one generating set is to be provided in cargo ships engaged on non-international voyages in category 3 service.

4.1.1.3 At least one generating set is to be provided in passenger ships engaged on non-international voyages in category 3 service where the auxiliary machineries serving the main engine, steering gear oil pumps, fire pumps and bilge pumps are driven by the main engine.

Section 2 EMERGENCY SOURCE OF ELECTRICAL POWER

4.2.1 Period of power supply

4.2.1.1 For domestic ships engaged on non-international voyages, the period of power supply of the emergency source of electrical power as required in 2.2.2.1 and 2.2.3.1(2) to 2.2.3.1(5) of Chapter 2 of PART FOUR of the Rules may be reduced to:

(1) category 1 service: 12h for passenger ships and 6h for cargo ships;

(2) category 2 service: 6 h for passenger ships and 3 h for cargo ships;

(3) category 3 service: 3 h for passenger ships and 3 h for cargo ships.

4.2.1.2 For passenger ships engaged regularly in international voyages of short duration and proceeding not more than 20 n miles off shore, ISC, if satisfied that the same level of safety would be attained, may accept a lesser period than the 36 h period required in 2.2.2.1(1) to (4), Chapter 2 of PART FOUR of the Rules, but not less than 12 h.

4.2.1.3 For cargo ships engaged regularly in international voyages of short duration and proceeding not more than 20 n miles off shore, ISC, if satisfied that the same level of safety would be attained, may accept a lesser period than the 18 h period required in 2.2.3.1(2) to (5), Chapter 2 of PART FOUR of the Rules, but not less than 12 h.

4.2.2 Reserve power source

4.2.2.1 For ships engaged on non-international voyages in category 3 service, the emergency source of electrical power as required in Section 2, Chapter 2 of PART FOUR of the Rules may not be fitted provided that an independent reserve power source in compliance with the following requirements is fitted.

(1) The reserve power source is to be the accumulator battery in compliance with the following requirements:

① located not in the same space as the main source of electrical power and located above the uppermost continuous deck as far as practicable;

② complying with the requirements of 2.2.1.4(1), (2) and 1.2.1.1(2) of PART FOUR;

③ capable of providing immediately power supply for any equipment as required in 4.2.1.1(2) of this Section.

(2) The capacity of the reserve power source is to be sufficient to supply the following equipment for at least 3 h:

① lighting at muster and embarkation stations, over the sides, in all alleyways, stairways and exits, in cabins accommodating more than 16 persons, and at the main switchboard, reserve power source and control stations;

② navigation lights and other signal lights as required in the International Regulations for Preventing Collisions at Sea;

③ internal communication equipment required in emergency;

④ fire detection and fire alarm system (if any);

⑤ daylight signalling lamp, the ship's whistle, the manually operated call points (if any) in intermittent

operation and all internal signals that are required in an emergency (e.g. general emergency alarm system, etc.);

⑥ radio communications on board.

Section 3 MISCELLANEOUS

4.3.1 Transformer

4.3.1.1 Requirements of 2.1.3.1(1) and (2), Chapter 2 of PART FOUR of the Rules may not be met for domestic cargo ships engaged on non-international voyages in category 3 service.

.

CHAPTER 5 REFRIGERATED CARGO INSTALLATIONS

Section 1 GENERAL PROVISIONS

5.1.1 General requirements

5.1.1.1 Any proposed addition to or relaxation of the requirements of PART FIVE of the Rules in respect to ships navigating in restricted service, to installations of small capacity, or to other special cases is subject to agreement of ISC. In such cases a service limitation may be made to the ship.

5.1.1.2 Cargo chambers are in general not to be refrigerated by the direct expansion pipe grid system when ammonia is used as refrigerant. However, in the case of a ship navigating in restricted service where the total capacity of its refrigerated cargo chambers is less than 500 m^3, a direct expansion ammonia pipe grid system may be adopted.

Section 2 REFRIGERATING PLANT

5.2.1 Number of units

5.2.1.1 In ships classed for restricted service where the total capacity of the refrigerated chambers is less than 1,500 m^3, only one complete refrigerating unit may be provided, but a standby compressor is to be fitted as an addition.

Section 3 CARRIAGE OF REFRIGERATED CONTAINERS IN CARGO HOLDS

5.3.1 Ventilation within holds

5.3.1.1 When Chapter 4 Carriage of refrigerated containers in cargo holds of PART FIVE of the Rules is applicable to ships of restricted service, the ventilation of holds carrying refrigerated containers is to be determined mainly according to size, type, number of containers, type of refrigerated cargo to be carried and service area of the ship.

CHAPTER 6 FIRE PROTECTION, DETECTION AND EXTINCTION

Section 1 GENERAL REQUIREMENTS

6.1.1 Fire protection, detection and extinction of ships engaged on non-international voyages are to satisfy relevant requirements of ISC Guidelines for Statutory Surveys of Sea-Going Ships Engaged on Non-International Voyages or standards accepted by the Administration of the flag State.

CHAPTER 7 ADDITIONAL REQUIREMENTS

Section 1 ADDITIONAL REQUIREMENTS FOR OPEN-TOP CONTAINER SHIPS

7.1.1 General requirements

7.1.1.1 This Section applies only to open-top container ships engaged in restricted service.

7.1.1.2 The relevant definitions and the required plans and documents are the same as those given in Section 1, Chapter 6, PART EIGHT of the Rules.

7.1.2 Freeboard

7.1.2.1 The freeboards are to be in compliance with the requirements of the flag Administration. Where not required by the Administration, the minimum freeboard of ships engaged in restricted service may be determined by either:

(1) sea keeping characteristics (model test), intact stability and structural strength; or

(2) minimum geometrical freeboard, intact stability and structural strength.

Where the hull or hatch coaming of open-top container ships is fitted with freeing ports or scuppers, however, the minimum freeboard is to be determined in accordance with (1) of this paragraph.

7.1.2.2 Where the freeboard is determined according to 7.1.2.1(1), the significant wave height for model test and the permissible hourly rate of ingress of green water in any one open hold (hourly rate of shipped green water = open area of hold × hourly down flooding height) are to be in accordance with Table 7.1.2.2:

Table 7.1.2.2

Service	Significant wave height for test① (m)	Hourly down flooding height (mm/h)
Service category 1	7.5	300
Service category 2	5.5	200
Service category 3	3.5	150

Note: ① The significant wave height for model test may be determined according to wave statistics of service areas, subject to agreement of ISC.

The procedure of model tests is to be in accordance with 6.1.6 of Section 1 of Chapter 6 of PART EIGHT of the Rules.

7.1.2.3 Where the freeboard is determined according to 7.1.2.1(2), the minimum freeboard is to be not less than the minimum geometrical freeboards given in Table 7.1.2.3:

Table 7.1.2.3

Service	Minimum geometrical freeboard (m)
Service category 1	0.035 L_L
Service category 2	0.030 L_L
Service category 3	0.0275 L_L

where: L_L– ship's length measured to load line, in m.

7.1.2.4 The minimum bow height is not to be less than that required by the LL 1966, assuming hatch covers being fitted.

7.1.3 Arrangement

7.1.3.1 Where the freeboard is determined according to 7.1.2.1(2),the hull or hatch coaming is not to be fitted with freeing ports or scuppers.

7.1.3.2 A deckhouse, forecastle or breakwater, the width of which is to be not less than that of front coaming of the open-top No.1 hold, is to befitted forward of that hold.

7.1.3.3 The height of the rear top of the deckhouse or forecastle and the top of the breakwater above the summer waterline is to be not less than the values given in Table 7.1.3.3:

Table 7.1.3.3

At forward perpendicular	0.25 L aft of forward perpendicular
F_b + 2.35	F_{min} + 1.75

where: F_b — minimum bow height specified according to 7.1.2.4, in m;

F_{min} — freeboard, in m, determined according to Regulations 27 to 30 of Annex I to the LL 1966, assuming hatch covers being fitted; to be determined by linear interpolation if the top is between the two positions given in the Table.

7.1.3.4 The breakwater structure is to be in compliance with the requirements for hold hatch coamings.

7.1.4 Intact stability

7.1.4.1 The intact stability is to be calculated and checked in accordance with the requirements for general cargo ships in Section 9, Chapter 1 of PART TWO of the Rules.

7.1.4.2 The intact stability in full-load complete flooded condition is to be calculated and checked in accordance with the following requirements.

(1) The full-load complete flooded condition is a full load condition of the ship, assuming open-top holds being flooded to the extent given in Table 7.1.4.2 (in the case of a ship fitted with cargo hold freeing ports, to the level of those ports):

Table 7.1.4.2

Service	Down flooding height of open-top holds (% hold depth*)
Service category 1	85
Service category 2	70
Service category 3	55

* Hold depth is the distance measured from the upper surface of inner bottom of a hold to that of strength deck.

(2) For ships engaged in service of category 1, the intact stability in the complete flooded loading conditions stated in (1) above is to comply with the following criteria:

① the range of stability is to be not less than 20°, and the angles of immersion of openings including ventilators, doors and hatch covers, which cannot be closed weather tight, are to be greater than this value;

② the maximum positive righting lever within the range specified in ① above but not greater than 20° is not to be less than 0.1 m.

(3) For ships engaged in service of category 2 or 3 or equivalent to 3, the intact stability in the complete flooded loading conditions stated in (1) above is to comply with the following criteria:

① the range of stability is to be not less than 15°, and the angles of immersion of openings including hatch coaming top, ventilators, doors and hatch covers, which cannot be closed weather tight, are to be greater than this value;

② the area A_{min} under the righting lever GZ curve within the range of stability which complies with ① above is not to be less than the value obtained as follows:

$$A_{min} = 0.025 + 0.005\,(20° - \theta_f) \quad \text{m·rad}$$

where: θ_f — angle of heel at which openings in hull, superstructures or deckhouses which cannot be closed weather tight immerse. In applying this criterion, small openings through which progressive flooding cannot take place need not be considered as open.

7.1.5 Damage stability

7.1.5.1 The damage stability is to be in accordance with 6.1.9 of Section 1 of Chapter 6 of PART EIGHT of the Rules or the relevant requirements specified by the flag Administration for conventional container ships.

7.1.6 Strength and construction

7.1.6.1 The longitudinal strength and local strength of the hull are to be checked in accordance with Chapters 2 and 7 of PART TWO of the Rules.

7.1.6.2 In addition, the loading conditions for the check of the longitudinal strength and local strength are to include the full-load complete flooded condition indicated in 7.1.4.2, wherein the assumed down flooding height is to be determined according to Table 7.1.4.2. In loading conditions indicated in 7.1.4.2, the following requirements are to be satisfied:

(1) Where the still water bending moment in flooded condition exceeds the allowable value, or the draught in flooded condition is greater than the scantling draught, the actual still water bending moment and/or draught in flooded condition is to prevail. Hull girder longitudinal strength (including ultimate strength) is to be checked in accordance with Section 2, Chapter 7, PART TWO of the Rules.

(2) Where the draught in flooded condition is greater than the scantling draught, the former is to prevail. Local strength is to be checked in accordance with relevant sections of Chapters 2 and 7, PART TWO of the Rules.

(3) For hull structures forming watertight boundaries of open-top holds, requirements in Section 13 Deep

Tanks, Chapter 2, PART TWO of the Rules are to be satisfied, where the design pressure head h is the vertical distance from the calculation point to the highest point of down flooding height specified in 7.1.4.2.

7.1.6.3 When checking the longitudinal strength, the hatch deformation due to hydrodynamic torque need not be considered.

7.1.7 Bilge dewatering system

7.1.7.1 Where the freeboard is determined according to 7.1.2.1(1), the capacity of the bilge pumping system is to be determined in accordance with the relevant requirements of 6.1.10 of Section 1 of Chapter 6 of PART EIGHT of the Rules.

7.1.7.2 Where the freeboard is determined according to 7.1.2.1(2), the capacity of the bilge pumping system is to be not less than the greatest of the values obtained as follow:

(1) four-thirds of the amount of water required for fire-fighting purposes in the largest hold;

(2) an amount equal to the capacity required for ships with closed cargo holds;

(3) down-flooding height of open-top holds as listed in Table 7.1.7.2 multiplied by open hatch area:

Table 7.1.7.2

Service	Down-flooding height of open-top holds
Service category 1	150 mm/h for No.1 hold, 100 mm/h for other holds
Service category 2	130 mm/h for No.1 hold, 100 mm/h for other holds
Service category 3	100 mm/h for all holds

7.1.7.3 The ship is to be fitted with at least three bilge pumps for pumping open-top hold bilges.

7.1.7.4 The capacity and arrangement of the bilge pumps are to comply with the following requirements:

(1) At least one of these pumps is to have a capacity of not less than the required capacity as defined in 7.1.7.1 or 7.1.7.2 and is to be used for bilge and ballast service. This pump may also be used as an emergency fire pump. The pump is to be located in such a way that it will not be affected by a fire or other casualty to the space containing the pumps required in (2) below or the space containing the main source of power and is to be supplied from the emergency source of power complying with Sections 1 and 2, Chapter 2 of PART FOUR of the Rules or any source of power other than the main source of power. Where the pump is also used as an emergency fire pump, the relevant requirements for emergency fire pumps are to be complied with.

(2) The combined output of at least two further pumps is not to be less than the required capacity as defined in 7.1.7.1 or 7.1.7.2. These pumps are to be supplied from the main source of power complying with Section 1, Chapter 2 of PART FOUR of the Rules, or any source of power other than the emergency source of power.

7.1.7.5 The bilge pumping system is to be arranged to be effective with the ship in upright position and heeled up to 22.5°, or trimmed by bow or stern up to 10°, or with any combination of inclination angles within these scopes. The open hold bilge wells are to be readily accessible for dredging and cleaning.

7.1.7.6 All open cargo holds are to be fitted with high bilge level alarms. The alarms are to initiate visual and audible warnings in the engine room and the manned control locations (navigation bridge or control stations) and be independent of bilge pump controls.

7.1.8 Fire protection

7.1.8.1 Open-top cargo holds are to be protected by a water sprinkler or spray system. The system is to be capable of sprinkling/spraying water into the cargo hold from deck level downward. The system is to be designed and arranged to take account of the specific hold configuration so that the sprinkled/sprayed water will cover the complete hatch of the open hold.

7.1.8.2 At least one dedicated fire-extinguishing pump for the hold water sprinkler or spray system with a capacity to serve all container bays in any one open-top container hold simultaneously is to be provided. The uniform application density is to be not less than 1.1 l/min/m^2. The pump is to be installed outside the open-top area. In addition, the sprinkler or spray system is to be interconnected to an alternative source from the weather deck as backup means, the capacity of which is not to be 50% less than that of the dedicated pump.

7.1.8.3 For open holds of open-top container ships of less than 5,000 gross tonnage, deck fire main system may be an alternative to the sprinkler or spray system required by 7.1.8.1 and 7.1.8.2.

Section 2 ADDITIONAL REQUIREMENTS FOR PUSHER TUG-BARGE COMBINATIONS

7.2.1 General provisions

7.2.1.1 The scope of application of this Section is as follows:

(1) This Section applies only to pusher tug-barge combinations in restricted service.

(2) The pusher tug-barge combinations are to comply with the requirements of this Section and in addition, the applicable requirements in other Chapters of the Rules for single pusher tugs and barges, ISC Rules for Materials and Welding and the relevant requirements of the flag Administration (if any).

7.2.1.2 For the purpose of this Section:

(1) Rigidly connected pusher tug-barge combination is a combination of a pusher tug and a barge with the following characteristics:

The pusher tug is secured in the barge notch by mechanical means of any type whatsoever other than just wire ropes, chains, lines or other tackles, and there is no relative motion between the pusher tug and the barge. The pusher tug and the barge remain so connected throughout the voyage.

(2) Pusher tug-barge combination connected in articulated manner is a combination of a pusher tug and a barge with the following characteristics:

① the pusher tug is secured in the barge notch by mechanical means of any type whatsoever other than just wire ropes, chains, lines or other tackles;

② the articulated connector allows pitch between the pusher tug and the barge in one degree of freedom, i.e. rotation of the pusher tug/barge about the (transverse) axis of the connector. The combination is capable of being connected or disconnected remotely from the pusher tug or locally from the barge. The pusher tug and the barge remain so connected throughout the voyage;

③ when the articulated connector is disconnected, both the pusher tug and the barge may remain separately in mooring or operation.

(3) Length of combination (L_c) means the length of the pusher tug-barge combination acting as a single unit. The combined length L_c is to be taken as the distance, in m, measured on a waterline at 85% of the least molded depth of the barge (where the lowest point of freeboard deck of the pusher tug is at or above this waterline) or on the design waterline of the combination (where the lowest point of freeboard deck of the pusher tug is below this waterline), from the fore side of the stem of the barge to the after side of the rudder post or stern post of the pusher tug. Where there is no rudderpost or stern post, L_c is to be measured to the centerline of the rudder stock of the pusher tug. L_c, however, is not to be taken less than 96% and need not be taken greater than 97% of the total waterline length of the combination measured at 85% of the least molded depth of the barge.

7.2.1.3 In addition to the plans and documents required for pusher tugs and barges acting as single vessels in the Rules, the following ones are to be submitted to ISC for approval:

(1) Plan of strengthened hull structural portions in way of the connection of tug and barge for each vessel.

7.2.1.4 The following plans and documents are to be submitted to ISC for information:

(1) Provision and arrangement of connector of the combination;

(2) Connector load calculations;

(3) Diagram of mechanical principles of the connector;

(4) Analysis calculations of strengthened hull structural portions in way of the connection of tug and barge for each vessel;

(5) Operating manual for the connector, including instructions on operation, testing and maintenance.

7.2.1.5 Class notations are as follows:

(1) A rigidly connected pusher tug-barge combination complying with this Section is to be assigned the following class notations:

For pusher tug: Rigid Connection PB Combination — Pusher;
For barge: Rigid Connection PB Combination — Barge.

(2) An articulatedly connected pusher tug-barge combination complying with this Section is to be assigned the following class notations:

For pusher tug: Articulated Connection PB Combination — Pusher;
For barge: Articulated Connection PB Combination — Barge.

7.2.2 Freeboard, subdivision and stability, bilge pumping system

7.2.2.1 The freeboard, subdivision and stability, bilge pumping system of a pusher tug-barge combination

acting as a single unit and of pusher tugs and barges acting as single vessels are to comply respectively with the following requirements or the relevant requirements of the flag Administration (if any):
(1) The freeboard, subdivision and stability, bilge pumping system of pusher tugs and general barges acting as single vessels are to comply with the relevant requirements of the flag Administration.
(2) The freeboard, subdivision and stability, bilge pumping system of open-hatch container barges are to comply with the requirements for open-hatch container ships in Section 2 of this Chapter.
7.2.2.2 Freeboard and arrangement requirements are as follows:
(1) In addition to the requirements in 7.2.2.1(1), the freeboard and bow height of a barge are not to be less than those required for the combination acting as a single unit (general cargo ship).
(2) In all cases, a safe passage is to be available for crew between the aft part of the barge and the fore part of the pusher tug.
7.2.2.3 The intact stability of a combination acting as a single unit in full load condition (fully loaded pusher tug + fully loaded barge) is to comply with the requirements for general cargo ships.

7.2.3 Hull structure and outfitting

7.2.3.1 Requirements for hull structure are as follows:
(1) Hull structure of pusher tug
① A pusher tug acting as a single ship is to comply with the requirements for tugs specified in Chapter 10 of PART TWO of the Rules.
② When calculating the wave impact loading of superstructures and deckhouses, they are to be considered as those of the combination. However, the thickness of their decks and enclosures need not be greater than that of the main hull shell or deck of the pusher tug.
(2) Hull structure of barge
① A barge acting as a single ship is to comply with the requirements of Chapter 12 of PART TWO of the Rules.
② The collision bulkhead of the barge is to be located according to the length of combination L_c, i.e. at a distance, from the fore end of the barge, of not less than 0.05 L_c or 10 m, whichever is the lesser, and not more than 0.08 L_c.
③ Both the longitudinal and local strength of open-hatch container barges are to comply with the relevant requirements in Section 1 of this Chapter.
7.2.3.2 Requirements for outfitting are as follows:
(1) Outfitting of pusher tug
① A pusher tug acting as a single ship is to be provided with the anchoring and mooring equipment used for pusher tugs in accordance with the requirements for cargo ships specified in Chapter 3 of PART TWO of the Rules.
② The combination is to be considered as a single unit with regard to the rudder and steering gear to be provided on board.
(2) The combination is to be considered as a single unit with regard to the outfitting of the barge, and the anchoring and mooring equipment may be provided in accordance with the requirements for cargo ships specified in Chapter 3 of PART TWO of the Rules.

7.2.4 Electrical installations

7.2.4.1 The electrical installations of pusher tugs and barges are to comply with the applicable requirements of PART FOUR of the Rules and in addition, the requirements of this Section.
7.2.4.2 Requirements for pusher tugs are as follows:
(1) The calculation of power plant load of the pusher tug is to include the power consumption of the barge.
(2) The navigation bridge of the pusher tug is to be capable of initiating the following alarms on the barge:
① audible and visual alarm in case of high bilge level in hold of barges;
② audible and visual alarm in case of fault of any ship light on barges.
7.2.4.3 Requirements for barges are as follows:
(1) The barge may be served by the power plant of the pusher tug to which the barge is connected, and when at a port of call by a source on shore, as follows:
① A connection box is to be fitted at a suitable place on board the pusher tug for a flexible cable supplying power to the barge.
② A shore connection box complying with the relevant requirements of rules is to be fitted at a suitable place on board the barge for a flexible cable from an external power source. The shore connection box and the main switchboard on board the barge are to be connected by a fixed and

adequately rated cable.

(2) The barge is to be provided with accumulator batteries as standby power source for anchor lights in case of loss of power when anchoring separately. The power supply period of the batteries may be evaluated according to the possible duration of such case.

(3) Where refrigerated containers are carried in the barge, the power plant capacity calculation, power distribution, monitoring, socket type, etc. are to comply with the relevant requirements of Section 4, Chapter 4 of PART FIVE of the Rules.

7.2.4.4 Other requirements

(1) A multi-core flexible cable may be used to transfer monitoring and alarm signals between the pusher tug and the barge. Such cables are to be connected to the pusher tug and the barge via connector assemblies with a degree of protection of at least IP56.

(2) Means of interlock or alarm are to be used to prevent any damage to the flexible cable linking the pusher tug and the barge in case of disconnection of the connector between the two ships.

7.2.5 Connector and hull supporting structure

7.2.5.1 General requirements

(1) This paragraph contains only requirements for articulated connectors. Equivalent safety design may be used for rigid connectors.

(2) Indicators are to be fitted at the navigation bridge and local operation position to show the disconnected or connected status of the connector, and connecting/disconnecting operations are to be possible.

(3) The mechanical connection means (hereinafter referred to as connector) means the mechanical system used on the pusher tug for quick connection with the barge, including a telescopic connecting arm and all associated power and control parts.

(4) The connector is to be capable of being operated both locally and at the navigation bridge, and disconnected in less than 5 minutes in an emergency.

(5) The connector is to be capable of being operated at one side and at both sides.

(6) At least two separate power units are to be provided to serve the connector.

(7) An emergency disconnection of the connector is to be possible in case of loss of power.

(8) Means of communication are to be available between the space where the connector is located and the navigation bridge.

(9) The connector is to be fitted with a limiter to prevent the connecting arm from excessively stretching or retracting.

(10) For hydraulic connectors, the drawings and documents to be submitted, installing and arrangement, materials, structure and design, safety valve, monitoring and alarm, testing (including sea trial) may be dealt with in accordance with the appropriate requirements for steering gears specified in Chapter 13 of PART THREE of the Rules.

(11) The non-hydraulic connectors are to meet a standard equivalent to that for hydraulic ones.

7.2.5.2 Requirements for strength of connector and hull supporting structure

(1) Connector load

① The design of the connector is to take into account the quasi-static loads, including the buoyancy and propulsion forces, and the dynamic seaway loads, as well as the steering loads. The loads may be obtained either according to ② below or by model test, or calculated by an empirical method. The calculation results are to be submitted to ISC for check.

② The maximum lifetime connector loads may be used for the design of the connection system between the tug and barge. The maximum lifetime value is to be determined based on a prediction method for the long-term extreme value with an acceptable probability level. The methods of determining the maximum lifetime connector loads can be identified:

a) through a scale model test program covering a range of wave frequencies and headings so as to obtain the connector load response amplitude operators (RAOs) and then by analysis to identify the worst heading and predict the long term extreme connector load for that heading, or

b) by a motion response analysis, using a suitable sea keeping analysis program that can handle multiple bodies linked by articulation, in connection with a long term extreme analysis, and taking the wave data of the sea area where the pusher tug-barge combination is to operate into calculation.

③ The design calculation of the connector loads is to be documented and submitted for information.

(2) Specification of the connector system is to be submitted for information together with the design load calculations for the connector loads.

(3) Structure and strength of connection means

① Stress analysis is to be performed according to the load stated in 7.2.5.2(1) above to obtain loads acting on individual components of the connector. Strength calculations are to be provided for essential components of the system in accordance with the following criteria:

$$\sigma \le \frac{R_{eH}}{n}$$

$$\tau \le \frac{0.58R_{eH}}{n}$$

where: σ — positive stress, in N/mm^2;
R_{eH} — yield stress of material of components, in N/mm^2;
τ — shear stress, in N/mm^2;
n — safety factor, taken as 2.5.

② For components subjected to composite stress, the equivalent stress is to comply with the following formula:

$$\sigma_e = \sqrt{\sigma^2 + 3\tau^2} \le 1.1\frac{R_{eH}}{n}$$

where: σ_e —equivalent stress, in N/mm^2;
R_{eH}, σ, τ, n — the same as above.

(4) Main hull supporting structure and strength

① For the supporting structure of the means connecting the pusher tug and the barge, stress analysis is to be performed in respect to the load transmitted by the connector. The analysis is to follow the conventional engineering practice and is to be submitted for check. The connector loads applied are to be in accordance with the loads determined from 7.2.5.2(1) above. In the case of notch type connections, an analysis of the barge wing walls is to take into account torsional shear as well as primary and secondary shear and bending stresses. The results of the structural analysis are to be assessed for yielding and buckling failures.

② The structure in the bow of the pusher tug and the stern of the barge is to be suitably reinforced both in the athwart ship and fore and aft directions with a system of webs, stringers, bulkheads, etc. to withstand the forces developed at these locations due to the connection and also to transmit these forces into the main body of the ships. The hull structure adjacent to the connector is to be suitably reinforced, and assessed by fine finite element direct calculation. The fine finite element model is to be based on the following principles:

a) a separate fine finite element model may be used, with boundary conditions being obtained from analysis of a coarse finite element model; alternatively, direct calculation may be performed via a fine finite element model fitted in a coarse finite element model;

b) the fine finite element area is to be such that stress of the area will not be affected by the boundary conditions of displacement and those of forces. The fine finite element model is to be such that its refined edges are supported by primary members, e.g. girders, horizontal girders and floors in cargo area;

c) the size of meshes of the fine finite element area adjacent to the connector is to be taken as 50 mm × 50 mm. 4-node or 8-node hull elements are to be used, and the use of any triangular element is to be prevented. The weld geometry and structural alignment are not to be taken into account;

d) the permissible yield stress of structural members are to be in accordance with Table 7.2.5.2(4);

e) buckling assessment may be carried out in accordance with the methods provided in Section 5, Chapter 1, PART TWO of the Rules.

Permissible Equivalent Yield Stress [σ_e]① (N/mm^2) **Table 7.2.5.2(4)**

Model / Element	Local fine finite element model (based on 50 mm × 50 mm mesh size)
Plate element	1.36 R_{eH} (single element)② 1.0 R_{eH} (area average)③

Notes: ① The plate element is to be considered according to the equivalent stress (Von Mises stress), i.e.:

$\sigma_e = \sqrt{\sigma_x^2 + \sigma_y^2 - \sigma_x\sigma_y + 3\tau_{xy}^2}$ N/mm^2, the median plane stress at centroid of the plate element (membrane stress) is to be considered

where: σ_x — element stress in x direction, in N/mm^2;
σ_y — element stress in y direction, in N/mm^2;
σ_{xy} — element shear stress in xy plane, in N/mm^2.

② R_{eH}— yield stress of material, in N/mm^2.

③ The area average means the average of the Von Mises stress of the element considered in the fine finite element area and that of the element in the connecting node.

Section 3 ADDITIONAL REQUIREMENTS FOR PETROLEUM ASPHALT CARRIERS

7.3.1 General provisions

7.3.1.1 Ships specialized in carrying melted petroleum asphalt in bulk in restricted service are to be in accordance with relevant requirements of Chapter 10 of PART EIGHT of the Rules.

Section 4 DYNAMIC POSITIONING SYSTEMS

7.4.1 Environmental conditions

7.4.1.1 For vessels engaged in restricted service, a long-term distribution of environmental conditions prevailing where the vessel is in operation is to be considered.
